Track 1: Migration as the New Face of Change

Co-Chairs: Amos Brandeis, Israel; Njeri Cerere, Kenya

Adebayo, Ambrose Adeyemi, University of KwaZulu Natal, Durban, South Africa

Urban built environment in an era of uncertainty: migration, urban planning and housing policy in South African Cities

Cross border migration in the case of South Africa, has been met with a lot of resistance from the host country, with the poor ending up as refugees. This paper will evaluate the implications on South African cities' built environment and of policy interventions in place to address the issues outlined above.

Chatterji, Tathagata, University of Queensland, Brisbane, Australia

Participatory planning in the era of public-private-partnerships: complexities and contradictions in a migrant city in India (peer-reviewed)

This paper explores the role of planning in bridging the gap between local rural residents and new urban middleclass and poor migrants in the context of globalisation.

Chen, Xiaojian; Li, X.Y; Ding, N., Xi'an University of Architecture and Technology, Xi'an, China

The models of urbanization and their impacts on spatial evolution of built-up areas - Case studies of cities in Shaanxi in Northwest China

Large-scale demographic changes driven by migration have different effects on the spatial evolution of cities with different scales and different development conditions. This paper discusses the effectiveness and lessons derived from the implementation of city planning in these three units and takes Xi'an, Yulin and Ankang separately as examples.

Gonçalves Garcia, Marina; Vasconcellos Garcia, Antônio Jorge, Universidade do Vale do Rio dos Sinos, Porto Alegre, Brazil

Sustainable urbanism in coastal environment: an applied project to expanding urbanized zone of Aracaju City, Sergipe, Brazil (peer-reviewed)

This paper presents partial results of geo-science multidisciplinary studies applied to coastal environments and its usefulness in terms of a proposal for sustainable urban development in the expansion of the city of Aracaju, capital of the State of Sergipe, in the northeast of Brazil.

Heyning, Helena Chaya, MB&A BV, Amsterdam, the Netherlands

Design for shrinkage – Generating new opportunities and wealth

Shrinkage accompanied by economic, social and spatial decline also offers new possibilities. Identifying ones opportunities is incredibly important as is sustained and multi-annual community and stakeholder engagement.

Klinmalaj, Siwaporn; Kanki, Kiyoko, Kyoto University, Kyoto, Japan

Impact of different land use transformation on neighborhood relationship between newcomer and former villagers in a sprawl area of the Bangkok Metropolitan Region: the case of Nonthaburi and Pathumthani province in comparison, Thailand

Nonthaburi and Pathumthani province are experiencing a dramatically high population growth among five vicinity areas of the Bangkok metropolitan region with an uncontrollable growth of population. This condition has impacted different land use transformations and also affected different neighborhood relationships between the former village inhabitant in an agricultural area and the newcomer in a new residential area.

Lv, Yuan; Liu, Kewei; Liu, Lin; Zhao, Dan; Zhang, Fujuan, Northwest University, Xi'an, China

Problems and strategies of urbanization development in Western China from the perspective of urban-based society - A case study of Shaanxi Province (peer-reviewed)

Serious problems in the urbanization process of western China are raised from the perspective of the urban-based society, taking Shaanxi, a well-developing and typical province in natural geographical features in western China as a case. Strategies to solve these problems are put forward.

Mitra, Sheuli; Mitra, Tapas, School of Planning and Architecture, Bhopal, India; Chatterjee, M., Bardhan, S., Jadavpur University, Kolkata, India

Conflicts in land and housing markets in Kolkata: Emergence of a divided city

This research investigates reasons of conflicts between social sustenance and economic viability of urban housing projects in Kolkata, India. It traces the transition of housing from social sector to private sector, and its impact on urban land markets, which has consequently resulted in the emergence of a divided city.

Monardo, Bruno; Falco, Enzo; Polizzi di Sorrentino, Enrica; Boca, Alessandro; Ferretti, Alessia, Sapienza – Università di Roma, Rome, Italy

Urban agriculture as a socially inclusive and sustainable post-growth urban regeneration strategy

The experience of “New Roots Community Farm” within the distressed neighborhood of City Heights in San Diego shows how the “Urban Agriculture” approach can provide new integrated strategies for urban regeneration matching social inclusion and physical-economic redevelopment.

Perry, Guy, IN-VI, Warsaw, Poland

Planning for health and sustainability (or low fat cities)

The way in which our cities expand impact, not only on environmental sustainability, but on human health. Increasingly, current physical living patterns in transition economies make it challenging for humans to lead healthy and balanced lifestyles. Brazilian and Polish developments strive to keep their cities and their inhabitants lean.

Qin, Meng Di; Liu, Guan Peng, Tongji University, Shanghai, China

Strategies on improving the attraction of small towns in China, solving problems caused by migration

This paper explores advantages and disadvantages of small towns and cities in China, with the goal to enhance the attractiveness of small towns. It suggests that small towns should be concerned with being attractive, so that they can contribute to relieving various pressures on big cities caused by migration.

Shao, Dan; Mu, Ye, China Academy of Urban Planning and Design, Beijing, China

Planning practices coping with migration in a backward area in Western China: A case study of Liupanshui City, Guizhou Province

The rise of cities in western China is usually based on mineral resources under government intervention. The population migration shifts from net inflow to a concurring situation of aggregation of city and net outflow of region. Planning practices face challenges from expanding the scale of the city to blending into the region.

Wang, Fei; Wei, Wei; Li, Ming, China Academy of Urban Planning and Design, Beijing, China – presented by Shao, Dan

Equalization of public service facilities for tourist cities - Case study of Sanya's downtown public service facilities in the planning

Providing countermeasures to achieve the equalization of public service facilities in Sanya from contraposing its periodic variation of a population.

Zhang, Danming; Dong, Anrong, Tsinghua University, Beijing, China

Estimation of water resource capacity of Chinese cities for facing the challenge of future urbanization

This paper estimates the water carrying capacity of Chinese cities and major megalopolises and intends to offer future urbanization suggestions by considering issues in water aspect

Zhou, Yajie; Wang, Tinglin, China Academy of Urban Planning and Design, Beijing, China

Research on the migrant personnel flow's influence on the urban planning: Case study of Beijing and Xinyang city

China's migrant personnel flow will have a significant influence on both the migrant destination city and the home city. This paper takes Beijing with a large number of immigrants and Xinyang with a large outflow of population as the research object, to study the migrant personnel flow's impact on urban planning.

Zhu, Jin, Tongji University, Shanghai, China

Issues and solutions on the development of new towns in Shanghai from the view of migration and social structure transition

The boom of suburban centers and the recession of new towns are closely related to migration. This paper discusses the issues and solutions on development of new towns in

Shanghai by analyzing the migration and social structure transition process. The causes of the problems are clearly illustrated.

Track 2: Valuing What Already Exists

Co-Chairs: Silja Tillner, Austria; Belinda Yuen, Singapore

Alwehab, Abdelwehab, University of Baghdad, Baghdad, Iraq

Utilization analysis of Baghdad City urban waterfront

Urban waterfronts are vital components of the urban landscape for cities with such areas. A survey of land uses along the waterfront of the city of Baghdad clearly indicates underutilization, which constitutes a social and economic loss to citizens.

Ayangbile, Oluwabukola; Abiodun, Oluwafisayo, University of Ibadan, Ibadan, Nigeria

Cultural heritage planning and preservation in Yoruba cities: Case study of Ile Ife, Nigeria

This paper examines how heritage places and spaces are protected and managed to enhance historical artifacts in Ile Ife, the 'Cradle of Humankind'. It suggests traditional historical planning tools as a re-vitalization planning strategy to preserve, manage and protect the sacred groves, monuments, traditional and religious landmarks that already exists.

Chang, Hsueh-Sheng; Chen, Tzu-Ling, National Cheng-Kung University, Tainan City, Taiwan

Based on mitigation and adaptation viewpoint in water sensitive city - A case study in serious land subsidence area in Yunlin, Taiwan (peer-reviewed)

A coupling model of urban water balance on land use change can analyze the relationship between land use development, anthropogenic activities and water cycling, and further simulate different scenarios to propose appropriate land use patterns while achieving water safety, water satisfaction, and water environment communities.

Cillers, Elizelle Juane; de Jong, Nicolene, North West University, Potchefstroom, South Africa – presented by Bernice van Schalkwyk

Planning for lively spaces: adding value to old spaces (peer-reviewed)

Lively planning concept implemented in two case studies in an attempt to enhance the value and function of the old spaces.

Fattahi, Sara, Apadana Institute of Art and Architecture, Shiraz, Iran; Bazrkar, Mojtaba, Freelance Translator, Shiraz, Iran

From Garden City to City in a Garden (Case study: Shiraz city as a 'Permaculture' model in Iran)

In new urbanization, some gardens and open spaces have been destroyed in Shiraz, Iran, during the development of the city. Converting Shiraz city to a model of "Permaculture" and increasing green spaces in Shiraz by roof gardening is discussed in this paper.

Grant, Paula, University of Southern Queensland, Toowoomba, Australia

Old neighbourhoods showcasing new urbanist principles to promote walking for transport (peer-reviewed)

The built environment shapes our transport choices and has a significant impact on the environmental, economic and social wellness of communities. This paper shows that older urban neighbourhoods have displayed the compactness, connectivity, density, lot layout and land-use mix to be walkable long before the term new urbanism was coined.

Greenop, Kelly; Darchen, Sebastien, University of Queensland, Brisbane, Australia

Brisbane's urbanism: looking for an identity. Case study of Inala (peer-reviewed)

The objective of this paper is to create avenues of reflection on how to enhance the identity of urban spaces in Brisbane. We base our analysis on the Inala case study.

Goledzinowska, Anna, Gdansk University of Technology, Gdansk, Poland

Development policy or palliative therapy? Investing in the quality of public spaces in the distance from large urban centers (peer-reviewed)

The paper refers to two main issues: 1) the phenomenon of an extensive network of medium-sized towns in Poland 2) effectiveness of investments in the quality of public spaces as a tool stimulating social and economic development.

Gu, Zongpei, China Academy of Urban Planning and Design, Beijing, China – presented by Wei, Gang

The understanding of Beijing cultural spaces

Protecting and re-using cultural spaces is one of the most important issues during Beijing's development. A comprehensive understanding of the present situation of cultural spaces in Beijing is examined by mapping the spatial distribution of Beijing's cultural resources. More importantly, downfalls behind the current situation in Beijing are analyzed.

Gunay, Zeynep, Istanbul Technical University, Istanbul, Turkey

Renewal agenda in Istanbul: Urbanisation vs. urbicide

The paper intends to discuss how the large-scale property-led renewal schemes, which have been employed as an evolving model in resolving the "urbanisation" problem, are turned into the instruments of "urbicide" in Istanbul as a political evolving model of urban destruction.

Herron, Murray; Jones, David; Rollo, John, Deakin University, Williamstown, Australia

South West Victoria 2012 – 2050: Are the settlements sustainable? (peer-reviewed)

Regional sustainability in Victoria. Is it possible?

Kammerbauer, Mark, Technical University Munich, Munich, Germany

Adaptive strategies of urban disaster recovery planning (peer-reviewed)

Contradictions between recovery planning and urban master planning emerged in New Orleans after Hurricane Katrina in 2005. The Citywide Recovery Plan had to support rebuilding, while the 2030 Masterplan advocated growth and improvement. What role do existing conditions and the scale of disaster play for this process?

Langley, Joseph, SKM, St. Leonards, Australia

New funding options for urban regeneration

The traditional means of funding urban regeneration are proving to be inadequate as cities struggle to rebuild obsolete infrastructure while responding to changing demographic, housing and employment trends. New funding options are needed which share the value created by the public's investment in urban infrastructure.

Ledwon, Slawomir, Gdansk University of Technology, Gdansk, Poland

Valuing service and retail structures in core areas of cities

The paper describes the methodology to evaluate service and retail structures in cities in relation to their spatial form and possible future changes.

Liu, Yang, Tongji University, Shanghai, China

The dynamics of historic districts and the effectiveness of the historic conservation plan - Case study of Shanghai (peer-reviewed)

This research is about the effectiveness of the Historic District Conservation Plan in Shanghai. By focusing on the changes that happen before and after the implementation of those conservation plans, this paper reveals the advantage and disadvantage of those plans and the causes of the problems.

Magni, Peter, University of Cape Town, Johannesburg, South Africa

Strategic spatial planning's role in guiding infrastructure delivery in a metropolitan municipality context: The case of Johannesburg (peer-reviewed)

Strategic spatial plans have been used with limited success to guide infrastructure provision. The paper reviews the example of the City of Johannesburg where processes and mechanisms have been implemented to this effect highlighting tensions future visions and the reality of existing infrastructure networks.

Mitra, Tapas; Mitra, Sheuli, School of Planning and Architecture, Bhopal, India

Delineation, transformation assessment and intervention initiatives for 'Grey zones' of Kolkata, India (peer-reviewed)

This paper focuses on the aspects of dynamics of change in older residential areas of Kolkata, India, which do not necessarily qualify as 'heritage districts' and presents a rapid appraisal tool to initiate processes of developing design intervention strategies.

Moreira, Inês, CIAUD – FAUTL, Lisbon, Portugal

Expansion and abandonment: The urban duality in planning metropolitan Lisbon (peer-reviewed)

The paper approaches the expansion and abandonment of urban areas related to the presence of economic activities in metropolitan Lisbon, generated by the growth of the tertiary/quaternary sector and by the process of deindustrialization, by discussing their determinant factors, the policies and plans that have shaped them.

Murphy, Melissa, Norwegian University of Life Sciences, Oslo, Norway

Reading conflicts and congruencies in the built environment (peer-reviewed)

The results of urban planning and management are difficult to assess due to complexity and external factors after projects are built. The built environment can be read as a mitigation between past plans and current life. Tracing resident behavior through physicality can illuminate local conflicts and intention vs. implementation data.

Ren, Jie, Tsinghua University, Beijing, China

Siting green infrastructure: Synthetical solutions for leading the oasis city's sustainable development in Wuyi New Town

Owing to the particular conditions of oasis cities, the stability and security of the ecological environment seem to be quite crucial especially when dealing with urban sustainable development. This study showcases how Wuyi new town constructed its sustainable developing strategy by the solution of green infrastructure.

Sas-Bojarska, Aleksandra, University of Technology, Gdansk, Poland

The green waterfront of a city – where are the limits of good planning? Gdansk case

The paper presents the role of strategic planning of green areas of waterfronts in shaping the image of cities, and the threats to them caused by wrong planning decisions. The case study of Gdansk serves as an example to illustrate the potential of the sea-shore landscape and its possible degradation.

Thomas, Stacey, University of the West Indies, Diego Martin, Trinidad and Tobago

The Future is urban: The challenge for sustainable urban development in the Caribbean: The search for a sustainable urban form

Increasing urban populations coupled with the peculiarities of the Caribbean urbanization process, leave governments and policy makers grappling with how to manage and guide future urban development in a sustainable manner. Will densification, decentralization or a mixed urban form be the way forward?

Vaillant, Philippe, Université de Lorraine, Charleville-Mézières, France

Mining, environment and society: Contribution of the thought of Whitehead to the methodology of assessing the water that can really be mobilized in the Kimberley and Canning Basin, Australia

The Kimberley, one of the last pristine areas in the world, is subject to strong mining and gas pressure. The study, conducted with the Nyikina people and the International Water Centre in Brisbane, raises in a dialogic and organic way the issue of water resources that can be mobilized.

Van Zyl, Pieter, Western Cape Provincial Government, Cape Town, South Africa

Cape Town's V&A waterfront project adaptive re-use as a foundation for sustainable urban renewal

An overview of the V&A Waterfront Project in Cape Town, South Africa, describing how the new residential, commercial and leisure uses have been developed through adaptive re-use of harbour buildings and retaining the working harbour elements. An innovative “Package of Plans Process” facilitated the urban regeneration success story.

Vettorato, Daniele, European Research Academy, Bolzano, Italy

Smart City: the energy strategy of Bolzano transforming the existing city

The paper describes the opportunities, the strategies, and the synergies of the Bolzano Smart City concept.

Wei, Gang; Jiang, Zhaohui, China Academy of Urban Planning and Design, Beijing, China

Analysis of the spatial characteristics of commercial streets in China's Southern cities: A case of three commercial streets in SuZhou

Characteristic commercial streets are an important way to physically display the characteristics of cities. Based on a factual investigation on three characteristic commercial streets in SuZhou, this paper analyzes the space attributes and positive effects of the characteristic commercial streets, and aims to provide recommendations on building characteristic urban spaces.

Yang, Zhi; Hu, Haibo; Wang, Haiyong, Jiangsu Institute of Urban Planning and Design, Nanjing, China

Coordinating strategy of preserving the local identity during the rapid urbanization in China: Case study of three towns in the South of Kunshan (peer-reviewed)

This paper is aimed at exploring how to preserve the local identity as well as achieve the economic development during rapid urbanization. By the method of comparative analysis and evaluation, the coordinating strategy in historical conservation redevelopment, integrating space and policymaking has been proved to be effective.

Yuan, Lin, Tsinghua University, Beijing; Yuan, Lin, North China University of Technology, Beijing

Problems and countermeasures of Dujiangyan agricultural area protection during the rapid urbanization in Chengdu

To protect the Dujiangyan agricultural area during rapid urbanization in Chengdu, the paper suggests reiterating the 'traditional Dujiangyan watershed area' in the Qing Dynasty, strictly limiting urban growth within this range, and demarcating 'Dujiangyan Essential Agricultural Heritage Areas' to protect the farm land, human settlements, watershed and traditional culture comprehensively.

Yuen, Belinda, Singapore University of Technology and Design, Singapore, Singapore

Eco-city planning: pure hype or achievable concept

This paper will interrogate the key strategies, results, lessons learned and replicability of Singapore's eco-city planning. The analytical lens is on illuminating the strengths and weaknesses of eco-city planning – what has worked, what may work and what may fail elsewhere.

Zhao, Ye; Wang, Jianguo, Southeast University, Nanjing, China

The evaluation and improvement method of waterfront urban landscape - the case of urban landscape planning for West Lake in Hangzhou, China (peer-reviewed)

This paper takes West Lake as example, tries to find out both ways of adjustment from the respects of viewer and landscape, and proposes some thoughts on the design method.

Track 3. Community and stakeholder engagement

Co-Chairs: Warren Batts, Australia; Pietro Elisei, Italy/Romania

Baldwin, Claudia; Osborne, Caroline, University of the Sunshine Coast, Peregian Beach, Australia; Smith, Phil, Deicke Richards Architects, Brisbane, Australia

Planning for age-friendly neighbourhoods

This paper provides insight into two research projects: a desktop exercise investigating trends in international aged care provision and a participatory research project using PhotoVoice and design charrettes to ask seniors in South East Queensland about their preferences for neighbourhoods and housing.

Burton, Paul, Griffith University, Southport, Australia

Still climbing the stairway to heaven: public participation in planning

Arnstein's seminal conception of a ladder of participation continues to exercise the imagination of planners and to confound us by its assumption of a moral dimension whereby

climbing the ladder takes us closer to participatory heaven. This paper proposes other criteria with the potential to improve the practice of participation.

De Souza Tenorio, Gabriela, University of Brasília, Brasília, Brazil

The danger of community engagement as an exclusion tool - four case studies in four different scales in Brasilia, Brazil

The necessary community engagement must be put into perspective. Most individuals have difficulty to think in a systemic, global way, while contributing to their cities' planning processes. In all intervention scales, it is very hard to have inclusive contributions without previous education on the global implications of their local desires.

Heyning, Helena Chaja, MB&A BV, Amsterdam, the Netherlands; van der Bruggen, Wilma, LOGOS, Oosterbeek, the Netherlands

From top down to bottom up -a somersault?

Faced with the financial and economic crisis in The Netherlands and its aftermath and the ongoing decentralization process municipalities have great difficulties to cope with the demands and needs of citizens. Housing and planning are in the heart of the financial problem.

Heywood, Phil, Queensland University of Technology, Brisbane, Australia

Collaborative Planning: an evolving model of practice

As individuals, groups and activities are brought into ever-closer contact by radical developments in communication, opportunities for both conflicts and cooperation multiply. Making use of examples, this paper examines the role, scope and methods of collaborative planning as a means to build better futures in times of rapid change.

Karakiewicz, Justyna, The University of Melbourne, Melbourne, Australia

Societal paradigm shift and community (peer-reviewed)

For years now, we have been responding to the discovery of the profoundly disturbing consequences of climate change with evolutionary responses. Collective behavioural change is needed. But how do we make dramatic changes that bring the larger public over to such change and result in a societal paradigm shift?

Layson, Paulo; Nankai, Xia, Tongji University, Shanghai, China

Integrating community participation in urban redevelopment projects: Comparative study of Dar es salaam, Tanzania and Tianzifang Shanghai, China

Community participation in urban redevelopment projects is one of the key success factors to ensure sustainability of redevelopment projects. Here is a study on community initiated urban redevelopment projects in Tanzania and China as a Case study.

Le Roux, Jan-Hendrik; Cilliers, Elizelle Juane, North-West University, Potchefstroom, South Africa – presented by Louis Latagan

The participatory planning paradigm shift: Comparing disciplines and methods (peer-reviewed)

Public participation has experienced a paradigm shift over time with contrasting approaches emerging from it. These approaches are visible in different professions and disciplines. By comparing different disciplines it is possible to create best-practice scenarios for effective public participation.

Li, Fengqing; Huang, Huang, Tongji University, Shanghai, China

The 'three-old' policy of community renewal in China: Based on cases in the Pearl River Delta Region (peer-reviewed)

This paper studies the community renewal under the “Three-old” policy since 2009 in the Pearl River Delta, which is widely considered as the origin of community engagement in China.

Liu, Tao; Liu, Zhian, Urban Planning Institute of Yunnan Province, Kunming, China

Mobilizing social capital in low developed rural China: a case study in a village

Social capital is an important concept of endogenous regional development. Currently, the difficulty of improving local governance in China has aroused a great deal of attention from academics. The contribution presents the difficulty to mobilize the social capital and the difficulty of the participation in low developed rural China.

Lorens, Piotr; Kamrowska–Zaluska, Dorota, Gdansk University of Technology, Gdansk, Poland

Spurring the community involvement in planning - lessons from post-socialist cities

Community involvement in planning in case of post-socialist cities was until recently almost non-existent. But in recent years the development of demand for more public participation is dramatically increasing. This needs the creation of new types of planning tools as well as the introduction of innovative techniques of conducting the community dialogue.

Mchunu, Koyi, Town and Regional Planning, Durban, South Africa

'Insurgent' Spaces in Durban: An investigation on the proliferation of religious sites for the Nazareth Baptist Church

Planning in the context of diversity, temporaneous nature of uses poses numerous challenges.

Meenar, Mahbubur; Featherstone, Jeffrey; Mandarano, Lynn; Olszack, Brian, Center for Sustainable Communities, Temple University, Ambler, U.S.A

Effective community engagement tools in watershed plans: Examples from the USA (peer-reviewed)

This paper will discuss the typology of various “community design” tools used in USA-based watershed plans.

Monardo, Bruno; Ferretti, Alessia; Boca, Alessandro; Falco, Enzo; Polizzi di Sorrentino, Enrica, Sapienza Università di Roma, Rome, Italy

Innovative PPP tools supporting urban regeneration: the role of non-profit organizations in USA

Reflections are focused on innovation in PPP tools within urban regeneration policies in US through the flexible geometry of non-profit organizations and the changing role of municipal governments. How partnership models can work within the rising lack of public resources? To which extent and effectiveness?

Owei, Opuenebo; Ede, Precious; Brown, Ibama, Rivers State University of Science And Technology, Port Harcourt, Nigeria

Developing the new Port Harcourt City and community and stakeholder engagement: Lessons of experience

The study focuses on the methods of stakeholder and community engagement employed by the Greater Port Harcourt City Development Authority in trying to implement its vision of creating a world class city with modern infrastructure such that will attract investment, tourists and improve the well-being of the people.

Powell, Marissa, Arup, Brisbane, Australia

Online engagement – linking their digital world to ours

See how bespoke e-engagement/spatial mapping tools have been used to enhance stakeholder and community engagement processes for planning projects. This approach both broadens the reach of engagement programs resulting in more representative datasets and provides this data in formats that can be easily integrated into planning processes.

Prakash, Poonam, School of Planning and Architecture, Delhi, India

Legitimizing politics of influence through participatory planning practices in Delhi

The paper intends to explore how participatory processes are being used as a mechanism to co-opt technical expertise as well as legitimize real estate interests.

Torres, Yuri; Lucia Maria Sá Antunes, Costa, Universidade Federal do Rio de Janeiro, Rio de Janeiro, Brazil

Geo-social networks and the understanding of the dynamics of the city: the case of Rio de Janeiro’s boundaries of formal and informal neighborhoods

Geo-social networking reflects how cities are dynamic, while empowering the concept of social and collaborative involuntary creation drawn in the digital space. The overlapping of formal and informal boundaries within Rio de Janeiro can be mapped by that, raising discussions on how this data can become fruitful for planning practices.

Williams, Holly, University of Oregon, Eugene, U.S.A

Old town revitalization through innovative streetscape design

The revitalization of Portland, Oregon depends upon the addition of active streetscapes, which will shape the neighborhood into a center for prosperous community life.

Track 4 International Planning Exchange

Co-Chairs: Agatino Rizzo, Italy/New Zealand; Stanley Yip, Hong Kong

Arslanli, Kerem Yavuz, Istanbul Technical University, Istanbul, Turkey

Istanbul's changing skyline: The effects of landmark projects

After the 2002 economic crisis in Turkey the real estate market has evolved with respect to international globalization agenda. Istanbul, the biggest city of Turkey has been affected with many severe planning problems within last decade. This paper investigates the possible outcomes of the changing skyline of Istanbul with respect to planning future of the city.

Arthur, Martha Jillyan, the University of the West Indies, Arima, Trinidad and Tobago

The green economy: a strategic approach to sustainable urban development in Caribbean Small Island Developing States (SIDS)

Adopting a green economy approach in the Caribbean could provide a framework whereby decisions and strategies regarding cities and urban centres can promote resource efficiency, effective environmental management and a better standard of living for urban residents.

Beyazit, Eda, Istanbul Technical University, Istanbul, Turkey

The trilogy of power, politics and planning (peer-reviewed)

This paper understands socio-spatial inequalities in cities with reference to the trilogy of power, politics and planning.

Borja, Bij, JTC Corporation, Singapore, Singapore

2West Masterplan: A new paradigm in urban planning

The 2west Masterplan, an integrated mixed-use development, was conceptualized in response to the issue of land scarcity in the small island state of Singapore. One key feature of this development is the Integrated e-deck (Environmental Deck), an innovative system of multiple functions that redefines the concept of urban infrastructure.

Buitrago-Franco, Isabel; Chatterji, Tathagata, University of Queensland, St. Lucia, Australia

Planning for mining regions: building local government's capacity in a multi-stakeholder collaboration scenario (peer-reviewed)

The research draws attention to specific institutional deficiencies, in political and technological terms, which come in the way of the local agencies playing stronger role in a multi-stakeholder scenario in planning for mining regions, through case studies in Colombia.

Chakravarty, Surajit; Mansoori, Meera; Shehadeh, Meera, Alhosn University, Abu Dhabi, United Arab Emirates

What's Arabic for 'Charette'? Public participation in the Baniyas neighborhood of Abu Dhabi

The paper reports findings from the Baniyas Park public participation project in Abu Dhabi, UAE, conducted by the authors between August 2012 and May 2013. Recommendations based on the community input received are presented along with insights regarding substantive and procedural aspects of participation in contexts such as Abu Dhabi.

Cheng, Shang; Nankai, Xia, Tongji University, Shanghai, China

Village community: A planning practice of local-urbanization in countryside areas in Southwestern China

“Village community” aims to realize local urbanization, by constructing the new-style village in the countryside, which still locals in the countryside areas, but has fulfilled the same functions of the urban communities. As a result, villagers who live in the village communities are able to lead an urbanized life.

Dedekorkut-Howes, Aysin, Griffith University, Southport, Australia; Mayere-Donohue, Severine, Queensland University of Technology, Brisbane, Australia

Managing growth in the sunshine states: Urbanization and planning in Queensland and Florida (peer-reviewed)

This paper compares the urbanization and planning in the two sunshine states of Florida and Queensland highlighting the similarities and differences, evaluates how effective the growth management programs have been, and examines the recent changes and the challenges they bring to the respective states.

Espada, Rodolfo Jr.; Apan, Armando; McDougall, Kevin, University of Southern Queensland, Toowoomba, Australia

Using spatial modelling to develop flood risk and climate adaptation capacity metrics for vulnerability assessments of urban community and critical water supply infrastructure (peer-reviewed)

This study developed a new spatially-explicit analytical approach, identified as flood risk-adaptation capacity index/metrics-adaptation strategies (FRACIAS) linkage model, for urban flood risk assessment and generation of climate adaptation capacity metrics for assessing critical water supply network vulnerability.

Gezik, Peter, Slovak University of Technology, Bratislava, Slovakia

The role of social innovations in a revised urban metabolism concept framed by sustainable development paradigms

This paper presents the outputs of the research focused on a revision of urban metabolism conceptual framework, and a suggestion for a new approach considering social innovations as a key component shaping and redirecting metabolic processes and determining a city's sustainability.

Han, Jing; Kong, Lingyu, Tongji University, Shanghai, China

Interrelation between micro-blog hotspots and urban spatial network: An empirical analysis of Tongji-Rim intellectual-economic-zone, Shanghai, based on Sina Weibo (peer-reviewed)

This paper discusses the interrelationship between social network and urban spatial network. It takes creative people as target group and SINA micro-blog as platform. The basic concepts include projecting social network onto spatial network, testing spatial traits for explanatory power of social networks, and ranking levels of similarity.

He, Shan, University of Western Australia, Perth, Australia

From "insertion" to "incorporation": the Hangzhou example of the transformation of the railway in Chinese urban life (peer-reviewed)

This paper takes Hangzhou City as case study to review the relationship between rail and urban life in contemporary China. The conclusions illuminate today's practice of planning and design of new towns around station nodes of high-speed rail infrastructure.

Hua, Xiang; Hong, Liangping; Huazhong, University of Science and Technology, Huazhong, China

Greenway as a new path for the exploration of urban-rural coordinate based on a low-carbon model (peer-reviewed)

Based on the case study of Dongguan city in Guangdong province of China, this paper analyzes and concludes the specific role and contributions of Greenway Planning and Construction to coordinate the development of urban and rural differentiation with a new path of low-carbon model, and discusses its limitations further.

Jung, Wolfgang, Karlsruhe Institute of Technology, Karlsruhe, Germany; Buehler, Ralph, Virginia Tech., Alexandria, U.S.A

Sustainable transport in Germany and the US: A comparison of the Washington, DC and Stuttgart regions (peer-reviewed)

The Washington, DC and Stuttgart regions serve as examples for differences and similarities of the German and US systems of land-use and transport planning. We highlight best practice examples for sustainable planning in both countries using case studies of Scharnhäuser Park and Arlington County.

Lategan, Louis; Cilliers, Juaneè, North West University, Potchefstroom, South Africa

An exploration of the informal backyard rental sector in South Africa's Western Cape Province (*peer-reviewed*)

This paper examines the backyard sector in South Africa's Western Cape Province and examines why the sector remains largely unregulated and unaddressed whilst being recognised as a major component of SA's stock.

Effects of Drastic Changes in Living Environment: A Displaced Community

Miriam Billig, Ariel University, Israel

Abstract

The objectives of this study were to understand the implications of the forced transfer of a community to a different physical environment, and assess the effects of such an environmental change on the community's sociological structure and on restructuring people's cultural identity. We used Ingelhart's methodology of cultural shifts to describe these cultural changes. In the K.D. community, changes in the physical environment caused significant changes in the community's social structure. As a result, the collective characteristics that had once united and strengthened the community's social structure began to dwindle. Meanwhile, a growing tendency towards individualistic characteristics gradually increased, causing the weakening and eventual dissolution of both the community and its social structure.

Introduction

Community displacement and resettlement effects on population well-being have been subjects of extensive academic research in recent decades. A vast body of evidence has been collected about the difficulties encountered by resettled populations as they try to adapt to their host environments (Oliver & Smith, 2013; Fong & Green, 2011; Bhugra & Becker, 2005). In their review of recent migrants' adaptation in an Australian community, Hutchinson & Dorsett (2012) identify several elements that may impede this process, including: language barriers, discrimination, and labeling of the trauma story. Bhugra & Becker (2005) further emphasize the loss of cultural norms, religious customs, and social support systems, adjustment to a new culture, and changes in identity and concept of self. The authentic identities brought by migrants to their new environment are perceived by them as a source of pride, self-respect, a sense of community, and moral strength. This is in contrast to mainstream psychology's universal, linear models of immigrants' acculturation and adaptation, which emphasize the dissimilation of migrants' identities in a common, nationwide identity of the host community (Sunil, 2009). According to Bhugra & Becker (2005), we should preserve migrants' foundations of cultural identity to promote their well-being and successful integration into the receiving community.

Accordingly, researchers of disaster-related, forced displacement and resettlement have theorized that mobilizing the internal powers from within the resettled community itself may be the most effective strategy in assisting a population's adaptation to the new environment. This theory condones the preservation of original identities and the social structure of the community, instead of merging its social mechanisms with that of the host community and delegating responsibility for community functioning to external agents (Perry & Lindell, 1997).

A number of migrant studies were recently performed on the role of identity processes in resettled populations that encounter a new environment. Among other identity dimensions, the so-called concept of *place identity* was found to have a profound influence on the migrant adaptation process (Marcu, 2011; Sunil, 2013; Sinn & Wai-Ling, 2013). According to this line of research, physical environment and housing type may have a prominent effect on the preservation of community structure and community members' place identity. A special role is ascribed to the similarities between the new physical environment and the preceding environment and its conditions before resettlement (Heller, 1982; Kliot, 2005).

The aim of the current study was to examine the displaced community's ability to adapt to their new environment. The current study is unique in that it focuses on a normative community, one that was adequately stable from an economic and cultural point of view, and which enjoyed a high level of cultural unity and social resilience before its displacement. From a variety of possibilities that were offered, the community chose a living environment that greatly differed, from a physical aspect, from their previous home. However, they believed it was an environment that would provide them with a sufficient quality of life level, and most importantly, it would allow all of the community members to stay together.

Value analysis methodology (Inglehart & Baker, 2000) will be employed to reveal the process by which changes in physical environment and housing conditions bring about gradual shifts in community values, loss of identity, communication deficiency and, consequently, to the ultimate breakdown of the resettled community.

In contrast to prior studies that appear in the literature, which indicate a connection between environmental and cultural factors in creating place identity, the current study systematically shows the specific connection between each of the physical and social variables, and how they contribute to the concept of place identity.

The study findings will be incorporated into a framework for resettlement policy on appropriate housing for resettled communities.

Methodology

The current qualitative-phenomenological study examines the significant structures and insights of the participants throughout the subjective narratives they present in regard to the place and the community (Smith, 1993; Geertz, 2003).

Study Population: The insights that appear in this chapter are based on in-depth interviews conducted four years after the evacuation, in the new homes of the K.D. residents. A total of 30 interviews were conducted, which included 6 residents who lived in the building, 14 community members who had chosen to leave the building and move elsewhere, and 4 professionals who had accompanied the community before the evacuation¹. Sixty percent of the interviewees were women; the rest were men. Two women were housewives; one had been injured in a terror attack.

Among the interviewees were people who had been farmers, teachers and other types of professionals before moving to the city. After the move, some continued to work in their previous profession, while others changed their profession, and four became unemployed.

Research Tools: The study included in-depth interviews, according to the subjects raised by the interviewer and the interviewee and their ensuing dialog. Interviewees were asked to focus on the experience of the move to the building in Ashkelon and its influence on their lives – as both a family and a community. The interviewees were not asked about their lives in K.D., so as not to cause them any unnecessary pain, and to allow them to focus on the research questions. In spite of this, many chose to compare the reality they remembered whilst living in K.D., with the current reality of life in the building in Ashkelon.

1. The K.D. Community Settlement

The community settlement of K.D. was established in 1989. The founding families of the community wanted to establish an agricultural community settlement with a religious character (Haredi Leumi), wherein a modest lifestyle would exist; the religious Jewish law

¹The remaining six interviews were filmed interviews taken from a documentary project done by Gush Katif residents.

(*Halacha*) and the study of Torah would be its supporting pillars. Sixty families, most with many children - between 5-10 children, sometimes more per family - lived in the settlement.² The settlement area included 124 acres. Since K.D. is a border settlement, a fence was erected around the entire village and a guard was posted at the front gate for security purposes.

The residents lived in houses built by a government-run construction company, one-family and two-family homes measuring 750-1,500 sq. ft., each surrounded by a garden. As befits the needs of expanding families and according to economic ability, some of the houses were expanded over the years to 3,000 sq. ft. Despite this, the houses were simple and modest. In the settlement, educational institutions were established and a large and spacious synagogue was built. The synagogue's basement was used as a gathering space by settlement members. Likewise, additional public buildings were erected in the settlement: a library, a youth clubhouse, and a building that housed a secretary's office, emergency clinic and small grocery store. The industrial area was built within the area of the settlement; no clear physical separation existed between this area and the commercial and residential areas, and some of the residents were employed there. An area of 7.4 acres was defined as the "village green" and made into public gardens. After the settlement was evacuated, within the framework of the one-sided disengagement plan, the community was moved to a hotel in Beer Sheva, after which members were moved to a high-rise building in the city of Ashkelon, which had been rented specifically for this purpose.

2. The High-rise Building

After the residents of K.D. were evacuated, they moved to live in an apartment building in the city of Ashkelon, bordered by the sea. The high-rise building is located next to a busy, 5-lane highway, lined by other large buildings. The building was built in 2000, but by 2005, the owners had only managed to sell 40% of the apartments. In 2005, after the evacuation process from the Gaza Strip had begun, the State rented some of the empty apartments for the evacuees. The building has two entrances and a lobby. Rising above each entrance is a 20-floor tower, four apartments on each floor. Each tower houses a total of 80 apartment units, so the entire building houses 160 units, and has three elevators. Beneath the lobby are two floors that serve as a common storage area for both buildings and an under-ground parking area. The evacuees who were moved to the high-rise building received spacious

² The average age (in 2005) of the heads of families was 30, while the average age of the older members was 40+.

apartments, most of which had 5-7 rooms, each apartment's dimensions ranging from 1,200-1,900 sq. ft. Next to the parking area, a playground and sandbox were erected but, as there was no shade, most of time, this area was not used.

The move of the K.D. residents to the high-rise building didn't take place in the usual manner in which people move house. Before the decision was made, the members of the community were given a tour of the building, after which, a heated discussion was held by the general assembly, in which all of the community members took part. The majority were in favor of moving the community to the high-rise building.

Several months after the move, individual families from the community began to leave the building and look for alternative living arrangements in other communities. By the end of one year, most of the young families had left the building, leaving only 30 families from the K.D. community. Two years after the evacuation, another group, comprised of 16 families - who preferred to live in a caravan³ rather than an apartment - left the building. One year later, all of the remaining residents had left the building. Hence, within four years, the K.D. community broke up, most of its members spreading out to live in various other areas.

The uprooting of K.D. residents from their ground-floor, private homes, and their removal to a high-rise apartment building in the city was the first attempt of this type in Israel - to graft an entire community on to a new living area, which was extremely different from the previous living space. The circumstances surrounding the forced evacuation, and the need to cope with the trauma stemming from displacement, certainly did not make the process of adapting to the new environment any easier, but this was not the decisive factor for the break that was created within the community, as a result of this change in living environment.

Findings

Members' feelings about their first experience upon seeing the high-rise building in Ashkelon were expressed in most of the interviews conducted with them four years later. They spoke about a feeling of shock, and described how, from the very first glimpse, the building looked frightening and threatening; they emphasized how this fear never left them during their first months of living in the building. In contrast to the description of these fears and difficulties, many expressed the importance of the entire community staying together. Therefore, the "solution" of the building provided an answer to this immediate need. The spacious

³ These were 450-sq-ft. caravans, located in the East Lakish.

apartments and the feeling that the family had somewhere to live after their insufferable stay at the hotel persuaded them, on that night-time visit to the building, that the move to the high-rise was the right step to take. In addition, the promise that soon they would be moved from the building to a permanent settlement, also contributed to this decision. After the K.D. residents moved into the building, however, everything looked different.

From the interviews, we see that the first period of living in the building was difficult from a mental point of view. Many mentioned an accumulation of feelings of anger and resentment; others reported stomach pains that accompanied them upon arrival to the building, and which continued for a long time afterwards. The interviewees said that nothing they had experienced in the village settlement remained – everything had changed: the environment, the community itself. Changes began to occur within the families and within the feelings of the people about their new living space. In turn, these changes caused other significant changes within the structure of the community, and which in the end, resulted in its dissolution. We will now briefly describe the changes of cultural identification experienced by the community members, as a result of their forced uprooting and removal from a village environment to an urban, high-rise apartment building, as expressed by community members.

3. Physical-environmental Identity Components

3.1 Residence: In K.D., the dwelling space was that of a village environment. Residents lived in ground floor, private homes, which could be expanded and designed to fit the needs of a religious family's lifestyle – a family with many children. The families made sure to maintain their gardens, and planted fruit trees. The yard around the home also served as a play area for the children, a place in which to host neighbors and conduct family celebrations. The yard was also a place for hanging laundry and parking bicycles. There were also 20 houses which were used as temporary housing for absorbing new residents into the community, and the next generation, which allowed for the growth of the community. In addition, certain tracts of land were allocated for the building of new homes for these new families.

Although the apartments in the building were spacious, they did not necessarily fulfill the needs of a family with many children. There was no room in the kitchen for a double-oven or double-refrigerator, appliances that the families had used in their old homes. Since the apartments were rented and because of the building's limitations, it was not possible to

make any renovations or expansions as the number of family members increased. Despite the pretty view from the small balcony, it was no substitute for the garden, and the potted plants did not receive the same attention and care as the trees in the village gardens. The cost of renting an apartment in the building was high, and beyond the budgets of most young families and that of their children; therefore, the next generation could not join an apartment community without government support. The departure of individual families and groups of families from within the community to other places led to the return of these now-empty apartments to the authorities, and the community began to dwindle.

3.2 The Public Space: In the village community, there was an abundance of green spaces and beautiful, quiet areas that were tended lovingly, blending in perfectly with the surrounding natural landscape of pristine sand dunes. Most people in the settlement got around on foot or by bicycle; the settlement was filled with quiet tranquility, birdsong, and the happy clamor of playing children. The ground-floor, private homes allowed for frequent eye contact, as people moved slowly between the private and public spaces. The settlement gate surrounded and defined the public space and imparted a sense of belongingness and responsibility to the residents in regard to the space. Walking in the public space invited frequent inter-personal contact among the residents and contributed towards strengthening social relationships and a sense of both belongingness and identification among community members.

In contrast, the public space in the high-rise building was neglected and unfamiliar; the great number of tenants from many different cultures, most of whom rented their apartments, and the many empty apartments in the building all led to a sense of foreignness and alienation, isolation and emptiness. The building overlooked busy highways, full of traffic lights and flashing billboards. The public space is described as being borderless and infinite, strange and detached from nature. From the apartment building, there was no direct eye contact with the public space and mothers could neither watch over their children from their homes, nor initiate contact with neighbors who had gone down into the street. Because of the large distances, most residents had no choice but to use private cars or public transportation.

3.3 Services and employment: In the village settlement, there had been a wide variety of educational as well as public institutions in which leisure activities took place for both adults and children, along with cultural and social events. In addition, the settlement provided only the very basic services. Thus, in order to attend to various errands and more extensive

shopping needs, residents would plan an outing once a month or once every two months and make their necessary purchases in the nearby city. The settlement's guiding ideology encouraged residents to make do with what they had – adhering to a sense of “ascetic” consumerism. A large number of residents were employed within the settlement itself in the educational institutions, services, and trade.

In the high-rise, there was no place in which to hold social gatherings and, as a result, meetings in which the entire community participated were non-existent. Although the urban environment offered an abundance of entertainment and leisure activities, these activities weren't suited to the religious lifestyle of the families from K.D. The plethora of shops meant that no planning in advance was needed; everything could be purchased in daily outings in the city and members were exposure to the city's constant sales. Many described the development of a type of obsessive purchasing of “everything in sight”; the buying of luxuries and unnecessary items became a sort of psychological compensation. In the city, there was a separation between the residential space and one's place of employment; educational institutions were also far away and the children went to school by bus, so that opportunities for meeting community members decreased.

3.4 Security and Safety: Despite the security threat and the large number of injured, settlement residents of K.D., in their descriptions, do not mention fear of terrorism or how it was to live under a constant security threat. They related to the strength of the community and the mutual support, which allowed them to live in K.D. They described the living space in the village as a safe environment for children, both from the perspective of protection from strangers as well from a security perspective. From an early age, the children wandered freely and independently around the settlement, at all hours, alone or in groups, with little supervision; front doors were never locked and always open, and mothers did not worry about leaving their children home alone.

The high-rise building, on the other hand, was perceived as a place of danger, because of the unfamiliar people who lived there - some of whom were often drunk - or the criminals who might wander in off the street. There were other dangers as well: open balconies of up to 20-storeys high. The many elevators and the fear that children would get lost in the huge building was perceived as a safety threat, one which might lead to contact with criminal elements; the heavy traffic was also a constant source of concern for the children's safety. As a result, residents locked their doors at all times and children were not allowed to go out

alone. The dependence upon the elevators in the building was also a difficulty in relation to family management; mothers of young children preferred to stay at home, rather than experience the difficulty and danger of getting in and out of the elevator. Afternoon meetings between the children after school stopped almost completely, and any such meetings were always supervised by parents.

4. Social Identity Components

4.1 Face-to-face relations: The private homes and unfenced yards of the village and the habit of walking on foot from place to place within the settlement encouraged eye contact among members. This type of eye contact created “face-to-face” relations which, in turn, created a sense of responsibility and mutual trust among members, stemming from the fact that everyone knew everyone. Relationships operated according to an “open door” policy: neighbors were friends, who could drop in for a visit at any time. No invitation was necessary; group meals and trips were frequent. Practical, daily chores like hanging up laundry, gardening and yard work or watching over small children in the garden were something of a public affair; each task of this type was a possible opportunity to converse with neighbors or to make eye contact with passing guests and invite them in for a visit.

Alternatively, in the high-rise building, people stayed shut up behind locked doors, and the door was never opened to strangers; there was no contact at all with the other neighbors. Sometimes a week or month might pass by without seeing a neighbor from the K.D. community, something that could never have happened in the settlement. Life in the building was dependent upon the elevator moving up and down between the floors; there were few opportunities to establish eye contact among community members. At times, a competition developed among community members in regard to entering the elevator, when everyone was trying to get to the same destination. This caused a great deal of tension and frustration. The move to the city transformed daily chores and tasks that had once been “shared” into completely private activities, since whatever was done at home or on one’s balcony remained singularly anonymous. Leaving the home to run private errands became activities completely lacking in social interaction, and were only experienced on the individual, private level.

4.2 Community Skills: In the settlement, all of the members belonged to the community simply by living there. The community life was very intensive; people were naturally interested in one another’s doings, and relationships were spontaneous, based on daily

contact. Most of the community members were involved in activities geared towards the good of all, and in the settlement committees dedicated to promoting the village's culture and education. During times of security threats, members came together to strengthen the community, and before the evacuation, most of the community's efforts were invested in activities related to propaganda and protests. The unique views and weather of the village and its close proximity to the sea were a source of attraction to visitors. The large and spacious homes allowed for the inviting of guests: friends and children of all ages on weekends, holidays and during vacation times.

Contrariwise, life in the high-rise building led to a reclusive lifestyle, members stayed at home, and the relationships among community members became much more formal and less frequent, rather than something that could be taken for granted. Community activities dwindled. Therefore, a great deal of energy was suddenly required to maintain close community relations. After moving to the city, the community set up new goals for itself, but members did not cooperate or make enough of an effort for the good of all as they had in the village; most people focused solely on the advancement of their own families. Moving to the apartments in the high-rise also changed the codes of hospitality: community members went from being families that were used to being hosts to families that were now the guests of others. The lack of an atmosphere of Shabbat and the holidays also brought about a change, causing families and teenagers to travel to others in order to celebrate with relatives and friends living in village settlements, and in an attempt to get away from the city.

4.3 Parenting and Family: In the village settlement, parents and children alike had to cope with the difficulties of terror attacks. They shared their fears and worries, as well as the struggle against the disengagement. These shared experiences contributed to the nuclear family's functioning as a unified and consolidated family unit. Together with this, the parenting style in the settlement was described as "casual" – for most of the day, children were not at home; after school, they played and wandered around the settlement together, under the watchful eye of "everyone". The relative isolation of the village from other settlements, as well as the security threat, served to minimize the arrival of the extended family to the settlement. Thus, neighbors and friends served as a replacement for the extended family, as reflected in group meals on Shabbat, holidays and celebrations; the families also supported and cared for families that were injured or in need of help, accompanying one another through difficult times.

In the high-rise, members related how parenting suddenly became a full-time job, without a break, 24 hours a day, all week long, without the help of other community members. In some of the families, the status of the parents was suddenly threatened. Some parents became unemployed and were forced to seek out support from external sources, thereby becoming dependent on others. In some cases, children supported parents. The move to the city caused each family to turn in upon itself, resulting in a decrease of the mutual support that had once among community members and an increased connection with the biological, extended family. As a result, the sense of belongingness with the family constituted an alternative for the previous sense of community belongingness.

4.4 The Religious Lifestyle: The framework of the village community allowed for community control over the religious lifestyle in the living environment. Certain standards were established regarding the community lifestyle and the extent to which religious customs and prohibitions would be followed – in both the private and public sphere. Most community members held places of significant authority in the community; decisions were made based on meetings, in which all members participated on an “as needed” basis. The synagogue that was erected in the settlement served as its spiritual and cultural center; the routine daily meeting for prayers formed close bonds of friendship among residents. After prayers, the entire community would often share a meal, and various matters would be discussed. In addition, the settlement offered many enrichment classes for men, women and children.

The move to the building in the pluralistic city meant that the community could no longer control the community’s religious lifestyle through the residential environment; no social supervision was possible, and the status of the community rabbi declined. Community members became exposed to the desecration of Shabbat, immodest dress, billboard images which they considered improper; and each person chose a way in which to cope with the new reality. A synagogue was established in the building’s basement, but many chose to attend different synagogues in the city, and women preferred not to come to pray at all. There were several attempts to arrange group meals among the community members and to hold lessons in the building, but the feeling of being crowded, the lack of windows, and the smell of dampness caused bad feelings among members and these types of meetings soon came to an end.

5. Place Identity Components

Patrilocality and collectivity: In the village settlement, residents were connected to their living space through the history of the place, the religious ideology, and through the memory of those that had died there. The state of the community was tested and ratified anew as the disengagement date drew closer. Community interaction and social unification grew and community members perceived themselves as one, big family. The rabbi led the community and residents held onto their religious faith, and believed they would win their struggle. There was a strong sense of identification and patrilocality, along with a great feeling of loyalty from the adults and youth – for both the community and the surrounding area. After the settlement's displacement, the evacuees expressed great longing for the village and a sharp desire to return to it.

5.1 Alienation and Individuality: The move of the residents to a high-rise building in an urban environment was perceived by them from the beginning as a temporary solution, and no one thought of staying in the place. Many community members could not find their place in the city or relate to either the city or the people in the area on an emotional, spiritual or ideological level. Many of the teenagers refused to live in the building and were ashamed to be living in the city. The lack of meeting places and eye contact among community members, and the transformation of daily practical tasks - that had once been shared and had now become completely private activities - were all factors that added to the members' sense of isolation and alienation.

Members spent much less time together, which led to a minimization of the collective components that had once strengthened and unified the community's social structure. Instead, in the city, individualistic components became dominant, serving to weaken the social structure, and concluding with the complete dissolution of the community.

Discussion and Conclusions

The events of the K.D. community gives us a deeper understanding of the process by which a community is structured, which develops as a result of specific characteristics - such as the type of homes and structures built, and the physical characteristics of a particular living environment within a certain culture. The use of Inglehart's (2000) methodology in describing the *cultural shift* process helped to present a clear picture of the different states of the community, resulting from each of the living environments.

The findings show that the type of lifestyle one leads in the village environment, and the variety of public structures and services established within the enclosed space of the settlement, created clear borders for the community and enabled it to maintain its religious lifestyle. Residents encouraged eye contact and frequent formal and informal opportunities to meet with one another. This contributed to developing and maintaining “face-to-face” relationships, and an “open-door” policy. The security risk and the number of injured among residents also contributed to the members’ sense of unity and social resilience. All of these factors played a part in the adoption of a collectivist structure, which was shared by all of the residents, and which encouraged the development of communal functioning, responsibility and concern for all of the community members. This type of community situation created a sense of *patrilocality* (place identification), and the desire of residents and their children to continue living there.

In contrast, the move to the high-rise building and urban environment, where there was no defined public spaces and no special public structures or services in the area, led to a blurring of the community’s borders, making it difficult for them to engage in direct eye contact with other community members. People tended to either stay at home, behind locked doors, or wander aimlessly and alone throughout the city. Hence, opportunities to meet became less and less frequent. All of the above brought about the adoption of an individualistic structure, which weakened the social structure, and did not allow for the development of place identity among the community members.

Apparently, the social structure, which had become increasingly strengthened and unified in the days before the evacuation, and the sharp desire of community members to remain together afterwards were simply not enough to help the community get through the great dramatic change in their living environment. The lack of appropriateness of the high-rise building for families with many children; the lack of a place where all of the community members could gather and meet; and the fact that there were no clear borders – only there were all key contributing factors that served to destabilize the foundations upon which the community was built, and which eventually brought about the community’s failure to adapt to the move. Study findings show how important it is to have an accurate prior understanding of the community structure, and the need to describe the important functions that will enable the maintenance of its stability during times of significant environmental change. We can assume that if the community had been moved to an environment that was more similar to K.D. or an environment where the group could have been isolated, instead of having

strangers in their midst, the community would perhaps have managed to better adapt to the new environment. This, in turn, may have prevented the community's breakdown and its eventual collapse.

Participatory Planning in the Era of Public Private Partnerships: Complexities and Contradictions in a Migrant City in India

Tathagata CHATTERJI, Manipal University, India

Author ID: 70

Synopsis

This paper explores how local political factors, rural-urban divide and conflicts between multiple tiers of government, impact participation of the migrant communities in the urban planning and governance process in a dynamic urban region, through a case study of Gurgaon, India. In two decades Gurgaon transformed from being a small agricultural town at the outer periphery of Delhi, to Northern India's premier corporate destination and a global hub for the outsourcing industry. The new city is largely made up of migrants from all over India. However, this largely unplanned, market driven, rapid urban makeover has also created a complex settlement pattern marked by overlapping layers of socio-spatial relations. The everyday tensions and contradictions of this transitional journey, which came out sharply with the formation of a new municipal corporation, form the immediate backdrop the study.

1. Introduction

In the contemporary era 'public participation' through involvement of non-state actors, NGOs and civil-society groups – have come to be recognised as one of the cardinal principles of planning in the democratic world. On the other hand, with the spread of neoliberal ideology, 'public-private partnerships' or outright privatisation have become the preferred mode of delivery for large scale infrastructure projects in the advanced capitalist economies of the Global North, and are being increasingly adopted by the emerging economies of the Global South. While a large body of research exists on both 'participatory planning' and 'privatisation of urban infrastructure' in the context of the well established cities of the matured democracies of the Global North, there is a gap in our understanding about how these abstract notions are shaping the cities of the newly industrialising, democratic countries in the Global South and particularly what role does planning play in this scenario.

This paper explores the interrelated twin issues of citizen participation and public-private-partnerships in delivery of large scale urban infrastructure in India. In recent years, India's impressive economic growth, particularly in the Information Technology driven knowledge economy sectors, along with the steady climb of the Indian cities in the megacities list, has attracted much international attention. Yet, despite the presence of a few megacities, and high economic growth rate, with only 69 percent urbanisation level, India as a whole, continues to be the largest rural country in the world. Sharp rural-urban dichotomy, has become a key feature of the Indian polity.

The case study location of this research, Gurgaon, exemplifies complexities and contradictions of this transitional journey. The city, which barely existed as a non-descript agricultural town, at the outer periphery of Delhi, in the early 1980s, over the next two decades, turned into a prime corporate hub for the office jobs outsourced from the West. The new city is largely made up of migrants as new economic opportunities attracted educated urban middleclass as well as construction labours and other lower-end workforce from all over India. However, this largely unplanned, market driven, rapid urban makeover led by the real estate interests and facilitated by parastatal agencies, has also created a complex settlement pattern marked by overlapping layers of socio-spatial relations. Simultaneous

existence of three layers of Gurgaon (i.e. rural, industrial manufacturing and IT services) in close proximity to each other is producing new claims and conflicts.

The paper argues that these socio-spatial dynamics has given rise to political contestation at multiple scales, in terms of rural-urban affiliations and of the interplay between class and caste interests and identities. The three dominant groups in the city: the existing rural population and people with ties to the old agrarian economy, the new urban middleclass tied to the knowledge economy sectors and thirdly the blue-collar workforce, made up of local poor but mostly migrants. Each of these groups has different ways of accessing the state and different channels of participation which ultimately impact the planning process and governance effectiveness. The underlying social and political tensions which came to the fore with the formation of a new municipal corporation in 2008, and its first election in 2011, forms the immediate backdrop of the study. The paper draws upon qualitative research involving field observations; interviews with state planning agency officials; corporate executives; and civil society activists. The next section of the paper provides a background about the participatory planning issues in India, by situating the urban reforms within the ongoing socio-economic and political changes in the country. The third section then provides an overview of the rapid transformation of Gurgaon from a small agriculture oriented township to a city of industrial manufacturing and then to an important corporate hub in the knowledge intensive IT-BPO segment. The fourth section then discusses the complexities and contradictions of participatory planning in the context of such dynamic economic restructuring. The fifth section concludes the discussion through a summary.

2. India's urban policy environment

With over 30 million people living in the cities, India has the second largest urban population in the world. But in percentage terms, India's urban population is still only 31.12 percent, even though the recent census shows that the decadal urbanisation rate has accelerated to 3.5 percent over the previous decade's fairly modest record of 2.5 percent. Such overwhelming domination of the rural areas had meant that in the democratic environment of Indian polity, urban development never received adequate attention at the higher echelons of governance. Rural areas matter more, when it comes to elections to the state and national legislatures.

However, closer integration of India with the global economy from the 1990s onwards has increased the importance of the cities – more particularly large urban agglomerations in national economy. Information Technology (IT) driven business process outsourcing (BPO), which have become fastest growing segment of the economy and the main export revenue earner for the post-liberalised Indian economy, are overwhelmingly concentrated in the extended metropolitan belts of Bangalore, Chennai, Delhi, Hyderabad, Mumbai and Pune, having supply of large educated workforce. New economic opportunities in the service sector has contributed to sharp increase in the number of middleclass from barely 1 percent of the population in 1985 to 5 percent (or about 50 million) people by 2005 and this is projected to reach 20 percent of the population by 2015 (McKinsey Global Institute 2007). On the whole, contribution of the service sector has increased from 37.9 percent of the GDP in 1981-82 to 56.4 percent in 2011-12, while over the same period the share of agriculture and other primary sectors has decreased from 37.6 percent to 17.2 percent (Reserve Bank of India 2012).

Economic and political reforms in India began almost simultaneously during the early 1990s. In 1991, a major set of reforms were announced on the economic front, which opened up several sectors, through reduction in customs duties, easing of norms for foreign investments and scaling down of licensing requirements for setting up of industrial units. Since then the national government has progressively adopted market friendly policies, favoured closer

integration with the global economy, and had sought to facilitate private entrepreneurship by reducing regulatory role of the state - jettisoning earlier policies of import substitution and dependence on public sector.

Almost simultaneously, a major step towards administrative and fiscal decentralisation was adopted through the 74th Constitution Amendment Act (74CAA) of 1992. In the multilevel governance framework of India, the constitution and functioning of the urban (and rural) local councils had traditionally been under the domain of the state (or provincial) governments. The landmark 74CAA legislation explicitly recognised the urban local bodies as the third tier in representative democracy, which ensured regular elections and security of tenure for the local councils (A matching legislation 73rd Constitution Amendment Act, extended similar facilities to the rural councils). The act also provided for clear demarcation of administrative powers and financial revenue sharing between the state and the urban local governments (Jain 2003; Shivaramakrishnan 2011). One of the most crucial functions, which the 74CAA sought to devolve to the local bodies, was the function of 'town planning'. It was envisaged that devolution of planning to the lower tier will ensure greater public participation.

Economic liberalisation, particularly rolling back of the Central government's licensing and other regulatory controls over industrial investments have considerably strengthened the role of the state governments on economic matters, in India's federal political system. There is increasing economic competition between the Indian states to attract new investments. However, reluctance of the state governments to devolve power to the lower tier has come in the way of the urban local governments functioning in the way envisaged by the 74CAA. Thus, elections to the municipal councils are regularly held, but their functional and financial domains remains restricted to managing only the basic services. Even there, the Municipal Commissioner, a state government appointed bureaucrat, retains the executive power. This distribution of power often turns problematic when rival political parties are in power at the state and municipal levels. Thus in the post-liberalisation era, in the multi-governance framework of India, considerable power has got concentrated at the meso-level rather than at the local government level.

Urban planning and control over land use change are particularly closely guarded by the state governments citing technical capacity gap, despite explicit intents expressed under the 12th Schedule of the Constitution, to transfer these functions to the elected municipalities (Shivaramakrishnan 2011). Land use planning continues to be handled by bodies like Urban Development Authorities or Town Planning Directorates, which not only report to the state governments, but in the case of big cities, are directly headed by the state chief ministers. The keenness of the state governments to hold on to the urban planning powers, need to be seen in the light of the ongoing structural changes in the Indian economy.

Rapid growth in the IT-BPO and other knowledge economy sectors had substantially stimulated the urban land markets of the Indian cities. Measures such as, lifting of controls on FDI investments in the real estate sector and passage of the Special Economic Zone (SEZ) Act in 2005, provided additional stimulus to the real estate market. According to a research by an international real estate consultancy, growth in the IT sector has been mirrored by the FDI inflow in India's construction and property markets, which went up from 3.4 percent in 2005-06 to 22.1 percent in 2009-10 (Jones Lang LaSalle 2010). By controlling town planning and land use functions, the state governments wish to retain control over this massive economic engine.

With rising domestic economic competition between the Indian states, the state governments are encouraging conversion of agricultural land at the peri-urban areas of the big cities to develop new townships and SEZ, to attract global investments in the IT-BPO sectors. In this neoliberal era, most of these new economic spaces, are being produced through public-private joint venture, with private sector real estate developers, building the gated enclaves,

matching quality specifications of the global corporate economy, while state agencies are prioritising delivery of trunk infrastructure. In spatial terms, these gated enclaves are located in the Panchayet (rural council) areas - beyond the jurisdictions of the municipalities or elected urban local governments.

While these high security and sanitised gated enclaves have emerged as the spaces of articulation for the globalised Indian economy – they have generated an utterly fragmented urban pattern split into multiple jurisdictions – rural *Panchayet* (council) areas, Development Authority areas, special economic zones and private townships. This multiplicity of jurisdictions has in-turn thrown-up fresh challenges in urban governance and ensuring participatory decision making, to meet the needs of the people from a diverse cross section. The new urban areas typically draw migrant population from a wide socio-economic stratum - from management professionals and software entrepreneurs at the up to humble construction labours and rural migrants. New tensions emerge in the process to reconcile the new middleclass, existing rural residents and the migrant labour. A graphic manifestation of these tensions is evident in the dramatic transformation of Gurgaon from a rural outpost at the fringe of Delhi, to Northern India's prime elite 'lifestyle' destination, as discussed in the following section.

3. Transformation of Gurgaon

Gurgaon district (and town of the same name) is located in the state of Haryana abutting the southern border of the National Capital Territory of Delhi. It is just about 15 km from Delhi airport and part of the National Capital Region (NCR) planning framework. The First Master Plan of Delhi (1961-81) envisaged a multi-polar spatial structure at a regional scale to decongest Delhi and recommended development of the surrounding ring towns as counter magnets to Delhi's urban core. Amongst the satellite towns however, "only a modest growth [was] contemplated" for Gurgaon (Delhi Development Authority 1962). It remained a backward agricultural town until the mid-1980s and started to grow dramatically.

The economic pull of Gurgaon has drawn a large number of migrants. As Table-1 shows, between 2001 and 2011, the population of Gurgaon district increased by almost 74 percent, the urban population increased by a staggering 283 percent, while the formal urban limits also expanded by almost six times. Phenomenal urban growth of Gurgaon, and two other districts (Faridabad and Sonapat) bordering Delhi, played major roles in catapulting Haryana amongst India's most urbanised states, from previously being the most rural. Haryana's urban population has increased from 24 percent in 1991 to 29 percent in 2001 to 35 percent in 2011 (Census 2011). However, barring the areas bordering Delhi, the rest of the state has still remained, predominantly rural.

Table 1:

Population Increase in Gurgaon between 2001 and 2011

Census Year	Population of Gurgaon District	Population of Gurgaon Municipal Area	Decadal growth percent	Urban Area (in sq.km)
2001	870,539	228,820	73.93	35
2011	1,514,085	876,824	283.194	207

Source: Census of India (2011)

Development process of Gurgaon reflects the tensions of its particular geographic location, where economic growth is happening due to its close proximity to Delhi, but is being

mediated through the political culture of Haryana - the push factors of Delhi's restrictive planning process and pull factors of Haryana's liberal regulatory regime. The growth may be divided into two clearly discernable phases. From the mid-1980s to the mid-1990s, Gurgaon developed as Delhi's industrial and residential suburb. And then the growth momentum further picked-up as Gurgaon turned into a major business services outsourcing hub.

The industrial era of Gurgaon began with the establishment of the Maruti-Suzuki automobile plant and its ancillary factories in 1982. Later on several other factories in diverse fields like auto components, telecommunication equipment, and fashion garments started in Gurgaon. In 1981-82, two big Delhi based property developers, received licenses from the Haryana government to build large private sector residential townships, which began to be occupied from 1991 onwards. Gurgaon's land market, however, benefited from the concurrent shrinkage of real estate opportunities in Delhi.

Supply and control of urban land within Delhi is closely managed by the Delhi Development Authority, a public sector agency, through a restrictive planning regime. But, this rigid land use control mechanism ran into a major crisis during the 1990s, with the proliferation of illegal construction, leading to court cases over environmental degradations and Master Plan violations. The lengthy legal controversy virtually stopped building activities in Delhi from the mid-1990s, until a revised plan was notified in 2007 (Chatterji 2003). Supply constraints in Delhi during a vital phase of economic growth, stirred the property markets of the suburban towns in the neighbouring states. At this stage, Gurgaon's nearness to Delhi airport and availability of high quality real estate, turned it into a sought after destination for the business process outsourcing industry.

In sharp contrast to Delhi, Haryana had been following a liberal land policy since the late 1970s onwards, long before the advent of economic liberalisation on the national stage (Joardar 2006). The Haryana Urban Development (HUD) Act of 1977 empowers the state agencies to acquire agricultural land for developing residential townships and industrial estates and contracting out development to the private sector. Under the Haryana Development and Regulation of Urban Areas (HDRUA) Act of 1975-76, licenses are awarded to big private developers to acquire, assemble and develop a minimum contiguous 100 acres of land. Later on, encouraged by the impressive growth of the corporate economy and the construction boom of Gurgaon, Haryana government took steps to provide further impetus to the sector, by easing norms for conversion of industrial manufacturing zones to IT-Business parks under the state IT policy. Moreover, Haryana government enthusiastically encouraged growth of the IT-BPO oriented Special Economic Zones (SEZ) in Gurgaon, after the promulgation of the SEZ Act by the national government in 2005. Under this act IT-BPO oriented SEZs could be established on a minimum 10 hectares of contiguous land. These liberal provisions enabled large real estate companies to build up huge land banks in the state, particularly in Gurgaon near Delhi. They started churning out high quality residential and commercial projects in quick succession as demand started soaring from the mid-1990s. Interestingly, until 2008, Gurgaon region was mostly classified as rural and absence of a local regulatory regime, (in the form of a municipality) further fast-tracked the permits and clearances from friendly parastatal agencies (Debroy & Bhandari 2009).

GE Capital's decision to locate its call-centre facility in 1997 in a DLF business park set the trend for other companies in the IT-BPO sector (e.g. American Express, Erickson, British Airways) to establish their global business sourcing offices in Gurgaon. Almost as a rule, the global corporations operate from leased space in business parks promoted by the property developers, which provide large floor plates in mirror-glass office buildings, pleasant landscaping, big parking lots, round the clock power back-up to offset for frequent outages in grid supply, advanced communication and security infrastructure, matching the specifications of the global corporate sector. Leasing of space, rather than direct property ownership, provides them with operational flexibilities in scaling up and down their establishment sizes,

with the ebbs and flows of the global economy, but also shelters them from the messy dealings of land and property markets. The corporate real estate sector, in this situation, has come to represent global capital, as the point of interface between the global corporations and the local state. Three big real estate developers, DLF, Ansals and Unitech in particular, played pioneering roles in this shaping of modern Gurgaon.

Dramatic transformation of Gurgaon, within a span of two decades from agriculture to industrial manufacturing to hi-tech business services have drawn into close proximity people from diverse socio-economic strata and also migrants from different parts of India. However, this property development-led growth model with loose planning control has produced a patchwork quilt development pattern. Educated middleclass, which are closely associated with the corporate economy of Gurgaon generally, reside in planned gated apartment complexes and HUDA sectors. The modern city has engulfed several villages which have turned into urban slums with informal commercial and residential activities. Original local residents, people associated with the agrarian economy, usually reside in the village areas and have expanded their old village houses to several stories for rental and commercial purpose.

There are strong symbiotic economic relationships between the formal and informal settlements. Shopping malls and markets within the planned residential enclaves accommodate only a few high-end shops. Thus, most residents of the gated complexes depend on the informal village bazaars for their daily needs. The lower-end migrants, who started coming to Gurgaon during its take-off as an industrial city, and the subsequent construction boom, find their shelter in these urban villages – turned slum areas. Thus these informal areas now accommodate the entire service population of the formal economy. The security guards, electricians, and maids, who work in the business parks and the apartment buildings, reside in the nearby village pockets. Yet, the middleclass areas detest the presence of the rural enclaves.

Unplanned growth at a rapid pace has put severe pressure on Gurgaon's civic infrastructure. Seven to eight hours of power outage is almost a daily occurrence. Up-scale residential enclaves and corporate business parks all provide power back-up through diesel generators, along with good quality internal infrastructure. But the villages abutting the boundary walls of these enclaves are in abysmal condition due to inadequacies in water supply, sewage and drainage facilities. While the newly extended metro rail has improved connectivity from the commercial core of Gurgaon to Delhi, there is no public transport for inner city commuting. Corporate firms in Gurgaon regularly operate chartered bus and taxi fleets to transport their employees. For those without a personal vehicle, the only commuting option is to hitch a ride in crowded three wheeler auto rickshaws. Cycle tracks and pedestrian walkways are practically non-existent.

Management of Gurgaon's urban transformation has suffered due to institutional deficiencies and a multiplicity of agencies. Haryana Government's Department of Town Planning (DTP) was entrusted with responsibility for ensuring development coordination between public and private agencies. But, land configurations and project phasing by the private developers has tended to follow the logic of land assembling through negotiations with local farmers, rather than the phases prescribed by the DTP's Master Plan. This in turn has created difficulties for routing of trunk utilities (Biswas 2006). The absence of a strong locally based planning agency had further compounded the problems of development coordination. M.C. Gupta, a former chief secretary of Haryana, when interviewed on 4th January 2011, observed that 'Gurgaon needs its own development authority. Planners sitting in Chandigarh (*the joint capital of Punjab and Haryana*) cannot coordinate such a fast growing area on a daily basis'.

A number of state and local agencies are involved in plan implementation, each with piecemeal jurisdiction. Haryana Urban Development Authority (HUDA), a state level agency, having a local office, is responsible for developing roads and provision of water supply,

sewerage and drainage in the newer parts of the city, which includes master planned sectors directly developed by HUDA and the gated enclaves, developed by the private builders. For private enclaves, the developers provide internal services and pay External Development Charges to HUDA for trunk services linkage. The industrial estates, like Udyog Vihar, is under the Haryana State Industrial Infrastructure Development Corporation (HSIIDC), The older part of the town, is directly under the control of the municipality, while state government's Public Works Department (PWD) is in charge of providing roads and services. The village areas had been traditionally under the jurisdiction of the local *Panchayets*.

The local agencies, the municipal committee and village Panchyets have been the weakest entities in Gurgaon's transitional journey, lacking financial, technical and legal capacity for urban management. Parastatal agencies like HUDA and HSIIDC, who have technical or financial capabilities, tend to act more like private entrepreneurs, in parcelling out new land developments, rather than enforcing overarching development controls or coordinating delivery of public services. A local municipal councillor complained:

For all these years, Gurgaon had been treated as Haryana's cash cow. Gurgaon generates half of Haryana's revenue. But what does it get back in return?
(Interview: 6 January 2012)

Similar resentments against the way Chandigarh based state leadership had handled the state of urban affairs of Gurgaon, were expressed by almost every politician and civil-society activist interviewed, indicating a rare degree of unanimity amongst the local elites in an otherwise fractious environment.

4. Politics of public participation

Incomplete devolution of administrative powers from the state government to the local government; a privatised approach towards city building, without a strong institutional set-up for urban management; and deep rural-urban social schism, have generated multiple problems in Gurgaon's transitional journey from a small town to one of India's prime international economic gateways. In this context, the formation of the Municipal Corporation of Gurgaon in 2008, encompassing 207 sq.km areas, generated much hope amongst a large section of the urban and rural population alike, in anticipation that it would become the overarching body for coordination of the developmental activities and become a platform for negotiation between the diverse stakeholders. However, the prevailing social divisions have come in the way of effective engagement between the urban middle class dominated civil-society groups and the elected municipal councillors with a rural background, turning the MCG's focus away from developmental issues and reducing it into another forum for power tussles between rival caste lobbies in Haryana politics. The first election of the newly formed Municipal Corporation of Gurgaon (MCG) vividly exposed these internal tensions, which had been simmering for two decades.

Residents of the rural and urban areas of Gurgaon follow separate paths to engage with the state on day-to-day matters. Residents of the urbanised villages tend to follow the party based political system, by seeking help from the political leaders, as the political leaders have deep local ties. But the middle class professionals residing in the planned HUDA sectors and private colonies prefer the 'apolitical' route. A large percentage of the middleclass is also not 'local' and has migrated to the region from other Indian states. In recent times, neighbourhood associations of the formal, planned areas, called Resident Welfare Associations (RWA) have emerged as the main vehicle articulating the voice of the middleclass. All HUDA sectors and builder enclaves have their own RWAs, elected by local residents. However, the RWAs are only consultative bodies. Management control rests with the original developers: HUDA for planned HUDA sectors and private real estate companies for the privately developed apartment complexes and townships, even decades after people

moved in. The private developers avoid obtaining Completion Certificates, by keeping a small part of their project incomplete, to retain possession of the areas developed. The Town Planning department, functioning directly under the Chief Minister's office, tends to extend the project time frames, in lieu of small fines,

The RWAs have taken up with HUDA the issues of infrastructure deficiencies and non-compliance with the Master Plan guidelines by the private developers, but without much result. During a meeting with several RWA committee members on 3 January 2012, it was frequently alleged that the private developers had not delivered community facilities as promised. An RWA executive committee member alleged:

The land which was marked for Community Centre has been converted into a membership-only club. Now there is no space to organise festivals like *Bhagwati-jagarans* or *Ram-leelas*.

During the same meeting, other RWA executives complained that in several apartment complexes, builders had converted areas originally marked for local convenience stores into air-conditioned shopping malls, encroached roads and children's parks and frequently hike monthly maintenance charges. Sanjiv Sablok, a prominent community activist expressed his helplessness about complaining to HUDA about private builders:

We keep doing rounds at HUDA office and submit petitions. They listen to us. Treat us to tea and coffee. But that's about it. They file the complaints and forget it. Nothing further happens. The builders are very powerful.

Initially content with playing second fiddle to the big developers and HUDA, the RWAs of Gurgaon have become increasingly active politically. Subinder Khurana, President of the Cyber City Welfare Association, when interviewed on 3 January 2012, held that the reluctance of the middleclass to engage with the political process, could be due to their transient nature. Professionals from different parts of India initially considered staying in Gurgaon only as a temporary step in their career ladder. However with the passage of time, they started growing roots, purchased property and taking more interest in civic affairs.

In 2005, more than one hundred RWAs of Gurgaon came together to form an apex body, called Joint Action Forum for Resident Associations (JAFRA), to more effectively lobby the local administration. Representatives of a few village areas were also accommodated, to give it a more inclusive character. Since then JAFRA has been at the forefront of demanding formation of a more responsive local government with overarching power over various public agencies for integrated urban development. But its effectiveness as a lobbying body is to a large extent compromised due to its internal contradictions. The day to day problems faced by the HUDA sectors and the private enclaves tend to differ, except on issues like mass transport or public parking spaces. There is also a huge trust deficit between the village areas and the planned enclaves. It is a common feeling amongst the educated elites of Gurgaon, that local rural people, many of whom had become rich overnight by selling land, lack 'education, culture and social manners'. Whereas, P.K Sangwan a political activist, originally hailing from Jharsa village observed:

Highflying people who live in these flats look down upon us, as rustic, uneducated blokes. They don't give us any respect. Our worlds are very different, though we live, side by side. (Interview: 6 January 2012).

Engagement between the civil-society activists and the local government received a major boost in 2008, with the formation of the municipal corporation. Like other municipalities of India, the MCG has two wings: a legislative wing consisting of the mayor and the elected councillors of each ward, and an administrative wing directly under the Municipal Commissioner. Since the urban middleclass in India typically consider urban local bodies to be 'corrupt' and 'inefficient', one of the first priorities of the newly formed MCG was to build

trust amongst the people. Mr. Rajesh Khullar, who was the Commissioner from 2008 to 2011, initiated several moves in that direction, by enhancing partnership arrangements with the civil society groups and augmenting e-government tools. According to Mr Khullar, the objective was to create a template for a 'transparent and efficient civic body' before the start of politicking, with the arrival of the elected councillors (Interview: 2 February 2011). 'Harnessing the power of the IT to break the barrier between the in-group and the out-group' became the guiding mantra of the nascent municipal body.

With the above objectives the MCG started to upload information about contracts and tendering for municipal projects on its website, apart from regular items such as property taxation, birth, death and marriage registration, and a section for lodging of complaints. To encourage public participation in local developmental issues, the MCG formed Citizen Supervisory Committees for each ward. Payments for small civic works, such as road repairs, were linked to getting a satisfactory report from the citizen committees of the concerned ward. Additionally, the MCG partnered with NGOs to launch environmental improvement programmes like creating shelters for stray cows, turning rubbish dumps into parks and cleaning of local markets. However, participation of the civil-society groups in urban governance took a downward turn after the municipal elections, due to the social gulf that exists between the urban elite dominated 'apolitical' NGOs and the 'rustic' political leadership which came into control of the MCG following the election. This, in turn, robbed the nascent body of much-needed technical and managerial capacity at a crucial stage.

The MCG, consisting of 35 wards, covering an area of 207 sq.kms and over 1.5 million people, had its first election in May, 2011, three years, after it was formed. Each ward elected one councillor for a five year term. The councillors themselves elected a mayor and a deputy mayor amongst themselves. The voting pattern was marked by sharp rural-urban polarisation. In the formal planned areas, voting was only 20 to 30 percent, but in the village areas it was between 80 to 90 percent (Times of India 2011). This general pattern was only defied in Ward-30. Here middleclass voters came out in large numbers to elect Ms. Nisha Singh an ex-Google executive as an independent candidate. Ms. Singh extensively used social media tools like Facebook and Twitter to mobilise her supporters. In almost all other wards, candidates with strong rural links, having caste and deep socio-political ties with the village communities, were elected. The election was fought along party lines. However, cutting across political divide, elected councillors mobilised along caste lines to elect the mayor. The caste and political mobilisation, in the MCG election, once again demonstrated the relative insignificance of the urban middleclass in electoral politics, despite its recent economic success.

Performance of the MCG has also been impacted by conflicts between multiple levels of governance. While the councillors have been elected from an extended jurisdiction covering 207 sq.km their real authority is extremely limited. Only old Gurgaon (about 35 sq.km), which was earlier under the Municipal Committee, and 37 village pockets which were earlier under *Panchayets*, are now under the direct control of the MCG, informed the Chief Engineer of the MCG when interviewed on 5 January 2012. Vast new developments, all HUDA sectors, HSIDC industrial estates, privately developed residential enclaves, and business parks, are effectively out of bounds for the MCG. According to Councillor Nisha Singh, at least the HUDA areas should have been handed over to the MCG, with the formation of an elected body (Interview: 24 December 2011). However, there is neither any time frame, nor any agreement between the two bodies on how to account for the civil works undertaken so far and the extent of pending tasks. Thus, even after assuming office, the elected councillors are unable to deliver and are getting discredited.

While this political tussle continues, the quality of life for both rural and urban Gurgaon continue to deteriorate with severe infrastructure deficiencies and other consequences of uncoordinated growth, putting a question mark on its status as the icon of neoliberal urbanism in India.

5. Chapter Title Conclusion

Through the example of Gurgaon, this article discussed the difficulties of implementing global concepts like participatory planning and public-private partnerships in transitional economies of like India. Rapid change of a small rural town to a centre of industrial manufacturing and then, a global IT-BPO hub, in an unplanned manner, over a short time has resulted in a complex and heterogeneous urban pattern with overlapping layers of socio-spatial relations. The transformational journey has been further compounded by Gurgaon's geographic location, where economic growth has occurred due to its proximity to Delhi, but where the management and consequences of this growth are mediated through the local political channels.

The state government encouraged a joint approach towards city building. But the parastatal agencies in the name of facilitating the private enterprise led growth machine had relegated their planning responsibilities. The liberal land policy and minimal regulatory control enabled the developers to amass large land parcels from the peri-urban farmers, to create production and consumption spaces for the IT-BPO-led new globalised economy. Rapid growth in property prices enabled a large number of farmers to move away from agriculture and become stakeholders in the new urban economy. By channelising new economic opportunities, the real estate sector turned into the bridge between the global investors and the local state.

The outcome is a highly unsustainable urban landscape, marked by environmental degradation and stark disparities between planned and unplanned areas. The development pattern has followed the ease of land assembly, rather than a coordinated plan and did not create any space for public participation. The politics of this urban transformation is marked by high degree of social stratification. In this scenario, creation of a new municipal institution, through direct election by the people, instead of facilitating participatory decision making, widened existing social cleavages - rural-urban dichotomies, caste rivalries and power struggles between local and state level politicians,

The urban middleclass preferences for indirect control over local governance through civil-society activism face strong challenge from the rural pockets, which follow the route of direct electoral politics. The political system, dominated by the entrenched rural rich, has reduced the influence of the civil-society groups over the local governance of Gurgaon. This contestation between the urban middleclass and the rural rich has also overshadowed and made invisible a third category of citizens - the informal sector workers and migrant labourers. Not registered as voters, they are voiceless in the local governance system and routinely bypassed. The rural elites have captured power in the newly formed MCG, but its power to implement developmental works is extremely restricted due to a complex interplay of institutional deficiencies, horizontal and vertical power relationships between the parastatal agencies and caste centric politics. The incomplete devolution of administrative power from the state government has made the elected representatives of local government ineffective

Lastly, the process of Gurgaon's transformation illustrates the difficulties migrants face in accessing power to influence urban planning and policy arena, even if they are economically successful. The astronomical growth of Gurgaon was made possible due to the forces of globalisation, which created the IT outsourcing economy. Migrant workers – from upper middleclass technocrats to seasonal construction labours, are the back bones of this success. But their participation in the planning process faces stiff opposition from entrenched local interests.

The Models of Urbanization and Their Impacts on Spatial Evolution of Built-up Areas—Case Studies of Cities in Shaanxi in Northwest China

Xiaojian Chen, Xi'an University of Architecture and Technology, P.R.China
XinYuan Li, Planning and Instruction Management Bureau of Xi'an Economic & Technological Development Zone , P.R.China
Ning Ding, Xi'an University of Technology, P.R.China

Abstract: Large-scale demographic changes driven by migration are already a fundamental force in urbanization and have different affect on spatial evolution of cities with different scales and different development condition. In Shaanxi, the gap between the household registration population and permanent residents increase gradually. Furthermore, it results in different effectiveness of planning practices, especially, to spatial development and layout because of the uncertainty in population. The paper describes the drivers of regional development, spatial evolutionary course of the built-up areas of the dominant cities, planning practice and their effectiveness etc.. The specific focus is on the relationship between population migration features and spatial evolution of built-up areas by the compared analysis of cities with different scales and different drivers. The results demonstrate that the central Shaanxi has been experiencing the increase of permanent residents. Especially, the mega city-Xi'an- has been experiencing a large number of permanent residents increase from every municipal regions throughout Shaanxi and other regions in Northeast China over the past several decades. For Northern and Southern Shaanxi, the population migration has complex characteristics. Different migration models make different urbanization models as well as different growth and spatial evolution characters of built-up areas of dominant cities. Furthermore, it results in different effectiveness of planning practices

1. Introduction

Nowadays, the bound between migration and population floating is confusion in China because of the more and more separation of residence and household registration place, and there are many terms related to them, such as permanent migration, temporary migration, migration as registered permanent resident, migration without registering as permanent resident, floating population and temporary resident population etc.. Although the statutory migration refers to the migration as registered permanent residence, the migration population in census and sampling survey does not mean that because of the complex and diversity of population migration and floating ^[1]. In this paper the authors use the same concept-including migration as registered permanent resident and residing in another place more than 6 months without registering as permanent resident-as that used in the census and sampling survey.

The migration is an social expression of spatial interaction of original places and destination, and it reflects the regional differences of economy level, investment strength and employment opportunity etc.^[2]. In China, the main migration directions are moving from rural areas to cities of different scales and moving from developing areas to developed areas while there are different characters in different regions. Migration between provinces is characterized by moving from Mid-west to some developed cities in costal areas, and migration within province is characterized by moving from rural areas and small towns and cities to the dominant cities and industries areas. What's more, the phenomenon of migrate workers intensify the diversity and complexity of population migration in China. Furthermore it results in the transformation and transition of urban and rural structure. Large-scale

demographic changes driven by migration are already a fundamental force in urbanization and have different affect on spatial evolution of cities with different scales and different development condition. Based on regional survey of Shaanxi province in Northwest China and case studies of Xi'an (in Central Shaanxi), Yulin (in Northern Shaanxi), Ankang (in Southern Shaanxi)), which has different development condition and bases, this paper explores the models of urbanization and their impacts on spatial evolution of regional dominant cities, especially the relationship between population migration features and spatial evolution of built-up areas by the compared analysis of cities in different regions with different scales and different drivers.

2. The basic characters of three regions in Shaanxi

Shaanxi province is located in Northwest China, and is divided into three geographical unit—loess plateau in Northern Shaanxi with rich mineral resources such as coal, oil, gas and salt mine resources, and Plain in Central Shaanxi with good location and development base, and Qinling Mountains and Ba Mountains in Southern Shaanxi with important eco-protection position and water resources.

2.1. Northern Shaanxi

The region borders western Shanxi province in the east with Yellow River in the middle of them, adjacent to Gansu province and Ningxia with the meridian ridge as boundary in the west, neighbor with Inner Mongolia in the North and connected with Tongchuan city of Guanzhong Plain in the south. Its scope includes Yulin and Yan'an administration areas which has 25 counties in all. Its total area is 93,000 square kilometers and its total population is 5546400 peoples. The dominant cities are Yan'an and Yulin city. The basic landform is loess tableland, beams, hilly, ditch, Plateau. The main industries in this area are energy carriers industry, coal making oil, coal-salt chemical, petrochemical. The Yulin and Yan'an are the services bases for immediate counties with leading secondary industries while the city proper mainly develops tourism, tertiary industry, and light industry. Shaanxi. Energy and chemical base in northern Shaanxi is approved as China National Energy and Chemical Base in 1998, and it is also one of the regions with rapid economic development since the late of 20 century in Shaanxi.

2.2. Guanzhong Plain

Guanzhong Plain, sits in central Shaanxi. It's the most prosperous place in Shaanxi province. Guanzhong Plain is close to Qinling Mountains in the south and neighbor with the Loess Plateau in the north. It includes five municipalities, such as Xi'an, Baoji, Xianyang, Weinan, Tongchuan and Yangling District. The resident population of Guanzhong Plain is 23497700 and its area is about 34,000 square kilometers. Guanzhong Plain is the main production base of grain, cotton, oil plants and high-quality fruit base in Shaanxi. What's more, it is also the most important industrial base in Shaanxi Province, and it has been formatted a relatively complete industrial system of agriculture, textiles, electronics, coal, petrochemical, machinery and equipment manufactory, energy etc., especially in the equipment manufacturing industry and high-tech industrial development with five different levels of high-tech development zone, where three is at the state-level. Guanzhong plain is the important research base for national aerospace, aviation, machinery, electronics, instruments etc..

2.3. Southern Shaanxi

Southern Shaanxi contains Hanzhong, Ankang and Shangluo three administration areas which have 25 counties in all, and dominant cities are Hanzhong, Ankang and Shangluo city. The resident population is 8382000 by the end of 2011 and has a total area of 70,200 square kilometers. Sorthern Shaanxi is extremely rich in water, heat, forest, grass resources and local products, mineral and other natural resources, and it also very rich in hydropower

resources since it is the birthplace of the Han River which is the largest tributary of the Yangtze River. In recent years, southern Shaanxi has concentrated on the building the core of circular economy gathering area, and formed the new ideas of developing three leading industries of bio-processing, eco-tourism, and new materials. The population density is sparse compared with the Guanzhong Plain because of the natural condition limit, and it is the radiation source of population migration. Table 1 shows the basic Characters of three major regions in Shaanxi Province.

Table 1. The basic Characters of three major regions in Shaanxi Province

Regions	Total population	Total area (square kilometer)	Dominant city	Major industry
Northern Shaanxi	5, 546, 400	93,000	Yulin, Yan'an	Agriculture, energy and Chemical Industry etc..
Guanzhong Plain	23, 497, 700	34,000	Xi'an, Baoji, Xianyang, Weinan, Tongchuan, Yangling District	High-Tech Industry. Modern Equipment & Manufacturing Industry, Tourism etc.
Southern Shaanxi	8, 382, 000	70200	Hanzhong, Ankang and Shangluo	Biological processing, Ecotourism, New materials, etc.

3. The population migration Characteristics of Shaanxi

The regional distribution of population in Shaanxi Province is significant differences, and display the features of dense population in Central Shaanxi and sparse in the North and South. According to the Sixth Census, the resident population of the Central Shaanxi, Southern Shaanxi and Northern Shaanxi accounted for 62.69%, 22.47% and 14.84% respectively. In terms of the population distribution of administration areas, compared with the year 2000, the population proportion in some rapid socio-economic growth areas, such as Xi'an, Yulin, Yan'an and Yangling have increased to varying degrees, especially in Xi'an, the population proportion of the province rose from 20.56% in 2000 to 22.69% in 2010, increased by 2.13%. The features of dense populated in central Shaanxi and sparse in the North and South Shaanxi become more striking.

Table 2 demonstrates the migration within province is much larger than between provinces and the ration of migration population to residence population is increase rapidly with the social and economic development.

Table 2 The migration ratio in census in Shaanxi Province

Time	The ratio of migrate people to total residence population (%)	The ratio of migration between provinces to total migration (%)	The ratio of migration within province to total migration (%)
1990	0.3	30.59	69.41
1995	1.4	29.95	70.05
2000	7	18.01	81.99

Sources: the fourth and fifth census and sampling survey

The number of migration population is large, and the trend that the population from rural to urban area, and from less developed areas to economically invigorating regions and big cities is more prominent. According to the Fifth Census data, at 0:00 on November 1st, 2000, the residence population was 36,050,000 in Shaanxi province, and migrated population was 3,405,600, accounted for 9.5%; and the migrants lived mainly in Xi'an, Weinan, Xianyang and Baoji (four cities occupied 58%), as illustrated in figure 1. The migrants were born inside the province mainly choose to live in Xi'an(19%)、Weinan(15%)、Xianyang(14%)、and

Baoji (10%) and the migrants born outside the province mainly choose to live in Xi'an(49%)、Weinan(9%)、Xianyang(11%)、and Baoji (12%) too.The main reasons of population migration in Shaanxi Province are as follows: study, business, marriage, moving, employment, job transfers and seek help with relatives and friends in addition to the large amount of rural surplus labor and the great income gap between urban and rural area. Xi'an has excellent resources for primary and secondary education, and many universities gathered here, which attract those who from Northern Shaanxi and Central Shaanxi want the best education for their children. They purchase house and send their children to school in Xi'an. They mainly choose the central area and suburb of Xi'an to settle down where have educational resources, and migrate follows the chain migration patterns. The chain migration is the most common mode in China. The Social Relations Network has become the main factor of location choice for present China's floating population. Migrants make the decision and get the information about the new places from kinship, village relationship and interpersonal relationship net, rather than from the government and the market. On November 1st, 2010, the floating population of Shaanxi for 5,894,400 people, accounted for 15.79% of residence population, compared with 2000, the floating population increased by 1.5 times, accounted for the proportion of the residence population advanced 9.1 percentage point. 60.1% of the people from other provinces to live, work, study and trade in Xi'an, 12% in Yulin for natural resources development. The outflow population of the region in Shaanxi can be viewed that Southern Shaanxi took up almost half of the migration, Hanzhong and Ankang accounted for 23.93% and 19.45% respectively of the Southern Shaanxi; Xianyang, Weinan and Baoji accounted for 12.11%,10.95% and 9.01% respectively of the Central Shaanxi, and these five cities occupied 75.45% of the total outflow population. For the situation of population migrating in the province, intercity floating population was 1,015,200, more than 80% fixed upon the Xi'an as a migrant destination.

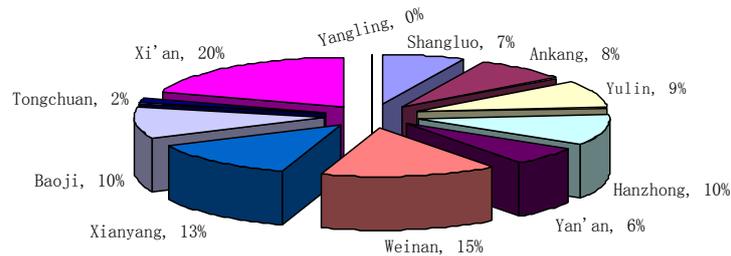

Figure 1. The distribution of immigration of Shaanxi in 2000

Figure 2 shows the number change of residence population in different administration areas according to the fifth and sixth census, and it demonstrates that the residence population of Xi'an, Baoji, Yan'an and Yulin increase while that in other administration areas decrease.

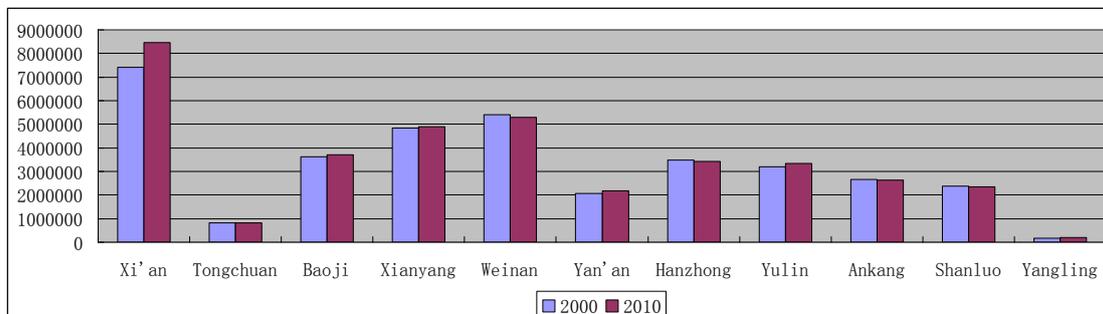

Figure 2. The residence population of the fifth and sixth census

4. Migration and urbanization model in Shaanxi

Demographic changes takes on different characterise in these three areas. General speaking, the central Shaanxi has been experiencing the increase of permanent residents. Especially, the mega city-Xi'an- which is located in central Shaanxi and is the dominant city of Shaanxi, has been experiencing a large number of permanent residents increase from every municipal regions throughout Shaanxi and other regions in Northeast China over the past several decades. For Northern and Southern Shaanxi, the population migration has complex characteristics. There are coexist that people with medium income and above that level who live and work in cities in these regions purchase house in megacity-city and become the temporary residents at this time, while people who live and work in rural areas purchase house or rent flats in dominant cities in these regions and become the self-urbanization residents^[3]. Figure 3 shows the migration direction in Shaanxi province

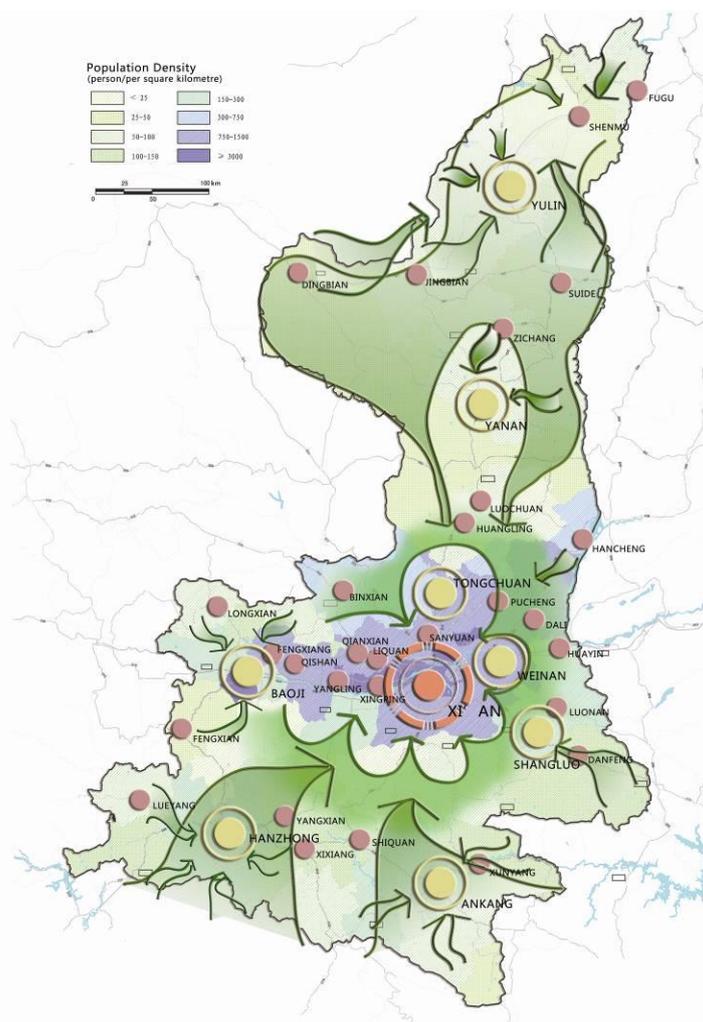

Figure 3. The migration of Shaanxi province

We take Yulin, Xi'an and Ankang as case study. The population migration of Yulin administration area is dominant city and industrial areas oriented. Town population of northern six counties is 1.63 times as that of southern six counties because of good natural condition and development potential. The intensity characteristics of population spatial distribution are consistent with the intensity of GDP spatial distribution. Yulin population migration is mainly composed of two parts, one of them is the middle-income class people migrate to the city of Xi 'an, and they purchase house in Xi 'an for children or themselves.

The other is a large number of agricultural surpluses labour transfer from rural areas to industrial areas or to other places where can provided employment opportunity or good living condition. In generally, their transfer destination mainly includes two types, one of which is to transfer to dominant city within the regions; the second is to transfer to various large industrial and mining within the administration area, such as Shenmu, Fugu, Jingbian and other places. According to the survey the ratio of agricultural surpluses labours that stay in this region to those moving outside the region is roughly 6:1. In terms of the spatial distribution, northern region is the main attraction place, accounted for about 80% of the total transfer surpluses labour. Especially the second industry's ability of the northern counties to attract and accommodate rural labour is better than six southern counties. Survey found that most of the surpluses labour who move to the regional dominant city would like to stay there forever, and urbanization has the characteristics of relatively long-term and stability; while the surpluses labour who move to the dominant towns in county would like to stay there temporary, and urbanization has the characteristics of seasonality and volatility. Figure 4 shows the migration direction of agriculture surpluses labour in Yulin.

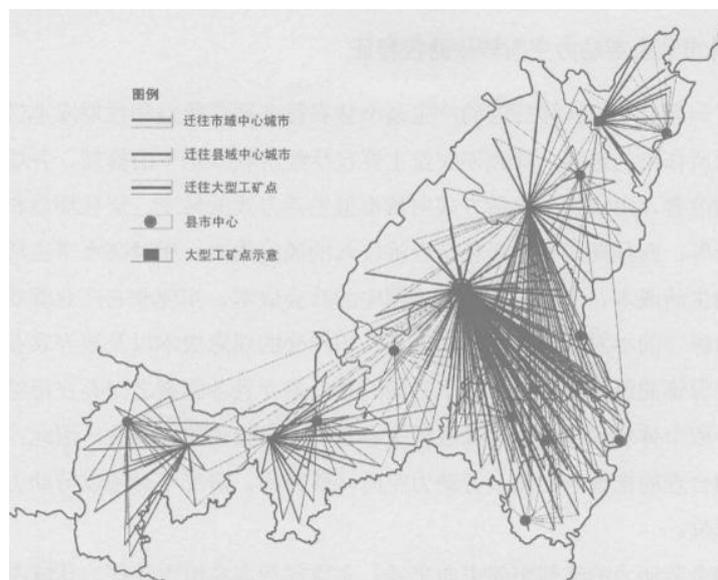

Figure 4 the migration direction of agriculture surpluses labour in Yulin

Sources: Hujia, *The dissertation of Xi'an University of Architecture and Technology*. 2010

For Ankang, that takes on different story. Some people with medium income or above that purchase house in megacity-city Xi'an and become the temporary residents. Agricultural surpluses labour transfers to dominant city within the regions or moving outside the region. Especially they move to Eastern China and stay there for a relatively long time and back at festival season. Figure 5 shows the change of residence population in Ankang in year 2000, 2005 and 2010. there are a little decrease of residence population that stay more than 6 months throughout the whole areas because of the difficult living and production condition in most of the mountain areas. The Ankang city proper became the main attraction place because of the better living condition and infrastructure within the administration area, but the attraction is limited at this moment compared with Megacity Xi'an and rapid development city Yulin.

Xi'an, as the dominant city of Shaanxi province and one of the mega-cities in China, has marvellous attraction for the people all over the province, even some people in Northwest China. The migration is characterized by coexist of permanent residence and long-term floating. From year 2000-2010, the net immigrant population as registering as permanent resident in Xi'an is 65.7900 totally while the resident population living longer than 6 months is 1.06 million. We can see that clearly from the Figure 6 and Table 3. Figure 6 shows the migration as registered permanent resident. The gap between the household registration population and permanent residents increase gradually. The number is much smaller

compared with the increase of resident population living longer than 6 months. That means there are big gap between the two statistics. Furthermore, it means that lots of population migration is Non-household registration population migration, but they stay much longer than 6 months as long-term floating. The bigger the city, the prominent the phenomena.

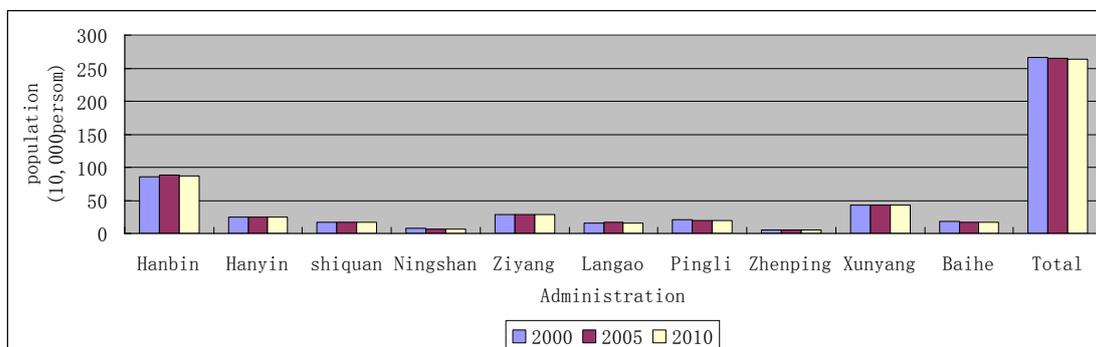

Figure 5 the change of residence population in Ankang in year 2000, 2005 and 2010.

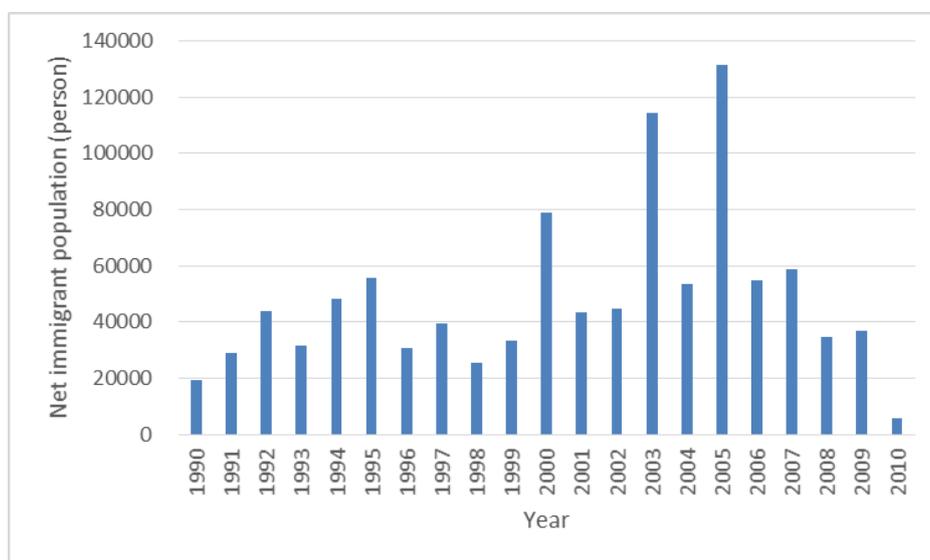

Figure 6 the migration as registered permanent resident in Xi'an

Table 3 the resident population and the Increase number

Year	residence population (10,000 person)	Increase number 10,000 person /per year
2000	741.14	
2005	806.81	67.67(5 years together)
2006	822.52	15.71
2007	830.54	8.02
2008	837.52	6.98
2009	843.46	5.95
2010	847.41	3.95
2011	851.34	3.93

Sources: Yearbook of Xi'an statistic.

According to the analysis above, we can conclude that migration in these regions means something more than that move from one place to another with registration as resident population, and it also means staying in other places without registration as resident population. The diverse migration models result in several migration flows and different urbanization model in different regions, for example, seasonal agriculture surplus labour and vocational and weekend migration population with medium income and stable job in other cities. All of this accelerates the complexity and make the population difficult to forecast. The Table 4 lists the migration characters in these three regions. Radial migration pattern is evident throughout the province, especially in rural areas. Both convergence and radial migration pattern have developed which made the Xi'an a powerful convergence centre. The industrial areas in Northern Shaanxi are as new attractive areas.

Table 4 The migration characters in these three regions

Regions	Migration Characters	Migration Impulses	The migration destination
Northern Shaanxi	Strong floating character: Some people purchase house in megacity-Xi'an and become the temporary residents. Agricultural surpluses labour transfer to dominant city within the regions or to various large industrial and mining within the administration area,	Employment opportunity, Education level, Living condition	Xi'an, Dominant city and towns, Industries areas
Guangzhong Plain	Coexist of permanent resident and long-term floating	Higher income, Better living condition	Xi'an or Towns immediate village with employment opportunity
Southern Shaanxi	Some people purchase house in megacity-city and become the temporary residents. Agricultural surpluses labour transfers to dominant city within the regions or moving outside the region.	Employment opportunity, Education level, Living condition	Xi'an, developed areas in costal areas.

5. Spatial evolution of the built-up areas of the dominant cities in three regions

Like most of the China's cities, the dominant cities in Shaanxi experience expansion continuously. Figure 7 shows the change of built-up areas of Xi'an, Yulin and Ankang. Xi'an grow fastest, and then the Yulin and Ankang grow is slower and stable.

The expansion of built-up area of Xi'an is radical. The main expansion direction is Southwest and North before 2002, and there is expansion in every direction since the beginning of 21st century.

In Yulin, from 2000 to 2007, the expansion in SS and S and SSW direction reach $292.08 \text{ hm}^2 / \text{year}$, $1004.49 \text{ hm}^2 / \text{year}$ and $276.05 \text{ hm}^2 / \text{year}$ respectively. And the expansion amount in this three direction account for 73.75% of total expansion amount. The extension in S direction accounts for 47.13%. The direction in east and north is at a lower level whether the expansion proportion of total land, or the amount of expansion. From 2007 to 2012, the expansion in SSE, S, and SSW direction is still larger. And the sum exceeds 50% of the total extension. What's more, the expansion rate is increasing each year. The expansion amounts

in NNE、NWW、NW and SEE direction increase by 3.8, 13.2, 14.3 and 16.7 times separately between 2007-2012 compared with those between 2000-2007. It shows that the South direction is still the main expansion direction while the North and West expand evidently.

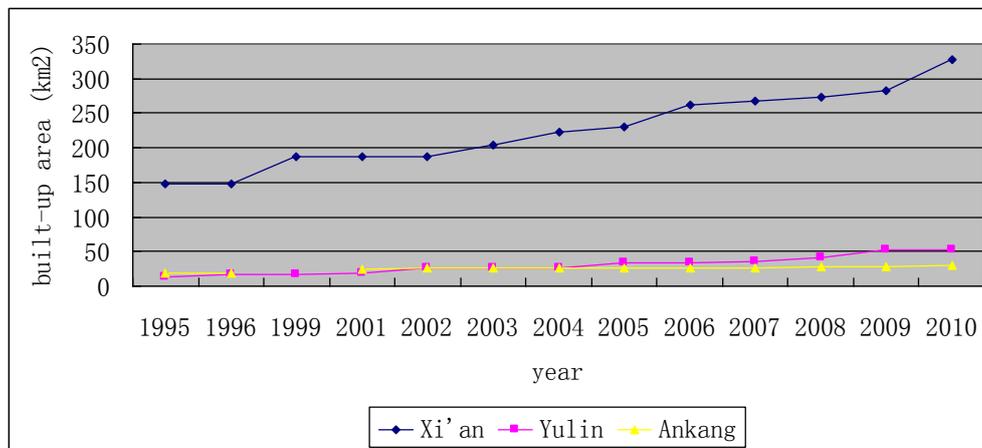

Figure7 the built-up areas of Xi'an, Yulin and Ankang

Sources: The yearbook of China's cities statistics.

For AnKang city, the spatial expansion in Northwest direction keep the leading position from 1985 to 2011. From 1985 to 2000, the increase amounts in Northwest direction reached 1.48 square kilometers. The increase amounts in Northern direction reached 0.82 square kilometer. The northeast direction growth was smallest, it was nearly 0. From 2000 to 2007, the expansion in Northwest direction was largest and the increase amount reached 2.55 square kilometers. The expansion in east direction accelerated and increased by 1.38 square kilometers. The expansion in North direction slow-down compared with the previous period. The northeast direction grows slowly because of the topography limit. From 2007 to 2011, the fast growth direction is still Northwest which increased by 1.22 square kilometers. However, the rate of expansion drops nearly 1/2 compared with the previous period. In this time, West direction has rapid development, which increased by 0.47 square kilometers.

6. The implement efficiency of plans in dominant cities

6.1 The implementation efficiency of population plans in Yulin, Xi'an and Ankang

The latest revision for comprehensive plan for these three cities was around 2008. Mega-city Xi'an has been experiencing the rapid population increase since the late of 20 century because it is the powerful convergence centre. Yulin and Ankang, as the dominant cities in Northern Shaanxi and Southern Shaanxi, the population is inconsistent with the planning prediction because different social and economic development condition and different population migration model. In Year 2000, there are less than 200,000 people in Yulin Built-up area. It is forecast in comprehensive plan the population in built-up area will be 250,000 in 2010, and 420,000 in 2020. But in 2007 the plan was revised because the population in 2006 is 350,000. The population tends to be underestimates in Yulin. Ankang, the increase of population and built-up areas is slower compared with Yulin. Table 5 shows the population forecast and practical increase in Ankang. And it demonstrates that population increase keep within the expectation. Sometime, the population tends to have been overestimates in Ankang. The reasons are that the impulses for Ankang are as not stronger as Yulin. Employment opportunity shortage results in people moving outside the region.

Table 5 The population forecast and practical increase in Ankang

1979's plan			1987's plan			2002's plan		
57000 People In 1979	Forecast the population will be 130,000 in 1985	Forecast the population will be 150,000 in 2000	140,000 People in 1987	Forecast the population will be 150,000 in 1990	Forecast the population will be 300,000 in 2000	244,000 People in 2000	Forecast the population will be 300,000 in 2005	Forecast the population will be 500,000 in 2020
The population within the same area in 2008 is 148981			The population within the same area in 2008 is 289451			The population within the same area in 2008 is 321144		

6.2 The implementation efficiency of land use plans in Yulin, Xi'an and Ankang

Different migration models make different urbanization models as well as different growth and spatial evolution characters of built-up areas of dominant cities. Furthermore, they result in different effectiveness of planning practices, especially, spatial development and layout because of the uncertainty in population.

Beside the population increase, the expansion directions are also difficult to forecast, especially, for the rapid development city. Figure 8 shows the planning boundary and the practical growth boundary in Yulin, Ankang and Xi'an. As we see from figure 8, the dominant cities in these three regions have different spatial expansion because of different social and economic development condition and different population migration model. The development and expansion of Yulin and Xi'an take on in consistence with comprehensive plan. The area of built-up area exceeds plan's expectations. Their driver forces are rapid economic growth and the construction of new development zone and services bases.

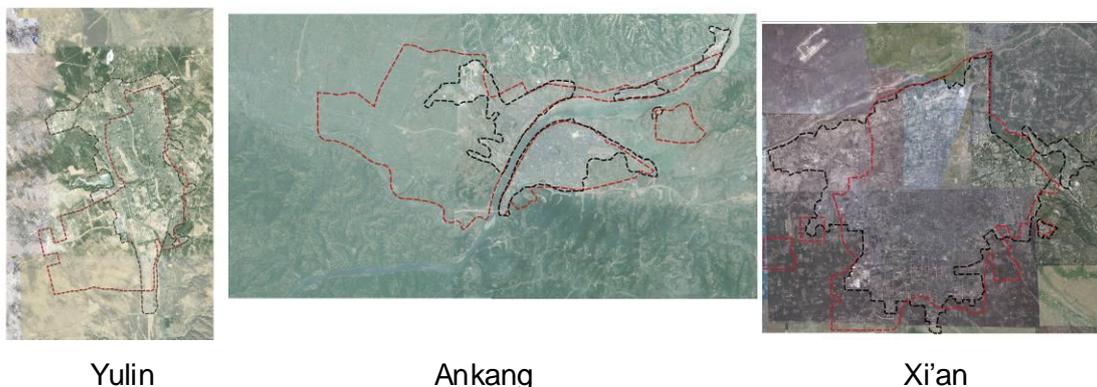

Figure 8 The planning boundary and the practical growth boundary

Note: Red line represents the plan boundary and the black line represents the practical boundary in 2012.

6.3 The relationship between migration models and spatial evolution of built-up areas

There are stronger relationship between migration models and spatial evolution of built-up areas. Different migration model results in different population convergence in region. The migration models are affected by several interconnected forces. One is the rapid economic development and the others are better employment and education opportunity etc.. What's more, the rapid population increases, especially the population without registration as resident population has played an important role for spatial evolution of built-up areas. The gap between the household registration population and permanent residents results in different effectiveness of planning practices, especially, to spatial development and layout because of the uncertainty in population. And it makes the plan prediction more difficult.

Figure 9 shows the GDP Growth rate in these three cities, and if we analyze it together with the spatial evolution of different cities, we could find that economy is the main driver force for these three cities. But the strength of driver force on spatial evolution has big difference, for example, the effect on Yulin is much strength than Ankang. Economy development is important force to shape the city's expansion. One the one hand, economic development provides more employment opportunity and spatial demand. Furthermore it results in population migration. One the other hand the construction of industry areas needs land in itself.

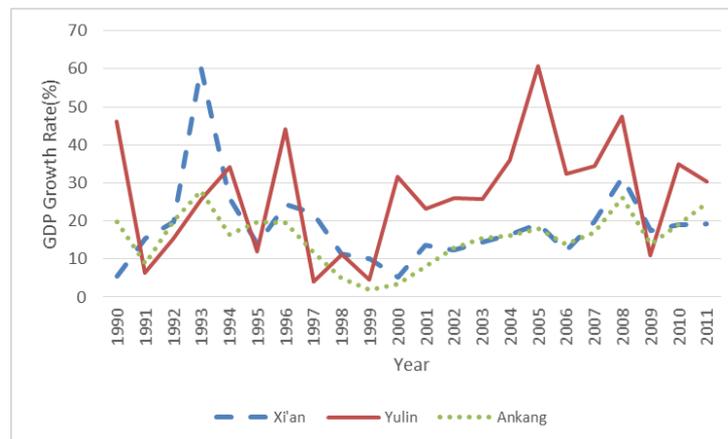

Figure 9 the GDP Growth rate in Yulin, Xi'an and Ankang

7. Conclusion

From the analysis above, we can draw the following conclusion.

[1] The features of dense populated in central Shaanxi and sparse in the North and South Shaanxi become more striking.

[2] The number of migration population is large in Shaanxi, and the trend that the population from rural to urban area, and from less developed areas to economically invigorating regions and big cities is more prominent.

[3] The central Shaanxi has been experiencing the increase of permanent residents. Especially, the mega city-Xi'an- has been experiencing a large number of permanent residents increase from every municipal regions throughout Shaanxi and other regions in Northeast China over the past several decades. For Northern and Southern Shaanxi, the population migration has complex characteristics.

[4] Migration in these regions means something more than that move from one place to another with registration as resident population, and it also means staying in other places without registration as resident population. The diverse migration models result in several migration flows and different urbanization model in different regions,

[5] The gap between the household registration population and permanent residents results in different effectiveness of planning practices, especially, to spatial development and layout because of the uncertainty in population. And it makes the plan prediction more difficult.

[6] Different migrations models call for new ways of thinking and new models of planning practice

AFRICA. FROM SHOULD TO COULD

New model of planning practice required addressing the increase in migrations. How to integrate informal mechanisms into the urban management of the African culture. (The uncontrolled independence of Peter Pan's shadow)

Metropolitan management methodologies confronting new challenges: shaping rapid growth in a context of informality, scarcity and misgovernment.

Metropolitan architecture methodologies facing the new urban paradigm of the *non optimal city*. The term *post-optimal city* is used to recall a post-functionalist dimension of the unfolding (new) size, scale and technology in the city.

Theme: the research involves the transformation of the settlements, which are at the fringed edge of the metropolis (Dar es Salaam in this case), constantly changing, due to the fact that a huge number of migrants come there from the countryside, and characterized by a variable degree of informality. The area project falls within a new typology of formal-informal interface that we want develop as a gradient of formality. We present a study of a way to regulate the growth: an evolution in scale. We applied the Reticular Matrix Model System that is a development model rather than a formal model. It's a study of a design method that allows us to describe and design urban phenomena related to the change of scale, which determines the mutation of types of morphologies of urban spaces and landscapes.

The research question: We started the Dar Es Salaam New Centralities analysis with a statement: the need for a cultural "jump" should identify a range of new elements and relations among elements in the urban context, rather than simply upgrade the instruments of intervention and investigation. So we are speaking about the need of a methodological indication for the development of a new settlement. Our vision may envisage a sustainable relation between green and grey infrastructure, when green is intended as the hydro-geological system of the territory. A strong economic attractor related to the infrastructure system should therefore foster the reversal of spontaneous settlements back into legality, providing them with services that could improve the sustainable level of the entire city.

Methodological outlines: The project area is a point between different landscapes and represents strong metropolitan dynamics, which re-connect sides through the design of the areas of transition. If we focus on the urban realm we must understand how to integrate, into the urban management of the African culture, the informal/illegal mechanisms of the migrants

to occupy and build the agricultural areas. It is necessary to integrate scales, disciplines and governance in the physical urban management. We promote a substantial change in the urban/rural relation. A formality-gradient type, able to capitalize on its city-centre proximity its advanced services, will be determined especially in relation to new mobility structures. Such strategic device, conceived through the analysis of the anthropological signs found into the informal city fabric rules of construction, should also be able to communicate with the agricultural landscape that not only has the potential to provide products for consumption and sale to local communities (urban agriculture), but also becomes an element of urban regeneration. The informal areas quality of life consists in cultural identity, social solidarity, which are factors of productivity and efficiency of the society as a whole. The approach is no longer to prosecute and illegitimize informality. It is a real change of paradigm. Informal settlements are like 'informal' numbers, as our approach to formality will go. If we follow the analogy, even if they imaginary numbers 'do not exist' they are extremely relevant in mathematics and physics to understand a series of phenomena and to be able to efficiently deal with them. Understanding and incorporating the 'imaginary' informal to the general development theory will help in great manner to economy development, social integration, urban sustainability and governance equilibrium, and to understand and deal with the 'formal' numbers.

Outcomes: Urban informal-formal integration. We present a study of a way to regulate the growth: an evolution in scale. It's a study of a design method that allows us to describe and design urban phenomena related to the change of scale, that determines the mutation of types of morphologies of urban spaces and landscapes. The Green and Grey infrastructures, Housing areas, Social urban centralities and Productive areas can be design as a Pattern Language mechanism of urban growth in a context of an Urban Design Guide. This will provide a framework for the formal-informal dialogue. The challenge, then, is not only for Planning and project Design. It is in the metropolitan architecture management side also. Though Planning and Design must be made with Metropolitan Architecture Management capacities in mind. That would be essential for an effective Planning and Designing. They are part of the same process and coordination is the means for success.

A discussion on relationship between migration, informality and the inability of governance structures to manage the phenomenon

The world will become far more urban in the next 30 to 40 years than it is now: 2 billion people will move to cities. However, this urban growth is only partially explained by rural-urban migration, but increasingly by natural urban population growth. William Cobbett (2008) highlights that the public authority doesn't know how many people live in the slums or illegal settlements, has no idea where they came from, has no knowledge of their needs. Manal El-Batran and Christian Arandel (1998) argued that most visible informal settlement on the periphery of Cairo has developed mostly on private agricultural land and, less frequently, on publicly owned desert land.

So we could say that the spontaneous urbanization occurs because of the fact that vacant formal housing units are not affordable to most urban dwellers, which are new in-urbanized citizens (very poor indeed) from one side. From the other side, nevertheless, the cities of the developing countries are not able to respond adequately to the challenges posed by a new bourgeois population growth, to their need for new infrastructure, to the provision of grossly inadequate housing and to the lack of basic urban services.

This fact leads to the proliferation of slums, a growing number of urban poor and a general deterioration in the quality of life in urban centres, but to the illegal settlements also. For a growing number of these cities, the poor planning has remained the main obstacle for the sustainable growth and the development of healthy living environments, where the prospect of an adequate life and production continues to elude especially the urban poor. According to

Cobbet, we can look at it as social insensitivity; some people look at it as private sector entrepreneurial behaviour. In fact, these are how settlements developed, very often outside of the administrative boundary, so that the local authority might not see these informal developments as its problem. The local government often provide inferior services and very often the authority acts with urgent projects as a short-term solution: urgent but not important projects into a *long duree*. Cobbet argued that the danger becomes because the informal settlement of today becomes the ghetto of tomorrow. The first choice, Cobbet said, is that the informal area will be accepted, upgraded, eventually becoming a suburb and a long-term part of the city. The second choice for the public authority is to ignore the informal settlement, fight it, and let it become a slum or an illegal settlement, very well rooted on the ground and sometimes into a corrupt system of governance, in which the entire city faces a decreasing of energies until the cultural one cause inside it's not possible to take a "social elevator" to change the own social position.

The post-optimal city era.

The coherence between formal settlement and the illegal one: ecologies of the metropolitan forms for the culture of a local identity open to the global integrative or hospitable

In his volume *The ecological thought* (1988), Edgard Morin introduced the concept of Ecology of the form, not only related to parameters of efficiency or effectiveness from the technical or economic point of view, but as a fundamental constituent of the organization of the life processes and structures. This is why, regarding the city and the architecture complex contexts, we prefer to speak about *ecologies of the forms*. Our study, in fact, concerns the foundation of the generative processes of the metropolitan architecture forms, which today are a mixture of legal and illegal elements, to overcome an only technological approach. The first act of the project, then, is the detection of the elements that make up the complex context of the metropolitan city scale, in order to determine the relationship with the generative process that is not only a material device, but a cultural one, tied to the physical forms of the space: is the meaning of the question that sets the result. The process, for us, is morphogenetic and only after the techniques intervene.

The aims, then, are the socio-economic development of the territories, through metropolitan relations into the new metropolitan space system (Ortiz, 2013), the creation of innovative processes of integration, compliance with qualitative / quantitative standards for an infrastructural revival, also through the development of new sources of renewable energy and intermodal transport.

A sustainable growth, in fact, that provides an increase in demand of space with a low environmental impact, requires new interpretation and planning tools and project. It is necessary, however, to rethink the network of energy-production, distribution and location-self-sustaining for new settlements, such as an integrated system of local identity and global inclusion, between rural and urban economy, the energy expenditure reduction and conversion: food and sustainable energy for the urban metabolism as a project to support the integration between town and its territory, through the redefinition of the physical issue of new urban settlements and their architecture.

Our research concerns the definition of a cosmopolitan globalization, that does not negate the places, rather then strengthens them, elevating them through a leap in scale: enhances ancient positions and creates new ones; leaves the other decaying, making them to be born as symbolic mediators (sustainable heritage). The new metropolitan architectural individuality, thus, are related to their position, but re-read at a different metropolitan scale.

A metropolitan architectural identity, not static and understood as a dynamic process, is determined, then, as a link between the different scales. This process tends to make similar

the people that have the same values. They are represented with the same gestures, which trace into the ground the signs of the work of the man who transform his territory. Only referring to shared values it is possible to integrate or host different migrant nationalities, without determining their marginalization.

Our research, therefore, aims at defining how, in the growing medium and small cities, is possible to balance both the macro / micro-economic factors and the spatial structure of the cities within the cultural ones: the background shape that consists of residential areas, public spaces and landscapes.

We discuss the relationship between the new settlement, activities and physical space and how this relationship is differently formed in different cultures and how different activities determine the needs of movement, the new settlement with its gradients of formalities and co-presence with the existing assets. Finally, we need to determine the way in which the models of integration between infrastructure and physical space influence the location of the various settlements, classes and social groups into the city, to resolve the pathology of the settlements and the public sphere.

Due to the fact that the spatial form must be understood as a key factor that helps to set up models of sustainable urban metabolism, of integration or vice versa of segregation into the city, the starting point of this work arises from the need to define the contemporary city within its territory, through a clarification of a new metropolitan scale of intervention, thereby addressing:

- a. economic and social aspects
- b. institutional aspects
- c. social consensus
- d. local and global sustainability values and their influence on the concept of citizenship

Conclusively, the framework of our research coincides with the formal and structural dimensions of urban scale linked together the metropolitan scale. The need of a cultural "jump", then, should identify a number of new elements and relationships in the metropolitan context, rather than simply update the tools of intervention and investigation. For this reason, we refer our research to the Reticular Matrix methodology (Ortiz, 2013). This means a better definition of the structural model, the backbone of this reality, to show the presence of some gaps in urban development and cultural awareness of such phenomena.

If, as a matter of fact, a strong economic attractor related to the infrastructural system should foster the reversal of spontaneous settlements back into legality, providing them with services that could improve the sustainable level of the entire city, nevertheless as a matter of concern, according to the European tradition related to the studies for the transformation of Frankfurt (1928) and the re-integration of one million of inhabitants in Berlin into self-sufficient Siedlungen (1932) , or the realization of the Italian "Città di Fondazione" (1933) that were inspired by the plan for the Tennessee Valley Authority, we think it is helpful to draw a consistent attempt to exceed the only hygienical and welfare targets that continue to characterize the interventions for the informal neighbourhoods of the cities in the developing world, towards a productive revolution that could be triggered into the heart of the metropolis from a project of true integration between green and grey infrastructure and new urban gradient of formalities: therefore able to integrate the urban agriculture, within the new typological concept.

The development paradigm for a formal / informal integration into the metropolitan city scale

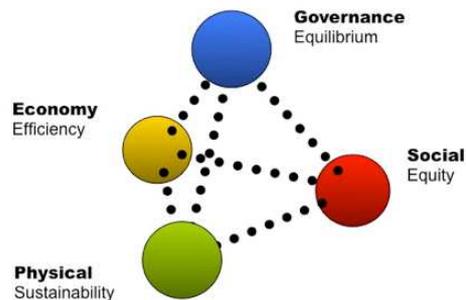

Figure 1: Tripod Development Paradigm. *Components and Objectives*

Development policies have to address three sets of components: Social, Economic and Physical, under the intervention of the fourth one, Governance. Each component has a clear objective: Economics' objective is Efficiency, Social one is Equity, Physical (Environmental) is Sustainability. These components are in conflict. Economic efficiency requires concentration to benefit from the 'economies of scale' phenomena, but Social equity requires dispersion to provide quality of life to the most marginal population. Economic and urban developments require resources and infringe in the limited environmental assets. Many other conflicts as share of consumption goods and access to health or education are as well part of the development formula. All those conflicts have to be solved by Governance. There is not a technical objective formula to solve them. It is Governance that plays that role and the objective of Governance is equilibrium among the objectives to achieve the necessary dynamic balance for development. This is the basic rule applied in developed societies and can take the mnemotechnic analogy of a Carbon Atom or a three legged stool, a tripod. The tripod analogy expresses rather better than the Carbon Atom the fact that it is Governance the component that has to control the equilibrium between the other three. It is the seat that holds together the three legs, as Governance does.

1. The Sub-components of the paradigm

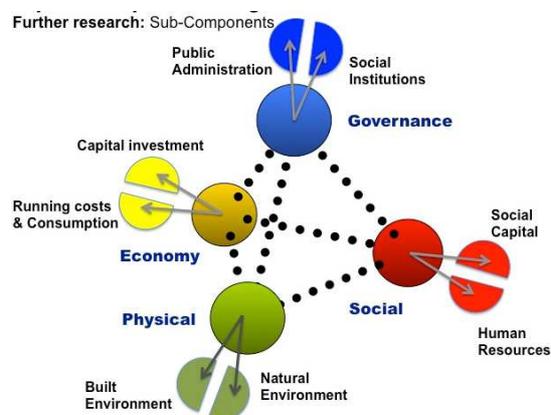

Figure 2: Tripod Development Paradigm. *Further research: sub-components*

Each component is a discipline on its own. It cannot be oversimplified. Nevertheless for the purpose of practical development policies decision-making we can discern among the many subcomponents of each discipline the ones, the dichotomies, especially relevant for Metropolitan Management and Planning. The following subcomponent set is open to debate but as we are going to see in the following discussion of the paper it allows for some analytical approach to the issues concerned and the capacity to arrive to some conclusions and make some proposals. It is this frame of mind, and the knowledge that further research should be undertaken that we present the following scheme.

The Subcomponents are:

a. Social

- Human Resources: The accumulation of knowledge from the population.
- Social Capital: The capacity of that population to have a multiplier effect out of that knowledge. The capacity to work together for a common purpose.

These two subcomponents of Social have been used and applied by the European Union to evaluate development proposals for more than ten years already.

b. Physical

- Natural Environment: The natural assets that require not only to be protected but also to be enhanced and augmented by compensatory and investment policies.
- Built Environment: the Urban or interurban capital is a physical asset that has to be adequately invested and maintained. It is as well a Cultural asset that feeds the Social Capital subcomponent increasing the strength and resilience of a society.

c. Governance

- Public Administration: The most obviously relevant aspect of Governance is Government: Public Administration. As the Dichotomy between Social equity and economic efficiency cannot be technically solved and only equilibrium might be reached through political decisions.
- Social Institutions: Social institutions are essential to complement government policies and to control, if necessary government doings. They are essential for a strong and dialoguing society, but have to be equilibrated to avoid the weight of any in lobbying the Government in policies that do not pursue the General Interest.

d. Economic

- Capitalization: There might be numerous ways of analyzing the basic components of an economic system.
- Consumption: Running costs both for a firm or for a population (consumption) is essential as it reduces the investment accumulation and thus the development speed.

2. The 'developing' actual context

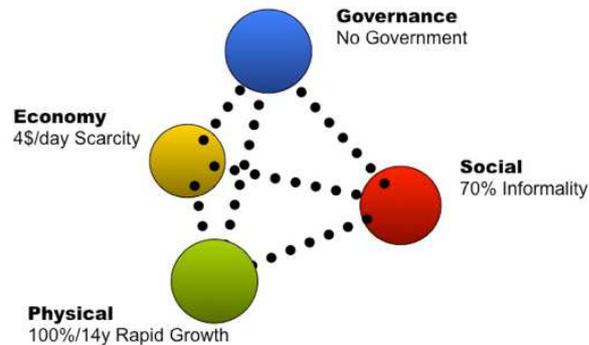

Figure 3: Tripod Development Paradigm. *Developing Challenge*

We have analyzed the paradigm of development for developed societies. Developed planning systems do have full-fledged instruments to act on these components and achieve (or approximate) the desired objectives: Economic efficiency, Social equity, and Physical sustainability in a framework of a Governance policy for equilibrium.

Such is not the case in developing societies. In developing societies the context is different:

- Social: The context of the Social structure is mainly informality: Sometimes as much as 70% or 80%
- Economic: The context of Economic activity is scarcity both in the private but mainly in the public sector: Municipal budgets for infrastructures investments might be 60 times smaller in medium income economies and 3.600 times smaller in low income economies (1 day investment equivalent to 10 years)
- Physical: The context of Physical challenge is an explosive growth with no respect to natural assets: Often they are under pressure of an annual 5% growth. That means 100% every 14 years. Twofold growth every 14 years
- Government is more of a formal figure with little capacity (or willingness) to implement policies that will improve the situation if it is not their own situation: You can Plan and manage when Government is deficient (as we might agree for many developed societies), but it is rather difficult when the Government is practically inexistent and mostly works for its perpetuation rather than to service the population is meant to.

What should be done

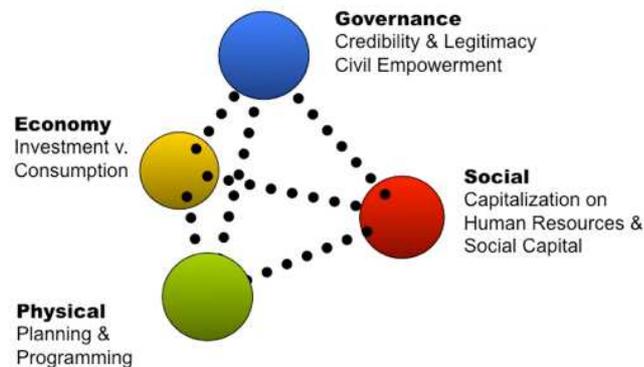

Figure 4: Tripod Development Paradigm. *What should be done*

The objectives of a policy for development should be bridging the gap between the actual situation and the development paradigm. En terms of each component that is:

- a. In Economic policies: To control the share of investment and consumption. To increase at most the proportion fixed capital investment as a base to promote and sustain a competitive economy. Sometimes in low-income countries the level of sacrifice required to achieve a fair share between investment and consumption might not be acceptable.
- b. In Social polices: Investing in human resources. Providing the population with knowledge needed for development on specific strategic sectors with country's economic future in view. Foster a system of social values based on attitudes of work ethics, collaboration, fair behavior, win-win approach, respect, dialogue, etc.: the set of values that make possible developed societies to be efficient against societies of opportunism, abuse and privileges. To move from societies were cheating is praised to societies were retribution for efforts admired values of societies with strong social capital. Values of 'to Do' and not 'to Be'; meritocracy instead of clienteles; deserved benefits instead of inherited privileges.
- c. In Physical policies: A clear definition by plans and programs of protection and enhancement of natural assets. A definition of urban public spatial components, with a set of regulations controlling negative externalities from the private sector and fostering positive ones. Defining components of a sustainable urban environment and instruments capable to enforce them.

- d. In Governance: To build up an Administration based in credibility (achievements corresponding to promises) and legitimacy (objectives according to ethics and procedures according to law). An administration that fosters and collaborates with semi-public Social Institutions. Achieving involvement and participation of the private sector in institutions that will collaborate with the administration in the definition of policies and the joint effort of implementing them. At the same time institutions that will be elements of stability and social resilience when confronted with and administration that needs to be addressed and possibly reminded it is departing from correct policies. A strong social institutional network with social participation and public involvement is the best guarantee for a long lasting stable and strategic vision.

3. Why it cannot be done

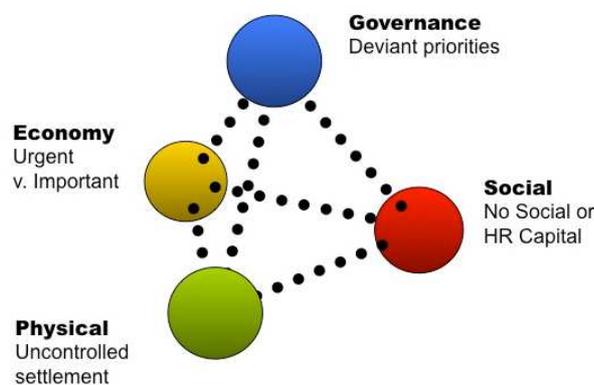

Figure 5: Tripod Development Paradigm. *Why cannot be done*

These objectives however are not possible to achieve in the actual circumstances. That was what should be done. But it will not be done, because:

- Economic policies are not based in a long-term vision of capitalization of the urban structures.
- Human resources take a long time to grow and accumulate. Education is costly. Results are seen in timespans longer than the expectancy life of the politician that has to take the decision and commit his budget to it.

Social capital is even more difficult to build. Society values are resilient and have long inertia. Often entangled with local culture and social patterns that are identified as cultural values. Not only there is a natural inertia and resistance to improvement, there is as well an ideological excuse to resist. (i.e.: Gender)

- Physical models require a consensus (Pattern) and an explicit proposal (Plan) that everyone formally or informally follows and implements. The Administration is unable to implement and make effective anything on a context with 70% informal sector. On top of that cultural patterns have been destroyed by an unresolved hybridization between the modern and the traditional cultures. Processes seem to be following the worst of both worlds.
- Administration-Governance is an empty shell. Posts are filled with people with social merits (tribal network) but no managerial capacity. Many Administrations are residual

colonial structures where jobs are filled up as political or social reward. No specific performance required. Public budget is either meager as there is no fiscal base to build a taxing system. Sometimes though it becomes substantial when fed by the income from extracting industries (Oil, Gas, Minerals, etc.). When meager it provides just for the self-sustainment of the Administration salaries and expenses with no effect on real world or civil society. When fed by extractive incomes it is used to secure electoral loyalty, often ethnically related, in unstable tribal compromises. No fixed capital (i.e.: infrastructures) accumulation is achieved; just income is spread around for consumption.

- If the country has relevant resources the economic groups and multinational firms that benefit from these resources will take active part in ensuring that the flow resources goes on.
- If the country has no relevant resources the multilateral agencies will intervene only when violence explodes and can affect donors domestic politics.

4. What could be done

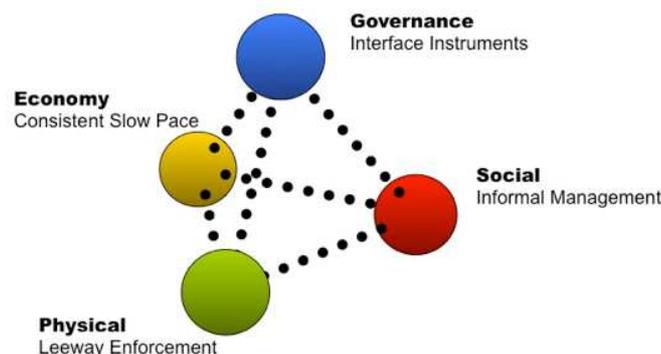

Figure 6: Tripod Development Paradigm. *What could be done*

What can be done has to be adapted to the very limited scope of action the circumstances allow. It has to be achieved with a long-term vision, but with a short-term attitude of patience: in the mood of the waiting for improvement of conditions rather than a mood of purposeful policy implementation to produce development. A policy avoiding bottle-necks that will definitively prevent development rather than a full fledge policy that will attain the forecasted development in a time frame as a result of adequate policies. **Preventive rather than proactive.**

Action policies might focus in four adaptation of the Development Paradigm:

- Incrementalist investment approach,
 - Adequate intermediate action scale,
 - Time-preventive policies, and
 - Social interface mechanisms.
- a. Urban fixed **Capital investment** is not possible. The public capital to make investments in indivisible public goods is just not there. The private capital for divisible goods lacks potential demand to respond to those services. (i.e.: Transport) In best of cases some

flow of public capital can be detected. Should rather be described as 'dripping' than 'flow'. Dripping can be directed to priorities, but the dichotomy among economic and social priorities is difficult and painful to resolve. Investment efforts are very difficult to prioritize when subsistence levels require social **consumption** to avoid, non-metaphorical, death. We can only wait. Wait for conditions to change. Meanwhile keep public spaces consistent and prepared to house those investments whenever they will occur in the future. When the dripping occurs the approach should incorporate an incrementalist method. Benchmark models should not be applied. If generalized the capital will be unreliable and the project will remain incomplete and ineffective. If specific they will not be replicated and will remain exogenous to the system. The approach has to be incrementalist. In a domestic analogy, instead of aiming for 'indoor closets', ideal and unattainable, the approach has to be '**hangers in the wall**' with an accumulative mechanism.

- b. **Social** Informality is the norm. We have to learn to interact with it. Impossible to 'control' from the formal sector (Administration). That might be for the best if we account for the proceedings and performance of the Administration.

Informality is an asset. It is 70% of economy activity, urban development or social governance. No country can underuse 70% of its assets for development; **we will have to learn how to interact with it for the best of both worlds.** Formal and informal are oil and water. Formal structures cannot accept informal ones as they put at risk the formal structure reducing its credibility for implementation and reducing its legitimacy. The Police-Justice system cannot accept petty crime, even if it cannot control it, because it will delegitimize the rest of its proceedings. Interaction takes place in denied obscure proceedings.

Interface has to be resolved in a more efficient way that will understand the needs of the informal sector and requirements of the formal one. Civil Society Institutions can be the interface. NGO's are a good example. They can relate formally to the Administration, they can adapt to the informal sector. NGO's are often seen as enemies by the Governance formal sector, the Administration, as they reach and succeed where the Administration doesn't. The administrators and managers of the formal sector see NGO's as proof of their own inability. They often antagonize, as the NGO's become platforms of expression of the unresolved needs of the informal sector by the formal one. The formal sector, the Administration, should understand that it is within the DNA of the formal sector system the incapacity to address informal sector. They should understand that the NGO's are instruments at their service to improve their performance. Final distribution of utilities and goods (water, electricity, sewage, waste, etc) can be managed by these interface mechanisms between the formal and informal sectors. Police knows very well how to deal with informal Governance mechanisms to keep the petty crime at bay, in the knowledge that it cannot be eradicated. Similar example can be shown for the Economic, Social and Physical sector as the one used for Governance.

We have given the NGO's example. It is not the sole one. In Nigeria it is traditional tribal patterns of social interaction (Kings, chiefs and tribal settings) that semi-formally interact (legally accepted and accounted for) with the formal democratic institutions. Research in these field exploring alternatives as to be undertaken.

- c. **Physical:** Administration has little capacity for implementation of any proactive urban-physical policy: No budget, no governance, and no instruments. The attitude can only be the one of minimizing damages rather than maximizing unachievable benefits. In absence of infrastructures we can only wait for them. And in the waiting prepare the space to hose them when they will be possible to build. **We can define the basic urban structure and prevent the encroaching of the public spaces required for a full development by protecting leeway.** If the urban structure is right, the infrastructures and urban services will come sooner or later and they will be adequately laid out. It the

urban structure is not in place the development will have a slum pattern and the cost of upgrading it will be threefold in the future. If the definition of public space is complemented with some sort of private lot pattern the result will be optimum. But even though this proves impossible plot standardization in the future will come, with time and effort, as a requirement of the private sector for its own economic improvement. Building regulations will be impossible to implement. No attempt should be made, as it would be effort consuming with inappreciable results. The time will come for substitution of the informal construction and the regulations will then be enforceable. Time to be measured in decades, or even centuries, but cities are there to stay, as slums would, if we are unable to prevent them. **Public space definition and protection becomes the main focus of what can be done.** Requires definition and divulgation by simple standards and policing with simple mechanisms. It is within the scope of the limited Administration capacities.

- d. **Governance provision: Scale** of interaction is mostly **1:500**. Large scales have to be formal. You cannot build up a national or metropolitan energy network in an informal way. You cannot build informal train services or informal highways systems. It has to be formal. The **1:500.000** or **50.000** scales are formal. **The informal is small scale.** It is the single individual or the small community that act informally. Accumulation of those small units can have enormous effects but the grain of performance remains small. The scale of the informal is 1:50. The household. We have the urban (**1:5.000**) or the neighbor (**1:500**) scales for the formal/informal interaction. The development objective should be to formalize the urban scale as much as possible. **To structure the urban informal expansion patterns into an upper grade biological system.** Provide elements, features and structures of upper grade biological systems to that primitive and resilient expansion. **The interface between the formal and informal should then take place at the neighborhood scale, 1:500.** The neighborhood community either using traditional management patterns like traditional tribe structures in Nigeria or interface instruments like NGO's in many places. Both can produce the interface dialogue between the upper formal scales and the informal one.

5. The *post-optimal city* Era. A methodology to describe and interpret the territorial basic matrix: reaching the rules of the informal settlement

According with Manal El-Batran and Christian Arandel "Among the most visible manifestations of the challenges posed by rapid urbanization are the informal settlements on the periphery and the first of these paradoxes is explained by the fact that vacant formal housing units are not affordable to most urban dwellers. The second is explained by the efficiency of the informal housing sector: those owning or developing private agricultural land have been better able to respond to market demand than the government authorities which controlled the desert land".

We are speaking about a **city that is beyond the optimistic idea of an "optimal city": formal and informal/illegal settlement of the city, as the shadow for Peter Pan, have to be considered to work together: we have to understand the slum economy and its linkages with the spatial issues;** so, the possible integration, from the spatial point of view, of the two parts of the same city. **Both the affordances of the formal and informal settlement have to be considerate as fundamental for the metropolitan scale operation,** that is:

*production of space

*situated practices

*everyday life

*time

*communication / networking

From the Pedro Ortiz point of view the urban (1:5.000) or the neighbor (1:500) scales are the dimensions for the formal/informal interaction, and indeed the development objective should be to formalize the urban scale as much as possible. So the Urban Design and Architectural fault is to structure the informal expansion patterns into an upper grade biological system, and in particular to provide elements, features and structures of upper grade biological systems to that primitive and resilient illegal expansion.

For that, our project is dealing mostly with the interface between the formal and informal matter that should then take place at the neighborhood scale, 1:500. For the project of the city related to the development paradigm outlined by Pedro Ortiz, there is a problem of governance and economic, but also the question deals with the location and the shape of the new settlements with respect to the role that they have to fulfill within the metropolitan body.

The object of our study concerns the way of the mutual adaptation of the formal and informal spatial and practices **to give shape to the area of contact or buffer zone that determines an architecture of boundary objects**. That paper wants to report a methodological approach to describe and interpret the territorial basic matrix, to shape a conceptual/physical terminology specified by definitions for reaching the rules of the informal settlement. All that, to be able to upgrading and to blend it with the formal one.

From the point of view of architectural and urban design, in order to deal with the theme of what does it means the “right development paradigm for the integration of the formal and informal settlements in the metropolitan cities”, we must consider three basic elements: the time, the scales of intervention and the models.

a. The Time

The right development paradigm is the one in which the development is feasible in the short and long term, and in which, therefore, the development between the two times is compatible, without having to delete one of these.

b. The Urban Scales

They are mainly two, the one related to a metropolitan scale model and the one that connotes a model of urban scale.

c. The Models

There are two models: a model of sustainability, which determines the indexes of quality to be respected, and a model of metropolitan city (Ortiz), which determines the rules for the possible presence of new metropolitan quantities.

The Issues

From these three basic data the issues we face are diverse and include:

- * the time which is peculiar to each model of development
- * the size that is optimal for each model of development
- * the sustenance of the residents and local economies
- * the local elements which in the transformation NOT to break not to destroy a sustainability that they have attained in any case
- * the local elements which in the transformation must be strengthened so that the inhabitants can participate and share their growth movement

- * the places of interchange and of densification within which to introduce the development

The Aim

The main objectives that we set deal with the possibility to explore an evolution of the local model of urbanity, but also, where it's possible, the opportunity for a growth of the local model through a transformation that we can define possible because it's realistic to consider that for the regional and local models.

The tools

The description and the interpretation of the new phenomena of metropolitan urbanization need the setting of a new mapping-project: that is going to be an hybrid mapping, a new mechanism of *re-territorialization* and care of the land, which can determine the processes of an identity formation. The projects carried out in the Laboratory of Measure and Scale of the Contemporary City of the Politecnico di Milano come from the study of the geography (geographic point of support, Febvre), interpreted as a layer of the earth that determines the characters able to structure the process of regionalization along history (psychological landscape of art / urban biography, Focillon): hence, the changes of territorial hierarchies, the structure of poles and networks, which are considered as the basis for the contemporary patterns of landscape (land + landscape).

These are transmitted to people through maps, which today are more properly hypertexts and are routed through the new technologies; we interpret them as deposits of information. In order to realize them, we use some methods of representation that are based on processes of narration and deal with topics like the testimony, history, data, diagrams, traditional or interactive maps. These may also be processed by users, which can increase, by themselves, the power of data. **These maps show a *landscape DATA*** (Bottazzi).

For the project, then, thanks to specific computational tools, it's possible to build a series of topological models, which describe and connect the main mechanisms able to generate the built space, by simulating the changing-reality from which it is possible to obtain, through a critical reading of the pre-configured scenarios, both previsions and models of sustainable development, which are strongly linked to the specific physical and cultural context.

The Premises

According to Chiara Brambilla, although places are often seen as physically and temporally stable data - in this way giving the time a spatial fixity - their meanings are continuously constructed, de-constructed and re-constructed in the present. Places, therefore, are not only constantly interpreted, but are also inhabited by both structures of meaning that belong to the past, and by physical presences that are linked to different times and origins. Because of that, according to Durand Lasserre: "Despite numerous initiatives during the last decade in sub-Saharan Africa to set up new land information systems or to modernize existing ones, have been limited results achieved." It is essential to understand the regimes of local properties as well as the logic of the regularities of relations, in order to define which is the model of the market, accessibility and of institutions, and, finally, understand the rules that different colonization processes have carried and determined over a territory.

As a result, the analysis able to localize the two models should be "functional" for two different types of reality:

- * the existing reality, which would not stand the changes set by the time
- * the reality of metropolitan growth, which has to be precisely located

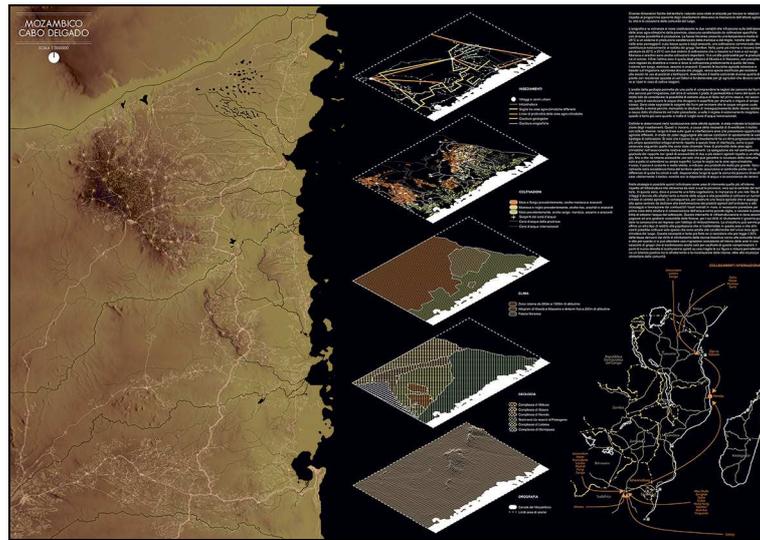

Figure 7: Mozambique. Orography, landscape, land use (Bovio, Musetta, Zammataro)

The Experimental Project

The sustainable design for an Urban Region finally will answer the questions of new metropolitan functions:

- _ Tourism (the desire to find again time dimensions of the past which are inconsistent today)
- _ Industry
- _ Agriculture

These will push into new migrations both the rural citizens and the ones coming from small and medium-sized cities, who will tend to settle down following the typical settlement-principles of their original cultures.

6. An hypothesis for the reading and the interpretation of the African sub-Saharan settlements

The projects that we have realized insist in areas both of transition between formal and informal and between informal settlements and countryside. The goal related to the proposed settlement-principle, is to generate between the two cities, both legal and illegal, a spread molecular system of services: in other words, to build a reinforcement of welfare through the construction of a demand (which is a cultural action) able to solicit a widespread offer of services for the citizen, signalized by a strong image of the institution and the public space. The administration who owns a Vision, must, to one side, accept (negotiate, be complicit with?) a temporary illegality which is able to provide collective services to citizens, but, on the other side, always, and firmly, reject an illegality exclusively for private purposes.

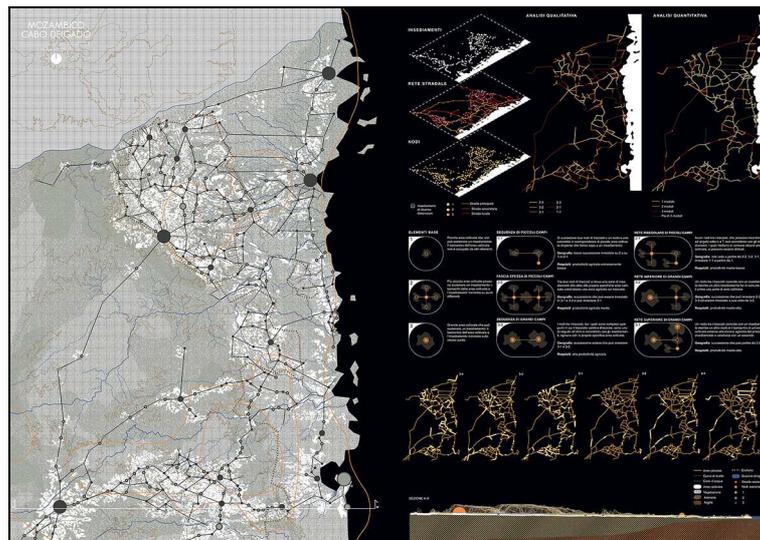

Figure 8: Mozambique. Settlements – villages/fields – parametric studies (Zammataro)

The Method

In order to design inside the “informal” tissue of sub-Saharan countries and, as a consequence, to develop services within its perimeter and, especially, in the buffer areas close to the legal city, we are experimenting a method of analysis, which is taking inspiration from the work of some Italian authors who codified the method for performing operations of morpho-typological interpretations; these are firstly the result of a “spontaneous consciousness” within a population, and later allow the construction of a typical figure of the territory through a robust and resilient image.

The first step deals with the identification of the primary territorial type -defined as “concept of territory” by Caniggia-, which every human-being, according to a specific Place and Time, assumes. This is a concept related to a consciousness of the territory, which is spontaneous and framed by:

- 1) a way to cross the territory
- 2) a way to choose the place for settle down
- 3) a way to locate the production activities
- 4) a way to locate a node-system, suitable for setting a trade/exchange area: the relation and meeting area

The importance of this issue is evident, yet is a concept that includes a dimensional entity (amount of territory) where the human-being carries his life, no matter the historical period. The primary Territorial Type is determined by the relations between the *podere (fundus)* and the pasture, so it is not exclusively related to a set of relations, but rather invests intersomatic relations between human-being and environment.

The concept of the robust-Image is directly connected to the act of seeing, which is typically something related to the Landscape, here interpreted -from his Latin meaning- as a Total-built-Landscape/Total-Landscape-made-Visible. In this case, Caniggia finds essential the

presence of a *Promontory*, i.e. a high point where is possible to look at the new physical territorial dimension of the Primary Territorial Type after its leap in scale. As a consequence, only if we look at it in its totality we could understand landscape through a mental image – originated therefore from consciousness-, and only after this it's later possible to conceptualize and design it. When both the territory and the relations we'll be grown, we'll then need a *Promontory of the Promontories*, urgency of territory, from which be able to understand in a unity the bunch of relations between the *podere (fundus)* and the pasture. This is a trade/exchange area, where the local characters, languages and behavioral codes meet the global ones, where the primary Type faces a leap in scale. There's no need to underline the importance of these "hinge points", above all if we consider their possible value within informal settlements, which are generally considered self-reflected and not-opened to external influences. The exchange process should indeed be coming from both directions, from informal to formal and vice versa: it's therefore important to set up the reasons why that should happen.

Because of the fact that the act of settle down in the Valley (*Geddes*, 1919) is for the human-being constant in time, according to the morpho-typological theory we can say that starting from the idea of Territory-Matrix (primary Territorial Type), we come then to the concept of typological process of the territory: human-being's experience within it dilates itself till understanding the consciousness of a system of sizes, which perform as metropolitan and invest the so-called agriculture-urban area. By dealing with this idea of territory, which is elastic and not-stable, but part of a process, we are then able to identify a "cultural area", which includes all the ways the historical overlapping of events conceptualized, identified and designed the territory, above all the trade/exchange area (psychological places of the art – Focillon).

According to the classic morpho-typological studies, the interpretation of the territorial typological process is possible through a system of signs, tangible clues, which are related to a concept of Territory and show its structural changes in case of a leap in its scale. These signs are necessary for getting to this "morphological crash", they appear complementary and inclusive of the previous ones, and are all values left by past generations and obviously link to each other, from different scales. These may be signs related to both essential or marginal structures.

A so-called mature-Territory appears organized into scalar sizes. Even informal areas (Ard al Aliwa in Cairo or Istanbul Gecekonu, for example) may already be characterized by a cycle of consolidation (from temporary homes, to medium-rise-buildings, up to towers), which is full of artificiality and consequent artificiality (as Caniggia was forecasting) due to rapid land/settlement-changes, like in the case of artificial structures that are designed against the territory and therefore difficult to be assimilated by it. The recent phenomenon of climate change accelerates and multiplies the risks associated with these uncontrolled structures. If a renovation cycle from consolidation isn't yet the condition of the informal areas that we are here discussing (in particular the case studied in Dar es Salaam in Tanzania), it is quite certain that this territory will face a crisis of adjustment, which, according to Caniggia, often drives to a phenomenon of neo-Middle Ages or *Favelism*. This later implies that the city could structure itself only from small scale procedures, blocked into minimum existence-values

The Procedure

According to Massimo Della Rosa, in order to describe the basic territorial matrix, which determines the typical figure of the territory through figurative landscape unities, it's fundamental to map all the main topographical elements of the territory; these constitute the fundamental tenets under which determine the coordinates of the relations between the *podere (fundus)* and the pasture. These basic element, in fact, have been matched into a matrix able to describe the Scenarios of the figurative landscape unities, which compose the different Sets / Tones of the Landscape. (Fig. 9)

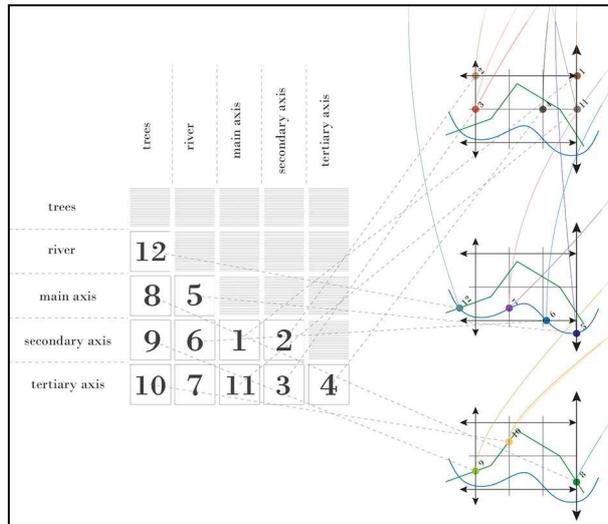

Figure 9: *Territorial Matrix*

The following step deals with the identification of the real, physical position -on the territory- of the previous elements (Fig. 10), so as to determine their anthropological meaning through their symbolic, or not, use-value.

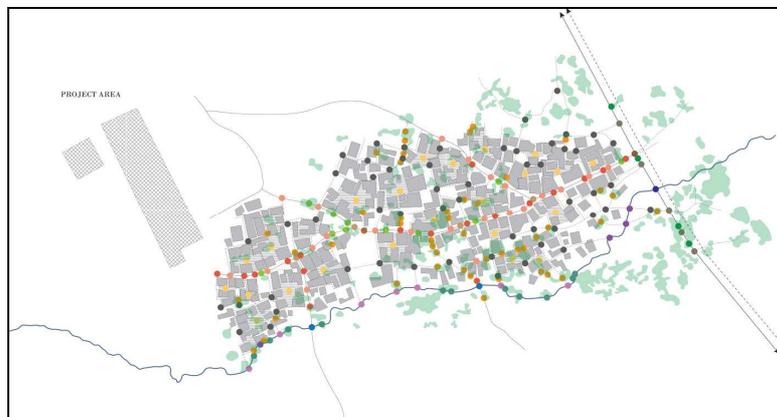

Figure 10: *Dar es Salaam, Tanzania: identification of the position of the topographical elements*

It's possible then (Fig. 11) to start with the analysis of the complexity produced by the leap in scale, determined by the transition from the relation between residential unity and its closest context, to the settlement to the environment, which brings to an upgrading of the anthropological meaning of the elementary Signs.

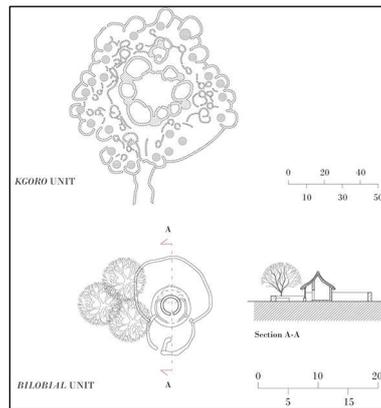

Figure 11: Molokwane, plan of house-type and settlement

The study of the elementary structure of the settlement, both of its image and its use, allows to clarify the conscious-process that determines a self-composition of the essential and complementary signs, which, in every scale reached by a settlement, define the use of a territory by a population (Fig. 12). It's thus possible to understand the quality of relations between the different elements; in fact, through the analysis of the hierarchies between the signs: structural, linked to the driving-areas and therefore consistent and durable, essential and complementary or marginal and fragile, we can identify the elements that set the weak images of the settlements, characterized by inconsistent dimensions that cannot survive the leap in scale.

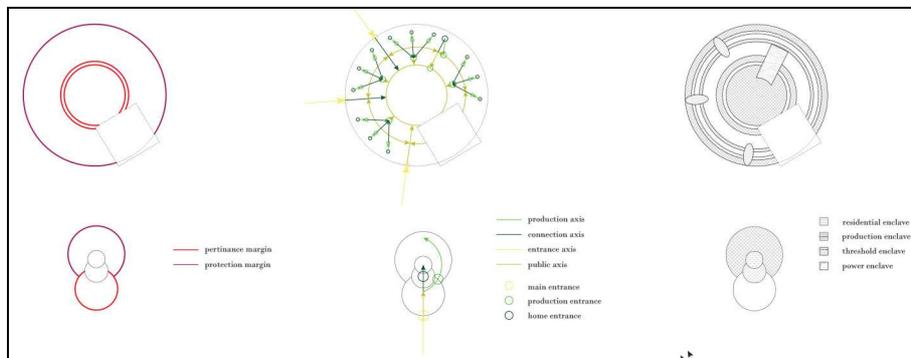

Figure 12: analysis of the use of the territory by local population

The settlement is then analyzed (Fig. 13) as:

- 1) quality of the perimeter (*finitio*)
- 2) internal relations: itinerary relations, spatial relations, land uses
- 3) enclave

Which are later specified as:

- 1) protection margin
pertinance margins
- 2) entrance axis
public axis
connection axis
production axis

The composition of these elements determines later the different areas of the settlement:

- 3) threshold enclave (limited entrance area, useful as protection spot of the settlement)
power enclave (area of the *Parade*)
residential enclave
production enclave (generally located in the central area of the settlement: *Central Cattle Pattern* type)

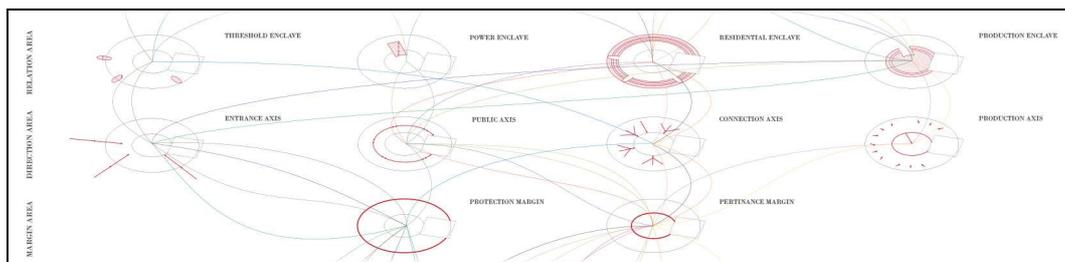

Figure 13: *structural signs that rule both the house-type and the settlement*

Each settlement, as the scale changes, modifies its range of influence towards the territory, that can be interpreted as an elastic entity (Fig. 14) and it's determined by:

- 1) a dynamic: it describes the way of crossing the land
- 2) a tonality: it's the meaningful feature of the act of living.
- 3) a frequency: it's the time-unit according to which an event occurs periodically; the described phenomena it's characterized by the same factors. The study of the frequency allows to identify the recurrent distances/measures between the axis of penetration, according to a typical rural settlement-type, which has a radius of 800m

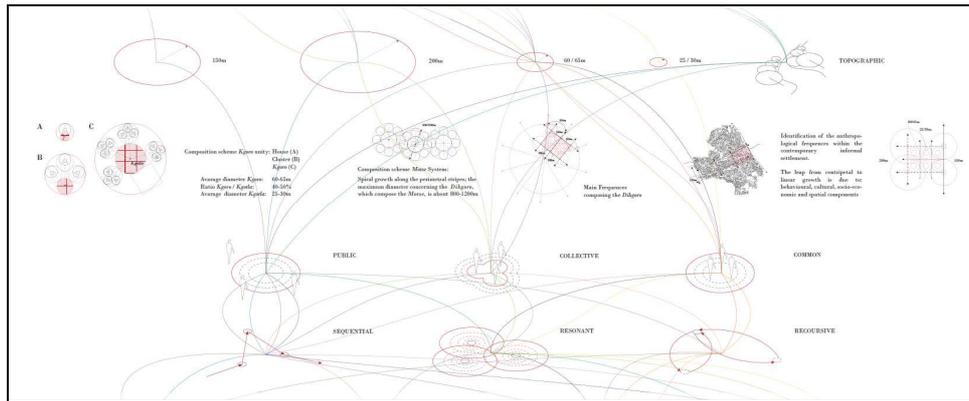

Figure 14: range of influences within the territory

Inside the new dimensional definition of the territory we should then determine the trade/exchange nodes (*Promontory of the Promontories*), which specify the areas of leap in scale where the different scales are simultaneous and include each other. According to Caniggia, this step is much more than dilate the metric dimension of the studied structures, as it implies also the simultaneous expansion of the qualities of the relations among the different observed objects. Each dimensional scale, asserts Caniggia, becomes a moment of understanding which is increased in scale; yet is possible to describe each scale through the identification of a singular point (the trade/exchange node), due to the fact that they are part of a continuous process of scale expansion, this moment, which is represented by the point itself, becomes an important phase of evolution of the informal settlement (Fig.15).

Figure 15: identification of the points

Conclusions

Within the context of rapid growing urban areas, one of the main phenomena turns out to be Informality, as a result of the processes of transmigration that produce a peripheral urbanization often solved without continuity with the existing fabric.

As a direct consequence, we assist to the birth of a line of discontinuity (threshold that brings a leap in scale), which separates the system of Palimpsest (urban center) from the one of Hypertext (periphery), physically bordering but not resonant.

The suburbs may then turn into urban belts of imbalance, places of informality, in which there's a lack of strategic planning useful for enriching of basic services and infrastructure the new urban spatiality. In many cases, in such areas, illegality transforms the area into a

loser and dried system, characterized by a need of profit -often alien to law- based on a pure exploitation of the environment.

The phenomenon of Informality appears therefore as a consequence of human/economical migration flows -from rural to the urban contexts-, something difficult to stop but in need of control.

Besides practical necessities, there's also a need to understand what informality is also in terms of its structural-features and rules, in order to operate in it respecting the Image of the Settlement, as a tool to contribute to the recognition of the environment and, as a consequence, to the resilience of the system.

Recommendation for planners particularly in regard to migration and its impact on informality

Metropolitan issues, as the ones we have addressed in this research, are of a new kind. The dimension, the scale, they have to be addressed are of a nature that never before the professionals and scholars have dealt with. It requires new disciplines and new approaches to confront them. Normal urban analysis, research or planning cannot address the issues. The structure and nature are different, either in economic, social, environmental or institutional terms. The metropolitan phenomena in Institutional terms does not involve, as in urban, mostly a single local authority (the municipality). It involves a multitude of municipalities and agencies. The process of governance is thus of a different nature. In Economic terms that large metropolies have for the first time a global network of economic relations and a productive capacity that overruns most of the time the majority of sovereign states with international recognition. In Environmental terms the footprint is unprecedented if compared with the urban impact and has to deal with completely different legal and technical tools. The dimension of inequity, persistent thought-out historical evolution, might find in size a new dimension.

All those elements make metropolitan issues a new phenomenon, which requires a new discipline, probably a new academic field of research away from traditional urbanism approaches and methodologies. This is what this paper pursues. In such way, from traditional urban values and attitudes as prevention of migration and formalizing of the informal sector, this paper presents an approach of accepting migration and metropolitan growths a phenomenon that is here to stay, and we have to deal with instead of turning a blind eye of denial. From turning a blind eye as well to an informal sector that is often 80% of the economy, sociology, institutional or urban components of those societies and as such most of its assets, to an attitude of collaboration and complementarity trying to find the ways to produce that dialogue. Formal/Informal interface research for a dialogue that has to be produced between very different procedural frameworks incompatible in principle. Interface in Physical-Environmental terms between the larger scales of national or metropolitan dimensions and the smaller ones of urban, local and domestic. Interface in Governance between the formalized institutions and the informality of local social networks.

This is the line of work this paper wants to follow/initiate and invites other professionals and scholars to pursue.

Abstract

In the context of social integration theory, the issue this paper explores is the social outcomes arising from the interactions between university students and indigenous Waala communities and families in the municipality, north-western Ghana. Drawing primarily on results from qualitative methods of data collection and data, this paper underscores that social integration outcomes have been both positive and negative, the latter being predominant. In the positive domain, majority of university students from varied ethnic backgrounds are socially accepted to live in shared rental accommodation compounds by indigenous Waala families and by extension allow for modest cross-cultural learning's and exchanges. University students, especially female students serve as role models of education to Waala youth, particularly, young girls – inspiring them to attain higher education. In the negative domain, these include conflict between students and Waala families over varied ways of life, conflicts over rents and ejection of students from rental apartments, differential application of rent rates and exploitation of students, differential application of market prices on tradable goods and exploitation of students, and finally, rising incidences of love relationships between students and indigenes leading to social tensions and undesirable social outcomes. The paper underscores that there has not been true integration of students into the Waala community because integration has been partial and underpinned by much more differentiated ways of lives, culture and conflicts than the communalities in social values necessary for binding what has become a secular municipality. Thus, the paper advocates an integrated approach to District Development Planning (DDP) through multi-stakeholder engagement for the promotion of education, platforms for dialogue, and strengthening institutions for dealing with emerging issues and conflicts arising from social integration.

Key words: urbanization, social integration, university students, outcomes, Ghana.

1. Introduction

This paper analyses the outcomes of the social integration of students of the University for Development Studies (UDS) at Wa into Waala communities and families in the Wa Municipality. Over the past decade, the Wa municipality has experienced an unprecedented rate of urbanization, partly attributed to the influx of a temporary university student population of the University for Development Studies (UDS). Most of these students are accommodated in shared private residential accommodation commonly referred to as compound houses in the city and its suburbs. This has brought students close to the indigenous people, the Waala, leading to close social and economic interactions between the two groups.

This paper therefore draws on social integration theory for analysing the outcomes of the interactions between university students on the one hand and indigenous Waala communities and families on the other hand.

In this respect, the paper is organized in five sections, the first being this introductory section. The next section is devoted to an overview of urbanization and the study methodology. In section three, the results and outcomes of social integration are presented. This is followed by a discussion and conclusion in sections four and five respectively.

2. The Study Area, Urbanization and Methodology

Historically, Wa has served as the headquarters of the Waala state and a rest stop for the Trans-Saharan traders prior to colonization. Even after colonization, Wa served as a service centre and it continues to play this role till date in modern Ghana. Currently, it is the regional capital of the Upper West Region, the last region of the ten regions of Ghana to be established since 14th January, 1983 when the region was created. It plays political and administrative functions and providing a wide range of administrative, commercial and financial services to the rest of the region.

The Wa municipality has experienced a phenomenal rate of urbanization over the past two decades, most of the demographic change occurring within the last decade. The municipality is the largest urban settlement in the region with a population of 71,051 in 2010 growing from 13,740 in 1970, 36,067 in 1984, 66,644 in 2000 (GSS, 1984; GSS, 2000; GSS, 2010). The municipality experienced an inter-censal growth rate of 84.7 per cent between 1984 and 2000. Much of this growth is attributed to high fertility rate and immigration. For instance, total fertility rate for the region is 5.0 compared to a national figure of 3.1 for urban areas in

the country and 4.0 for the whole country (GSS, 2008). Consequentially, population growth rate is estimated at 2.7 percent for the region and 1.7 percent for the country (GSS, 2000).

Migration is one of the main causes of demographic change in the Wa municipality and some of this is caused by the immigration of tertiary student population, especially students of UDS following the siting of a campus of the university (UDS Wa Campus). Total student enrolment of the campus increased from 6000 in the 2008/9 academic year to about 12000 in the 2012/13 academic year (Figure 1).

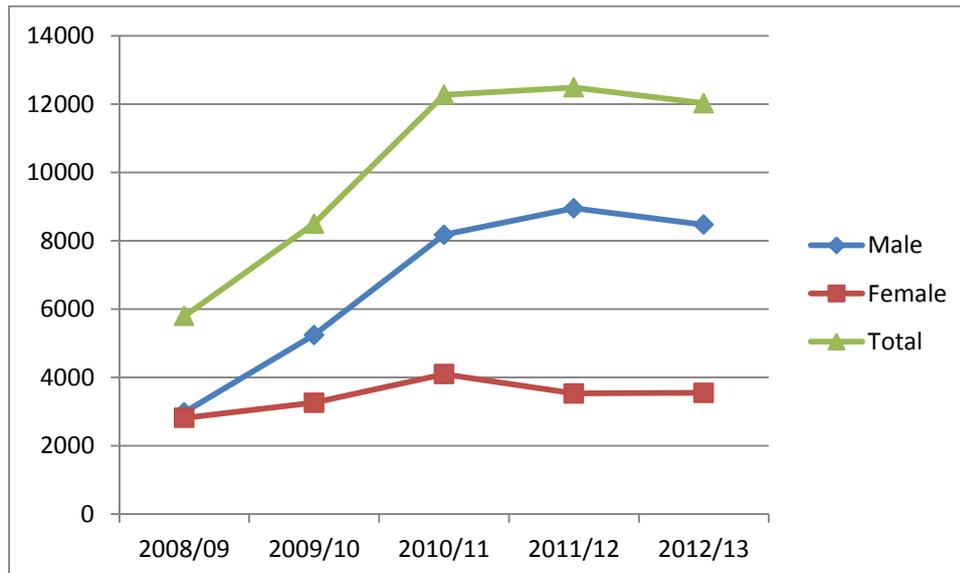

Figure 1. Student enrolment from 2008 to 2013 at the Wa campus

It's clear from the analysis (Figure 1) that student enrolments have consistently increased over the years and this coupled with other immigration streams and fertility rates has spurred demand for housing accommodation in the township. The housing stock in the municipality has increased over the years. For example it increased from 8,788 in 1984 to 20,551 as of the 2000 population and housing census (GSS, 1984; GSS, 2000). Nonetheless, demand far exceeds supply in the housing market and this has given room to abuses of tenants and or will be tenants by landlords/ladies in the township much the same way it occurs across other cities across the country. Accordingly, landlords in cities of Ghana blatantly breach the rent law and abuse tenants in pursuit of their self-interest (Songsore, 2003). Although the Rent Control Department (RCD) was established under the Rent Act of 1963 for mediating between landlords and tenants interest, it has not fared well in performing its function due to capacity problems and only had a physical presence in Wa recently.

This paper draws mainly on a qualitative study that employed eight focus group discussions (FGDs) among four categories of respondents/discussants. The wa municipality has over 15

communities or neighbourhoods that together constitute the Wa municipality. The FGDs were conducted in four purposively sampled communities (neighbourhoods). The sampling was informed by the need for geographic spread. These included Bamahu, a community with high student population and Dobile. The rest include two market squares one in the Central Business District (CBD) and the other in Kanbali, another community/neighbourhood – all of whom providing residential accommodation for indigenes and students alike. The distributions of FGDs conducted were as follows: two among female university students, two among male university students, two among Waala men and two among Waala women, most of whom also being petty traders. The data was analysed by means of detailed description, paraphrasing and use of boxes and tables.

3. Theory of Social Integration

In general the theory of social integration suggest mechanisms by which a group of people, very often a minority group are brought into mainstream societal life and or are accepted by the host group of people, the majority. According to the online Encyclopaedia, Wikipedia (2011), Social integration, in sociology and the social sciences refers to the movement of minority groups into the mainstream of societies. These minority groups may include ethnic minorities, refugees or underprivileged people and that their integration will require learning and speaking the language of the majority and acceptance of rules, laws and common set of values. It does not suggest assimilation of culture and or abandoning one's own culture, but making reasonable trade-offs consistent with the general acceptable norms for living within the society.

According to UNRISD (1994), social integration may be understood and or applied in three varied ways. First, it can be applied in the sense of an inclusionary orientation in which the goal of integration is to improve life chances through equal opportunities and rights for all human beings, particularly the minority group. Secondly, it may be applied in the sense of imposing some cultural values on a minority group for the sake of engendering uniformity in society. Lastly, it may also be applied as a way of simply describing the emerging patterns of human relations arising from the secularization of society.

The origin of social integration theory is attributed to Emile Durkheim, a French sociologist, in his works in the late 19th century that helped establish sociology as a distinct field of study from other social science disciplines like psychology. He considered social integration as the means through which people interact, connect and confirm each other within a community.

The theory proposes that “people experience mental, emotional and physical benefits when they believe they are contributing and accepted part of a collective. Without that sense of connection, they can experience depression, isolation and physical illness that could limit them from experiencing productive, happy lives.” (Hardy. n.d:1; Marijkeanker, 2011). Durkheim explained how social order varied and was maintained in pre-modern and modern societies. He explained that the transition from traditional society to modern society as driven by industrialization and the division of labour was associated with a transition from “mechanical” solidarity to “organic” solidarity as part of his theory of the development of societies in *The Division of Labour in Society* (1893). In mechanical societies, usually traditional, small scale and simple societies, social cohesion and integration come from the homogeneity of individuals and bounded by a common culture, including upholding similar values, common work and life style and kinship ties and familial networks. This is distinct from organic solidarity. The interdependence that arises from specialization of work and complementarities between people in a modern and industrial society is what gives rise to organic solidarity. Thus, it is clear that solidarity, be it mechanical or organic, is the key to societal cohesion. According to Blau (1960), social integration therefore, prevails if bonds of attraction unite its members and that persons interested in becoming integrated are often under pressure to impress the host group that they would make attractive associates.

For this paper, social integration is applied more in the sense of it being inclusionary of minority groups and as a way of describing the emerging patterns of human relations arising from the secularization of society.

4. Results and Outcomes

The results of interaction of students and indigenous Waala communities and families have yielded both positive and negative integration outcomes. Starting from the positive outcomes, the interactions between the two have resulted in a modest degree of social acceptability, cross cultural learning and the promotion of education among the Waala youth.

First, the interaction of students and indigenous Waal families has resulted in modest degree of social acceptability and cross cultural learning. Social acceptability of students to live within indigenous Waala communities and among families – but this is also driven by economic interest, rent payments indigenous house owners derive from the students. From the records, a large array of students find physical and social space among indigenous

Waala communities and families, most of whom not having access to university hostel accommodation. For instance, in the 2012/13 academic year, the total student population was 12021 out of which only 6% (700) were accommodated in university hostels. Thus, about 94% of the student population have to find private accommodation and most of these students live in compound houses together with Waala families.

Secondly, the social interactions between university students who come from a wide diversity of cultural backgrounds across the country and Waala families have also led to modest cross-cultural learning and exchange of values and experiences through living together. According to a female rice seller, *"Some of the students do pray with us, greet us very well and have regard for elders. This is how we want our children to be, there is a male student in my house; he is very respectful, he helps even when you haven't asked him. I wish all UDS students were like this"*. According to male FGD discussants Dobile and Bamahu:

Some of the students are very friendly and good to us in the house. As such, they easily learn waale, the local language but we really don't learn their languages like that because this is our home (FGD discussants, Dobile).

Students learn our language (waale) a lot and sometimes we also do learn theirs a bit. They also eat our traditional food, popularly known as Tuozaafi (TZ). Some students like it very much (FGD discussants, Bamahu).

Female discussants, mainly petty traders, corroborate the assertions made by their male counterparts that cross-cultural learning and exchange of social values occur between students and natives. Accordingly:

Most students, especially female students from southern Ghana learn how to prepare indigenous Waala meals such as T.Z and vegetable soup, bean cakes (Koose) and tubani. They assert that most female students learn how to prepare T.Z in particular before they complete. Conversely, we also learn how to prepare fufu with cassava and plantain from them. This is different from what we know, that is, preparing fufu with yam only. Even as women, we learn how some stews and soups are prepared to go with main meals. It is really lively. Many more male and female students learn how to eat T.Z even if they can't cook it.

The third positive outcome is that university students serve as role models of education to the Waala youth. In particular, female students have had a positive impact on indigenous Waala youth, especially Waala girls – inspiring them to attain higher education. It should be observed that illiteracy rates among indigenous Waala communities have been high and still is. Parents, especially mothers have also been influenced positively about the need for education. Some extracts from male discussants in Dobile shed light on this:

University students have served as role models to some of our female students and now they actually aspire to attain higher education like them.

As for education, we all know that prior to UDS, many people, even the elderly did not take education seriously but now children have actually been influenced by the university students and the very presence of the university here.

Female FGD discussants in *Bamahu* and *Dobile* corroborate the assertions of their male counterparts that university students have influenced their children positively in terms of inspiration for attaining high education, especially the female students influencing Waala girls. They cite a number of changes and examples to support their assertion (Box 1).

That most of their children, young boys and girls now behave like tertiary students, preferably, UDS students. Although there are other tertiary institutions such as the polytechnic and teacher training college, they prefer to copy the university students and sometimes fake university student status for the prestige attached to being a university student.

They further agreed that the university students serve as role models in education in the region. Some of them teach our young children at home voluntarily and or guide them to do their take home assignments. Some even give our children exercises to do and they mark them. According to a discussant, some students go further to organize free extra classes for our children. We appreciate such support because we all want our children to gain university education in the future.

Our children, especially the girls have been inspired tremendously by their interactions with university students, especially female university students. Prior to the University, this was not the mind set of children and so clearly their orientation for higher education is a positive outcome of the presence of university students living among us. Girls are now realizing the need for education and we are happy about that. This is certainly better than early marriage because we have hope that our girls will have a better future.

Box 1: University students as role models of education to Waala youth

As already stated, the interaction of university students have also led to a number of negative outcomes, the first being conflict between students and indigenous Waala families over different ways of social life. Very often, abhorrence, especially of indigenous Waala families of the way of life of students leads to social tension and in extreme cases verbal and physical assaults or violence. Extracts from the contribution of male FGD discussants in *Bamahu* reveal the dislike of the dressing styles of female university students:

- *They are not our children but their way of dressing is very bad. In this community, we are Muslims and this worries us because our children are learning how to dress like these female university students.*
- *There is nothing good about the dressing of female university students.*
- *The dressing of these students is very bad and they have changed our children's way of dressing. Our children are now also wearing miniskirts, short dresses and tops that expose part of their bodies, even including their breasts.*
- *Students, especially female students wear hanging tops, tight trousers, short skirts and dresses that expose their breasts.*

Instances of conflicts between students and indigenous Waala families are common and arise for varied reasons related to unacceptability of the behaviour of students by host families or co-tenants. According to male FGD discussants in *Bamahu*:

Very often we quarrel with students in the house due to their bad behaviour and disrespect for elders. They don't respect us because we are illiterates. They don't pay light bills; they refuse to scrub and clean bathrooms and general surroundings, especially among the girls. A student will rent a room from you as an individual and by the next day you see a pair of or even more than two students. Very often they try to cheat on us this way. Even sometimes, male and female students living together (cohabitation) against our will. What some do is that, they re-rent to colleagues at even higher rates and then they live together as roommates without the consent of us landlords. They also punch holes on our walls even against our advice.

Male FGD discussants from *Dobile* corroborate what those in Bamahu said:

As for their dressing, we had better not talk about it. The female students wear short skirts they call miniskirts. The male students dress like crazy people with their trousers hanging and their panties and bums showing. Even female students also expose their panties and bums in the same wear as a fashionable dressing style called 'I am aware'. These students display very bad, funny and unacceptable dressing. We see them every day our houses because they live with us. In our own families, we can see the changes in the dressings of our children, particularly the girls.

Female FGD discussants (women/traders) dovetail multiple and several negative outcomes arising from students and indigenous community interactions (Box 2).

Women expressed their disappointment and dislike of the way university students dress, both male and particularly females being women themselves. They particularly make reference to days that students organize 'road show floats' as part of celebration of SRC activities. They wear red, dress in weird ways and promote some extend of nudity on the streets of wa and across the town. Majority of the women think yes.

Their worry is that their youth, especially the girls are copying these bad dressings blindly. Accordingly, the days in which Waala girls dressed very well, such as wearing long dresses and scarfs (*Mariyafi*) to cover their bodies sufficiently, and consistent with Islamic traditions are long gone. Even in the past, non-Muslims also dressed well and elderly women felt good and proud to be called by them their mother in laws. Now, most Waala girls think it is a fashion to expose their breasts and buttocks on the street, commonly referred to as "Gentira" dressings. They even do it with impunity.

Even our own daughters in UDS want to wear short skirts and expose their buttocks and breast and they think it is normal. Some Waala girls now go out and come home very late. According to one respondent, some of the guys are womanizers and are always changing women here and there and when we complain they think we are interfering in their privacy.

According to one vegetable seller, I had two UDS students in my house, they were very dirty. They don't do anything in the house even their rooms. But when you see them outside you think they are angels. And our children copy them blindly.

Another social behaviour of students the women lamented over was gambling. According to the women, university students have now introduced gambling into the town and this is a source of worry. There are a few of such game centres where gambling is done and that it's promoting laziness among the Waala youth – because they are joining in the game of gambling. According to them, "our children hardly do any work in the house these days. They go out to gamble with the students. This is gradually destroying our homes. Our children are becoming thieves – they steal our monies for gambling purposes."

Box 2: Unacceptable student behaviour as described by Waala women and traders

Conflicts also occur over threats of ejection and or even in extreme cases ejection of students from their rental apartments. In many such instances, students are ejected inappropriately without even the requisite compensation, such as refund of balances associated with rent payments. In general, ejections from one's accommodation are associated with alleged misbehaviour of students, described to *include – disrespectful behaviour, uncooperative behaviour in payments of joint utility bills, lack of good care and or mishandling of rooms, and cleaning compounds, and cohabitation between male and female students*. According to female FGD respondents contributing on the subject:

Some students have no regard for their landlords/landladies. A year ago, one girl and her friend were ejected from their room because they were not participating in cleaning the compound house. Even sweeping their balcony (veranda) was a problem. Anytime the landlady asked the girl to sweep the back of their room during the dry season, the students murmured in Twi (southern Ghanaian language), show disrespectful behaviour and refuse to do so. Some students also make too much noise and don't like pay water and electricity bills although they use these utilities and bring their friends to come and cook and do everything they want in the house.

On the part of students as explained as female student discussants, students can be ejected for unfair reasons and that such occurrences were common. They cite an example in which a male student was ejected without refund of outstanding rent balances in Kambali until the police intervened when the incident was reported. A discussant cited an example in which a female student was ejected the fourth time from her room for alleged indecent dressing by landladies/landlords. In the most recent incident, the female student was accordingly ejected from her room for indecent dressing. She cited that $\frac{3}{4}$ of her breasts are always showing and that she wears short dresses (mini-skirts) and trousers that expose her G-strings, beads and tattoos all the time. In yet another example, a pair of male students got ejected from their room in Kambali by the landlord because he did not like their behaviour and general life style – complaining they entertained many visitors including different girls in the house, noise making and arguments over football, and drinking of alcohol and drunkenness. In general, female discussants report that several ejections were unfair as in the following:

- Some land lords are very jealous and do not want anybody to visit us student girls especially in the night. We left our first apartment because the land lord who is in his early forties expressed interest in one of us and she did not agree to his proposal, he started preventing even our group mates from visiting us, fought with a number of male visiting students and so finally we had to vacate his house to this current house.
- Some of the land lords too are just cheats, whenever light bills come, they don't show us the total sum but demand any amount of money from us for settlement of electricity bills. There are many instances in which students absorb utility bills of Waala families through the dishonest manoeuvring of landlords/land ladies where students share billing meters with them. They often argue that we use more electricity simply because we use rice boilers and electric irons – and yet they use irons and sometimes kettles for heating water. We've been quarrelling with them over unfair payment of utility bills.

- For student, student girls, receiving many different male visitors can provoke the landlord or land lady of the house and lead to your eviction.
- Some land lords also try to take undue advantage of their positions to make love proposals or 'befriend' us. When they don't succeed, they will surely find fault with you and eventually eject you from the house.
- Some too demand too many things very often from us. Things such as clothes, money, ingredients, and food stuffs among others. When students get fed-up and deny them something they are certain you have, it can create social tensions and lead to self- imposed ejection.

Furthermore, landlords/landladies profile and apply higher rents to students and lower rates to indigenes and or non-students for the same type of residential accommodation. In extreme cases landlords apply exorbitant rent targeted at ejection of particular students if such students put up social behaviour the host families dislike. According to male discussants from Dobile:

Conflicts between landlords and students over rent rates occur because some landlords want fast money and apply relatively higher rents on students who 'miss behave'. They really charge some of the students very high rents. Although this is pathetic, the students call for such punitive measures, especially those that further rent rented rooms to their colleagues under hidden tenancy agreements without the consent of the landlords. When some landlords detect such cases, they apply higher rents to them than indigenes.

It is very common for landlords to apply higher rents on students than indigenes or non-students. In such cases, students in some cases pay double what. This is partly because of the high demand for accommodation by students in town because of the lack of adequate hostel accommodation on the university campus. In exceptional cases, higher rents are applied to students who are known to misconduct themselves. This happens very often in Dobile.

Female FGD discussants were divided as to whether landlords/landladies applied higher rents to students than the prevailing market price. While some agreed it happened others claimed it does not happen. For those who claim it happens, they explained that it happened to students who try cheating on landlords and landladies. They will rent a room at a very low price and bring on board other students as tenants under their own internal tenancy agreements. When house owners detect this, they increase the rent and ask the students to pay additional money or face eviction. In paying additional money, they end up paying very high rate per room. This is how it happens. In other instances, higher rates are simply targeted at students. But some landlords argue that it's meant to cover utility bills or maintain the housing – although it is not always the case. According to some discussants, some students do not take good care of their rooms. They use irons frequently, fridges and heaters and don't pay electricity bills. So we apply high rent rates to enable us settle these bills. It happens every academic year. For those who said no, they said students were not workers and as mothers themselves, they all have children in school, who will definitely stay in someone's house one day. And so, it was not fair to do that.

However, female student discussants unanimously reported that landlords or land ladies applied higher rents to students in general and that they often target unsuspecting newly admitted students who report and are in desperate need of accommodation. In some cases, continuing students are ejected from their rooms to make room for newly admitted unsuspecting students who are more willing to pay higher rents because they are new and desperately looking for accommodation to settle. They also explain that in extreme cases, landlord/ladies apply higher rent to continuing students as a way to ejecting them from the house if they so wish. Discussants cite an example in which a female student was ejected from her room in a compound house in Kpaguri through the application of higher rent rate targeted at the student. While other students were asked to pay between GHC 300 and GHC 400 Ghana cedis, the particular student was asked to pay GHC 500 for similar accommodation and so the student packed and left the compound.

Traders in the market, particularly, retailers in the market profile students and applying higher market prices above the prevailing market prices in the sale of vegetables and consumables, especially foodstuff. Male discussants in Dobile assert as follows:

We hear these stories all the time. That when you speak English in the market, the traders take you for a student and charge higher market prices for goods above the prevailing market prices. We understand it is market women who sell foodstuff and vegetable who do this most often but also those retailers in clothes.

However, female discussants, particularly, traders themselves claim they don't quote higher markets prices for the students. According to them, it may be happening but none of them have done that to a student. They even claim to even reduce prices for students because as a discussant puts it – we all have children.

Nonetheless, female student discussants in Kambali and Bamahu corroborate the assertion that traders profiled students and applied higher market prices for goods above the prevailing market prices. They cite several instances and examples to buttress their stands:

- *In Bamahu here it's happening, you go to Town its even worst. Once you cannot speak Waali (the local language) to bargain or challenge the market price, they sell items on tables at a price higher than the prevailing market price to you. It's better with the super markets, but those selling vegetables on tables or in the market, and even food vendors, they do it very often.*
- *During one vacation, a market woman in the Bamahu daily market remarked to her colleague that ..."the students will leave and we will know the real market women and those cheats pretending to be market women". Accordingly, she said this to a fellow trader in Akan when she had a misunderstanding with her. The impulse of that statement was that her colleague trader cheated on students through unfair pricing (high) pricing and that she would not do well in business when the students are on vacation and actual prices prevail in the market.*

- *A discussant cited that she and her roommate wanted to buy a goat and the goat dealer put a price tag of GHC120.00. They refused to buy and instead gave money to their land lord, he bought that same goat for them at GH¢55.00.*
- *Even at the grinding mills, when we students go there to grind our small flour, tomatoes or pepper often little in quantities, we pay more for services than the natives do for their large quantities of malt and guinea corn. In fact our mates who are natives are far better than us; they can challenge the prices of goods because they are knowledgeable about local pricing.*
- *A discussant narrates as follows: I went to the market with my friend to buy okro. There was already a woman before us who asked about the prices and the seller placed a price tag of GHC 50p. As we were speaking, the seller asked the buyer to give her GHC2.00 so that she will give her change to prevent us from knowing the price. She spoke in the local language Waali but the students had already understood her because they spoke Dagbani which is similar/close to Waali. Thinking that she had outsmarted the students, the trader told the students a unit of okro was selling at GHC 1.00. The students declined the price offer and bought same quantity at GHC 50p from another trader.*
- *Another discussant narrates, she and her roommate's experience: We have been buying from the market, but one day we sent a small boy to buy meat and green pepper in the market for us. We gave him GHC 2.00 for the meat and GHC 50p for the green pepper. When he brought the meat, it was much bigger in quantity than what we get when we go as students to buy at the same amount of money. For the same quantity of pepper the boy bought at GHC 50p, we would have bought it for double the price (GHC 1.00).*

Finally, there is an increasing trend of love relationships between university students and indigenes in two main forms and these sometimes result in negative outcomes – social tensions in homes and teenage pregnancies. On the one hand, there is an increasing trend in teenage pregnancy partly, an outcome of social relationships between indigenous teenage girls and male university students. On the other hand, there is an increasing trend of female university students falling into love relationships with men (non-students) in town, including married men (what is termed the *Alhaji* phenomenon) leading to social tensions at home, hostile behaviour of wives towards female university students and occasionally, result in marriages that do not last. The following extracts from male FGD discussants in Bamahu shed light on the issues:

- *Teenage pregnancy resulting from love relations between male university students and our children is common. We just had one recently in Bamahu where one student impregnated a JHS two girl. She has just delivered recently.*
- *In Dobile, a male university student impregnated teenage Waala girl. She delivered a baby girl a week ago and she and the new born live in the next house, pointing his finger at the house.*
- *There is another recent incidence in which of the male students befriended one of our wives (an indigenes) wife and this led to domestic conflicts and finally divorce.*
- *It's not common for us the men here to befriend female university students. This is because we can't have them because we are illiterates – and so we can't have them as our girlfriends.*
- *Here in Bamahu, conflicts between female university students and our wives occur; but it's not as result of us the men befriending the female students. Rather, it results from completion for water at the bore holes and fee standpipes that we have. The student population have*

increased population of the community to the point that water supply is inadequate for the population.

- *Students indulge in open love and profane behaviour which indigenous families find distasteful and bad teachings to their children.*
- *According to male discussants, here in Dobile, conflicts arise over husbands love relationships with university girls. We hear stories about 'UDS girls snatching husbands' in town but in such cases, the wives rather quarrel with their husbands because they may lack access to the student girls.*
- *As for female university students getting pregnant with the indigenous men, it's rare. We have not heard about this except probably the big officers in town. What are common are male university students impregnating their female counterparts. That is very common. As for us, we can't get those girls easily because we lack formal education. How will one of us handle a female university student? A discussant asked, we are just not meant to get along with them in any courtship relationship.*

5. Discussions

As the results show, the interaction of students and indigenous Waala families has resulted in both positive and negative outcomes. There is 'compromised social acceptability' of students to live within indigenous Waala communities and families – but this is also driven by economic interest, rent payments indigenous house owners derive from the students.

The case of Waala communities and families letting in university students and living with them is the outcome of a compromise between the two to live together in order to achieve varying interest and goals consistent with integration in the sense of inclusionary orientation and goal for improving life opportunities, not of only the minority (UNRISD, 1994), but in this case the majority as well. The incidence of students and Waala living together cannot be described as social integration in the true sense of it because largely, indigenous Waala communities despise of the social behaviour that students put up. From the perspective of the Waala, it is plausible to observe that social integration in terms of integrating university students has not occurred because the two groups tend to have much more culturally differentiated behaviours than common values that should bind them. Equally from the perspective of students, social integration cannot be said to occur in the true sense of it; because students continue to live their social lives largely among themselves, exhibiting what can be described as the unique student way of life and culture, which indigenous Waala communities frown on. This has relevance for the assertion that among Hispanic and Native American college student, ethnicity influenced social integration process by students on campus (Murgui, E and others, 1991). This is at variance with the position by Blau (1960) that social integration prevails if bonds of attraction unite its members. What seems to be happening is closer to organic solidarity, not in the context of the division of labour and

associated interdependencies that Durkheim talks about; but more in the context of interdependence created by market forces, specifically demand and supply in the housing sector. Currently, students are a huge source of demand for rental accommodation and this has driven private investments in compound housing among indigenous Waala families as an important source of income for household sustenance. The average Waala family set aside a few rooms (1-2) rooms within their compounds for renting to students annually. This has become an important source of income for family sustenance so that although most families may despise much of the social behaviour of most students; they compromise and accommodate the students because of the economic benefits they gain from rent. In addition, students are a major source of market for tradable commodities and businesses in town. When they are on holidays, businesses are hit hard because they lose a significant market and when they return from holidays, they gain significant market. Thus, students seem to be spurring local economic growth and development and the indigenous people understand and appreciate this – thus, they accommodate students even if their behaviour is largely an affront to their culture and way of life.

According to the UNRISD (1994), social integration may also be understood as imposing some cultural values on a minority group for bringing about uniformity in society. In the case of interactions between students and Waala communities, it is the minority that has imposed a culture on the majority. The results suggest that although the Waala abhor the general behaviour of students; a process of acculturation has been imposed on the Waala community through the assimilation of these foreign cultural values of students by Waala youth much to the displeasure of their parents. Thus, a process of acculturation has been set in motion and driven by daily interactions between university students and Waala youth. In this case, the minority, the students are the ones who have imposed a 'student culture', foreign to Waala culture and traditions on the majority and host, the Waala. The analysis and description of these emerging dynamics in the relationships between students and Waala in itself consistent with the alternative understanding of social integration as description of emerging patterns of human relations arising from minority and majority group interactions.

6. Conclusions and recommendations

This paper examined the social integration of university students into Waala communities and families in the Wa Municipality, north western Ghana. It concludes that social integration has been partial because both groups have much more differentiated ways of lives, culture and conflicts than the communalities that would otherwise bind them together in an emerging secular municipality. It further underscores that integration outcomes have been both positive

and negative. For the positive outcomes, university students from varied ethnic backgrounds are socially accepted to live in shared compound houses by indigenous Waala families and this also enables modest cross-cultural learning's and exchanges. In addition, university students, especially female students have become role models of education to Waala youth, particularly, young girls – inspires them to attain higher education. In the negative domain, outcomes include conflict between students and Waala families over varied ways of life, conflicts over rents and ejection of students from rental apartments, differential application of rent rates and exploitation of students, exploitation of students through differential application of market prices (higher market prices) by petty traders on consumables in markets on students and finally, rising incidences of love relationships between students and indigenes leading to social tensions and undesirable social outcomes.

The paper recommends that an integrated approach to District Development Planning (DDP) in the municipality within the context of decentralization. The approach should engender community and multi- stakeholder engagement involving the University for Development Studies and Wa Municipal Assembly (WMA) for the promotion of the following: education of students and communities on issues of social integration; creation of platforms for interactions and building bridges between communities and university students; strengthening the Rent Control Board (RCB) to discharge its function of regulating rent and resolving conflicts to avoid exploitation of students; and working effectively with the District Health Management Team to design and implement reproductive health services targeted at the indigenous youth and university students.

ABSTRACT:

India is a developing country and it requires fast space quality infrastructure development, which is the need of current times. For any development, land is required and the land belongs to the people. Government is acquiring land for public purpose. Government of India (GoI) has substantially increased its focus towards infrastructure development, over the last few decades which lead to economic growth of the country. Acquisition of land for public purpose displaces people, forcing them to give up their home, assets and means of livelihood. The GoI recognizes the need to minimize large scale displacement to the extent possible and, where displacement is inevitable, the need to handle with utmost care and forethought issues relating to Resettlement and Rehabilitation (R&R) of Project Affected Families (PAF) and formulate R&R Policies (NRRP 2007 and draft bill 2011). The ground reality differs from it.

Road network is vital to the economic development, trade and social integration. It facilitates smooth conveyance of both people and goods. Size of the road network, its quality and access has a bearing on transport costs. Besides, road network promote specialization, extend markets and thereby enable exploitation of the economies of scale. Global competition has made the existence of efficient road transport and logistic systems in delivery chain an absolute imperative. Easy accessibility, flexibility of operations, door-to-door service and reliability have earned road transport an increasingly higher share of both passenger and freight traffic vis-à-vis other transport modes. Transport demand in India has been growing rapidly. In recent years this demand has shifted mainly to the advantage of road transport, which carries about 87 percent and 61 per cent of passenger and freight transport demand arising for land based modes of transport (i.e. roadways and railways taken together) respectively. Road transport has grown despite significant barriers to inter- State freight and passenger movement compared to inland waterways, railways and air which do not face rigorous en-route checks/barriers.

The total road length in India had increased significantly from 3.99 lakh Kilometre (Km) as on 31st March 1951 to 41.10 lakh Km as on 31st March 2008. Concomitantly, the surfaced road had increased from 1.57 lakh Km to around 20.36 lakh Km over the same period. The total road length had expanded significantly since 1970s. It increased from 9.15 lakh Km in March 1971 to 41.10 lakh Km in March 2008 - an increase of 34.9 % over these 37 years yielding a compound annual growth rate (CAGR) of 4.1 %. The total road network in the country grew from 36.21 lakh in March 2004 to 41.10 lakh in March 2008 reflecting an increase of 4.89 lakh Km yielding a CAGR of 3.2 % over this period.

Available reports indicate that around 21.3 million people are internally displaced populations (IDPs) due to development projects in India. IDPs include those displaced by dams (16.4 million), mines (2.55 million), industrial development (1.25 million) and wildlife sanctuaries and national parks (0.6 million) etc (IDMC, 2007). 21% of total shares transport and communication sector development. This paper appraises the displacement due to road infrastructure development in India's boom economy over the period.

A. DEVELOPMENT :

A preliminary assessment of Five Year Plan (FYP) of Planning Commission suggests that investment in infrastructure during the Twelfth Plan (2012- 17) would need to be of the order of about Rs. 40, 99, 240 crore (US \$ 1025 billion) to achieve a share of 9.95 per cent as a proportion of Gross Domestic Product (GDP). This would have to be a key priority area in the Twelfth Plan in order to sustain and support the targeted growth.

Based on the Eleventh Five Year Plan (2007-12), the Planning Commission has assessed the investment in infrastructure is Rs. 20, 54, 205 crore. The investment in infrastructure was likely to rise from 5.15 per cent of GDP during the Tenth Plan to about 7.55 per cent during the Eleventh Plan, as against a target of 7.60 per cent. This constitutes a significant shift in favour of investment in infrastructure. Except in some sectors, the overall performance of infrastructure during the Eleventh Plan compares well with the initial targets after accounting for the impact of the global financial crisis.

The projected investment in road sector was also significantly lower at Rs. 2, 78, 658 crore compared with Rs. 3, 14, 152 crore in the original projections in eleventh plan. The investment by the Centre is expected to decline due to award of lower than projected road projects by National Highways Authority of India (NHAI) during the first three years of the Plan. The investment by the private sector is also expected to go down due to award of a lower number of projects in the first three years of the Eleventh Plan. However, Ministry of Transport has decided to speed up the award and implementation of National Highways Development Project (NHDP) to achieve a completion rate of 20 kms of highways per day. The less investment from private sector was subject to mainly downfall of economy in global market as well as several risk factors has involved in Indian context. One of the major hindrances is land acquisition and displacement.

1. PHYSICAL GROWTH IN ROAD DEVELOPMENT:

The total surfaced road length grew from 3, 97,948 km (accounting for 43.5% of the total road length) in 1971 to 20,36,063 km (accounting for 49.5 % of the total road length) in 2008 reflecting a more than fivefold increase in surfaced road length. Category wise classification of road length showed that during this period, the length of National Highways (NHs) increased from 23, 838 km to 70,934 km – an increase of over CAGR of 2.8 %. During the same period, the length of State Highways (SHs) increased from 56,765 km to 1,54,522 km (an increase of over CAGR of 2.7 %) and the length of other Public Works Department (PWD) roads increased from 2,76,833 km in 1971 to 8,63,241 km in 2008 (an increase of about CAGR of 3.1 %). Various categories of Urban roads together expanded in length from 72,120 km to 3,04,327 km reflecting an increase of over CAGR of 3.97 %. The highest growth over these 40 years took place in respect of Rural Roads which increased from 3,54,530 km to 24,50,559 km (including 10,61,809 lakh km roads constructed under different schemes registering an increase of nearly CAGR of 5.4 %. The lowest growth, however, took place in the length of Project roads which increased from 1,30,893 km in March 1971 to 2,70,189 km by March 2008 resulting in a growth of CAGR of 1.98 % only. Table 1 depicts the facts of it.

Table 1: Total Road Network in India

	Total (T)/ Surfaced (S)	Surfaced Road Length by			Categories in India		
		2000	2004	2005	2006	2007	2008

	S	1573800	1760768	1846629	1910792	1997323	2036063

* Rural Roads include Panchayat Raj roads and roads constructed under Jawahar Rozgar Yojana (JRY) as of 31.3.1996 & Roads constructed under Pradhan Mantri Gram Sadak Yojana (PMGSY) since 2000.

** Other Roads include Urban Roads and Project Roads.

As on 31.3.2010, the total road length under National Highways is 70,934 km.

Source: NHAI

Government has envisaged huge investment for construction and upgradation of National Highways under various phases of NHDP over the medium term. Details of various phases of NHDP (Fig 1) are as under:

NHDP Phase-I: This phase was approved in December 2000. It envisaged - (a) Four laning of National Highways comprising Golden Quadrilateral (GQ) linking major metros, viz. Delhi, Mumbai, Chennai & Kolkata having an aggregate length of 5846 km; (b) North-South and East-West corridors covering 981 km; (c) Port connectivity by upgrading 356 km of NHs linking major ports in the country and; (d) upgradation of 315 km of other National Highways. The total aggregate length of NHs for upgradation envisaged under Phase I was placed at 7498 km. The total length completed upto 31st March 2010 was 7328 km.

NHDP Phase-II: This phase was approved in December 2003. The main thrust of this phase involved upgradation (4 laning) of (a) North-South (Srinagar to Kanyakumari) & East-West (Silchar to Porbandar) corridors covering a distance of 6161 km and; (b) upgradation of 486 km stretch of other National Highways. The total length coverage for upgradation under Phase - II involved 6647 km out of which 4465 km has been completed by 31st March 2010.

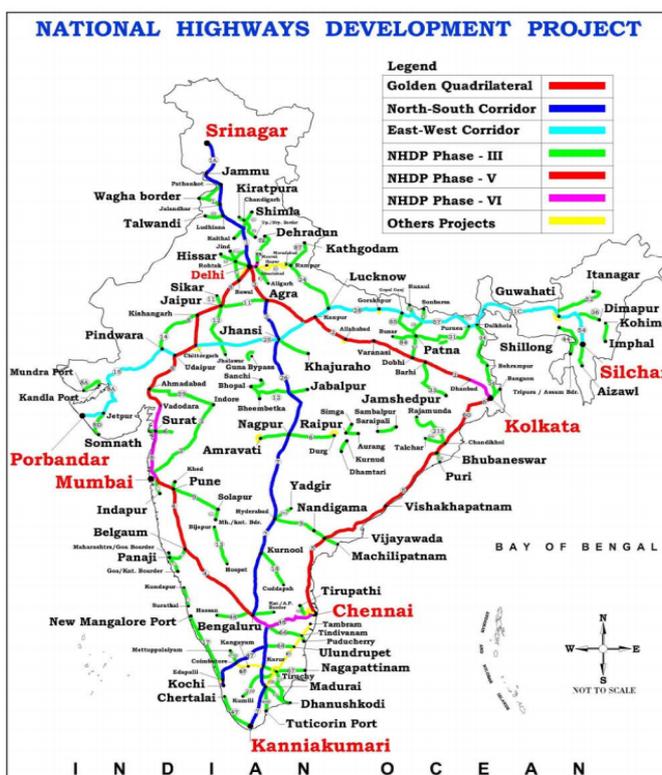

Fig 1: NHDP Roads

NHDP Phase-III: NHDP Phase-III involves 4-laning of 12,109 km of high-density stretches of NHs connecting State capitals, important tourist places and places of economic importance through Public Private Partnership (PPP) basis. Out of this, implementation of 4815 km on BOT was approved under NHDP Phase IIIA. NHDP Phase IIIB involving implementation of the balance 7294 km was approved in April 2007. Till 31st March 2010, 1581 km of road length had been completed.

NHDP Phase-IV: This phase involved improvement of 20,000 km of NHs to two lanes with paved shoulders.

NHDP Phase-V: This phase was approved for six laning of 6,500 km of existing 4 lane highways in October 2006 on Design Build Finance and Operation (DBFO) basis. This included 5,700 km of GQ and 800 km of other selected stretches.

NHDP Phase-VI: This phase, approved in November 2006, envisaged development of 1000 km of access controlled four/six lane divided carriageway expressways on DBFO basis.

NHDP Phase-VII: This phase was approved in December 2007 for construction of standalone ring roads, by-passes (including improvements of NH links in city), Grade Separated Intersections, flyovers, elevated highways, Road Over Bridges (ROBs), underpasses and service roads on BOT Toll basis. The status of national highway is shown in table 2.

Table2: Status of National Highways (as on 31st March 2010)

Lane Status	Length in km
6 lane and above	731 (1 %)
4 lane (2 lane dual carriageway)	14,584 (20.6 %)
2 lane (7 meters)	37,488 (52.8 %)
Single/Intermediate lane	18,131 (25.6 %)
Total length of National Highways	70,934 (100.0%)

Source: NHAI

The National Highway network of the country spans about 70,934 km. The National Highway Development Project (NHDP), covering a length of about 54,000 km of highways, is India's largest road development programme in its history. In many ways, this ambitious and path-breaking initiative of the Government of India, which began in the late 1990s acknowledged the importance of private sector in India's infrastructure development.

2. FISCAL GROWTH IN HIGHWAY SECTOR

India has an extensive road network of 3.3 million km - the second largest in the world. The National Highways have a total length of 70,934 km and serve as the arterial road network of the country. It is estimated that more than 70 per cent of freight and 85 per cent of passenger traffic in the country is being handled by roads. While Highways/ Expressways constitute only about 2 per cent of the length of all roads, they carry about 40 per cent of the road traffic leading to a strain on their capacity. The number of vehicles on roads has been growing at compounded annual growth rate (CAGR) of approximately 8% in the last five years.

The development of National Highways is the responsibility of the Government of India. The Government of India has launched major initiatives to upgrade and strengthen National Highways

through various phases of the NHDP. NHDP is one of the largest road development programmes to be undertaken by a single authority in the world and involves widening, upgrading and rehabilitation of about 54,000 km, entailing an estimated investment of more than INR 3,00,000 Crore (USD 60 billion).

National Highway Development Program (NHDP) Phase I&II consists of widening and strengthening of NH sections connecting four major metros of Delhi, Mumbai, Chennai & Kolkata, popularly known as "Golden Quadrilateral" amounting to a total length of 5846 km and improvements to North-South corridors connecting Kashmir with Kanyakumari and East-West corridors connecting Silchar with Porbandar amounting to a total length of 7300 km. It was launched in 1999 covering a length of nearly 14,0000 km at an estimated cost of Rs. 54,000 crore (at 1999 prices) (USD 12.317 billion). The NHAI project under study is under NHDP phase III, which was launched in 2005 for upgradation and 4 laning of 10,000 km of selected high-density corridor of highways at an estimated cost of Rs. 55,000 crore (at 2005 prices) (USD 12.544 billion). In addition to implementation of NHDP, the NHAI is also responsible for implementation of NHAI projects on National Highways (mainly road connectivity to major ports in India) at a cost of Rs. 4,000 crore (at 1999 prices) (USD 0.913 billion). NHAI is now responsible for implementing on National Highways of length around 24,000 km. NHAI will act as an employer and nodal agency for the NHAI project preparation and execution of NHDP. Out of total cost of NHDP i.e. Rs. 54,000 Crore or US\$ 13.2 billion in the following manner as shown in Table 3 fund will raise. All the NHAI projects under NHDP Phase III are envisaged to be implemented on Design, Build, Finance Operate and Transfer (DBFOT) basis. Finance share of NHDP as follow:

Table 3: Financing of NHDP

Total Cost	Rs.54,000 Crore (INR)	US\$ 13.2 Billion
Likely sources	Rs. Cr. (On 1999 Prices)	US\$ Billions (On 1999 Prices)
Cess on Petrol and Diesel	20,000	4.90
External assistance	20,000	4.90
Market borrowings	10,000	2.40
Private Sector Participation	4,000	1.00

Source: NHAI.

The total Rs. 3690.11 crore has been utilized for capital work in NHAI by 31st March, 2011 Out of total estimated Rs. 54,000 crore. Out of total estimated project investment 75% has already invested for the project establishment. The physical growth it has achieved only 45.80% which is lower than the estimated amount. Build Operate Transfer (BOT) concession contracts with an estimated Total Project Cost of approximately USD 23 billion (including BOT/DBFOT2-Toll and BOT- Annuity contracts) have been awarded under various packages till January 31, 2011 and these projects are expected to be fully operational by 2015-16.

The consistent policy and institutional framework, which has been the backbone of the more than INR 3,00,000 Crore (USD 60 billion) NHDP, also conveys the intent and commitment of successive governments to encourage increased private sector participation in developing the arterial road network of the country to world class standards. More than 60 percent of the estimated investment requirement is expected to be privately financed.

The early success of Public-Private-Partnerships (PPP) in the NHDP, arguably, set the tone for

similar initiatives in other infrastructure sectors and has provided the single largest opportunity for private financing and management of infrastructure services.

The NHAI is mandated to implement the NHDP. Most of the projects have been developed or are under development on Public Private Partnership (PPP) basis through Build Operate and Transfer (BOT)-Annuity and Build Operate and Transfer (BOT)-Toll mode. Typically, in an annuity project, the project IRR is expected to be 12-14% and equity IRR would be 14 -16%. For toll projects, where the concessionaire assumes the traffic risk, the project IRR is expected to be around 14-16% and equity IRR around 18-20%. The fiscal allocation has stated in table 4.

Table 4: Financial Performance - Expenditure on NHDP (Rs. Crore) (INR)

2.1 PRESENT PRACTICE:

Initially, projects under NHDP were awarded as item rate cash contracts. However, going forward, Public Private Partnerships (PPP) is going to be the main mode of delivery for future phases of NHDP. While there are a number of forms of PPP, the common forms that are popular in India and have been used for development of National Highways are:

- Build, Operate and Transfer (Toll) Model** on DBFOT basis: tollable Highway projects.
- Build, Operate and Transfer (Annuity) Mode** on DBFOT basis: annuity payments from NHAI that would cover his cost (construction, operations and maintenance).
- Special Purpose Vehicle (SPV)** for Port Connectivity Projects: wherein NHAI contributes upto 30% of the project cost as equity.
- NHAI is also proposing to award projects under a long term **Operations, Maintenance and Transfer (OMT)** concession.

2.2 RISKS IN PRESENT PRACTICE

Concessionaire Risk: With the introduction of the MCA, the risks involved in project and contractual issue is the commercial and technical risks which relating to construction, operation and maintenance are allocated to the concessionaire, as it is best suited to manage them. Other commercial risks, such as the rate of growth of traffic, are also allocated to the concessionaire.

Construction Risk: The concessionaire is required to commence construction works when the financial close is achieved or earlier date that the parties may determine by mutual consent. The concessionaire shall not be entitled to seek compensation for any prior commencement and shall do it solely at his own risk.

O& M Risk: Concessionaire to operate and maintain the project facility (includes road and road infrastructure as specified in the concession agreement). Failure to repair and rectify any defect or deficiency within specified period shall be considered as breach of responsibility.

Financial Risk: The concessionaire shall at its cost, expenses and risk make such financing arrangement as would be necessary to finance the cost of the project and to meet project requirements and other obligations under the agreement, in a timely manner.

Traffic Risk: The MCA provides for increase or decrease of the concession period in the event the actual traffic falls short or exceeds the target traffic.

Land Acquisition Risk: NHAI is responsible for acquiring the requisite land for the Project Highway

Common Risk: Force Majeure Risk - Force Majeure shall mean occurrence in India of any or all of Non-Political Event(s), Indirect Political Event(s) and Political Event(s),

B. DISPLACEMENT

Substantial changes in the environment often transform the patterns of human settlement and may result in population resettlement. Resettlement is the process through which population displaces from their habitat and/or economic activities relocate to another site and reestablish life. In sociology and anthropology as well as in the environmental literature, the term resettlement is used most frequently in the context of policies, planning activities and social research dealing with displacements caused by development. The term appears in such expressions as “involuntary resettlement”, “involuntary displacement and resettlement,” “forced resettlement,” and “resettlement and rehabilitation,” “involuntary displacement and resettlement” and “forced resettlement,” and “resettlement and rehabilitation. Environmental changes that cause resettlement fall into two categories: natural and human-made. The first category includes environmental disaster such as floods, droughts and famines, desertification, volcanic eruptions, and so forth. The second category includes environmental interventions such as the construction of highways, the building of hydropower dams and reservoirs, and the expansion of strip mining, the conversion of forested areas into cultivated agricultural lands and the construction of airports, railways and ports

1. RESETTLEMENT AND REHABILITATION AS PER INDIAN CONTEXT

The concept of resettlement is used also to describe certain development programs that encourage and finance “voluntary” resettlement. Voluntary resettlement has taken place under some government sponsored programs that made available large areas of uncultivated and uninhabited lands to farming families who reside elsewhere and who possess little or no land. Such programs for encouraging voluntary resettlement were organized in the 1960’s and 1970’s in Africa, in the 1980s in Indonesia, in Latin America, and so forth. In 1980, some of us decided to work for the proper rehabilitation of the tribal oustees of the Sardar Sarovar Project (SSP), a large

multi-purpose dam being built by the **Gujarat** Government on river Narmada. The major phases are:

- The 1st policy thought in the year 1985 (During Narmada Bachao Andolan), a Committee under B. D. Sharma: **A policy for displaced tribal communities.**
- 1993 2nd policy drafted by the Rural Development Ministry and in 1994, the draft was revised but did not accept rehabilitation as a right of the displaced.
- 3rd policy drafted in February 2004, as **National Policy on Rehabilitation and Resettlement** for Project Affected Family.
- 4th policy which was frame worked in 2007 and named as **National Resettlement & Rehabilitation Policy, 2007.**
- And now the Government of India had formulating another Draft bill on **National Land Acquisition and Resettlement & Rehabilitation Bill, 2011**
- **World Bank R&R Policy 2000:** The World Bank's OD 4.30 requires a review of the legal framework for resettlement in preparing a resettlement plan
- **ADB R&R Policy 1995:**

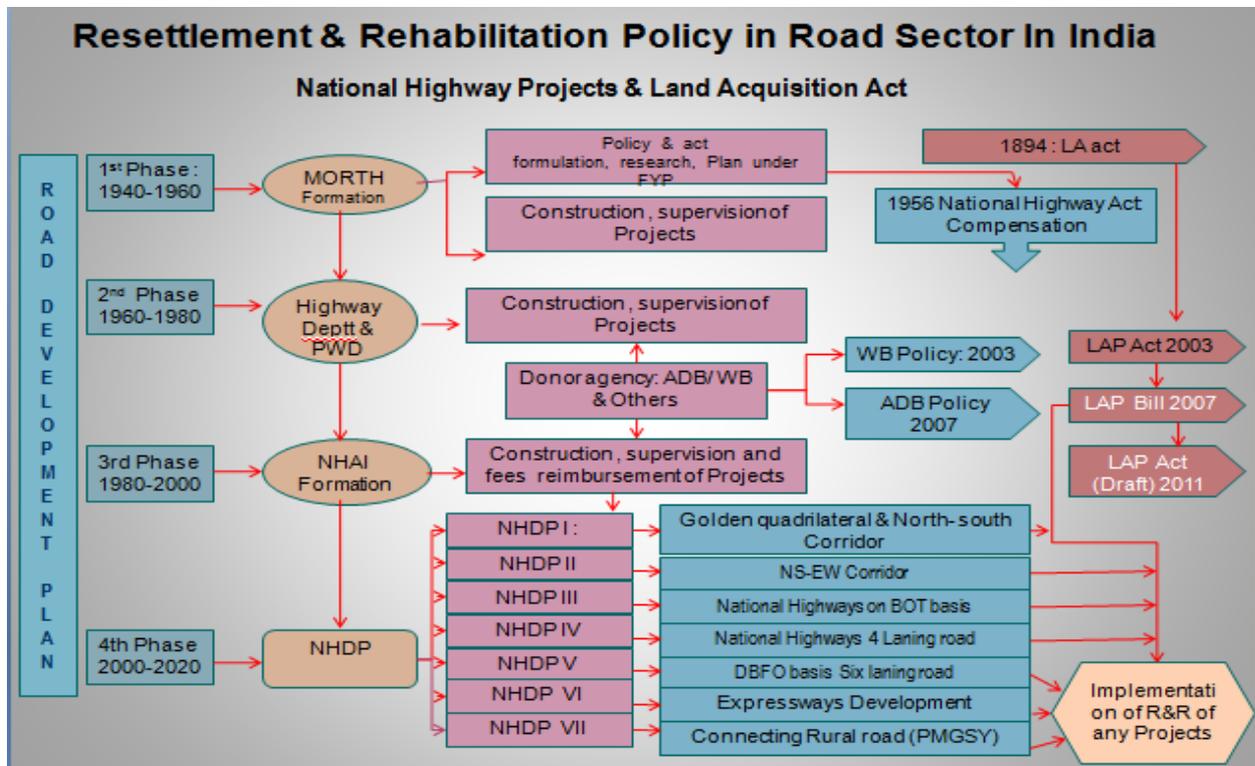

The Comparative assessment of different R&R policy with the purview of Road Projects in India is stated below:

Table 5: Comparative Assessment of Different R&R Policy in Road Project

CATEGORY	ADB1995	WB 2000	PDTC 1985	NPRR 2003	NRRP 2007	NLARR Bill 2011
OBJECTIVE	<ul style="list-style-type: none"> • Avoid involuntary resettlement • Ensure PAF assistance 	<ul style="list-style-type: none"> • Involuntary resettlement avoided. • Providing sufficient investment participation of PAF in implementation 	<ul style="list-style-type: none"> • Involuntary resettlement to Tribal community only. 	<ul style="list-style-type: none"> • Non-displacing or least-displacing • Plan R&R of PAFs including Tribal's and vulnerable sections; 	<ul style="list-style-type: none"> • Minimize of displacement • Rehabilitation package with participation of PAFs special care for weaker section through mutual cooperation. 	<ul style="list-style-type: none"> • Avoid displacement • Institutional mechanism for implementation, monitoring & grievance redressal.
APPLICABILITY	All ADB's operations	Components of the regardless of the source of financing.	Only Tribal Outstees	<ul style="list-style-type: none"> • Applicable in whole India (except J&K state). • If displace 500 families or more in plain areas and 250 families in hilly areas, 	<ul style="list-style-type: none"> • Applicable in whole India (except J&K). • If displace 400 families or more in plain areas and 250 families or more in hilly areas, 	Applicable everywhere whoever is displaced
PROJECT TYPES	significant, not significant or no involuntary resettlement	Two category: Major, and Minor (WB OP 4.12 para 25)	No Classification	No Classification.	No Classification. (only emphasis separate category for linear project)	Classified
AFFECTED FAMILY & AFFECTED PERSON	Affected person people/family /firms/ private have house, land	Any person loses the right to own, use, or otherwise benefit from a-built structure, land	Title holders	Affected family means property substantially affected & residing continuously for a period of ≥3 years	Affected family residence or property substantially affected	Affected family residence or property substantially affected
EMPOLYMENT	Alternative employment for non agricultural displaced	Alternative employment for non agricultural displaced.	Only land	Nil for landless only compensation	Affected families (at least one person per nuclear family) shall get preference for employment	Displaced and other affected families shall be eligible for employment (one member/family)

CATEGORY	ADB1995	WB 2000	PDTC 1985	NPRR 2003	NRRP 2007	NLARR Bill 2011
COMPENSATION IN TERMS OF HOUSE / LAND / MONEY	<ul style="list-style-type: none"> Assistance for relocation, Compensation to replace lost assets, livelihood and income. 	<ul style="list-style-type: none"> Shelter, infrastructure in the resettlement area. Compensation to replace lost assets, 	<ul style="list-style-type: none"> Assistance for relocation 	<ul style="list-style-type: none"> Any affected PAF who lost his/her house due to project, may be allotted free of cost house ($\leq 150 \text{ m}^2$ of land in rural areas, $\leq 75 \text{ m}^2$ of land in urban areas). 	<ul style="list-style-type: none"> Any affected PAF who lost his/her house due to project, may be allotted free of cost house ($\leq 250 \text{ m}^2$ of land in rural areas, $\leq 150 \text{ m}^2$ of land in urban areas). 	<ul style="list-style-type: none"> At least 1/10th of an acre of land free of cost in a resettlement habitat for homestead purpose Rs. 1,50,000/- to each displaced family for construction of house
OTHER BENEFITS	Relocation and transfer expenses. Assistance	<ul style="list-style-type: none"> Vocational training to the member of PAF. Moving allowances. Support after displacement for a transition period. 	Nil	<ul style="list-style-type: none"> Monthly subsistence allowance i.e. 20 days minimum agricultural wages/month/1 year from the date of displacement. Training to PAP. Cattle shed assistance of Rs.3000 Shifting assistance of Rs.5000 	<ul style="list-style-type: none"> Monthly subsistence allowance i.e. 25 days/wages/month/1year Training to PAP. Scholarships to eligible member of PAF. Cattle shed assistance \geq Rs.15,000 Shifting assistance of \geq Rs.10,000 	<ul style="list-style-type: none"> Training to PAF for Type-A, Type-B project. Rs.2,000/- per month Rs.10,000/- each family for temporary sheds. Transportation allowance of Rs.2,000/- Registration cost of land up to 5 acres
R & R BENEFITS	Not specified	Not specified	Nil	Rs.10000/-	Rs. 20000/-	Rs. 250000/-

The different policy and applicable road development projects in India is showing the following flow diagram.

2 RISKS IN DISPLACEMENT:

Given their complexity, the process of displacement, transfer and resettlement involve substantial socioeconomic risks for the affected populations. These risks are:

- **Landlessness**, which occurs when expropriation of land removes the foundation upon which people's productive systems and livelihoods are constructed;
- **Joblessness**, which occurs when resettles lose access to their employment and remain unemployed or underemployed;
- **Homelessness**, which occurs when the displaced people lose shelter and cultural spaces;
- **Marginalization**, which occurs when families lose economic power and other assets and spiral on a downward mobility path;
- **Food insecurity**, which occurs when resettles fall into temporary or extended undernourishment;
- **Increased morbidity and mortality** as a result of the outbreak of relocation-related illnesses, transmitted diseases, social stress and psychological trauma;
- **Educational loss**, particularly by children who because of displacement interrupt school or do not return to school;
- **Loss of access** to the previous common property natural resources (pastures, forests, rivers and quarries ect.), which causes drops in incomes and livelihood levels and increases pressures on natural resources at the resettlement sites; and
- **Social disarticulation**, which bears apart the social fabric and dismantles mutual help networks and patterns of community organization.

Under Section 4 of Land Acquisition Act (1894) or under section 3A of National Highway Act (1956): land can be acquired only for "Public Purpose". "Land acquisition and Resettlement & Rehabilitation" are inevitable process in Highway infrastructure development project process in India as well as over the world. The process of displacement, transfer and resettlement involve substantial socio-economic risks for the affected populations as stated by *Cornea* in resettlement and rehabilitation risk in project development.

Resettlement and Rehabilitation Risk in Project Development

"The process of displacement, transfer and resettlement involve substantial socio-economic risks for the affected populations" impoverishment risks and reconstruction (IRR) model by Cornea

C. DEVELOPMENT VSs DISPLACEMENT

If we can analyse the parent state from where the coinage of R&R policy has evolved the displacement of Road development is very high 23.05% i.e Gujarat (Narmada Bachao Andolan).

Table 6: Category-wise Decadal Land Acquisition in Gujarat 1947-2004

Available reports indicate that around 21.3 million people are internally displaced populations (IDPs) due to development projects in India. IDPs include those displaced by dams (16.4 million), mines (2.55 million), industrial development (1.25 million) and wildlife sanctuaries and national parks (0.6 million) etc (IDMC, 2007). 21% of total shares transport and communication sector development.

Sustainable Urbanism in Coastal Environment: an applied project to expanding urbanized zone of Aracaju City, Sergipe, Brazil.

Sustainable Urbanism in Coastal Environment: an applied project to expanding urbanized of the zone of Aracaju City, Sergipe, Brazil.

Marina Gonçalves Garcia, University of Vale do Rio dos Sinos, Brasil.
Antônio Jorge Vasconcellos Garcia, Federal University of Sergipe, Brasil.

1. Introduction

The beaches are coastal environments with deposits of unconsolidated material, formed by the interaction of the continent (rivers that arrive in port material to the coast) and the sea. The main process includes reworked sediments by waves, tides, coastal currents and wind processes. The beaches are dynamic and sensible environments and responsible for important functions, mainly a special protection for adjacent ecosystems, where lived many species of animals and plants (Souza et al; 2005).

Despite of the human occupation, one of the crucial factors for degradation of natural coastal environment, other factors also operate to the occurrence of degradation processes. Thus, it is necessary to know the sediment dynamics of the beaches and the natural and anthropogenic mechanisms that interfere with coastal processes. After these to be achieved the proposition of preservation program will be important to environments preservation during the urbanization project implementation.

The Sergipe State follows the global trend of occupation and use of the coast for various activities (Carvalho and Fontes, 2006). On coastline of Sergipe, especially in the stretch where they understands the estuaries of Japaratuba and Vaza-Barris rivers, is located the higher income and higher population densities in the state. In this excerpt comprising just over 50km of coastline are located with industrial complex, port, tourism and housing.

Besides the strong anthropic occupation in the area, it is also characterized by the occurrence of mangroves, dunes fields, sandbanks recovered by xerophytic vegetation, sand beaches, becoming this area very sensible under the coastal dynamics. This complex human and natural system asked by multi-disciplinary studies to understand the relationship between the anthropogenic and natural aspects over the coastal zone.

The first approach was carried out field surveys and data requests for recognition and mapping of processes occurring on the beaches over the coast line between the estuaries of Japaratuba and Vaza-Barris rivers. The estuary of Sergipe River, that is located Aracaju City, is located between these both. The results of this investigation identified some critical erosion points, with serious problems of retreat of the shoreline and environmental degradation. Our studies are related to coastal line situated between the Sergipe and Vaza-Barris rivers, where is localized the Expanding Zone of Aracaju City.

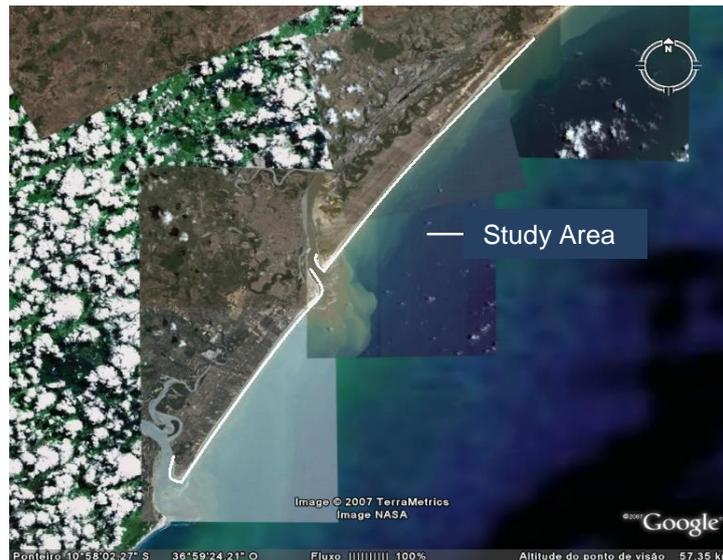

Figure 1: Image representing coastal study. Source: Google Earth, 2004, modified.

2. Environmental Impacts

The human occupation is being one of the natural environments through the construction of urban areas that must rigorously be preceded of studies of Ambient Impact. The Expansion Zone of the Aracaju City (Figure 2), in Sergipe State (Brazil), as well as come being busy without concern with the consequences, in terms of actual damages to the flora and fauna, to the proper environment (coastal dunes and lagoons integrated to the littoral ecosystem) and hydrological systems (underground water and lagoons). Many of the projects that today are implanted in the studied area are compromising the ambient sustainability of the region, making impracticable the pluvial and underground water draining, improving the proliferation of human contaminants agents in the groundwater and of superficial waters (lagoons and mangroves).

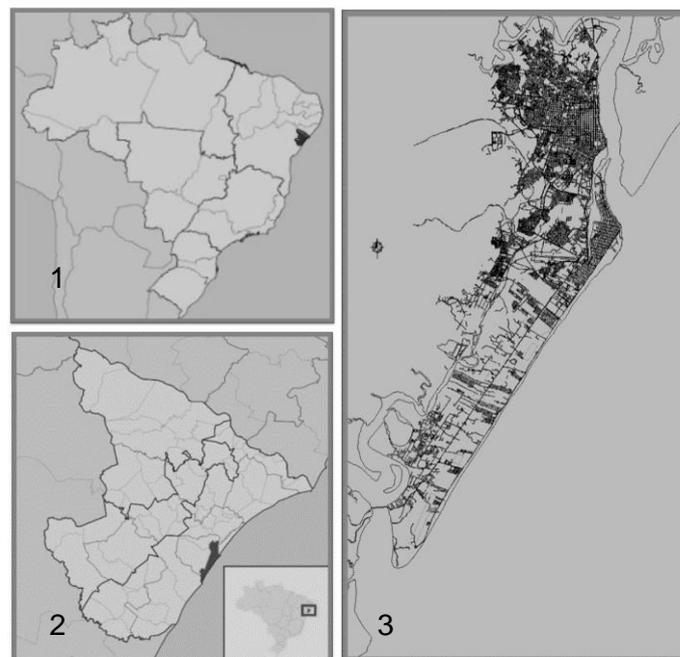

Figure 2: Geographical context of the city of Aracaju highlighting the main routes of connection between the center and Expansion Zone (3), Sergipe (2) Brazil (1).

3. Diagnostic Aspects

The “geoenvironmental urbanism” is a reply to urbanism developed in areas of recognized environmental fragility, as littoral and coastal zones.

The search for solutions that add skills to modify the environment without interfering drastically with the sustainability is the major challenge to be overcome by the society in such contexts of territorial occupation.

The proposal to "urban adequacy of the Aracaju City", Sergipe, Brazil, aims to bring sustainable urban development to the expansion zone, located in a coastal environment defined by 20.70 km².

The coastal area where Aracaju City is located has high environmental fragility. A complex of sand dunes and coastal lagoons, associated at salt marsh vegetation and sandbank, represents a fragile coastal ecosystem that must be maintained and integrated into the process of urbanization.

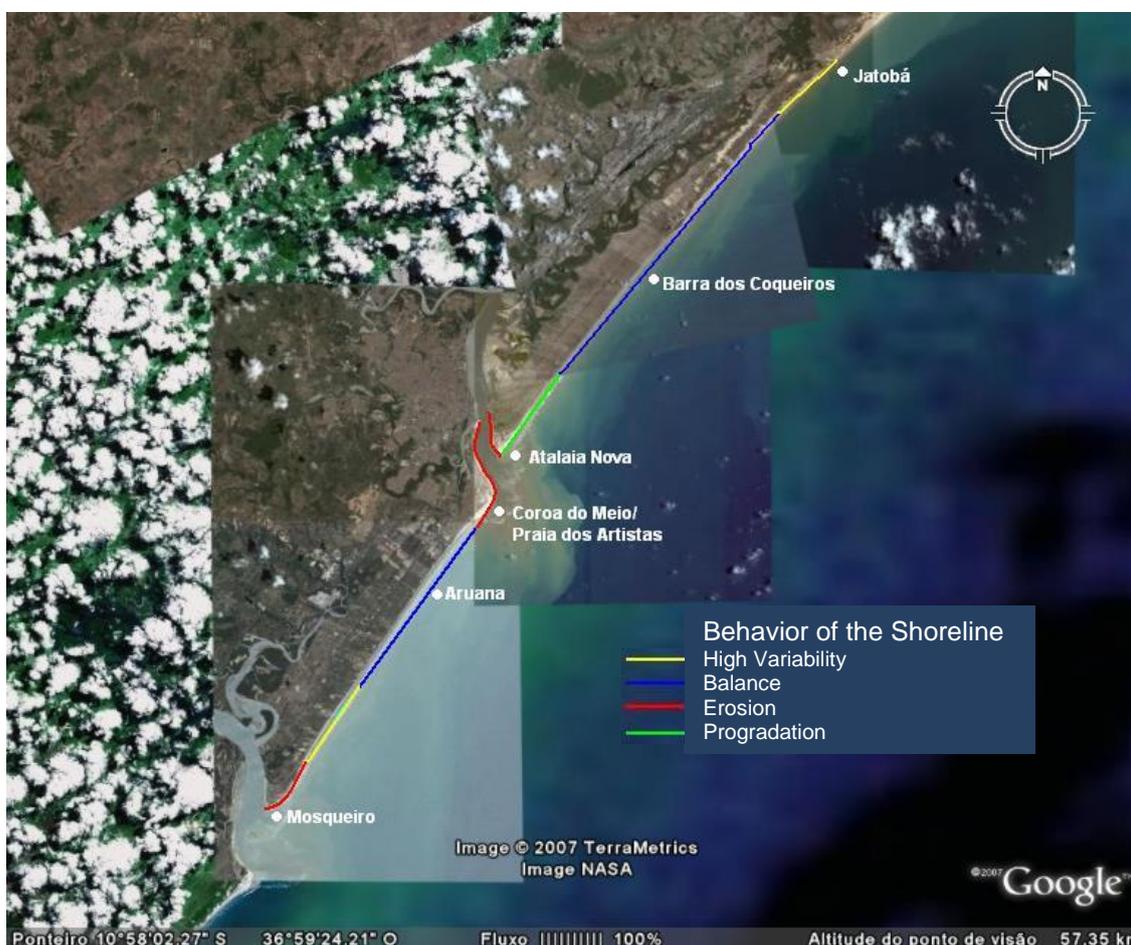

Figure 3: Real behavior of the shoreline in the studied area. Source: Google Earth, modified.

Based on observations and conclusion of this work is possible to conclude that in some areas with greater human interference the biggest problems occur related to the retreat of the coastline, caused due to the changes in the dynamics of these coastal sites. The most critical areas are associated with the estuaries of the three rivers that cover the study area (Japarutuba, Sergipe and Vaza-Barris rivers) (Figure 3).

4. Methods

The diagnosis of problems promoted by disorganized urbanization need to consider the present relationship between the urban and the natural elements destroyed. The mapping of the current state of urbanization and the remnants of natural environments possible to be used as reference points need to be considered to the Sustainable Planning to Aracaju City.

These natural elements were analyzed by aerial photographs (source: performed by ortophotomap Base Aerial Photography and Projects SA), mapping the distribution and height of sand bodies forming dunes and ridges of lagoons and sandbanks areas, and especially the distribution of flora and fauna in each eco-system identified (Figure 4).

The geological and biological knowledge need to be contributed to the proposed distribution and suggestion of new buildings and access roads, in order to ensure the survived of ecosystems and of the ecological ways between ecosystem environments. Another important aspect to be considered is the dynamic of hydrologic flow, both surface and underground, in order to maintain the natural runoff and prevent flooding by the damming of the flows generated by human works, as now recorded without proper planning.

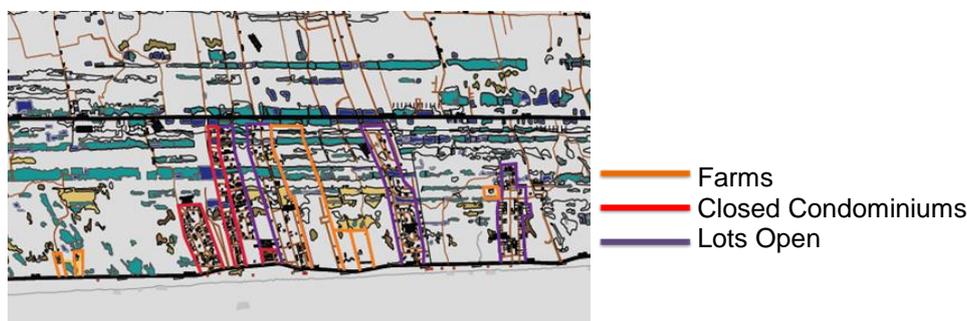

Figure 4: Mapping of the main economic enterprises established in the expansion zone of of Aracaju and targets of the presented suggestions of adequacy in this work.

5. Indicative of Environmental Risk

5.1 Sergipe River Estuary:

Figure 5: Comparative image of the estuary of Rio Sergipe. To observe the occurred changes in the morphology of the mouth of a river. Photos of the years of 1979 (satellite Landsat 2) and 2004 (Google Earth), respectively.

The estuary of the Sergipe River (Figure 5) is the most complex area and further altered by humans across the coastline encompassed by this work. Since the year 1975 the estuary

undergoes modifications to enable the occupation of areas of the mouth. The intervention occurred was the largest landfill of sandbanks that bordered the river banks to make possible the occupation of the neighborhood of Coroa do Meio Urbanized Area (Carvalho and Fontes, 2006).

Among the changes in the dynamic coastal jetties causes, the main ones are: (a) modifying the conditions of the local longshore introducing wave patterns completely foreign to the environment, (b) altering the dynamics in the distribution of sediments, (c) almost completely interrupting the longshore; (Dias, 1993).

All these elements that compose the impacts generated by piers occur in the estuary of the River Sergipe. It was observed that the jetties, events associated with high tides and strong winds aggravate increasingly the retreat of the shoreline in Atalaia Nova and Coroa do Meio, more precisely in Praia dos Artistas (Figure 6).

Figure 6: Advance of the sea on the bars of the Beach of the Artists.

5.2 Atalaia Beach - Aruana Beach - Naufragos Beach - Jose Sarney Beach:

These four beaches, situated between the estuary of Sergipe and Vaza Barris rivers, represent important touristic points. Hotels, restaurants and others commercial and habitation edifications are distributed along these four beaches.

Two of these beaches need special attention, the Náufragos and Jose Sarney beaches., because a large part of the commercial areas is located just a few meters of the influenced zone by the sea during the high tides (Figure 7).

The same problem occurs in parts of the Jose Sarney Highway that was constructed on a dune field's area and very closed to the sea. This highway was completely destroyed near to the Vaza-Barris River estuary (Figures 8 and 9).

Figure 7: This photo evidences the proximity of the comercial point of the beach of the Sarney in relation to the sea during the high tides.

5.3 Vaza-Barris River Estuary:

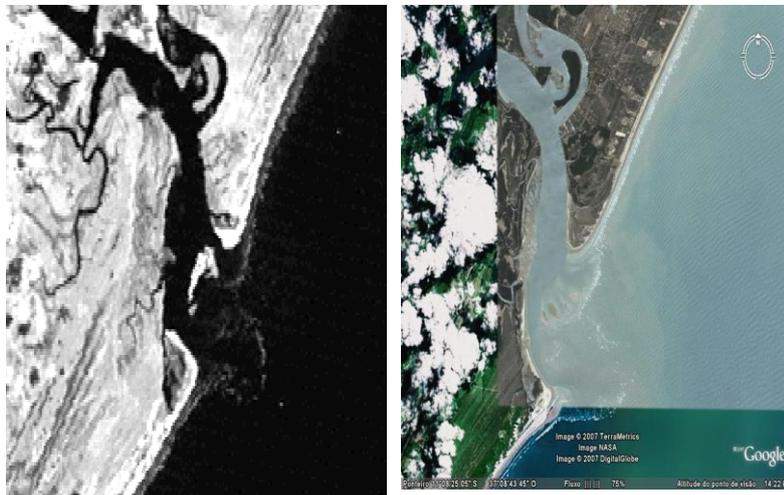

Figure 8: Comparative image of the estuary of the river Vaza-Barris, years of 1979 (satellite Landsat 2) and 2004 (Google Earth) respectively.

The estuary of Vaza-Barris River is characterized as very dynamic coastal environment (Figure 8). The wave actions and coastal currents in the region inhibit the development of mangroves, facilitating the movement of sands and the erosion of the mouth of the river (Carvalho and Fontes, 2006). The construction of the highway did not considers the geologic knowledge about the area (Figure 9 and 10).

Figure 9: Destruction of the track that of the access to the lighthouse of the Mosqueiro. 2007/08/12.

Figure 10: This photo shows the emptiness that was left by the destruction of the highway. 2007/08/12.

6. The Next Step: A Proposal of Urban Adequacy - Aracaju Integrated To the Environment

The Dra. Augusta Maria Vargas, manifest in the following way with regard to the urban development of Aracaju: “Planned in the current days, Aracaju would be vetoed by the ambient evaluation of the current law. However, the construction of a sustainable city is possible and only viable with the elimination of the agreement of the untouchable nature, that “would congeal” Aracaju, as well as of the agreement of the unwanted natural environment, to be conquered and to be artificialized”.

The south region of Aracaju, close to the border with the Bahia state, presents great potential for investments that are being planned and developed, therefore, is a region that needs of a urbanely adequacy plan.

The socio-economic stagnation to the process of urban development to Aracaju city at this area would be as catastrophic as the damage caused to the environment if this development won't happens to be sustainable.

Some Integrated Project could be suggested in advance.

6.1 Residential Condominiums

The concept of “closed condominiums” (Figure 11) is in opposition at the concept of “opened cities”, where the distribution of the building and roads want to be harmonic with the topography and the natural elements as dunes, natural lagoons, coastal and mangrove vegetation. These elements shelter a specific and fragile fauna and flora assemblage.

The territorial divisions adopt three basic principles: 1- The first one that consider the environment, biological and hydrologic aspects; 2- The second one that consider the occupation of the spaces harmonized with the physic environment; 3- and the last one in according with the Brazilian Environmental Legislation (Federal and Local). In this way, the considered territorial divisions must present enough irregular aspects that allow the distribution of the lots of well adjusted form to the environmental aspects.

The natural elements such as dunes, lagoons and vegetation were considered as part of the urbanism project in each territorial division, thus making possible, the preservation of the natural elements and in some cases, its proper revitalization, in according with the determinations of the Brazilian Environmental Legislation (Figure 12).

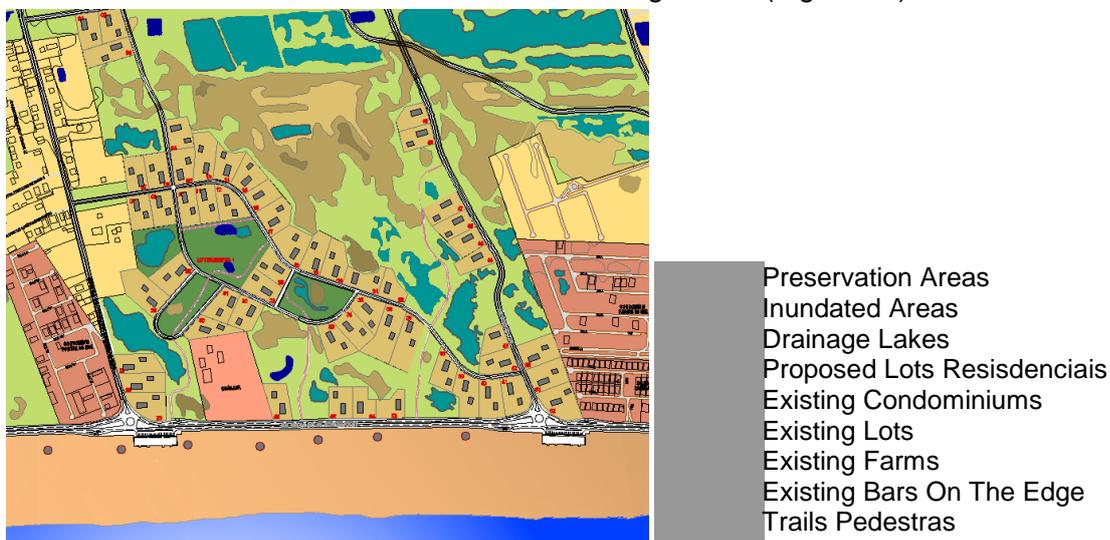

Figure 11: Model of “open condominiums” in urban environment, assuring the sustainable urbanism in coastal environment to zone of expansion of the Aracaju City. Area of environmental preservation integrated with access ways and commercial polar regions.

Figure 12: The Highway of access to the built zones must be planned in order to allow to the flow of vehicles and pedestrians without intervening with the flow of waters (underground and superficial).

Study on Tianjin Public Housing Residential District Planning to Meet the Needs of Migration in Rapid Urbanization

Gong Yuan, Xiao Yu, Lu Li, Tianjin urban planning and design institute, China

1 Background

Along the rapid urbanization, the housing problem of medium and low-income residents in cities has been one of social problems, which is drawing the attention of government in the world for a long time. In present China, both the national policy and market of housing system are in the process of perfecting, which pay more attention to the low-income residents and rural residents. At the same time, planning and design ideas, criterion and statute of low-income residential districts are in the process of promoting.

In late 2008, the General Office of the State Council issued *the Several Opinions on Promoting the Stead Development of the Real Estate Market* and proposed to strive for solving the problem of transforming urban low-income poor family's houses and shantytowns basically for 3 years. And public housing construction has become an important method to solve housing problem, promote healthy real estate market and meet people demand. In June 2010, seven national ministries jointly issued *Guidance on Speeding up Development of Public Rental Housing*, and asked every area to formulate the development plan and annual plan of public rental housing, and organize to carry out by years. Before and after the policy issued, every area has carried out the corresponding plan and construction about public rental housing, the major layout is that the public rental housing groups with large amount and small scale are distributed at every area of a city, which brings inconvenience for the service level and final-period management of supporting facilities.

2 Tianjin public housing Residential District development situation

With own reality, Tianjin formulated the public rental housing developing strategy "reasonably building in central city, large homeland at periphery of city"; particularly, a lot of new homelands are planned at the periphery of the central city since the beginning of 2006 and became an important measure of pushing the housing construction, driving the development of small towns at suburb, and satisfying the housing demand, wherein the constructed Huaming new homeland was selected into Shanghai World Expo in 2010 and shown to the world as the best practice area of city. Now in Tianjin, large-scale public mixed residential districts at edge of city core area with convenient traffic condition, which named new-homeland, are one kind of good choices for the low-income residents as well as medium residents.

Wherein the Shuangqing new homeland is located at the north part of Tianjin and covers 3 square kilometers; the current land mainly includes farmland and accompanies with a few channel and pond. The land is closely adjoined to outer ring express way, 15 km to the center of Tianjin, and 13 km to Tianjin Station; this area has good traffic environment and preliminarily formed a road traffic system formed by a highway, an express road, main and secondary roads; 2 subways in plan will pass through this area, therefore, this area enjoys superior geological position and regional advantages (figure 1).

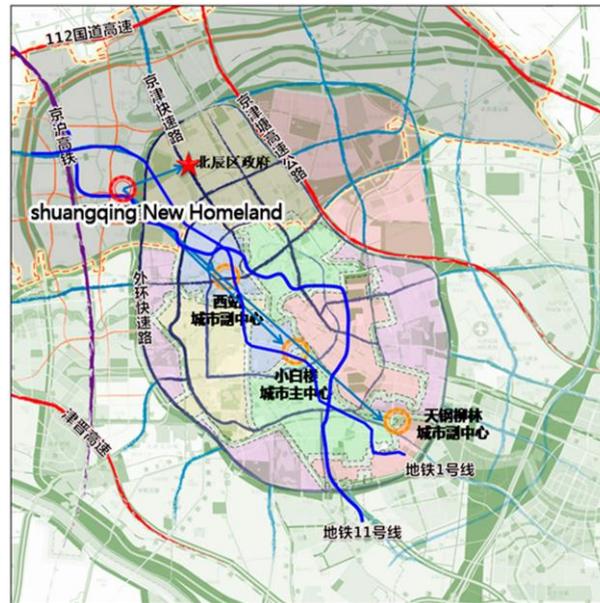

Figure 1: Traffic condition of Shuangqing new homeland

3 case study: planning method and feature of Shuangqing new-homeland

3.1 Model of big mixing residence and small group

By following the security housing model of “big mixing residence and small group”, the residential product includes public rental housing, low-cost commercial residential building and ordinary commercial residential building (figure 2); therefore, the residents of public rental housing can organically fuse with the residents of commercial residential building, and equally enjoy the public service without psychological gap, thereby avoiding the formation of a new slum.

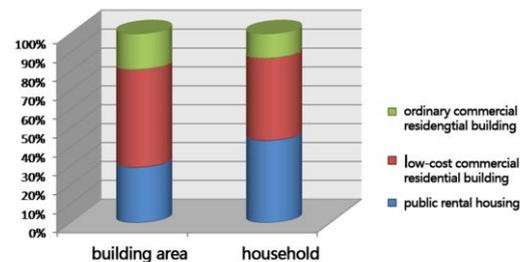

Figure 2: Residential product of Shuangqing new homeland

3.2 Core idea stressing on regional coordination

The homeland security housing community is not alone, and capable of really reflecting the theme of humanistic concern by being integrated to the urban life and regional development. Shuangqing new homeland takes traffic as the entry point in planning, structures the road system for regional balance, contacts demonstrated town in south-north direction, communicates the central city in east-west area, and arranges the new homeland center at the core area of the principal bidirectional axis,

thereby a good grading service relationship with the main center of the area is formed, good service at the inner part of the new homeland is realized, and it becomes an important consisting part of Shuangqing area achieving the development and location of new north livable area of Tianjin central area. Moreover, the travel convenience of new homeland residents is guaranteed, residents can get a job at this area conveniently, and thus residents can live and work in peace and contentment really.

3.3 Respect of ecological environment and local memory

A brand-new security housing community must protect the ecological environment of the base, reserve the existing element of the base, create own cultural deposits, and promote overall quality of the area, thus its health and sustainable development can be realized. Shuangqing new homeland concentrates on renovating the current channel and surrounding land of the base, plans it to be an ecological valley, realizes the communication with surrounding water system, and forms a small cycle of the entire regional ecological system. The planned ecological valley covers about 25 hectares, and 2.2 km long, and 40-200 meters wide; it becomes an important ecological breeding land of the new homeland, links various functions in series, provide a place of leisure and entertainment for the whole community, and realizes the balance of environment and landscape (figure 3).

Figure 3: Ecological valley design of Shuangqing new homeland

3.4 Model of guiding space by green transport

One of the key points of security housing community planning is to realize the green and convenient travel goal. By fully using the traffic advantage of two rails, Shuangqing new homeland arranges a public traffic system connected with the rail stations, and realizes the traffic service system with relatively high accessibility between the new homeland and the central city, the public traffic stations within 500 meters is completely covered by the

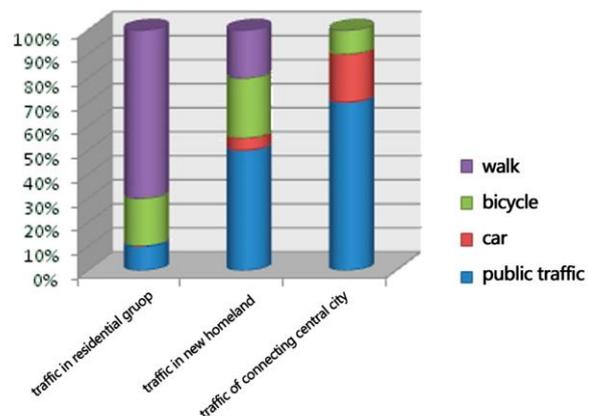

Figure 4: Green transport of Shuangqing new homeland

main traffic network system in the area, and the traffic network system reaches in front of every residential building through a slow system. Finally, the green traffic mode of public traffic, bicycle and walk mainly in the new homeland security housing community is realized (figure 4). The plan is focused on deeply studying the security housing community at the rail station area, has carried out the comprehensive real estate development by combining the rail station. Starting and ending stations of public traffic are planned at the bottom layer to realize the no transit with the rail traffic; the bottom layer and roof platform of the building are properly developed to be the public facility of community service, thereby creating a good landscape service environment. The security housing community is intensively constructed in the form of point type high-rise, so that the utilization efficiency of land is improved and the regional value is promoted (figure 5).

Figure 5: Comprehensive real estate development of Shuangqing new homeland

3.5 Exploration of public service supporting standard of public rental housing

In actual life, there is a big difference among building area per capita of living communities in all levels. In view of this, the demand of living community in all levels shall be considered when the thousand-people index is checked by the planned population number of the residential community. Shuangqing new homeland is in the control index, and carries out the non-differential control with the commercial housing item on community building density, limit height of building, layer height, greening rate, and other indexes for guaranteeing the living quality of the public rental housing area; as considering about the particularity of public rental housing, population per household and plot ratio shall be adjusted, wherein the population per household is adjusted from 2.8 people/house to 2.4 people/house, and the plot ratio is adjusted from 2.5 to 3.0. According to the characteristics of the public rental housing user, individual public supporting facilities are adjusted so that it can accord with the using characteristics of the public rental housing better. It specifically includes: primary school, kindergarten, and other education facility shall lower the thousand-people index by 20% according to the requirement of the households structure; the community culture activity station and resident's activity field shall raise the thousand-people index by 10% according to the age structure and demand of

residents; The nursing home shall be shared with surrounding living area without compulsive requirement according to the age structure of the community residents; according to the income level and travel manner of residents, the parking space for bicycle shall raise by 20%, and the index for locomotive shall lower by 25%.

3.6 Structure of security housing community model of “small family, big community”

Viewing from the design of the house layout to the external environment, the plan of the public rental housing community has performed the directive consideration and design, and pointed out the design standard of the house layout. For the public rental housing is characterized by small living area, a part of living function, including receiving visitors, reception, party, is concentrated in the community, so that the group center of the public rental housing becomes a platform of interpersonal communication, and greatly shortens the distance of residents. Through the spirit molding of the field, residents generate the sense of identity and belonging on this community, simultaneously, safety of this street is enhanced, and the complexity and difficulty level of the high-density community management are reduced within limits. Specific to the supporting standard of the public service facility, the group of 300*200 meters street outline scale is a model community; the new homeland project adds a public canteen, tea room, a washhouse, a chess and card room, a fitness room, a swimming pool, bathrooms, small size hotels, community medical stations, police service room, room for community management, and other facilities in the public facility supporting of every model community; through a part of overhead first layer of the building, the enclosure of corridor of the building, affiliated opening space of the public building, two-level public spaces of group courtyard, and other design methods, a comfortable and convenient public service is formed, a part of demand of internal household space is transferred to the public space of the community, thus the development model of “small family, big community” is realized (figure 6), the requirement on intensive and efficient development is reflected, and the human-based concern is spread.

Figure 6: Overhead first layer and enclosure of corridor for public community

3.7 Assurance guiding system by proper technology

Directing at the characteristics of the security housing community, the new homeland plan stresses on the development idea of structuring an ecological community by a proper technology. The plan designed a rainwater open trench with greening landscape effect, which can make rainwater flow into the water system in the community and is used for supply the water for landscape and wetland landscape. Rainwater in normal year can strive for zero discharge, thereby saving water for greening and irrigation. Reclaimed water through strict treatment can be reused by residents on the basis that every index reaches standard strictly; the treated recycled water will be used for the greening and irrigation of this community, thus the burden of inside water is reduced. The demonstration function of the security housing community in terms of water resource utilization is really realized. The plan adopts the intensive heat supply method to supply heat, preferentially uses clean energy source and intensive solar water heating system; moreover, the soil source hot pump, the underground water source hot pump, and sewage source hot pump techniques are tried. A low-cost energy-saving and environmental-protection ecological circulatory system of new homeland is structured. Through calculation, energy source can save about 13, 000 ton standard fuel yearly by promoting the solar energy utilization and ground source hot pump technology; finally, the ratio of renewable energy sources of Shuangqing new homeland area in the regional energy source consumption reaches 6.7%, which is higher than the 3% development goal of Tianjin.

4 conclusion

Since starting at the beginning of 2012, Shuangqing new homeland has completed the construction of million square meters of public rental housing and low-cost commercial residential building at present; it is predicted that the first phase of the public rental housing and a part of low-cost commercial residential building will be checked in at the end of 2014, and the second phase project of the public rental housing will be checked in at the end of 2015. Along with the gradually construction of Shuangqing new homeland, the planning work and method has performed in-depth thinking on guaranteeing people's livelihood, maintaining social equity, and other core ideas. It is a good try in more concerned about the demand of migration of a lot of low-and-moderate-income population in rapid urbanization progress, and more focused on the housing demand of urban "sandwich" group; and carried out beneficial exploration on slowing down the population pressure in central city and pushing forward the construction of new demonstration area at suburbs.

IR HELENA CHAJA HEYNING

Design for Shrinkage Generating New Opportunities and Wealth¹

Helena Chaja Heyning, The Netherlands

Analyzing trends show that the population in the Netherlands is growing until 2040 (16,7>17,8 million). However over the past two decades the number of residents in the peripheral regions decreased and this decline continues. Out-migration and aging go together: less people, less households, youngsters leaving for the big city never to return, and the old and less educated people lagging behind as well as the poor ones, isolated and stuck. Primary neighbourhood facilities, shops and schools close down. In its wake the peripheral regions also experience economic decline, it speeds up the departure of the able people -they look for a job elsewhere. A shrinking region begets a 'poor image' much to the distress of the local politicians; authorities go through a mourning process of denial first and acceptance in the end. It might take some years before they assess the situation, recognise the new opportunities and start the necessary transformations bearing in mind 'turn a disaster into opportunity'.²

1. Identifying ones opportunities

Decline or shrinking in a region is not the end, on the contrary it can be the beginning of something different: a new élan, a new resilience. For instance it creates new choices: contrasting regions -rural versus metropolitan-, or iconic and rejuvenated landscapes – viz. the German IBA³ Emscher Park in the Ruhr region, or a new economy –viz. the *slow food* economy in Toscana greatly befitting the spatial quality of the region. Or it reconciles a new quality of life: organic growth, a balanced architecture, urban agriculture and *slow living*: 'go *avant-garde* into a slow-village movement'. Energy conservation as part of a *bio based economy*, beneficial for *people* as well as the *planet* and *profit*, makes sense when one has to economise.

Identifying one's opportunities is incredibly important as is sustained and multi-annual community and stakeholders engagement, viz. the German IBA Saxony-Anhalt.⁴ It might take one or more decennia to reinvigorate shrinking or shrunken communities but it's worth the effort as can be seen in the south-east of The Netherlands, the Parkstad Limburg region (Parkstad = Parkcity).

2. History of Parkstad Limburg

Parkstad Limburg embraces the former eastern coalmining district in the south-east of the Netherlands, bordering Germany and Belgium. The landscape shows soft rolling Aeolian-loess hills with originally dispersed farms, castles and hamlets, cut by valleys, brooks and small rivers. For centuries, this rural region was the plaything of foreign powers' strategic interests with nowadays consequences still visible and tangible. The period of coalmining (1900-1965/1975) brought unprecedented prosperity and growth (Facts & Figures, fig. 1), in-migration from all over Europe, authentic mine colonies next to haphazard urban texture and a very intricate and strong social structure –but also dependency on the mine owner (jobs, housing) and the local priest (knowledge).⁵

The closing of the mines (1965-1975) inflicted a tsunami of unemployment: 75.000 jobs were lost. It is still felt today despite the national and European recovery programme ‘Green for Black’ (1970-1980).⁶ This concerted programme truly enough yielded a better labour market and more employment but also a second wave of haphazard urbanisation –chaotic as every municipality pursued its individual goals (fig. 1). It also meant the merciless destruction of the heritage of the mine-industry and the loss of extensive green urban fringes.

In spite of the efforts the region did not overcome the economic depression. From the nineties on the situation was further aggravated by a dwindling and ageing population –many of the young and able people leaving, birth-rates low and budgetary constraints tight as less funding flows into the cities budgets. Rebalancing is not yet in sight. People proud to have worked in the mines, the so called ‘koelepieten’⁷, lost hope a long time ago.

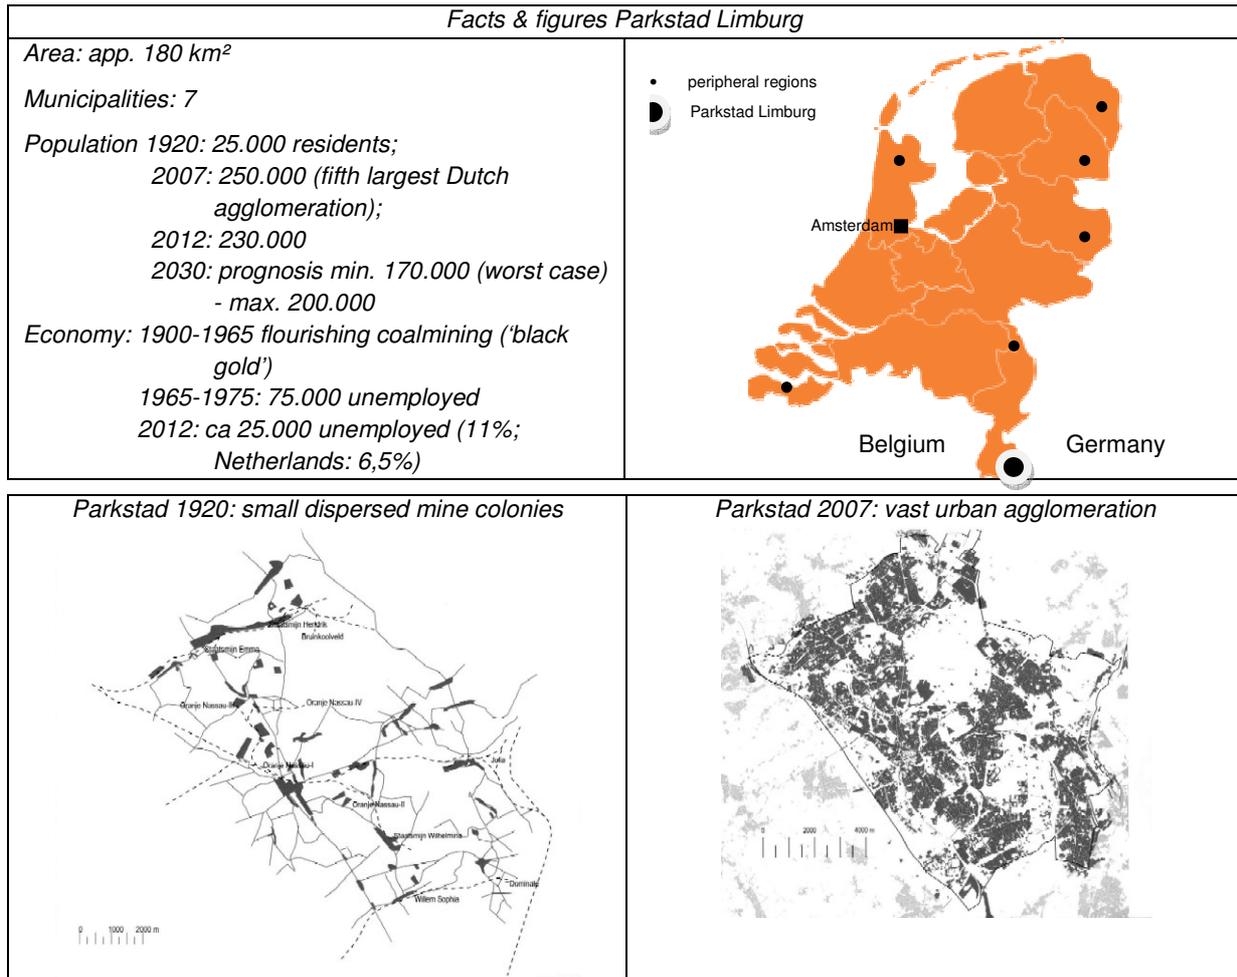

Fig. 1

3. Coalition of the willing

In 2003 a group of local captains of industry pressed the local politicians for a concerted action: ‘There is no more time to lose!’.⁸ December 2005 seven municipalities⁹ decided upon a close co-operation –the Parkstad Limburg region was born: *a coalition of the willing*. Their first aim and foremost overriding objective was to tackle the (bad) economic situation as ‘the inhabitants of the region deserve a better perspective and a safe income’. It was closely followed by the identity-mantra ‘make use of the inherent qualities of the region’ important for the strategies of perception.

However the Parkstad Council had no ready-made solutions available to the Parkstad problems, it was a virtually uncharted territory in The Netherlands. So both strategy and best practices had to be invented from scratch –a massive project.

4. Parkstad Laboratory: ‘what works counts’

The Parkstad region became a ‘laboratory’ creating and testing new strategies, scenarios and policies as well as instruments and toolboxes specifically tailored to this situation of structural changes. Technical surveys were followed by plans and projects, by burden-sharing; piecemeal shared budgets were put together and decided upon etc. Some instruments included so called ‘unorthodox’ measures as the combination of economic decline and a shrinking population had to be tackled in unconventional ways -sometimes by disobeying official rules... As was said ‘success is more important than democratic legitimacy. –what works counts’.¹⁰

5. Reinventing *good governance*: consensus, participation & mental switch

It was evident that technical fixes alone were not enough. The commitment and cooperation between seven autonomous municipalities deeply divided by historic events and set apart by the imminent threat of a municipal fusion was essential. Granting, giving and taking, became a *condition sine qua non*. Much time was needed to avoid falling prey to hurried, political posturing as well as the destructive Calimero effect between the one big city (Heerlen) and six smaller ones.

The different working constellations and alliances with the business community and the civic institutions also required a boost in mutual confidence and a change in the culture of communication & public relations as well as in power-sharing: who is taking the lead, who decides. Many multi-coloured coalitions and alliances were build, codes of conduct for all sides developed, old frictions set aside. More than once mediation of conflicts and values was needed.

A third important group were the residents, many weary by too long a period without a perspective. Quite a few families had a record of three generations stuck to unemployment benefits, an antidote for one’s sense of self-worth. The objective ‘to make people want to act’ (mental switch) was not achieved itself and the self-motivation was not implemented itself. A wakeup call became urgent and was heralded by the Parkstad Council in 2011 by the kick off of an IBA. This IBA, like the Sachsen-Anhalt one, focuses on energising the citizens in Parkstad to create entrepreneurship (jobs), ambition, self-confidence and innovative ideas that give an impulse to the quality of living and working in the Parkstad region. People are addressed as potential stakeholders and not just as those affected by planning -new forms of cooperation and new stakeholder alliances are indispensable, especially in informal planning, which is typical of urban redevelopment.¹¹

The challenge of commitment and cooperation between all parties was a fundamental one, in one word ‘reinventing’ *good governance*.

6. Vision and strategy

The awareness grew that a comprehensive and integrated vision and strategy was needed encompassing employment, housing, infrastructure, amenities, retail and leisure etc. as the multifaceted decline affected all sectors. All programmes were in need of a coherent adaptation, transformation and restructuring as well honouring the paramount decision of the

Parkstad Council to choose quality of life and strengthening the identity of the region and its selling points, the beautiful landscape/nature, historic and authentic mine colonies etc.¹² A strategic spatial –economic perspective had to bond all upcoming ideas and initiatives. The Parkstad Council knew it would take time to implement such a perspective –maybe decades. So they didn't want a rigid template ('blueprint') probably out-dated within a short period but asked for a set of principles ('conscience') to guide future opportunities and dynamics. It needed small steps not cast in stone and useful for both the fat years and lean years ahead. The Council also requested some freedom for the individual municipalities to act on the local level. It was understood that the large and complicated regional projects needed a joint effort. A small professional and high quality regional office (Parkstad bureau) was set up to guide and coordinate the inter-municipal working groups, to prepare the policy and decision-making for both the Parkstad Council and the municipal Councils and act upon it.

7. Concerted action, major tasks and challenges

In a concerted action the initial situation of the region was thoroughly explored: its major assets, problems, alternative solutions, distribution of tasks and its challenges as well as opportunities regarding economy, spatial planning, housing, quality of life, nature and landscape, cultural heritage, etc. Along the way a myriad of questions appeared: what (limited) resources do we have, what investments are crucial to ensure the resilience of the region and its inhabitants, what should be implemented first (priorities, multiplier effects) and what follows and who can invest, when and how much? Where do authorities come in (top down or as facilitators?), where do trade and industry and their CEO's take the initiative, where the historically social-sturdy local communities and their citizen-stakeholders (bottom up movement).

The connection with nearby (rival) cities like Maastricht and the German and Belgium regions too had to be dealt with: Parkstad is not an island, tuning in with nearby big agglomerations like German Aachen (*Städteregion*, 800.000 residents) is necessary and can be fruitful. As it is said 'the future of Parkstad is cross border'.¹³

8. Strategic spatial –economic Development Perspective: core themes

In the Development Perspective the spatial – economic strategy for the region was explicated into so called pillars (icons fig. 2) and principles of restructuring (icons fig. 3).

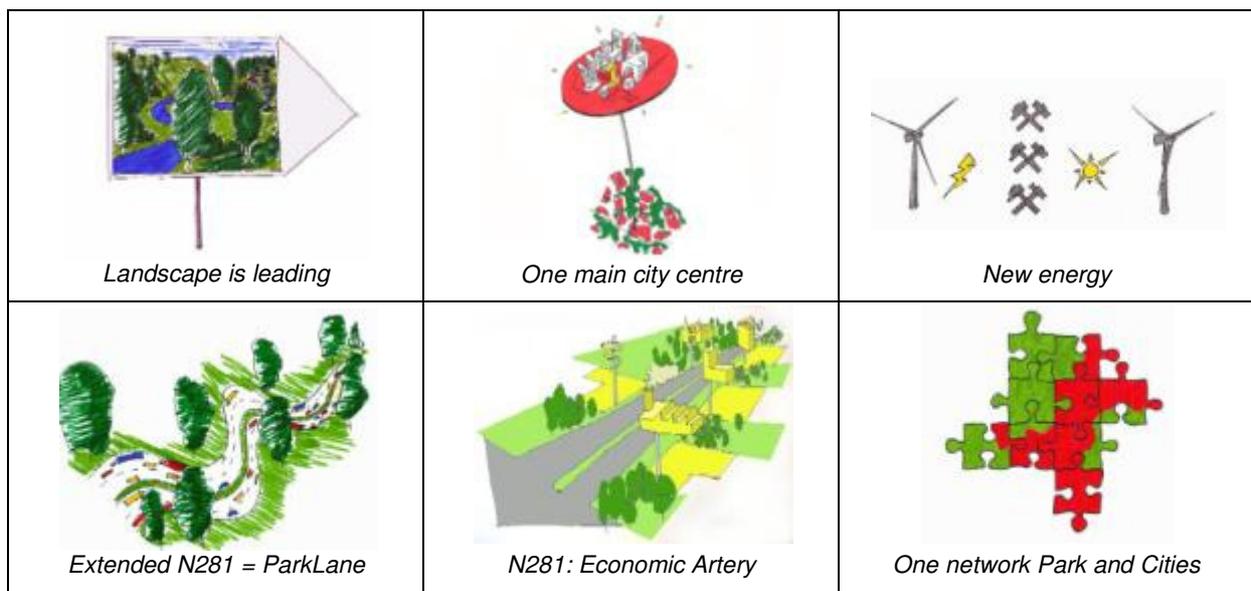

Fig.2: Pillars

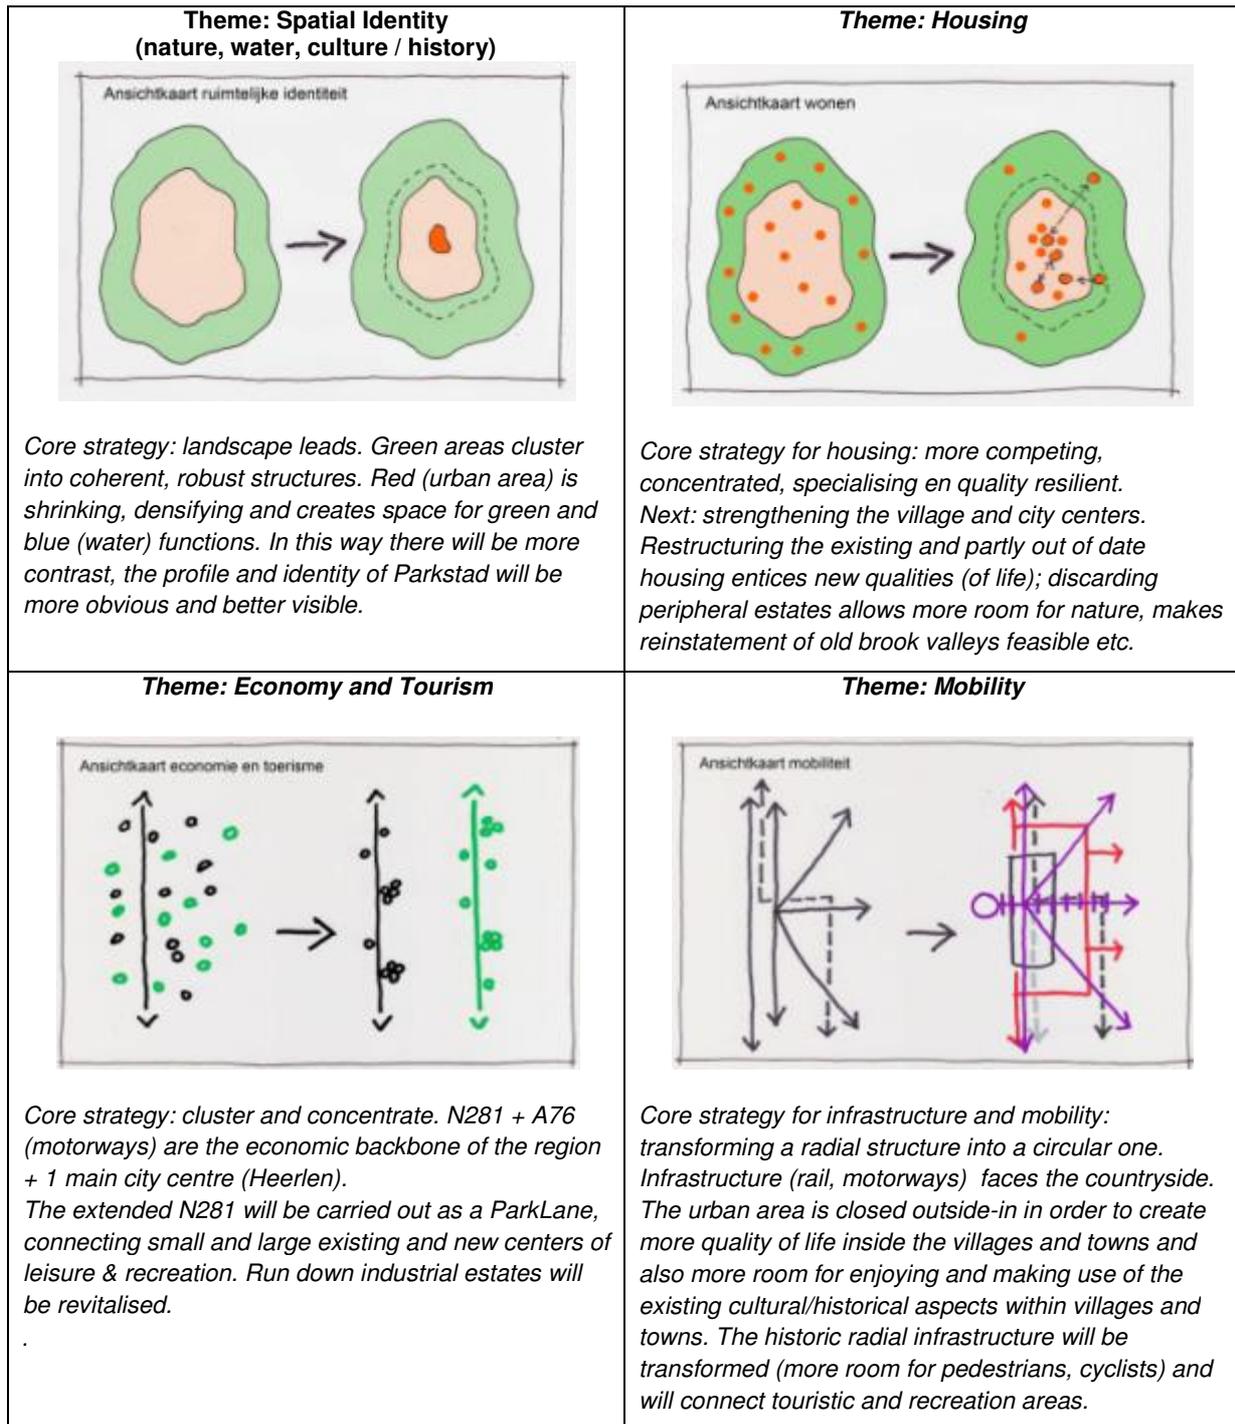

Fig. 3: Principles of restructuring

Pillars and principles are the ‘conscience’, all future initiatives will be put to the test with these interacting ‘doctrines’. Above pillars and principles is the omnipotent umbrella of ‘sweet and sour to be evenly shared’, i.e. fairly distributing the gains and losses of transformation and willing to make compromises in the process. Shrinking often means redistribution –and redistribution means ‘negotiation’.

Note: citizens do understand icons and/or (comic) strips sometimes better than complex maps or tedious long policy reports –so if it helps develop a strong visual language. Storytelling is another useful instrument as are social media.¹⁴

9. Parkstad on its way

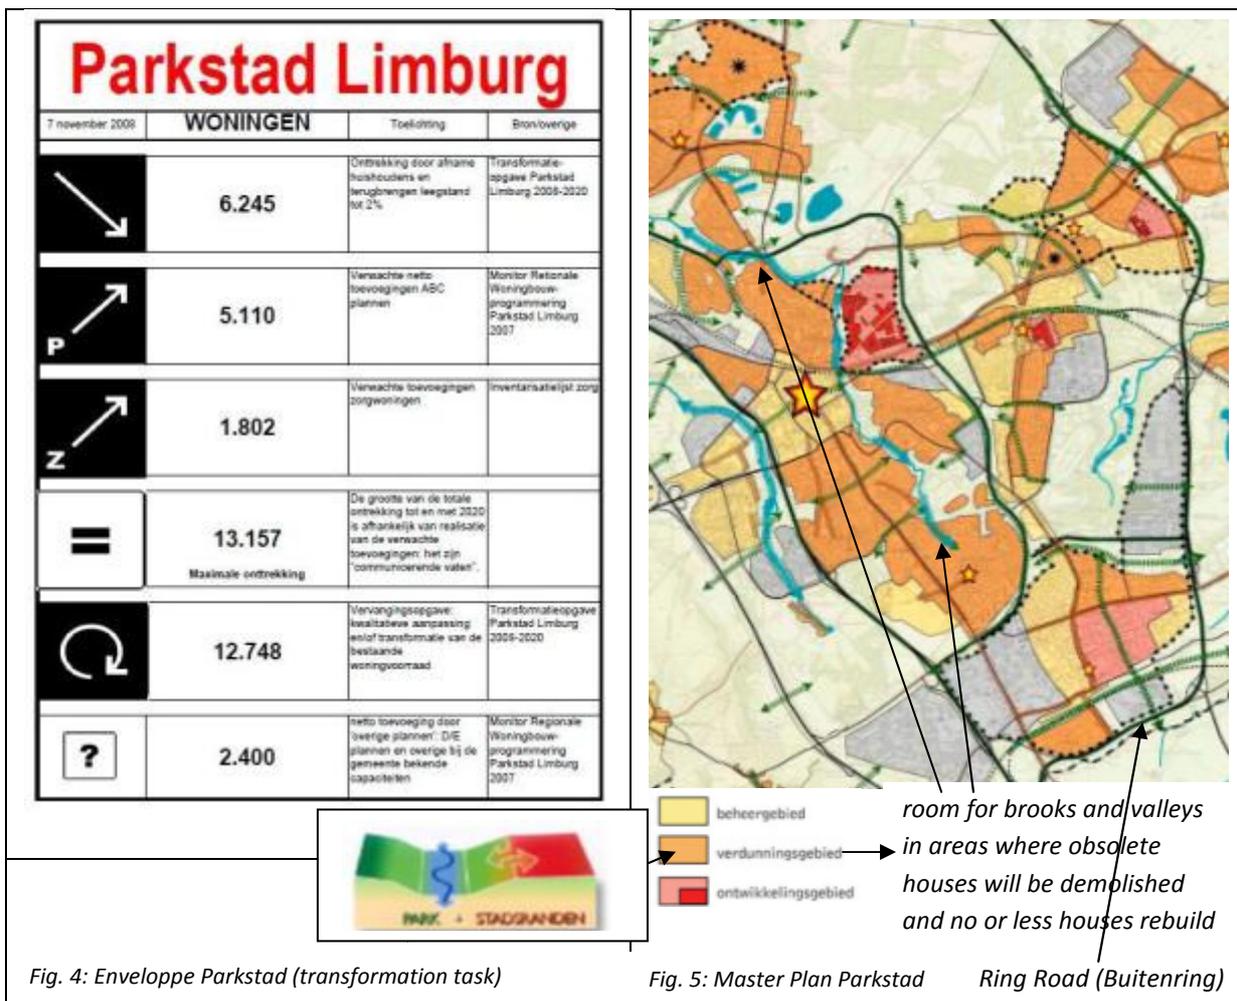

The Development Perspective was laid down in maps, schemes, clarifications and instructions. Connected is a roadmap showing:

- what issues are the responsibility of the local municipalities including a realistic timetable (e.g. small local developments, services & maintenance)? If wanted/needed every municipality can ask for assistance from the regional bureau experts;
- what issues need extensive cooperation between neighbouring municipalities, as well as the help of the experts of the regional bureau (2008: 6 large inter-municipal development projects and restructuring zones)?
- In particular, for which pilot projects is the regional bureau accountable, and the municipalities in assisting and monitoring them (e.g. regional infrastructure –train, motorways, trans-border activities).

Next to the list of projects annual and multi-year programmes coupled with budgets were drafted, to be reviewed yearly.

10. Plans and projects: 2 examples of mutual-gains

Given the nature of this case study only a fraction of the plans and projects the region and its partners developed, tested and made to measure, can be shown. The focus here will be on 2 examples regarding the quality of life and the green identity incorporating the relevant 'pillars' and 'principles'.

Take the case of the many former brooks and ecologically rich valleys/ That past era disappeared in the wake of vast and often ruthless urbanisation robbing the region of its green/blue *genius loci* and identity.

Too much town for too few residents was what a thorough survey and prognosis (2007) showed: a large surplus of houses, many not meeting present standards, as well as a high vacancy rate. The surplus amounted to some 13,000 houses (of a total of some 114,500 [2007])¹⁵ to be earmarked for demolition between 2007-2020 and a mere 6500 new houses were built in that same period (instead of 20,000 new houses foreseen in municipal plans ...).¹⁶ Complicating factor: 30-40% of this obsolete housing stock is private property.

After several heated public debates it was decided that, provided there is enough money available to compensate the owners, the obsolete and non-historic hot-spots would be demolished as they do not meet present standards and often downgrade their neighbourhoods socially, physically and/or financially (lowering values of nearby estates).¹⁷ It follows that if such a neighbourhood coincides with a place where nature and hydrological system are squeezed and dented by past urbanisation, the old bygone green-blue 'connections', brooks and valleys, will be reinstated in full glory and given back their authentic and historic identity (*genius loci*).

The same formula applies for the out of date peripheral housing estates from the nineteen sixties, most property of housing cooperatives: thwarted by high vacancy rates. They would be demolished too and the earth given back to the surrounding landscape and nature (fig. 3 Theme: Housing).

Where buildings are removed, landscape modules are inserted according to the opportunities that arise, gradually generating the building blocks of a future urban landscape. This way the multifaceted desire for a life on the outskirts of town can be realised in inner-city locations.

Caumer Brook

Brunssum heather-covered moors near German border

In the case of the new outer Ring Road (Buitenring) several planning principles were successfully combined creating a cascade effect of added value:

1. building a 'green' Park Lane (fig. 2) deviates the present heavy through traffic from the villages, thus
2. enabling the restoration of the historic, pedestrian friendly profiles of local roads, and
3. giving the citizens more quality of life: less noise, stench, more room for biking, walking and tree planting,

and also:

4. enabling to remove old dilapidated industrial estates on the track of the ParkLane and
5. giving better access to some viable industrial and leisure areas, impetus for new investments,

as well as:

6. creating the opportunity honouring the principle of 'green for red' (according to Dutch EIA) to connect the Parkstad nature reserves with the nearby German national park by calling upon the compensation acres,
7. the result: a vast trans-border nature area -more than the sum of its parts.

11. Lessons learned: looking back and looking forward

The closing of the coalmines in 1965-1970 was a horror-scenario for the people of the Parkstad region. The following shrinking of the population, the loss of jobs and the declining economy were severe blows hard to overcome. Every shrinking region will have its own specific story and fitting solutions, nevertheless what can one learn from the Parkstad experience?

- A strong (regional) leader(s) is urgently needed, one who wants to take on this demanding task. It's all about audacity, passion, charisma, optimism and political ingenuity. Even then not everything will be plain sailing but at least things start 'moving' and 'work can be in progress'.
- It is recommended that central government shows compassion from the beginning –a 'wait and see' attitude (or worse 'it's your own fault') will damage citizens' trust.¹⁸
- As for (local) authorities: in periods of growth and prosperity (high tide) 'sharing the abundance' is a less brittle and strife-ridden subject than in times of economic stagnation and decline. A low tide induces 'fighting for the bacon'. Sharing 'sweet and sour' in a low tide period asks a lot from previous autonomous municipalities (as in Parkstad), but cooperation and acting *in unison* is inevitable as there is always the danger of a third party catching the most wanted prey.
- Cooperation, exchanging knowledge and expertise can ease the burden of the workload.¹⁹
- By cooperating and networking, the shrinking towns and villages can accumulate 'borrowed size' and a sizeable amount of 'social capital'.
- Don't wait too long to get the residents activated and involved; authorities need residents' support (pioneers of urban redevelopment) and their self-confidence (social capital).
- Note that citizens understand icons and/or (comic) strips sometimes better than (complex) maps or (tedious long) reports/policies; so it helps to develop a strong visual language and to use social media. Children are very smart in expressing the essence –this raises new generations of understanding as well.
- Best practices are an excellent instrument to show that 'things happen': Yes We Can! One should celebrate these moments beyond the cosy circle of politicians and tech-nerds.
- Leadership and vision, self-confidence and a 'can do' attitude are of utmost importance.
- The aspect of 'urgency' and 'focus' on matching problems with solutions in a fragile situation are important. As is the 'framing of the message', it is essential to get residents energised and involved in their own bright future.²⁰
- Seeking to manage development without growth requires flexible concepts and dynamic implementation strategies, if needed small steps not cast in stone.

And last but not least: the structural tuning of complex problems in a long timeframe asks for steady and long term cooperation. That cooperation can be a happy marriage if it's *con amore*. Things then can happen. A painful foot-dragging relation has less output. Nobody wants to be part of a tragedy, everybody wants to father a success!

Notes

¹ The case study is based on the article 'Regionale strategieën Parkstad Limburg: een nieuwe toekomst!' by HelenaChaja Heyning et al. (2007). In 2007 the author was in charge of the Parkstad Limburg 'Infrastructure & Regional Planning' programme and task force.

¹⁴ Every day the Amsterdam City Lab sends a promising message to its followers: innovative ideas, things to be seen, etc.

¹⁵ E,til (2009), Sociaal-economische doelgroep en kernvoorraad Parkstad Limburg.

¹⁶ As can be expected numbers change over the years: a recent prognosis (Stec [2013], Financiële arrangementen voor de demografische transitie) shows that 20.000 houses have to be demolished in the period 2013-2030 as the population will shrink 15%.

¹⁷ A draft decision is being prepared (2013): building a new home has to be matched by pulling down an obsolete one.

¹⁸ Note: compassion can be manifold, f.e. 'help in the laboratory', specific legislation rising the occasion or a financial contribution ('seed money')/subsidy to overcome the situation and/or create a multiplier effect. In the period 1970-1990 there were all kinds of state subsidies for urban renewal and regeneration but not for housing demolition in shrinking regions.

¹⁹ The Parkstad bureau and its interdisciplinary work- and decision groups in which civil servants, aldermen of all municipalities and sometimes private enterprises participate, are very effective.

Affordable Housing Opportunities in Small Indian Cities- A Case study of Industrial Migrant

Author: Kana Ram¹ National Institute of Urban Affairs, New Delhi, India

Abstract

Houses are the basic human need. It has been one of the priorities of the Government of India (GOI) right from the First Five Year Plan till date. Government has provided various fiscal incentives to promote housing on both, the demand and supply side. Since independence, a large number of schemes have been launched but target of affordable housing for all has not been achieved. What can be done to make housing more affordable? For the owner-occupied sector, lack of affordability is a problem for Lower Income Groups (LIG) and Middle Income Group (MIG) in most of the cities of the country. However, this paper shows that excessive affordability is not a problem in small cities unlike metropolitan's cities. Till now the main concerns are metropolitan's cities and this paper argue that small cities are often neglected with respected to affordable housing. If we ignore our fast growing small cities now, which are potential metropolitan cities, then the future may become more critical in terms of providing affordable housing to inhabitants of these cities. The Government is concern on metropolitan cities as compared to small cities, which has to be change for a balanced and sustainable future urban development.

¹ Kana Ram (kgodha@gmail.com) is a Research Associate at National Institute of Urban Affairs, New Delhi, India

Introduction:

The growing concern over the affordability of housing among the people arises from two factors. First, housing is the single largest expenditure item in the budgets of most families and individuals. The average households allocate roughly one-quarter of their income to housing, while poor households commonly devote half of their incomes. These high proportions suggest that small percentage changes in housing prices and rents will have large impacts on housing consumption as well as welfare of household. Second, the recent trends indicate that in many urban areas have experienced unprecedented price hike which further makes the dream of an affordable house beyond the reach of common people.

In India, affordable housing is raised as a major policy concern of the government in "National Housing and Habitat Policy" (2007), but housing planners are apprehensive with the rhetoric of "affordability," which jumble together in a single term a number of disparate issues like the distribution of housing, prices, quality, income, purchasing power of households, and their knack to scrounge money from housing finance institution affecting housing markets severely. It's further affecting the supply of new or refurbished housing to the beneficiary resulting in a choice and cost mismatch. These complex issues raise difficulties in interpreting basic facts about housing affordability. For example, the rapid rise in the price of homes clearly made homeownership a distant dream to many buyers, but it has also greatly reduced the financial costs of home-ownership to a much larger group of existing landlords, by providing substantial capital gains. Among buyers, the large share of income devoted to housing surely reflects their voluntary consumption choices, as compared to the consumption of a publicly determined minimum quality and quantity of housing, for other consumers in this sector. However, the poor group of households would choose a lower quality of housing given their opportunities; one might conclude that the incomes of the poorest households are grossly insufficient to afford the socially imposed minimum standard.

Affordable Housing: Affordable housing or low cost housing is a widely discussed issue in India today. This generally refers to cost effective housing, based on low cost technology that ensures similar quality and durability; as compared to more commonly used technologies. In India, affordable housing policy is primarily designed to provide low cost housing to lower middle income groups, lower income groups and economically weaker sections of the society. The involvement of government authority is likely to be prominent. As per the latest definition, households having an annual income of less than Rs 1.5 lakh per annum are termed as LIG and hence households belonging to EWS will be further down in terms of income classification.

The concept of affordable housing, in contrast to low cost housing is applicable across all income categories. The affordability of a household in a given location is an interactive outcome of the house price, household income, spending and saving behaviour and other demographic factors like size of the household. It is recognized that affordability is relative to geographical area, time and income category. Thus defining affordable housing continues to be a challenge for real estate operators, policy makers and planners of the country.

In developed country like the US, a frequently used norm for affordability is a residential unit costing 30% or less of a household's gross annual income. In sharp contrast the Housing Development Finance Corporation Limited (HDFC), the largest lender in the housing finance market in India, considers five times of annual income as the maximum affordability of a households. For example a households earning Rs. 3 lakh a year, should afford a house cost at most Rs. 15 Lakh.

Even though there is no concurrence on any standard affordability norm in India, the fact that there is a pressing need to identify the affordability of various income groups in different cities is acknowledged by major stake holders in India's real estate industry. Given that, between 1991 and 2001, 79% of the new jobs were generated in urban areas, and the urban population in India is growing at a brisk pace, the focus of affordable housing is expected to be more urban centric.

Affordable House for Whom?

The household income is the major criteria to measure affordability; the affordable housing is not restricted to the lower middle income class, but spreads across levels like LIG or EWS. However, in India, affordable housing is perceived to be related to low and lower middle income households and relates to the affordability of the households. This shows that the maximum demand for affordable housing is for LIG and lower middle income groups of the society.

Table 1: Distribution of Housing Shortage among economic category - 2012

S.No.	Category	Distribution of Housing Shortage among different economic categories as on 2012	
		No. (In Millions)	In Percentage
01	EWS	10.55	56.17
02	LIG	7.41	39.45
03	MIG and above	0.82	4.36
04	Total	18.78	100.00

Source: Report of the Technical Group on Urban Housing Shortage (TG-12), Ministry of Housing and Urban Poverty Alleviation, Government of India

Table 1 illustrates estimated housing shortage in India as on 2012. In India in spite of the quantum leap in the housing stock in the country, the housing shortage has also been increasing. According to the Report of the Technical Group (12th Five Year Plan: 2012-17) on Estimation of Urban Housing Shortage, the total urban housing shortage in the country in 2002 was 18.78 million dwelling units and 95 percent of this shortage pertains to the economically weaker sections and the lower income groups of the society.

The shortage of affordable housing is getting worse instead of better. The country's urban population of 285 million has multiplied by five over the last 50 years. It is projected that it will continue to increase at this fast pace, and that 50 per cent of all Indians will be living in urban areas by the end of the next three decades. So, if the shortage for housing for the lower income segment stands at 25 million today and there is no increase in the pace of supply of affordable housing launches, what will this figure look like in 30 years?²

A Case study of Industrial Migrant: A small town Bhilwara

Bhilwara is the 'Textile City of India' and one of the most industrialised town of Rajasthan. The textile industry is the back-bone of the city's economy. However, textile industry is the second largest employer in the organized and unorganised sector after agriculture. Over the past few decades Bhilwara has emerged as Rajasthan's premier textile destination. It is currently India's leading Polyester-Viscose suiting and yarn exporter. Bhilwara is a demographically diverse city and one of the fastest growing cities of the state. The favourable weather conditions and historical development have facilitated investment in the city. Bhilwara is the seventh largest city of State having a population of 280185 (Census-2001). The growth rate of the city in last three decade is more than 50%.

The textiles sector, being the prime economic driver of the city, is directly responsible for the increase in housing affordability among the city's various demographic segments. Over the past decade there has been a paradigm shift in the attitude of home buyers. The economic growth has resulted in an increase in the city's per capita income, promoting fast development that has changed the home buyer's outlook. The traditional conservative consumer mindset has been replaced by a desire for instant gentrification, resulting into frantic activities in housing market. Home buyers in Bhilwara represent a mix of end users and investors, whereas previously the former constituted the majority of housing demand.

Demand perspective: A primary survey of tenant households was undertaken by the author in 2011 in Bhilwara city. According to this survey tenant households, who are considered to be the most potential buyers of residential houses, indicate certain household characteristics. It has been observed that most of the sample households are nuclear in

² <http://www.thehindu.com/business/Industry/a-growth-engine-of-the-future/article4912425.ece>

nature, with rest belonging to the joint family type, with an average household size of 5.3. Another important issue worth mentioning is that more than one third of the respondents are migrants and it highlights active participation of migrants in the process of house purchase. Among the households surveyed, 92% represents the migratory population of the region. Of this, nearly 92% of the households have migrated to Bhilwara for job in textile industries and 8% for other reasons. The average number of years for which a migrant household has been living in the Bhilwara is about 7 to 8 years.

Table 2: Distributions of Sampled Households According Types of Occupation

S. No	Types of works	% of Respondents
1	Self employed	14.4
2	Government service	7.8
3	Labour	10.0
4	Vendor	1.1
5	Private service (Factory)	63.3
6	Others	3.3

Source: Primary Survey, 2011

Table 2 illustrates the distribution of the sampled households according to the type of occupations with a majority of 63.3% of the households working in textiles industries and spinning mills in Bhilwara, while 14.4% are self employed, 10% are labour category and 7.8% are other major categories of occupation.

Table 3: Distribution of Sampled Households According to Total Annual Income

Annual Income of Households	% (Sampled Households)
< Rs 39600	12
Rs 39601 to 87600	59
Rs 87601 to 174000	26
> Rs 174000	3
Total	100

Source: Primary Survey, 2011

Table 3 shows the distribution of sampled households according to their total annual income. 59% of the sample reported to have an annual household's income in the range of Rs 39,601 to 87,600 and 26% between Rs 87,601 to 1,74,000. 12% of the sample households reported to have an annual total income, less than Rs 39600, which comes under economically weaker section of the society. Only 3% of the sampled households recorded

Rs 1.74 lakh and higher annual income. This means that most of the workers, who are working in textiles and spinning industries, are earning less than Rs 10000 per month.

Table 4: Percentage Distribution of Current Residence Type based on Annual Income

Annual Income of Households	Single room	Room With kitchen	1 BHK	2 BHK	3 BHK	> 4 BHK
< Rs 39600	5	1	1	0	0	0
Rs 39601 to 87600	36	13	10	3	1	2
Rs 87601 to 174000	6	5	1	7	0	4
> Rs 174000	1	1	0	2	1	0
Total	48	20	12	12	2	6

Source: Primary Survey, 2011

Table 4 indicates the distribution of the sampled households according to current residence types and annual incomes of the family. The table indicates that majority of residents (48%) are staying in single room. As far as the house types and incomes are concerned, out of 48%, 36% of the sampled households are staying in one room who are earning Rs 39600 to 87600 annually. 20% of the households are residing in one room kitchen type of accommodation. The people who are living in 1BHK or 2 BHK are generally the owners of the house. The households which are earning more than Rs 10,000 per month generally inhabit in 2 BHK or 3BHK types residential houses.

Table 5: Distribution of Sampled Households (Owner) According to Rental Value of Houses

Rental Value of Households	1 Room Kitchen	1 BHK	2 BHK	3 BHK	4 BHK & above
< Rs 1000	0%	0%	3%	0%	0%
Rs 1001 to 2000	9%	12%	21%	3%	6%
Rs 2001 to 3000	0%	0%	9%	9%	6%
> Rs 3000	0%	0%	3%	6%	15%

Source: Primary Survey, 2011

Table 5 depicts a distribution of sampled owner households according to the rental value of their houses. The average monthly rentals values are vary from Rs 1000 to 3000. The majority of the sample lies in Rs 1000 to 2000 per month rental values of 2BHK and more than Rs 3000 for 4BHK. Which suggests that most of the houses having 2 or 3 tenets. The average rent is Rs 700 to 800 and more than 50% sampled stick to single room accommodation.

Table 6: Distribution of Sampled Households (Rental) According to Rent of House

Paid Rent	1 Room	1 Room with Kitchen	1 BHK	2 BHK
< Rs 500	22%	1%	7%	0
Rs 501- 750	24%	9%	0	0
Rs 751- 1000	10%	7%	0	0
> Rs 1000	6%	7%	3%	1%

Source: Primary Survey, 2011

Table 6 illustrates a distribution of sampled rental households according to rent and types of houses. It is observed that in Rs 500 to 1000 rent category are around 62% residing in single room house and 24% reside in 1Room with kitchen.

Buyer's Preferences: A prospective buyer's purchase decision is influenced by a host of factors ranging from price to location. Due to the growing awareness among consumers, choice of facilities and amenities are also found to be important determinants. To start with, the survey has gauged the budgets of households who are willing to purchase a house in the near future. In addition, the household survey has also brought out the factors influencing preferences of potential buyers pertaining to locations and projects.

In Bhilwara, the average budget of the buyers varies between Rs 1500 to 4500 per month and has increased with the higher income of household.

Table 7: Distribution of Sampled Household According to Average Preferred Budget & Types of Houses

Types/Budget	Rs < 1500	Rs 1501- 3000	Rs 3001-4500	> Rs 4500
1 BHK	11%	4%	0	0
2 BHK	9%	45%	12%	0
3 BHK	0	0	16%	4%
Total %	20%	49%	28%	4%

Source: Primary Survey, 2011

Table 7 depicts the distribution of sampled households according to their average preferred budget and type of houses. Generally for the owner the prices and size of the houses are important factors to determine when they are making a purchase decision. It was observed earlier in the table that most of the tenants (50%) currently reside in single room, but here 66% of the sampled preferred 2 BHK as ideal house for them. 49% of the households wanted to invest Rs 1500 to 3000 as average budget or EMI for houses per month.

Table 8: Distribution of Sampled Households According to Their Preferences of Location

Respondent	Where People Want to Buy a House			
	Near to work place	Same area where I am living	Anywhere in the city where I can afford to buy a house	Place having proper basic services
Yes	16	8	49	0
% of Respondent	21.9	11.0	67.1	0.0

Source: Primary Survey, 2011

Table 8 indicates the distribution of sampled households according to their preferences of location for housing. It is observed that the price or affordability of the houses attract most of the households. The nearness to work place is next important factor of attraction to the households for new houses. On the other hand the presence of basic services holds the least weightage for decision of potential buyers of houses in Bhilwara. The majority of households were interested in purchasing affordable houses anywhere in the city and few prefer same area where they are living.

Supply Perspective: In the recent past, the residential market in Bhilwara witnessed hectic real estate activity, aided by strong demand from the textile industries workers. The major real estate companies like Ansal Group, Manglam, DLF, Essel Group and some local developers are investing in residential market into the city.

In the last few decades, estimated population growth and inward migration is more or less 50%. In the last decade the proportion of the migrant population in total population is 38.63%, which assured steady demand for housing unit in the city. Thus, the housing sector in Bhilwara is primarily at the end user driven.

There are some opinions and apprehensions expressed by the one of the developers & Rajasthan Housing Board Bhilwara (RHB Bhilwara) on the affordable housing market in Bhilwara.

House Size: According to the household survey, the EWS, LIG and MIG have their own choice with cost variation. The maximum affordable housing price for EWS of Bhilwara is Rs 280000, and for LIG, Rs 350000 and for MIG, Rs 420000. The industrial workers are the most targeted customers.

Availability of Land: In term of land supply, considering the cost of land and its availability within the city limits (BMC), developers and RHB Bhilwara, have lots of possibility of the affordable housing schemes to the city. The major areas are Shri Ram Nagar, Azad Nagar,

Jawahar Nagar, labour colony, Chandra Shekhar Azad Nagar, Biliya where the cost is around Rs 300 to 500/Sq. Ft. The land rate in the city is varies from Rs 300 to 1200/Sq. Ft. (Approx)

Cost of Construction: The cost of construction is around Rs 500/Sq. Ft. in Bhilwara.

Affordable Housing in Bhilwara: Now a day's in urban area of Bhilwara housing affordability is a serious concern for inhabitants of Bhilwara, Being the textile hub and one of the most prominent city of state for employment generation, authority ought to address the housing crisis adequately. The rapid urbanization and population influx increased the problem of the housing affordability in the city in many fold. In urban area the lower income and middle income group always had difficulty in purchasing a residential property within the city but it is the fact that despite being in comparison to Mumbai, Delhi, Hyderabad, and Jaipur where the property prices are considered to be highest in the country, Bhilwara is relatively more affordable for purchasing a house. However, it has larger areas with huge land area available for housing development, at various locations as options for the residents of the city to fulfil their housing needs.

Bhilwara revealed a number of interesting facts during the households survey carried out in order to ascertain the affordability of the various income groups at city level. The results of the household survey were used to compute affordability pertaining to various locations in the city.

Table 9 depicts in details of the maximum affordable EMI of households of various income levels. The EMI for EWS is Rs 984/months; LIG is Rs 984 to 2190 and for MIG is Rs 2190 to 4350/months is calculated. There is a wide gap between the EWS and MIG groups.

Table 9: Affordability in Bhilwara

	EWS	LIG	MIG	HIG
Households income (Per Annum)	< Rs 39600	Rs 39601-87600	Rs 87601-174000	> Rs 174000
Maximum EMI for Migrants/ Month (Rs)	984	984 - 2190	2190 - 4350	> 4350
Affordable housing Price (Rs) (Calculation according to HDFC Definition of Affordable Housing)	201960	201961-446760	446760 - 887400	> 887400
Preferred Plot Size for House (Sq. Ft.)	400	500	600	
Price (Rs350/Sq. Ft.)	350	350	350	
Total Plot Value (Rs)	140000	175000	210000	
Total Built up Area (70% of Plot Area)	280	350	420	
Construction Cost (Rs 500 sq. Ft.)	140000	175000	210000	
Affordable House/property Value (Rs)	280000	350000	420000	
Maximum Loan eligibility (Rs.) (9% interest rate ,for 15 year loan tenure)	224000	280000	336000	
Buyers Own Contribution (Rs.) (Assuming 80% loan)	56000	70000	84000	
Maximum EMI for Migrants (Rs)	1680	2100	2520	

Location Available considering preferred size and few residential Area	Shri Ram Nagar, Choti Harni, Badi Harni, Harijan Basti, Kanwa Khera Mangal Pura, Biliya	Azad Nagar, Labour colony, Bapu Nagar, Gandhi Nagar, Ambedkar Nagar, Laxmi Pura,	Chandra Shekhar Azad Nagar, Azad Nagar, Pratap Nagar, Jawahar Nagar Ram Dham Sanjay Colony	
--	---	--	--	--

Source: Primary Survey, 2011 and Calculated as per Assumption

The calculated affordable housing price for EWS is Rs 201960, LIG is Rs 201960 to 446760, and MIG is Rs 446760 to Rs 887400 and above Rs 887400 is for higher income groups of the city. This EMI figure for assumed houses was arrived at by considering the respondents stated affordable EMI with regards to their spending capacity. The resulting figure was then translated into the house price based on an assumed interest rate, Loan tenure and loan to value ratio. The house price is then converted to a per square feet rate assuming house size, assuming construction cost for 70% built up area and this conversion facilities comparisons with prevailing rate in different location in the city.

An interesting point that was inferred from the survey results was that the income groups of Rs 39600 and Rs 39601 to 87600 and Rs 87601 to 174000 preferred different sized unit for their housing needs. All income categories expressed area of their residential units in the range of 400 to 600 square feet across all income categories. While this allows the all income groups (EWS or LIG or MIG) to purchase a house with an average price of Rs 350/ square feet.

Meanwhile, the households especially those in the income category of Rs 39,600 per annum are willing to compromise on house size, and can only afford to buy a home in location like selected pockets of the outer region of the city, like Shri Ram Nagar, Choti Harni, Badi Harni, Harijan Basti, Kanwa Khera Mangal Pura etc. while the households in the slightly higher income category of Rs 39601 to 87600 can additionally afford a home in Azad Nagar, Labour colony, Bapu Nagar, Gandhi Nagar, Ambedkar Nagar and Laxmi Pura etc.

The MIG Households with slightly higher income of Rs 87600 to 174000 can additionally afford a home in Chandra Shekhar Azad Nagar, Azad Nagar, Pratap Nagar, Jawahar Nagar, Ram Dham and Sanjay Colony etc.

Conclusion: What should be done to make housing more affordable? For the owner-occupied sector, lack of affordability is a problem for EWS/LIG and MIG in most of the urban centre in the country. However, the study shows that in Bhilwara, the affordability is not a problem like other metropolitan cities of the country. Till now the main concerns are metropolitan's cities and this paper argue that small cities are often neglected with respected to affordable housing. If we ignore our fast growing small cities now, which are potential metropolitan cities, then the future may become more critical in terms of providing affordable housing to inhabitants of these cities.

The Government and the developers are emphasizing more on metropolitan areas where the saturation point has already been achieved and ignoring areas where it could have been more fruitful in realizing the dream of affordable housing for masses, with all the basic amenities with strong infrastructure. If that is done over a period of time, with gradual growth these under developed areas would turn into a metropolitan area in the future without having housing problem.

Most of the EWS/LIG and MIG category houses require the basic necessities for comfortable living which are more important in the present housing scenario. Affordable housing has become a top priority for developers. The majority of demand is coming from EWS/LIG and MIG sections of the society. The small and medium towns are an ideal destination for investment and purchase of property and will be highly affordable for the masses. Bhilwara provides all such scenarios where the concept of affordable housing can be realized in practical manner.

Neighborhood relationship measurement between newcomer and former inhabitants in sprawl areas of Bangkok Metropolitan Region: the case of Nonthaburi and Pathumthani province, Thailand

(Gated Housing Development impacts on neighbourhood relationship in sprawl area)

Siwaporn KLINMALAI, Kyoto University, Japan

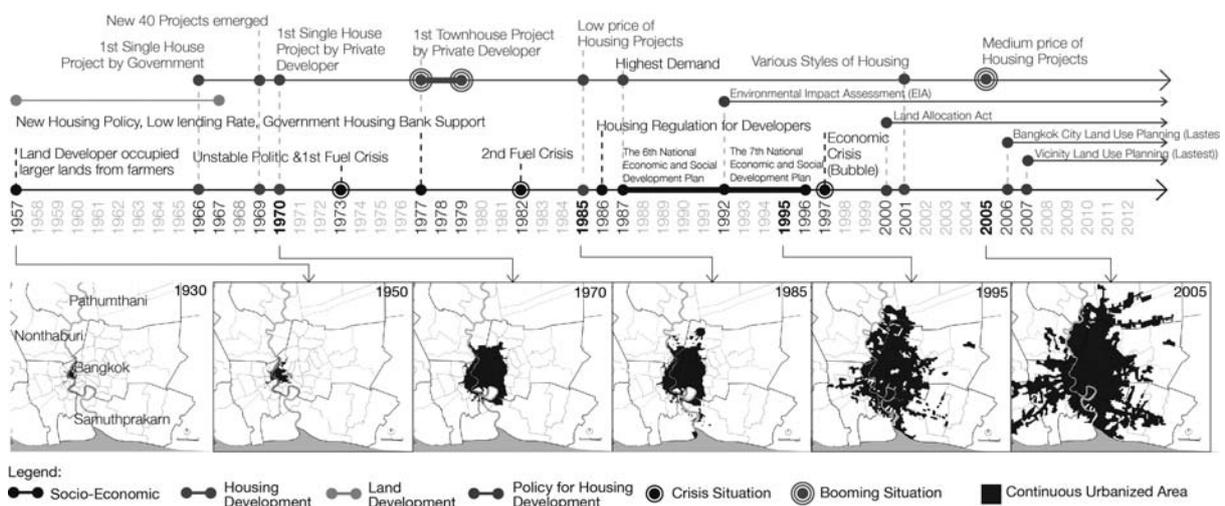

Kiyoko KANKI, Kyoto University, Japan

Bangkok Metropolitan Region (BMR) faced impact of sprawl situation spreading in large scale, and land use has rapidly transformed, changing from agriculture to urbanization and dose of new residential projects. This transformation conduces to livelihood problems between newcomer and former villagers. The study has conducted with site survey and questionnaire distribution. After empirical study and review literature in study area in Nonthaburi and Pathumthani was investigated, the positive and negative impact of different land use transformation was revealed. The results can propose idea to improve new housing project in the future.

1. Introduction

1.1 Research background and objective

Bangkok city has been coped with high economic activities and migration of rural population because of rapid urbanization. In order to reduce impact of speedy population growth and distribute urban development from city center, the 6th and 7th National Economic and Social Development Plans^{1) 2)} are established and became effective. Consequently, greater areas of Bangkok city are included as target area, called Bangkok Metropolitan Region (BMR)⁽¹⁾. Five vicinity areas, where are target area, obtained extreme infrastructure network. New urbanized area has been developed along the road network, as known ribbon development (Figure 1). Furthermore, this situation motivates developers to construct residential projects flowing in this area to support high housing demand. The projects have been disorderly overlapped on many paddy fields. The significant impact from land use transformation, changing from agriculture to urbanization and dose of new residential projects (called Gated Housing Project (GHP)) in a few decades. Consequently, sprawl emerged borderless around the city and spread in large scale, and then land use has rapidly

changed.

Figure 1: Urbanization Area Diffusion in Bangkok and greater area and its background (1930 – 2005)

The sprawl impact is investigated in various dimensions. Demolition of neighborhood relationship is an effect of sprawl that has little empirical evidence exists to support this notion¹⁴⁾. For example, characteristic associated with sprawl that can reduce the potential for spontaneous interaction is the privatization of open space. The low densities associated with the typical sprawling development provide ample room for gardens, patios and lawns. Thus, the need to make use of public parks or other public open space is reduced¹⁴⁾. Therefore, sprawl situation in BMR relates to neighborhood relationship problem that caused by new housing development (GHP), because of rapid migration and land use transformation. This transformation conduces to livelihood problems between newcomer and former villagers because of unplanned location of new residential development. For example, some former villages are enclosed by new housing projects with high fence; consequently, they might confront an accessibility problem. Moreover, contrast housing unit and project boundary design can impact on social segregation. Therefore, this study aims 1) to examine impact of different land use transformation caused by overwhelming migration, and 2) to compare neighborhood relationship between newcomer and former villagers through questionnaires in different case studies. The prospect outcome is suggestion for new housing development in sprawl area.

1.2 High movement of population and Land use transformation

Table 1. Population growth in BMR

Province in BMR	Area** (km ²)	Population** (pp)		Density** (pp/km ²)	Population Growth	Ratio* (1998) Agricultural/total area
		2004	2012			
Bagkok	1,568.737	5,6341,132	5,673,560	3,616.64	+0.7%	0.14
Nakhonpathom	2,168.327	789,016	874,616	403.36	+9.6%	0.51
Nonthaburi	622.303	942,292	1,141,673	1,834.59	+21.2%	0.22
Pathumthani	1,525.856	769,998	1,033,837	677.55	+34.3%	0.46
Samuthprakarn	1,004.092	1,049,416	1,223,302	1,218.32	+16.7%	0.09
Samuthsakhon	872.347	442,687	508,812	583.27	+14.9%	0.26
Total	7,761.662	9,636,541	10,455,800	1,347.11	+8.5%	

Source: **http://stat.dopa.go.th/xstat/pop55_1.html , *Ministry of Agriculture and Cooperation, 1998

Among six provinces of BMR, population growth rate in Pathumthani and Nonthaburi is significant different from others by 34.3% and 21.2%, respectively since 2004 (Table 1). Although both provinces have high movement of population, there is also large scale of agricultural area as shown 0.46 and 0.22 ratios. Those huge numbers of population is highly possible to replace agricultural area by residential area where support high demand of housing. The differences of land use transformation in Pathumthani and Nonthaburi bases on geographic and land composition in that area. This also impacts on distinct formation of new development such as housing projects (GHP) and another built-up area. As a consequence, the relationship between former villagers and newcomer is necessary to pay consideration and investigated because inhabitants will be directly troubled by disorder land use transformation. Hence Pathumthani and Nonthaburi were selected to clarify district that also faces high migration, population growth in Khlongluang and Bangyai district is 8.87% and 9.10%, respectively, higher than other districts.

2. Research methodology

Structure of this paper has conducted with two parts; first, we study background of sprawl development in BMR. Then we found that GHP development related to neighborhood relationship in Pathumthani and Nonthaburi need to be examined in term of background of physical land composition. Second, characteristic of inhabitants and neighborhood

relationship inside and outside gated housing project was clarified and assessed. We thoroughly observed physical and distributed questionnaires by face-to-face acquirement, which rely on literature review. Additionally, we also inquired non-structural interview to residents during observation that can support result from statistic. Summary, all results will be analyzed neighborhood assessment between inside and outside communities, especially, affect from gated housing development on newcomer and former villagers.

2.1 Measuring neighborhood relationship

According to many sprawl researches mentioned about adverse common impacts of sprawl is loss of sense of place and community⁸⁾. Some American gated community study revealed that gated communities reflect to varying degree four social values (sense of community, exclusion, privatization, and stability) in positive social value for the residents inside. In addition, the notion of social problems in sprawl area in section 1.1 also supports importance of neighborhood relationship investigation. Sense of community is a dimension in neighborhood relationship that applies to communities in both the geographic and relational sense, and should be considered distinct from individual characteristics⁹⁾. McMillan and Chavis (1986) discuss four key elements inside community: (1) membership, which involves the sense of belonging and emotional safety it provides; (2) influence, reflecting the ability to affect change in each other; (3) integration, which refers to the feeling or perception that needs are met through the cooperative behaviors of the group; and (4) shared emotional connection, which individual member’s commitment and shared life experiences or history of time and place. Moreover, relationship between physical aspect of community and social relation is also mentioned in many researches. Buckner (1988) revealed the physical attractiveness of the neighborhood also has been found to strength social cohesion. A well-defined boundary contributes to the connection to a particular place and the sense of community therein. The ultimate boundary of gated communities are often promoted as increasing sense of community, on the other hand, there is conflict on this discovery. Wilson-Doenges (2000) found that gated communities do not increase sense of community, and may actually decrease it, and give either a false sense of security or not sense of security at all. These findings focused inside community assessment, however, social problems in BMR also influence on people outside community. Therefore, inside and outside neighborhood relationship should be assessed in the same time.

2.2 Sampling and tools

Research population was calculated with Taro Yamane’s formula or table as follow;

Where n = Sample size

N = Population size

e = Sampling error (usually .10, .05 and .01 acceptable error)

$$n = \frac{N}{1 + Ne^2}$$

Table 2. Neighborhood assessment

Statement	Point Scale				
	1	2	3	4	5
Inside Community: Community Value					
(1) Environment Satisfaction	very dissatisfied	dissatisfied	neutral	satisfied	very satisfied
(2) Feel good when someone help to improve your community	strongly disagree	disagree	not sure	agree	strongly agree
Inside Community: Neighbor Interaction					
(3) Degree of trust in neighbor	very mistrustful	mistrustful	neutral	trustful	very trustful
(4) Number of acquaintance (persons)	0-5	6-10	11-15	Over 15	
(5) Number of friend (persons)	0-5	6-10	11-15	Over 15	
(6) Frequency of neighbor visiting	never	once a month	once a week	twice a week	almost everyday
(7) Frequency of talking to neighbor	never	once a month	once a week	twice a week	almost everyday
Outside Community					
(8) Perception to surrounding community	Feel bad	Neutral	Feel good		
(9) Number of using outside service in district (activities)	0	1-2	3-4	5-6	7

According to the formula, the sample size is 400 people when sampling error is 0.05 and population is 239,172 people in Khlongluang district and 126,562 people in Bangyai district. According to literature review mentioned above, neighborhood assessment in this paper consisted of; (1) inside relationship evaluation, which combined neighbor interaction and community value factors, and (2) outside relationship, evaluating by perception to surround community and number of using service outside community but in district. Respondents were asked to indicated their satisfaction, perception, frequency, and number of activity participation with nine statements referring to “your own neighborhood, community, and surrounding community”. Each statement was rated on point scale as shown in Table 2.

3. Characteristics of community and background of case study areas

3.1 Case 1: Khlongluang district, Pathumthani province

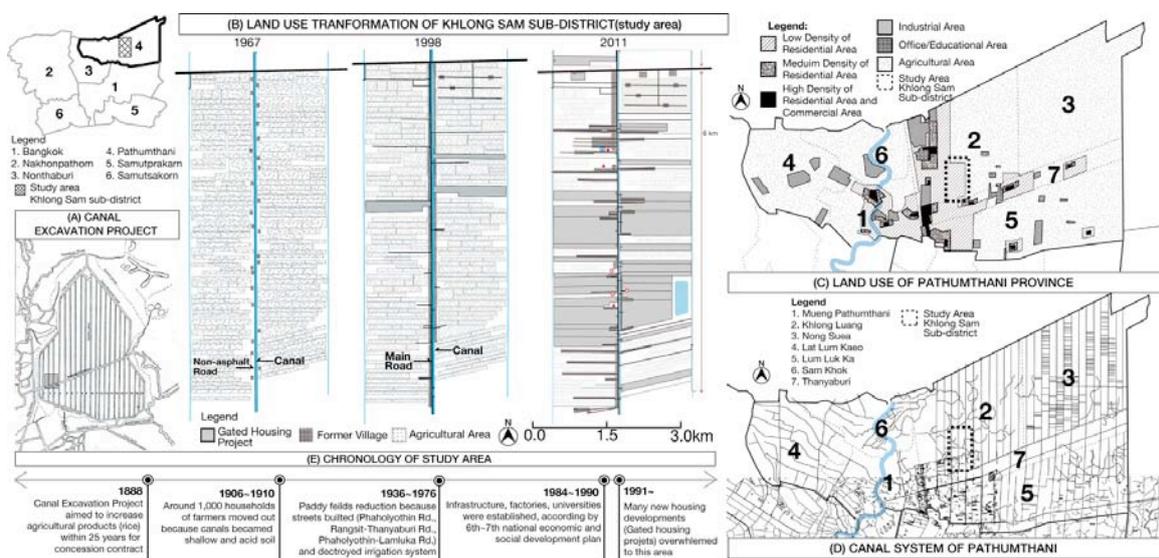

Figure 2: Land use and canal system of Pathumthani province

Beside Pathumthani is the high population growth; agricultural area is replaced by residential area (Fig.2-B). According to history of area, the study area was a part of drilling canal project and was used as agricultural area since King Rama V era (1868 – 1910), who bestowed on land of the north of Bangkok city as rice trading center of the region. The drilling canal project aimed to increase agricultural products (rice) within 25 years for concession contract. They ran the project from 1888 to 1913, which covered area around 1,350 km² (Fig.2-A). Farmers from many places moved in to settle down since 1895 with scatter settlement and temporary shelter to rent small paddy. During 1906 – 1910, around 1,000 households moved out because canal became shallow since 1906 and acid soil. Consequently, paddy fields declined around 60% of whole project area in 1936, and 1976 destroyed irrigation system⁷⁾ (Fig.2-E). Therefore, area in Khlong Luang, Lum Luk Ka, and Thanyaburi district regards as kinds of land readjustment⁵⁾ area especially in physical meaning condition. The road network was located to be parallel to grid canal system. Land configuration, which is geometric form such as rectangular, polygon and narrow shape, based on man-made water features (Fig.2-D). However, the highest number of house is in the third canal sub-district (Khlong Sam sub-district) by 128,859 units ⁽⁴⁾. In addition, its land use has been rapidly transformed from agricultural to residential, which contains GHP concentrated area that replaced many paddy fields (Fig.3-B). Hence, we selected Khlong Sam sub-district to examine relationship between residents inside and outside of new and former communities.

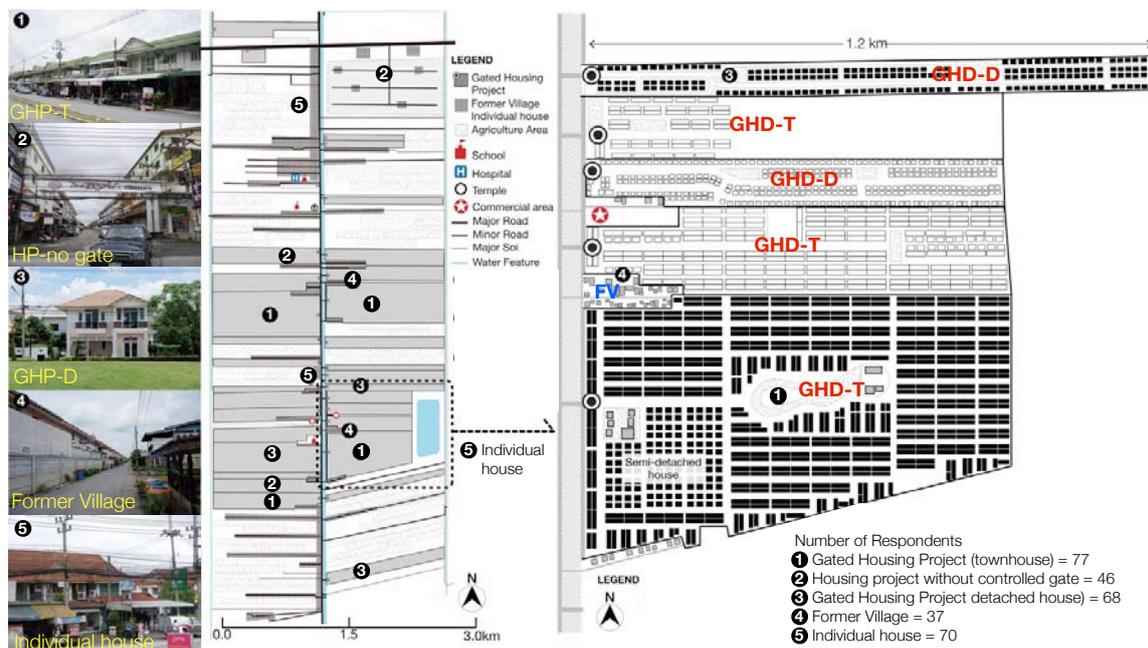

Figure 3: Characteristic of Gated Housing Project in Pathumthani

During site observation, GHP-T contain commercial business area inside the project, it makes community livelier. GHP-D tend to be inside environment with many aesthetic architecture and features but lacks of shops. On the other hand, former village does not have their own or nearby amenity. (Fig.3). It usually found gated housing projects located along main road in the west and along canal in the east. Because there is only one main 4 lanes road next to canal in the west side, people who live the opposite side have to connect by their own bridge, while, former village located in small alley on both sides of canal. We found that the road network conforms to canal system; it was constructed parallel and along with one side of the canals. All projects and communities face to main road with only one access, so they cause traffic conjunction during rush hours and supposed to be inconvenient to go to use public facility outside community. GHP-T plot is geometric form in huge scale (around 1 km. length); they contain over 1,000 households in one project, while GHP-D and former village is narrow. In addition, its master plan inside GHP-T is similar to GHP-D in grid pattern; (1) a main corridor connects from the gate to alley of housing units, and (2) a common space located in the middle of project. GHP appearance is significant symbol; one decorative gate at the front of project, and high fences (Fig.3). This ultimate boundary also implicitly enclosed outside community where is behind that fence. Hence appearances of different community in study area are obviously distinct in terms of size, plot shape, dwelling unit density in project, and architectural elements. Regarding these empirical evidences and literature review in section 2.1, the different physical appearance in study area possibly influence on neighborhood relationship both inside and outside community.

3.2 Case 2: Bangyai district, Nonthaburi province

Because geography of land is plain and contains many natural canals and connects to Chao Phraya River, this potential is suitable for agricultural activity. Original local people were from Ayutthaya who immigrated during Ayutthaya Era (14th-18th Century) as farmers who operated paddy fields and orchards¹⁴⁾. Many traditional local communities and local markets settle down as the waterfront. Agriculture business has been success; currently there were a huge agricultural product market center for western side of Chao Phraya River as shown in Fig.4. Since, urbanization is spread from the city by public facility and modern transportation such as outer ring road, the pattern of city has been changed. New housing

project development (GHP) occupied land and directly connected to the main road network without canal connection. On the other hand, local communities still located at the original settlement along to canals and access to small local road. GHP also replaces patchy paddy fields and orchards with free-form shape as follow fields' form, while some area is still doing agricultural business. Therefore, current land use of Bangyai district is hybrid between agricultural and residential area. The consequences of rapid transformation possibly impact on environmental and social aspect of newcomer and former villagers.

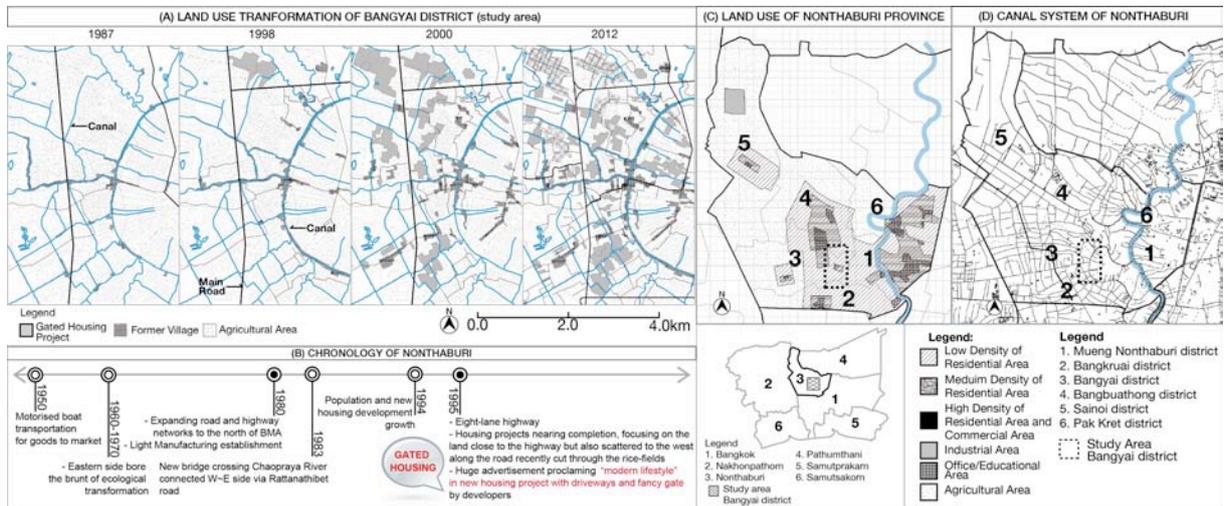

Figure 4: Land use and canal system of Nonthaburi province

Figure 5 shows the gate of GHP directly connected to main road and was back onto canal routes, in the same time former villagers settle down in waterfront area. The ultimate boundary of GHP enclosed community behind and closed involuntarily their accessibility. In this area, we also found some housing projects that were constructed since 2000 eliminated gate but kept fence and connected internal corridor of project to be public road. The number of dwelling unit in project is around 200-500 units that are smaller GHP in Pathumthani.

Figure 5: Land use and canal system of Nonthaburi province

4. Results

Regarding the site observation as mentioned in chapter 3, both case studies contained five typical types of community, namely, former village (FV), gated housing townhouse project (GHP-T), gated housing detached house project (GHP-D), housing project without gate (HP-No gate), and individual house (Ind). Although 400 questionnaires were distributed in those five types of community, but respondents are 300 and 363 copies, respectively. The first part of questionnaire aims to understand characteristic of inhabitants in different type of community that will be explained in section 4.1. Second part proposed to assess inside and outside neighborhood relationship among different those communities that will be presented results in section 4.2.

FV = Former Village
 GHP-D = Gated Housing Project (Detached house)
 GHP-T = Gated Housing Project (Townhouse)
 HP = Housing project without gate
 Ind. = Individual house (not by developer)
 (a) = Variable that Sig. <0.05 in Pathumthani
 (b) = Variable that Sig. <0.05 in Nonthaburi

Mean of Household Income:
 1.00-1.49 = 0 – 10,000 THB
 1.50-2.49 = 10,001 – 30,000 THB
 2.50-3.49 = 30,001 – 50,000 THB
 3.50-4.49 = 50,001 – 70,000 THB
 4.50-5.00 = Over 70,001 THB

The similar characteristics of respondents in five types of community in Pathumthani are occupation and workplace. Most of respondents are private company officers that work in Khlongluang district or at home. The indicators that related with different type of community and can clearly indicate distinct characteristic of five communities are; (1) Age of respondents, which FV is oldest, (2) household member, which illustrates density of people

in dwelling unit, (3) household income, which GHP-D and IND has highest average income in Nonthaburi and Pathumthani, respectively, and (4) period of dwelling, which FV live longest period as local people.

4.2 Neighborhood measurement between inside and outside relationship

| PSC = Perception to Surrounding Community | ** p < 0.01 |
| NOSU = Number of Outside Service Usage | Pearson correlation coefficient |

In Pathumthani, period of living correlated with inside and outside relationship in positive correlation. People who live former has stronger neighborhood interaction and inside-community value than newcomer, in terms of number of acquaintance and frequency of talking to neighbor. The elderly have higher trust in neighbor and a lot of friend than younger because of positive correlation coefficient. Salary of respondent related with talking to neighbor. The community value inside community correlated with outside relationship in terms of number of outside services because of positive coefficient. Often neighbor communication can create high outside relationship. Trust in neighbor and number of acquaintance strongly related with community value that illustrated by high correlation coefficient (Table 4).

| TN = Frequency of Talking to Neighbor | * p < 0.05 |
| PSC = Perception to Surrounding Community | ** p < 0.01 |
| NOSU = Number of Outside Service Usage | Pearson correlation co-efficiency |

In Nonthaburi, period of dwelling and density inside dwelling unit related with inside relationship in similar way, namely, there was negative correlation coefficient in community value aspect. Former people with big family less related inside relationship in terms of environment satisfaction and trust in neighbor. Moreover, outside relationship also correlated with period of dwelling in perception to surrounding community. However, people who have high inside environment satisfaction influence on trust in neighbor and number of outside service usage.

5. Discussion

Regarding table 3 and 4, period of living is an indicator of characteristic of community. Therefore, inside-outside relationship of former village in Pathumthani is higher than new community such as gated housing project with townhouse or detached house. Namely, former villagers have more friends, higher trust, and more united to inside community than gated housing project people. These results can be explained with difference of physical appearance of GHP and FV as follow; (1) size of new community is much more larger than former village, (2) number of dwelling unit in new housing project, and (3) area adjustment in new project has changed such as providing temporary commercial area and opened for outsider. These can create less trust on neighbor and inside community value. High number of outside usage in former village can increase mutuality to district. Because former villagers today do not have private facility, they have to share recreation space in public. On the other hand, housing project by developer provides private facility space, that decrease outside relationship. In order to improve outside relationship, neighbor communication should be promoted.

In Nonthaburi, period of dwelling also indicate characteristic of community. According to table 5, former villagers have low inside relationship, although they have many acquaintances. While people who live in gated housing project are newcomer, they know not so many people but satisfied inside community and have high trust. Because master plan of housing project provides more privacy and high quality of common facility, and there is less difference of social class. In addition, former villagers have lower perception to outside relationship than newcomer. This can be assumed there is confliction between former and newcomer in Nonthaburi area. According to Figure 5, boundary of new housing project obstructed accessibility and lead to environmental problem to former villagers. Community value can be supported by neighborhood interaction, namely, often neighbor visiting can promote unification.

6. Conclusion

The study revealed physical appearance of community related with inside – outside relationship of people who live in gated housing project and local people. We conclude and suggest ideas about new housing project improvement in sprawl area as follow;

In hybrid land use (Nonthaburi province); (1) In order to promote neighborhood interaction among resident in gated housing project, site planning should be more considered such as providing common space more than one place, and (2) Quality of environment outside gate housing project should be improved or better outside perception of former villagers by local government. Moreover, location of gated housing project should be controlled to reduce inconvenient accessibility of former villagers.

In land readjustment area and high density of gated housing project (Pathumthani province); (1) Scale of gated housing project should be reduced. Zoning rearrangement in project should be clear and controlled between commercial and residential zone, and outsider access.

In further study, dimension of neighborhood assessment should be assessed in deeply dimension and included another stakeholders' opinion, in order to propose more practical implementation.

Notes:

- (1) Bangkok Metropolitan Region (BMR), as the national plan, includes 6 administrative provinces are; 1) Bangkok: 1,568.737 km², 5,702,595 people, 2) Nakornpathom: 2,168.327 km², 851,426 people, 3) Nonthaburi: 622.303 km², 1,078,071 people, 4) Pathumthani: 1,525.856 km², 956,376 people, 5) Samuthprakarn: 1,004.092 km², 1,164,105 people, and 6) Samuthsakorn: 872.347 km², 484,606 people. Total BMR area is 7,761.662 km² and number of residents is 10,237,179 people. It consists of 69 districts in total. Source: <http://th.wikipedia.org/wiki/กรุงเทพมหานครและปริมณฑล>
- (2) 30 administrative districts consist of 14 districts of Bangkok city, 4 districts of Nonthaburi, 5 districts of Pathumthani, 5 districts of Samuthprakarn, 2 districts of Samuthsakorn, and 1 district of Nakornpathom.
- (3) Land Readjustment is a land management instrument by which a public authority assembles and controls conversion of land from rural to urban use according to town planning requirements. The landowners also collectively leave land for streets and other public services, build the required infrastructure wholly or partly adapt existing boundaries to the new plan.¹⁰⁾

Problems and Strategies of Urbanization Development in Western China from the Perspective of Urban-based Society —A Case Study of Shaanxi Province

Yuan LV, Kewei LIU, Lin LIU, Dan ZHAO, Fujuan ZHANG; College of Urban and Environmental Science, Northwest University; China

In case of peer review: ID 138

Synopsis

Serious problems in the urbanization process of western China are raised from the perspective of urban-based society, taking Shaanxi, a typical province in natural geographical features and fast developing economy in western China as a case, and then the strategies are put forward to solve these problems.

1. Introduction

Urban-based society is a kind of social formation with urban population as the main part, human behavior and non-agricultural industries layout in urban area and residents survive in urban lifestyle. At present, whether a country or a region enter urban-based society rely on the threshold internationally that the proportion of urban population reaches 50 percent. Urbanization rate between 51% and 60% is for elementary urban society, 61% to 75% for intermediate urban society, 76% to 90% for advanced urban society and more than 90% for complete urban society (Pan and Wei, 2012). Transformation from village-dominated society to urban-based society means the great progress of agricultural modernization, industrialization, new urbanization and the fast pace of social progress, economic growth and modernization (Zhao, 2012). The achievements on urbanization in academic circles are fruitful; however, the study on urbanization from the perspective of urban-based society now is in its infancy. Among the scholars who studies on urban-based society, A recent study illustrates the urbanization strategies of Britain, America, Japan, Brazil, etc. from the perspective of urban-based society (Zhao, 2011) and challenges and choices of China (Zhao, 2012). Pan and Wei (2012), GUO *et al.* (2013) thought that there are 5 standards for urban-based society that are urban population, spatial form, life-style, social culture and relations between urban and rural areas.

China's urbanization has just reached 51.27% in 2011 (Zhao, 2012), which means China has ended the times of village-dominated society and entered urban-based society. Coastal developed regions of eastern China such as Beijing, Shanghai, Guangdong, and Jiangsu provinces have entered urban-based society many years ago. However, the concentration of large scale of migrants to the developed regions has led to series problem like population explosion, traffic congestion, environmental pollution, housing shortage, jobs crisis, etc. social contradictions are increasingly prominent under the premise that not foreseeing and avoiding these problems. Urbanization of Shaanxi reached 47.3% in 2011 (Ren *et al.*, 2013) and is about to enter urban-based society. Besides, Shaanxi develops faster than other provinces like Guizhou, Yunnan, Guangxi, etc. in western China and Hainan, Heilongjiang, Shanxi, etc. in middle part of China. Besides, GDP per Capita in Shaanxi has exceeds 5000 dollars¹ which makes Shaanxi the 3 place in western China. In this case, this paper is about to discuss the new problems and strategies in the process of Shaanxi urbanization from the following 5 aspects so as to provide experience reference for similar areas in China.

2. Problem analysis of Shaanxi urbanization from the perspective of urban-based society

2.1 Peri-urbanization is increasingly significant

2.1.1 Population peri-urbanization

Peri-urbanization population includes population moving from rural to urban area and changing from "agricultural to non-agricultural" residence registration by demolition and reconstruction. They live in city but get worse treatments on public service, employment,

social security and housing comparing to citizens (GUO *et al.*, 2013; Liao and Zhang, 2004; Chen, 2012).

As the typical representative in western China, the scale of peri-urbanization population in Shaanxi has enlarged greatly from 3.86 to 7.35 million², which has covered 43.09% of urban population and 19.64% of permanent residents (Tab.1). Among the prefecture-level cities, the peri-urban population of Xi'an, the capital city of Shaanxi, has grown to 2.18 million². Peri-urban population intended to gather in big cities like Baoji, Yulin, Hanzhong etc. rather than small cities or towns. Besides, most peri-urban population keep agricultural residence registration, living habit and neighborhoods, some of them are taking rents as their main income, which made them lack of willingness to make a living by their wisdom and efforts. All these go against the connotation of urban-based society.

Tab.1 Peri-urbanization population change of Shaanxi from 2000 to 2010

	Urban population (million)	Non-agricultural population with household registration (million)	Peri-urbanization population (million)	Percentage of peri-urbanization population (%)
The fifth population census	11.63	7.77	3.86	33.22
The sixth population census	17.06	9.71	7.35	43.09

Data source: The fifth and sixth population census.

2.1.2 Spatial peri-urbanization

Land urbanization faster than population urbanization is a significant problem in the development of many cities in China. The extensive use of urban land will cause sharp conflicts between human and land under the background of urban-based society. It is common that urban lands expand blindly in China. Population in China grow with the annual average rate of 0.5%³, but the construction lands of municipal districts expand 10 times than that of the population speed since 2005. Shaanxi population growth rate is 0.24%¹, which is much slower than some other provinces in China (Fig.1). However, its expanding speed of construction land is 6.27%⁴, much faster than other provinces in the corresponding period, Xi'an is a typical one (Fig.2).

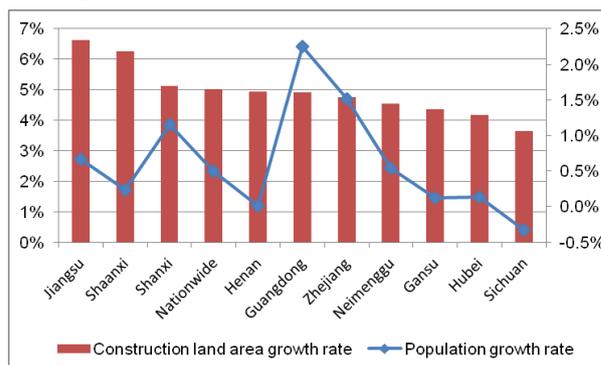

Fig.1 Construction land area and population growth rate of Shaanxi comparing to some other provinces in China since 2005

Data source: Shaanxi Statistic Yearbook.

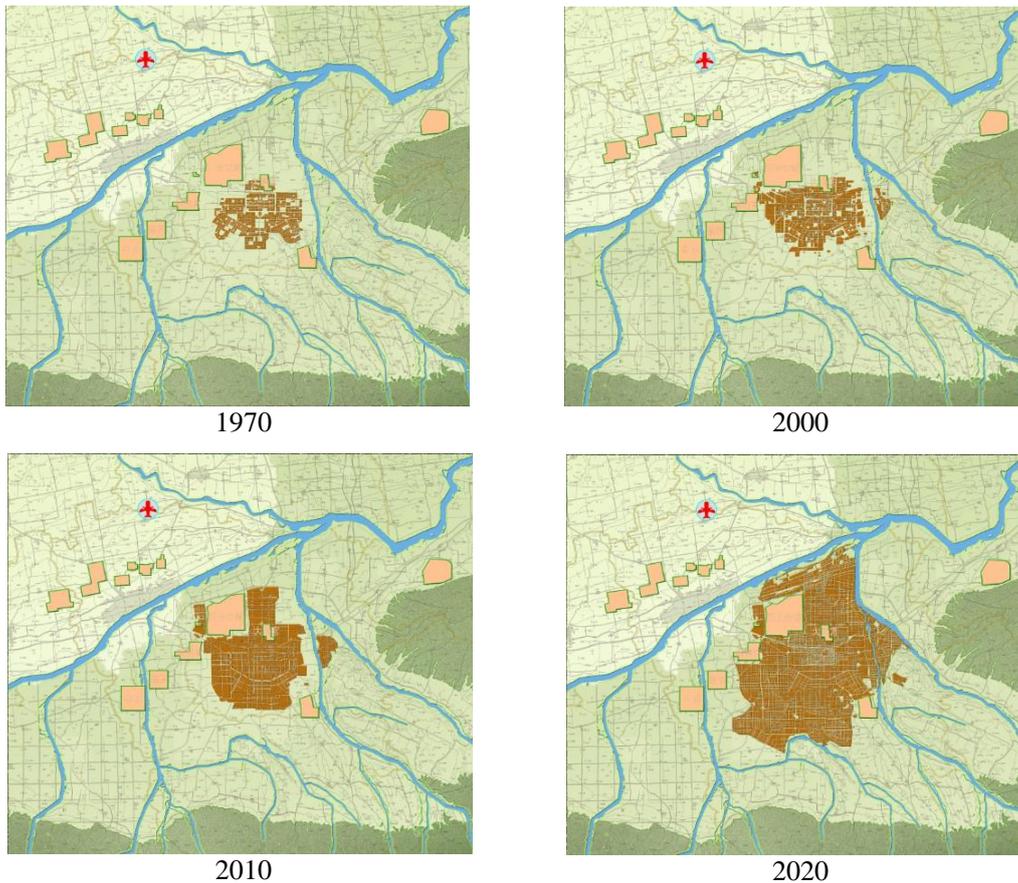

Fig.2 Spatial expansion diagrammatic sketch of Xi'an main city

Data source: Xi'an Urban Master Plan (2004-2020).

Landscape of towns are much alike rural areas and rural area are alike towns are the true portraiture for peri-urbanization area. On one hand, urban constructions always bypass the peri-area because the residents living there don't want to give up the rents of their houses, which lead to urban villages. Landscapes in such area always change rapidly affected by multi-influence of urban construction and environment, and its instability is stronger than both urban and rural area. On the other hand, convenient location, low living expenditure makes the area the first choice of the rural migrants. However, such area has always been the blind area for city management, making it bad accommodation, bad security area to live. This unique landscape is due to the double lags that are the increase of urbanization lagging behind the rate of both non-agricultural employment and industrialization.

2.2 Unreasonable spatial layouts of cities and towns

2.2.1 Big cities develops surpassingly while small towns are underdevelopment

First, metropolis and big cities developing surpassingly is a significant phenomenon in the process of Shaanxi urbanization. The concentration of population to big and metro cities is due to its economic, facilities, transportation, living expenditures and civilization superiority than small cities and towns. And the gathering of population will enhance the renewal and perfection of the conditions to attract more people, which will raise their position in lager regions (Zheng *et al.*, 2003; Pan, 2005). In 2000, there is 1 metropolis, 4 medium-sized cities and 5 small cities while no big cities, making a unstable urban system. But till 2011, Baoji, Xianyang have grown up to big cities and Yan'an, Ankang have ranked in medium-sized cities (Fig.3). So Shaanxi has formed a urban system with a structure of 1 metropolis, 2 big cities, 5 medium-sized cities and 3 small cities. We can tell from the changes that though the number of big cities has increased, but the number and scale of small cities declined, making the urban system still unstable and unreasonable (Tab.2).

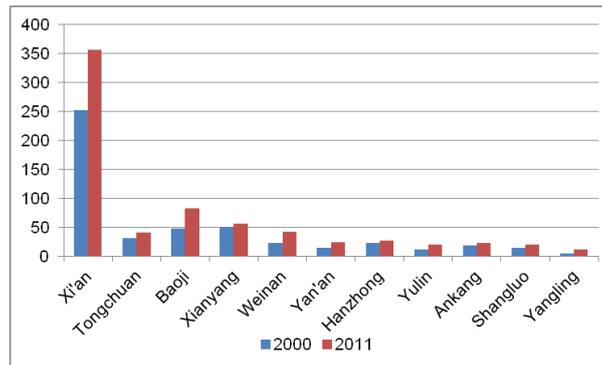

Fig.3 Urban scale change in prefecture-level cities of Shaanxi

Data source: Shaanxi Statistic Yearbook.

Tab.2 Change of city size of Shaanxi

Urban scale	Number		Proportion (%)		Population scale (million)		Proportion (%)	
	2000	2011	2000	2011	2000	2011	2000	2011
>1 million	1	1	9%	9%	2.53	3.57	52%	51%
0.5-1 million	0	2	0%	18.2%	0	1.39	0%	20%
0.2-0.5 million	5	5	45.5%	45.5%	1.73	1.55	35%	22%
<0.2 million	5	3	45.5%	27.3%	0.62	0.50	13%	7%

Data source: Shaanxi Urban Construction Statistics Report.

Second, the phenomenon of weak small towns is getting series. Average population of 10 municipal districts is 1.26 million¹; the population of only 32 counties out of 83 as the intermediate level of urban system has exceed 100 thousand⁴; the percentage of small towns with less than 10 thousand people covers 88.6% of the total number 1011⁵. However, small towns are the key carriers to develop non-agricultural industries and hold rural migrants. So we can confer that weak base and insufficient development power are the main shackles for Shaanxi urbanization.

2.2.2 Population density and population change differs greatly in different regions

Population density in a certain time can reflect its static population distribution. The population density of Shaanxi is of great difference, which differs from 18 to 5000 people¹ per square kilometers. Fig.4 shows that population density in Guanzhong area of Shaanxi is the highest, which is 400 people per square kilometers, and most population is gathering along the Weihe River. Xi'an is the most densely populated city with 2000 people per square kilometers. Southern part is the second densely populated part with 100-500 people per square kilometers and northern part with the density under 100 people per square kilometers. Comparing with 2000, the population weights of Guanzhong and northern part have raised 2.37 and 0.24 percentage¹ points separately (Fig.5), which have close relationship with the construction of Xi'an metropolis and energy development. However, population weight of southern part of Shaanxi has decreased 2.6 percentage¹ points; the reason for this is that its development is confined by available lands, environmental protection and capital shortage. We can infer that people intend to move to fast-growing cities like Xi'an, Yan'an, etc., especially to those municipal districts of metro and big cities.

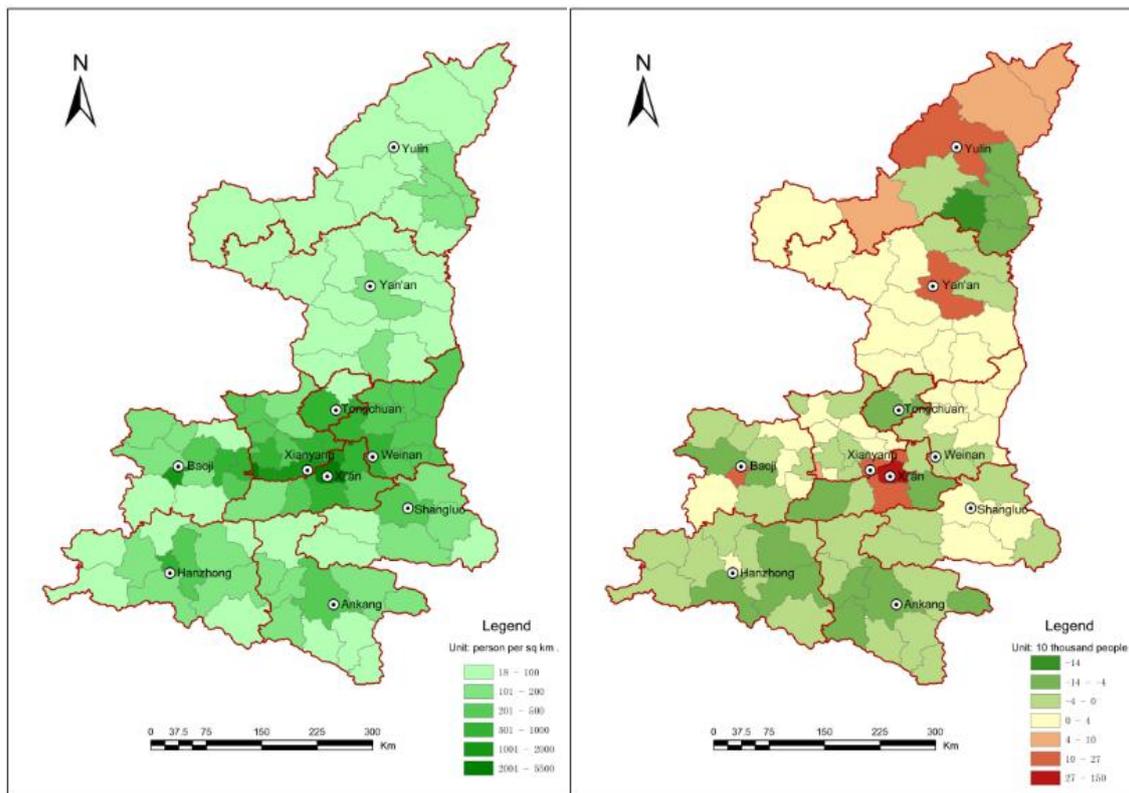

Fig.4 Population density of Shaanxi

Fig.5 Population change from 2000 to 2010

Data source: Shaanxi Statistic Yearbook.

2.3 Urban characteristics are missing

Urban-based society asks the urban area should have distinctive characteristics which can embody its cultural deposits and landscape characteristics. Urban characteristics have been a judging standard for a long time. Xi'an is a typical city of significant characteristics with clear functions and division in different blocks. The northern part of Xi'an is a typical label of modern industry in Shaanxi taking economic and technical development zone as its carrier and undertaking advanced equipment manufacturing as its leading industry. The southern part of Xi'an takes Qujiang New District as its carrier with traditional architectural style and increasingly prosperous cultural industry. The western part of Xi'an has solid foundation on emerging industry, hi-tech industry, information industry and creative industry relying on Xi'an High-tech Industrial Development Zone which reflects the advantages of sci-tech talents, creation and modern city characters. The eastern part of Xi'an exerts itself to forge green lung of Xi'an to reappear water and ecological landscape with Chanba Ecological Zone as its carrier. However, other cities in Shaanxi don't have significant characteristics like Xi'an. These cities have similar architectural style with more and more slab-type apartment building, similar road label and landscape opusculum in public space, and long overshadowed buildings. The feeling of "thousands cities with same face" and "somewhere in time" is stronger than ever before, which make the city recognition discount heavily.

2.4 Distance between urban and rural area is enlarging

One of the characters of urban-based society is harmonious co-prosperity and advancing as a whole. But the distance between urban and rural area in Shaanxi is enlarging (Tab.3), which still has a long distance to meet the basic demand for urban-based society.

In income and expense aspect, the income balance between urban and rural residents enlarges from 3680 Yuan in 2000 to 13217 Yuan¹ in 2011, the urban/rural consumption ratio is 3.5:1, urban living condition is superior to rural significantly on indexes of living quality like number of computer per 100 households and percentage of household expenditure on education, culture and entertainment. But percentage of resident expenditure on health care

in rural area is increasing, which means inadequate rural medical insurance system and no proportionately change between rural resident expenditure on health care and the income.

In investment in fixed assets aspect, urban area accounts for the vast proportion of the investment, the proportion even reached 95%¹ in 2011. The widening investment distance between urban and rural area make the rural environment improve sluggishly. So the survival and development distance between urban and rural area is getting even large.

In landscape aspect, urban area is a regional integrated system containing physical features like rivers, hills and artificial scenic such as cultural relics and historic sites, buildings and structures, public facilities and streets. However, rural landscape is featured by messy layout and style of architecture, mixed function of land use, extensive way of land use and appalling sanitary conditions.

In living condition aspect, urban area is facilitated by complete public facilities such as education, medical care, sports, recreational facilities and municipal facilities like road and pipe networks. But in rural area, road hardening rate is too low; configuration of reading room, activity rooms for old people, sports and recreational facilities is not complete at all. The efficiency of many facilities is too low because they are layout near village committee making them not convenient for those who live far away from the committee to use. Environmental pollution in rural area is getting serious, sewage depending on evaporation and rubbish on wind blows are the true portraiture. Proportion of elderly people relying on pension in rural area is only 4.6% (Han and Wei, 2012), covering less than urban proportion (Zheng *et al.*, 2003). Besides, rural schools are lack of educational resources; some school buildings have serious security threats.

Tab.3 The distance between urban and rural residence in Shaanxi province

Year	2000		2005		2011	
	Urban	Rural	Urban	Rural	Urban	Rural
Per capita income(Yuan)	5124	1443.9	8272	2052	18245	5028
Per capita expenditure(Yuan)	4277	1251	6656	1896	13783	4496
Investment in fixed assets(Billion)	64.4	10.1	184.1	14.1	816.7	39.3
Number of computer per 100 households	7.03	0.18	27.9	0.5	82.4	16.6
Percentage of household expenditure on education, culture and entertainment (%)	12.8	14.5	16.3	15.7	13.5	9.0
Engel coefficient	35.8	43.5	36.1	42.9	36.6	30.0
Percentage of resident expenditure on health care (%)	7.9	7.3	9.1	8.7	8.0	11.9

Data source: Shaanxi Statistic Yearbook.

2.5 Resources and environmental problems are standing out

Urbanization is the concentration of population and industries. However, the concentration also means the gathering of production and living pollution. So the quality of urban ecological environment is the important index of urbanization and has got more and more attention. Urbanization reaching 50% not only mean the great change of social structure, but also means the transformation of industry from the second industry to the third industry. Complex non-agriculture industry demands diverse production and consumption, which makes the urban system even complex. Resources and environmental problems are standing out in the cases of limited urban environmental capacity.

The problems are expressed on the following aspects. First, urban expending has occupied a great number of cultivated lands; cultivated land in Shaanxi has reduced sharply from 3114 to 2861 thousand hectares¹. Second, air are polluted in every level of Shaanxi cities, and the more advanced of economy developing, the serious pollution it has; in much time of a year, PM2.5 in Xi'an has exceed 100⁶, making Xi'an a national heavily polluted city many times. The reason for this can be explained by more than 70%¹ coal consumption out of energy consumption, coal consumption can discharge waste gas and water, which are the main sources of pollution; besides, raise dust and automobile exhaust are other reasons for air pollution. Third, inappropriate or under-standard deposition of "three wastes" will also lead to environmental degradation, insufficient processing capacity of facilities and lagging infrastructure construction than population concentration can account for this.

Comprehensive utilization of industrial solid waste of Shaanxi is only 60%⁴ in 2011, Shangluo, a small city in Shaanxi, is less than 7%⁴. Shaanxi urban sewage treatment rate is just 82%⁴.

3. Strategies to meet urban-based society

3.1 Innovating social security system

The key to solve the problems of peri-urbanization is reforming a series of supporting system which are residence registration system-centered. Explore new way to reform residence registration system draw on the practical experience of Shanghai, by adopting the residence registration system of identity cards and residence permits which are taken as certification to participate in production and living activities in the city, and audit regularly. Meanwhile, take transient population's social security, medical and health care, children education, occupation introduction, employment training, legal aids and so on into the management categories of residence permit. The insurance scope of security housing which is another main content of social security should be extended reasonably from housing difficult family having urban residence registration to those holding residence permit living above a certain year, referring to the corresponding type of housing security aiming at housing difficult family according to income level. By these means to set up the fair and equal security network system within a certain area (such as provincial area) and release anxiety caused by population migration. In addition, rural residents who don't want to live in the countryside are able to live in the town comfortable and realize complete urbanization gradually through switching the homestead to security housing and social security.

3.2 Optimizing urban developing space

It is necessary for Shaanxi to implement the strategy regarding local conditions of urbanization and realize regional coordinated development. It suggests taking metro and big city as the center node to build networked spatial pattern of urban system which is multiple, multipolar, and connected by traffic corridor (Fig. 6). Networked spatial pattern of urban system takes Xi'an international metropolis as regional development core, Yulin, Baoji and Weinan, Hanzhong particularly as the growth pole of northern, Guanzhong and southern area separately of Shaanxi province, Yan'an, Tongchuan, Ankang, Shangluo, Hancheng, Yangling as regional central cities. The urbanization of center node should focus on mining development potential, improving quality, and promoting the transformation to senior urban social. The cities of regional growth poles should turn to improve urban development environment, guide the aggregation of population and industry, expand city scale, enhance influence, and transfer into the primary city society. The urbanization of regional central cities should focus on stronghold spatial development strategies which can speed up the urbanization process through enhancing the ability of aggregation and influence of regional central cities on the premise of ecological protection. The development of small cities should be paid more attention with the rapid development of big cities. Since small cities have the potential to develop into regional growth poles that can absorb rural population and has strong radiation ability.

In order to change the situation that urban primary index of primate city is too high and small and medium-sized cities lag behind, it is necessary to strengthen the interaction between cities and towns on the basis of existing urban system, taking urban agglomerations as the primary form in Guanzhong area which has stronger resource and environmental capacity (Zhang and Liu, 2012; Wan and Zhu, 2010). From the perspective of urban economics, polycentric structure of urban agglomeration is helpful for preventing city disease caused by excessive concentration of urban functions as well as redundant construction and waste caused by excessive dispersion. So taking urban agglomerations as the primary form of urban system is the main direction of improving regional competitiveness and attracting population to gather to promote urbanization (Zhang and Liu, 2012; Li, 2008).

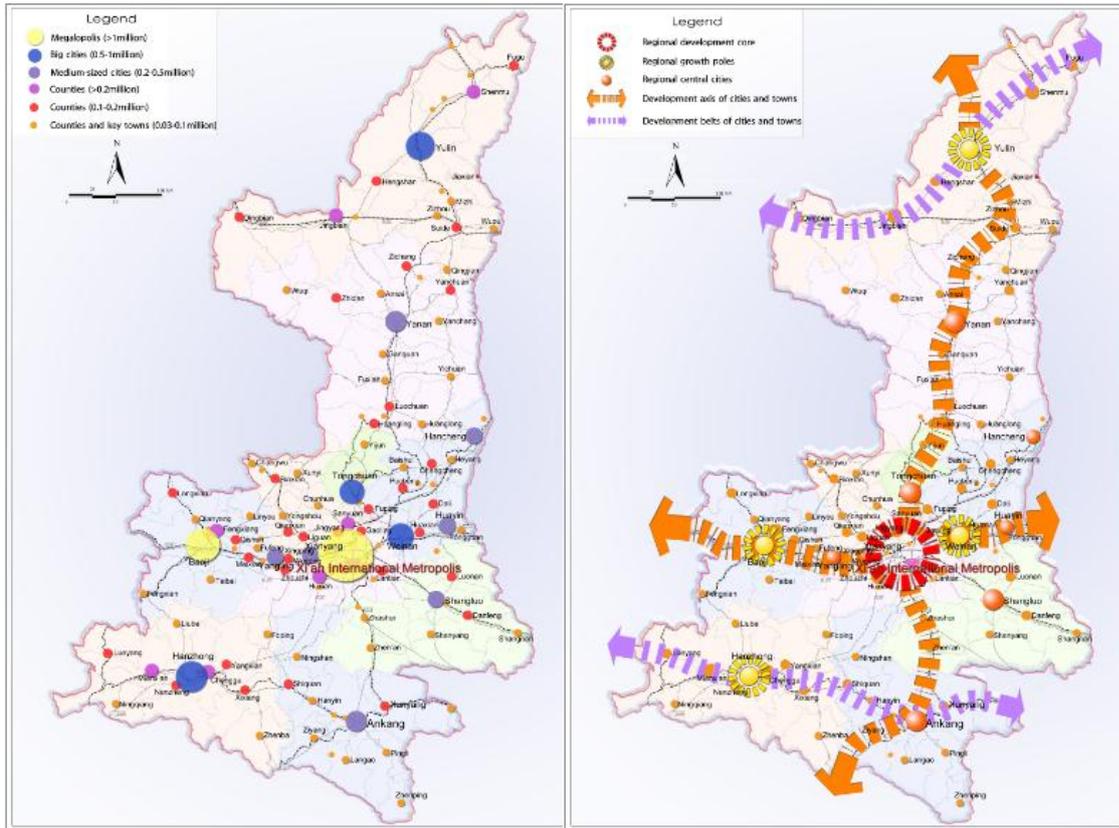

Fig.6 Shaanxi urbanization planning

Data source: The twelfth five-year urbanization plan of Shaanxi province.

3.3 Figuring clear urban characteristics

The establish of urban characteristics should be done with city culture as the foothold, with city history as extension, city feature as starting point to show the integration of city characteristics by urban planning, architectural design, landscape design and construction in it. Urban road named after historical figures and streets can reflect the integration with local culture. Architecture design also can reflect the local culture like architectural style of rural community, such as Pingli county in Ankang (Fig.7). From the perspective of different cities in Shaanxi, Xi’an and Xianyang can highlight city characteristics based on the long sequence and thick accumulation of Qin, Han, Tang history and culture. Baoji, Weinan, Yanan, Yulin should grasp their local culture elements to highlight city characteristics, such as the promotion of Xifu culture of Baoji, the inheritance of traditional opera of Weinan, the red culture of Yanan, the earth construction of Yulin. Ankang , Hanzhong, Shangluo can create urban leisure culture based on their typical natural scenery to realize integration of urban planning and mountain as well as water; at the same time, the historic town as architectural feature should be attached more importance.

Fig.7 New rural communities in Pingli county, Ankang city, Shaanxi province

Data source: Taking by author.

3.4 Overall planning for urban-rural development

After recognizing the importance of harmonization between urban and rural area, Shaanxi has put strategic focus on government-subsidized housing, issues of agriculture, farmer and rural area, equalization of basic public service, energy-saving and emission reduction, coordinated development of regions etc. We can tell that formerly thoughts of emphasizing urban but ignoring rural area have been broken and the development of rural area has been raised on an important position. The primary task is to narrow the gap between urban and rural area.

First, narrow the public service gap to realize equalization (Hong, 2008). In the premise that drafting a unified accessory standard for public service in the circle of province, governments who is capable of providing the basic service can solve their own, and other governments without sufficient finance can use financing mode like BOT to get the basic money to provide service. On education aspect, build a rotating mechanism of teachers from urban and rural schools to balance the teaching resources and avoid too much concentration of teachers in urban area by awards or performance; increase input on education in backward areas and improve the quality of educational facilities to realize educational opportunity and process equally. On medical care aspect, compile regional medical plans guided by demand difference and adjust medical resources layout by population distribution and migration trend. Second, narrow the infrastructure gap. Build convenient transportation linking nearby towns or cities to improve external traffic; villages near towns or cities can extend the water pipes to rural houses while other villages can build central drinking-water source; improve sewage pipes to end the current sewage crosscurrent situation; advocate designated collection, sorting collection and processes together of household waste to improve rural living conditions. Further extend the electricity, communication and network to rural houses to make the rural residents get the same access with outer world as urban residents do.

Third, narrow the income gap. On one hand, strengthen the base of urban non-agricultural industry to provide more working opportunities and raise the income level of migrants; on the other hand, it is necessary to develop rural characteristic economy, villages near cities can develop modern agriculture like rural tourism, experience farming and picking garden while villages far from cities can improve agricultural efficiency by enhancing the level of agricultural modernization and large scale production; improve agricultural management to raise the income level.

3.5 Strengthening the environmental protection

Confined by lag ecological construction, old manage concept, level and matures, a series of problems has broken through the capacity of resources and environment and actions should be taken immediately. Taking Shaanxi as an example, firstly, metropolis and big cities should develop around the concept of compact development and smart growth, advocating compact mix land use pattern to raise land use efficiency. Secondly, increase the investment scale on pollution treatment by improving energetic consumption structure, advocate clean energy,

build multi-scale green belts, hoard construction in process and raise vehicle fuel efficiency to prevent the air quality from declining. Third, increase investment on construction and operation of infrastructures, especially for refuse and sewage treatment plants to end the embarrassing situation that facilities in some counties stop working due to expensive operation costs. Forth, environment is a king of public goods that every can own, its maintaining and improvement can't go without every resident. So public participation not only reflects on the participation of decision-making, but also on obligations to enhance everyone's environmental awareness and protection actions starting from our own.

Conflicts in land and housing markets in Kolkata: Emergence of a divided city

Sheuli MITRA, School of Planning and Architecture, Bhopal, India

Tapas MITRA, School of Planning and Architecture, Bhopal, India

Monidip CHATTERJEE, Centre for Habitat, Environment & Disaster Management, Kolkata

Suchandra BARDHAN, Jadavpur University, Kolkata, India

1. Research Background

The population of India in 2011 stands at 1.21 billion, of which 31.16% is urban, translating to around 377 million people living in urban India. In the last decade from 2001 to 2011, the urban population has grown by an estimated 90 million and the country's rate of urbanization has increased from 27.81% to 31.16% in the same period. Additionally, urban India had a total housing requirement of 26.53 million housing units in 2012, as estimated by Government sources. 99% of this housing pertains to the lower income groups of population. Government sources also estimate the total number of houses constructed in urban India as 14.34 million in the 10 years since 2002-2012. The housing gap is appalling and the dilemma of providing the basic need of shelter to an inordinately large segment of urban population unable to afford housing, is perhaps the biggest challenge of Indian cities.

In post-independence India, the decade of the 1950's saw construction of large planned townships developed by the State along with major employment hubs like factories and state capitals. These new towns were developed on land acquired by the 'Land Acquisition Act, 1894', which enabled the state to acquire land for public use. In the middle decades from the 60's to the 80's, most residential development was in the form of satellite towns around metropolitan cities and large urban extension areas. The progress of actually developing these residential townships was slow and sporadic, due to lack of public funds. The onus of providing urban infrastructure and housing in India had been solely on the Government in these years and the private sector had been totally excluded from the provision of urban services.

A change in the perspective of urban development in favor of a liberal system of governance and management is clearly discernable in India, as also several other developing countries since the mid-1980s. A recent work 'India's New Economic Policy- A Critical Analysis',¹ through a series of critical writings, discusses the developmental approach to understanding the growth scenario resulting from the introduction of a neoliberal approach to economic policy. The demographic explosion and infrastructure deficiencies in most cities and the inadequacy of the state and local governments to make adequate investments to alleviate this forced many countries including India to usher in programmes of globalization and 'structural reform'. Amitabh Kundu in his article 'Urban System in India'² discusses how these measures have been responsible for '*the segmentation of India's cities, the accentuation of intra-city inequalities, and a strengthening of the process of degenerated peripheralization.*'

The context of the quoted text, one among many other recent critiques on the effects of the opening up of the economy for the provision of urban services, forms the backdrop of this research. The impact of economic reforms and resulting urban management systems on urban morphology and structure of the city have been analysed through a case study of Kolkata, one of India's most populated cities. The emphasis has been on the emerging divide in the character of peripheral residential development of the metropolitan area of Kolkata.

2. The Research Structure

'Urban spatial structures are usually the unintended result of unforeseen consequences of policies and regulations that were designed without any spatial concerns.' - Alain Bertaud in 'The spatial organization of cities: Deliberate outcome or unforeseen consequence?'³

The present study uses the work of Alain Bertaud as a starting point of reference in understanding the dynamics of land markets and urban form. Several parameters of analyzing cities are identified by Bertaud and have been referred to for formulating the research framework for analyzing the land and housing markets of Kolkata Metropolitan area.

The present work has undertaken the following research tasks using appropriate tools for the purpose of analysis of land markets and urban form:

- i. Introducing the study area of Kolkata Metropolitan Area in the context of its suburbanization.
- ii. Reference to salient factors of Alain Bertaud's studies used as reference in this research.
- iii. Commentary on chronological density maps of the metropolitan area sourced from planning documents.
- iv. Interpretation of Landsat images to map the extent of built up area in the KMA area and identification of the predominant directions of suburban growth on a temporal scale.
- v. Commentary on the role of the Metropolitan Development Authority and other state parastatal agencies in developing organized housing and township projects in these suburban areas.
- vi. Commentary on the recent trend of private developer driven residential development in these growth corridors.
- vii. Interpreting time series data from archived Google Earth images to analyse the pattern and morphology of development in one of the selected suburban areas.
- viii. Plotting of land price gradient along various suburban corridors and correlating it to other factors affecting it.
- ix. Conclusions and learnings from the emerging pattern.

3. Land Markets and City Structure

A large body of work by Alain Bertaud discusses the impact of land prices on urban development and vice-versa, analyzing various cities across the world. It is interesting to note the variations in population densities in cities with different land price gradients. The classical Bid Rent theory which explains the dispersal of urban population in response to the price of land, fails in socialist states where no land markets exist (e.g. case of Moscow).

In the paper quoted above, Bertaud puts forward the argument that in the case of large metropolitan cities, the urban spatial structure is the possible cause of labour market's consolidation or fragmentation. He further states that any shape whose effect would be to fragment labour markets would not be viable in the long run. He argues that a viable type of urban structure should therefore allow complete labour mobility within a metropolitan area. Households, whatever their location within the metropolitan area, should be able to reach within a reasonable time (say less than 1 hour) all the locations where jobs are offered.

Traditionally, the monocentric city has been the model most widely used to analyse the spatial organization of cities. The works of Alonso (1964), Muth (1969), and Mills (1972) on density gradients in metropolitan areas are based on the hypothesis of a monocentric city.

Over the years, the structure of many cities departed from the mono-centric model as many trip-generating activities were spread in clusters over a wide area outside the traditional CBD. It may be observed that large cities are not born polycentric; they evolve in that direction with various circumstances accelerating the mutation.

Another important factor highlighted by Bertaud is that a polycentric city is not an aggregation of self-sufficient 'urban villages', with a self-sufficient community growing around each cluster of employment, as planners often like to believe and propagate, as this urban structure contradicts the only valid reason of the existence of large metropolises: the increasing returns obtained from large integrated labour markets. The urban village concept is the ultimate fragmentation of the urban labour market. He argues, that in reality, all polycentric cities function very much in the same way as a monocentric city: jobs wherever they are, attract people from all over the city. The only difference is in trip distribution, as trips tend to show a wide dispersion of origin and destination, appearing almost random.

The correlation between the polycentric city model and urban land values establishes that **'for a given point in the city, the shorter the sum of trips to all potential destinations, the higher should be the value of land.'** Thus, polycentric cities also have a negatively sloped density gradient, like mono-centric cities, but not necessarily centred at the CBD but on the geometric centre of gravity of the urbanized area. The slope of the gradient should also be flatter, as is observed in distinctly polycentric cities like Los Angeles and Atlanta.

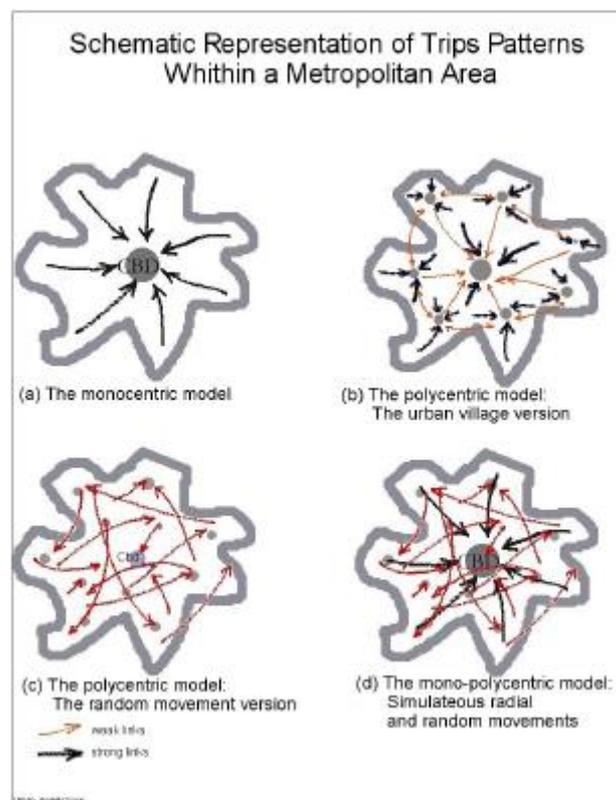

Figure 1: Pattern of daily trips Source: Alain Bertaud

The other significant aspect discussed by Bertaud is the consumption of land in urban areas, which is measured by the densities of cities. Density is often measured as population divided by an administrative boundary. Bertaud argues that this measure of density is not very useful as municipal limits may include a large amount of vacant land, water bodies etc. **'The only meaningful measure of density is to divide population by the built up area consumed by urban activities.'**

The density profile of a city shows the distribution of population within a metropolitan area. In the large majority of cities, the profile of density from the centre point is a negatively sloped exponential curve, predicted by the model developed by Alonso, Mills and Muth.

A related aspect, relevant to most developing nations including India is the effect of urban spatial structure on the welfare of the urban poor. In India, where the poor cannot afford individual means of transport, dense monocentric cities are more favourable as they reduce travel distance to work place and allow a more efficient network of public transport. However, land is usually much more expensive in dense monocentric cities and the urban poor can afford much less land. This leads to creation of inner city slums within the core of the town, where the urban poor occupy sub-grade buildings and live in a poor quality of environment. This is not the focus of the present research, and the thrust shifts to the urban poor who choose to stay in suburban locations far from their work place. The problem in most Indian cities is the absence of public transport to the peripheral locations of the city. The urban poor thus concentrate in pockets serviced by suburban rail, if and when present, and is able to get affordable living units at lower prices. Hence the development of the earlier mentioned band of development in the Kolkata Metropolitan Area along the suburban rail networks.

Thus it can be concluded that in accordance with the classical Bid Rent Theory, each income group will adjust its consumption of land, and hence density, according to the tradeoff between the two vital factors of (i) distance to work and (ii) floor space consumption.

Bertaud further illustrates through a case example that many land use regulations have the effect of segregating the poor in areas which might not be the best for their welfare. Excerpts from the theoretical example are quoted below.

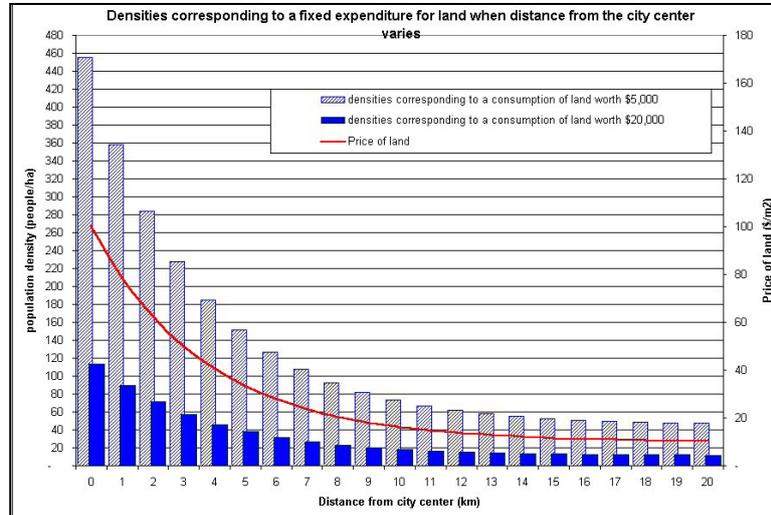

Figure 2: Affordable density by two income groups with distance from the city centre.
Source: Beratud Research

The figure above illustrates that at the same distance from the city centre, the lower income group can afford lesser built space and hence has a higher density, whereas the higher income group can afford more land and built area, and has lesser density, to achieve the average bid rent price of land at that distance.

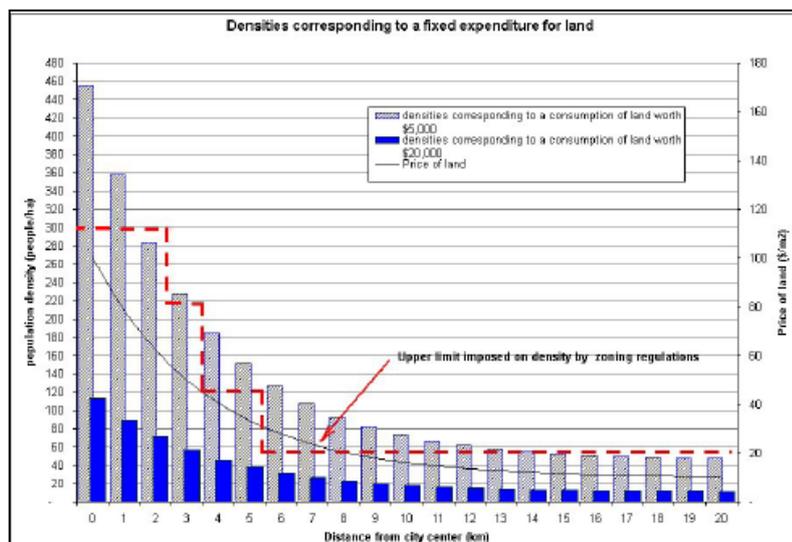

Figure 3: Zoning Restrictions and Affordable densities. Source: Beratud Research

While implementing zoning regulations, most cities set an upper limit for the densities of each zone. The dotted line in red superimposed on the theoretical maximum density graph of the two earlier discussed income groups shows the relation between the permissible density of a zone and the respective income group's affordable density. It is seen that apart from the areas at 3-4 km from the city centre, the lower income group can afford the zoning density only after 14 km distance from the city centre.

Thus, the effect of Zoning regulations often further moves the lower income groups to distant locations. In absence of good public transport, these people tend to find alternate locations in close proximity to the city core and set up informal housing. This leads to the creation of slums and squatters in the city and leaves the periphery as fragmented low density fringes having a transitory character of the semi-urban-rural.

In the backdrop of these theoretical discussions on land and housing dynamics, the Kolkata Metropolitan Area is analysed as a case study and a commentary on its own unique characteristics is developed.

4. The growth of the suburbs of Kolkata Metropolitan Area

Kolkata Metropolitan Area (KMA) is estimated to house a population of about 17 million people in 2011, of which only about 4.5 million live within the city core whose administrative boundary is the city Corporation. The 17 million people are distributed over 1851.41 sq.km. of Kolkata Metropolitan Area, achieving an overall density of about 9000 persons per sq.km. The decadal growth rate of KMA has been constant, hovering around 21-22% for the three decades between 1961 and 1991. There has been a decline in population growth to about 16% for the decade of 1991-2001. During the same period, the decadal growth rate of Kolkata Municipal Corporation (KMC) has progressively declined from 12.39% in 1961-71 to 3.93% in 1991-2001.⁴ This clearly corroborates the fact that KMC has reached its saturation limits and the future growth of the metropolis would continue in the suburbs.

The general pattern of settlements within the Kolkata Metropolitan Area (KMA) suggests a strong linear bias along the river Hooghly, which serves as the central spine of the metropolis. The north – south development axis has been strong, reducing in intensity as the distance from the nucleus of KMC increases. In the east west direction, the cross section of development has historically shown a decline in the density of development from the river outwards, gradually merging with the rural development in the hinterland.

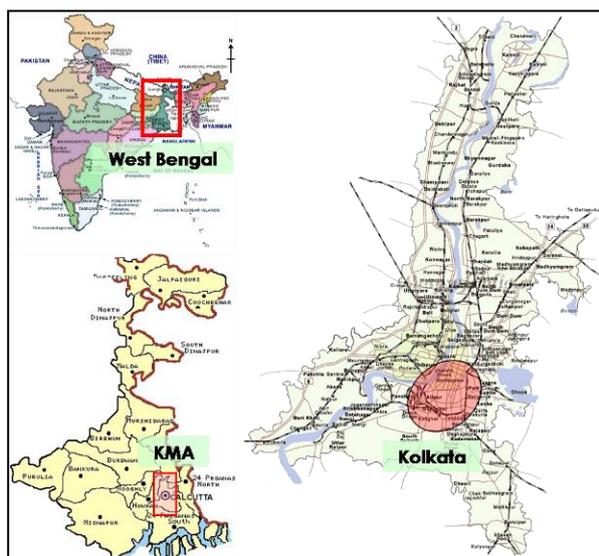

Figure 4: Location and delineation of KMA

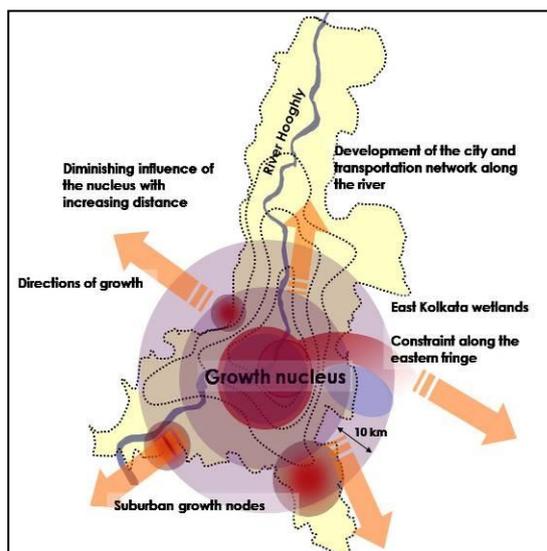

Figure 5: Growth directions of KMA

The Government of West Bengal, the state whose capital is Kolkata, in 1991, discusses the development of Kolkata (erstwhile Calcutta) in a volume 'Calcutta's Urban Future: Agonies from the past and prospects for the Future'. In one of the essays, Monidip Chatterjee explains the pattern of suburbanisation and urban sprawl.⁵The evolution of isolated settlements within the metropolitan area to a continuous band of development over the years was propelled by the introduction of a fairly large network of suburban railway lines, which is a usual suburban growth phenomenon. However, the morphology of these fringe areas is described as 'rural land being divided into small plots for building creating the most effective breeding ground for future urban chaos'. Chatterjee also clearly observes that 'the metropolitan fringe provides a welcome refuge for the vast number of urban poor who are gradually pushed out of the old and established urban core of Calcutta.'

It is worth noting that the phenomenon mentioned in the preceding section was common till the 1990's. Post liberalisation of the Indian economy, with the advent of private developers in the residential supply market, large integrated residential development was mobilised by the developers. Land for such large township-like developments could be found only at the urban fringe and rarely in brown field sites within the city Corporation limits. Thus, the urban poor who used to be pushed out of the city core towards the urban fringes, now had to compete, even for fringe land, with developers, whose paying capacity was much higher and development interest quite different.

5. Correlating the Theoretical Framework of Housing and Urban Land Markets to the context of Kolkata

This research work analyses the Kolkata Metropolitan Area on various parameters which have been discussed in the preceding section on theoretical framework, and attempts to interpret the findings.

5.1 Density Pattern

The Plan Document for KMA, 'Vision 2025, Perspective plan of KMA: 2025' has been referred to as the source of data on densities in various parts of the Metropolitan Area. It is noteworthy that KMA spreading over 1851 sq. km comprises of three city corporations including Kolkata Municipal Corporation, and house about 39% of the population. There are 38 municipal towns, housing about 45% of the population and 77 census towns housing around 7% of the KMA population. A vast chunk of land in KMA is rural (40.31%) but house only 9% of the total population. Given this heterogeneous composition of the Metropolitan

area, it is imperative to understand the variation in densities in the different parts of the metropolitan area.

Density in persons/ha

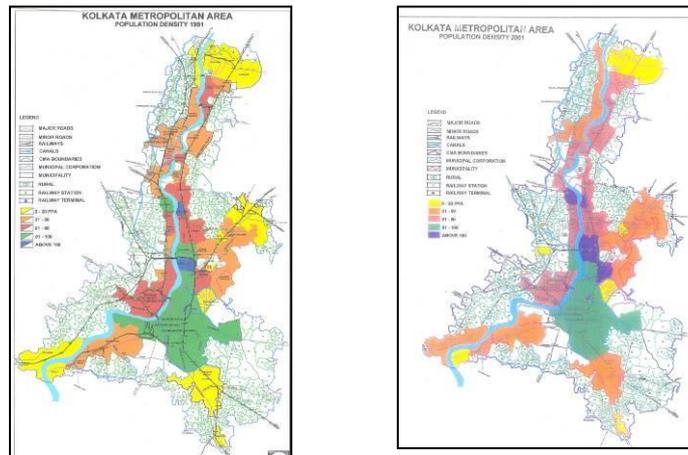

Figure 6: Densities in KMA in 1991 and 2001

The above figure represents the densities in the various urban entities within the KMA. It is seen that in a decade, many of the peripheral urban entities, particularly on the eastern and south eastern fringes have shown an increase in density from around 0-50 persons per hectare, which is the lowest density, to densities of 51-125 persons per hectare. All peripheral locations have shown an increase in density to the next higher range in the decade of 1991 to 2001. It is interesting to note that the large core area of KMA, which is the Kolkata Municipal Corporation area, has shown no change in density and remains dense but stagnant at 201-250 persons per hectare density.

The research, in line with Bertaud’s methods, has computed the density of people on urban built up areas, through image interpretation of LANDSAT images. Three LANDSAT images of 30 meter resolution were used at decadal intervals for around two decades, with the dates of image acquisition being 11 Nov. 1989, 24 Feb. 2002 and 19 Feb. 2009. A Multispectral 7 band (MSS) IMAGE was used to detect the built up areas within KMA boundary. Linear features (roads and railways) were traced and verified using Google Earth imagery.

The KMA boundary was superimposed from drawings made available by KMDA. Taking the existing CBD as centre, concentric rings at 5 km distance are mapped to have a quick reference of the extent of the city’s built up area in different suburban growth directions. The yellow lines traced on the image depict the extent of urban built up area as interpreted from the image.

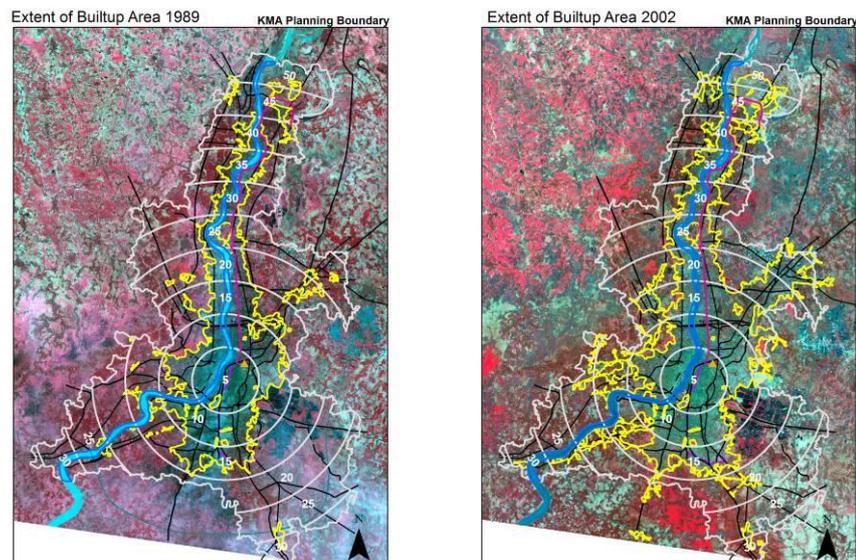

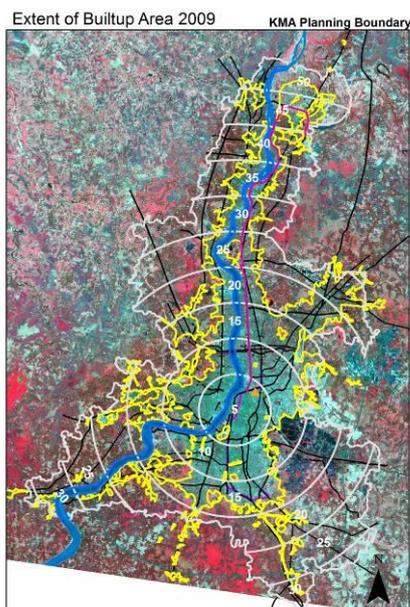

Figure 7a, b, c: LANDSAT image interpretation of Built up area in KMA for 1989, 2002 and 2009.

The key observations which can be interpreted from the images are as follows:

- i. The geometry of the KMA region shows the CBD and the centre of gravity being towards the southern side. The delineated Metropolitan area stretches upto 45 km to the north boundary and barely 15 km to the south boundary.
- ii. Growth in the eastern and south eastern fringes has been significant in the decade 1989 to 2002.
- iii. In the last decade of 2002 to 2009, the settlements have grown southward along two major spines and gone beyond the delineated metropolitan area limit.
- iv. It is evident, that even though the Metropolitan Planning Area has more land on the northward side, with increasing distance from the CBD, the development rate is much slower and restricted to the river edge. The south however has been growing at a faster pace due to its proximity to the CBD with built development even showing signs of going beyond the delineated Planning Area boundary.
- v. The southern and eastern part also has a robust road network along which the development has taken place, in contrast to the north and west, where the suburban rail is the main commuter mode, also explaining a more rigid controlled form of development.

The extent of builtup area and the computed density on built land are shown in the following table:

Year	1989	2002	2009
Population of KMA (in Millions)	12.64*	14.72*	17*
Urban Built up Area (in Sq. km)	461	704	738
Population Density on built up area in Persons/sq.km	27,418	20,909	23,035

*Population numbers used here are the ones available from the closest Census enumeration years of 1991, 2001 and 2011.

Thus the density of people on built area is as high as 23,000 persons per sq.km as against the figure of 9000 persons per sq.km when overall density of KMA is computed for the same population.

The burdens on the development corridors in the suburban areas can be understood, as the growth in the city corporation area has been stagnant. The rural hinterland does see sporadic development, but it is the urban peripheries which bear the burden of these extraordinary density figures.

5.2 Residential Development and Land markets

An analysis of the pattern of development in recent years shows significant development on some transport corridors in the south and south eastern periphery. The land price gradient on all these corridors and the nature of residential development along them form a part of a larger research. In this paper, some cases have been documented to give an overview of the transformations taking place at the fringes.

The phenomenon of urban development in all the peripheral corridors can be broadly classified into three types of development:

- i. Land conversion of agricultural land to residential use followed by subdivision into small plots for individual residential development. Land prices are low compared to core city areas for the two reasons of distant location with poor accessibility to city and absence of planned infrastructure (drains, sewer lines, electricity etc.).
- ii. Organised residential townships developed by the Government agencies- the metropolitan development authority, state housing boards being the major players. These developments would bring with them infrastructure development in phases and the accessibility of the entire area would increase. Being welfare projects, the mix of plots and housing units would include all income groups and work on the principle of cross subsidy to ensure availability of plots to the lower income groups of population as well. While the drawback of this model was the slow rate of progress, the benefits to the city's population were many, and most of the organized housing was developed in this way till the early 1990's.
- iii. In recent years, post liberalization, the private sector has been included as an actor in the urban development process. These developments work on a maximum profit basis. Thus they situate themselves in places of lowest land cost and with basic trunk infrastructure and then create islands of gated communities predominantly for the middle and upper segments of the population. These developments disrupt the socio-economic profile of the surroundings as they usually come up in low income suburbs. The residents usually have their own transport and hence do not need to interact with the immediate community at all. All amenities are provided within the gated community and they are isolated paradise islands. These islands create social divides and increase the land values in the surroundings, without giving any direct benefits.

6. Character of the Peripheral Residential Development in Kolkata

The change in morphology in one area surrounding these large residential developments in the fringe areas has been documented through archived images of Google Earth.

Case Study: East Kolkata Township- a large area developed by Kolkata Metropolitan Development Authority (KMDA).

Year of project initiation: 1976 Year of completion: Developed in phases from 1990s.

Total project Area: 315 hectares (approx.) Distance from CBD: 7 to 10 km on Eastern Fringe

Figure 8 a. East Kolkata Township in 2002.

- Government institutional group housing projects completed.
- Large number of vacant land parcels
- Surrounding area on eastern periphery rural in character with sporadic loosely strung development

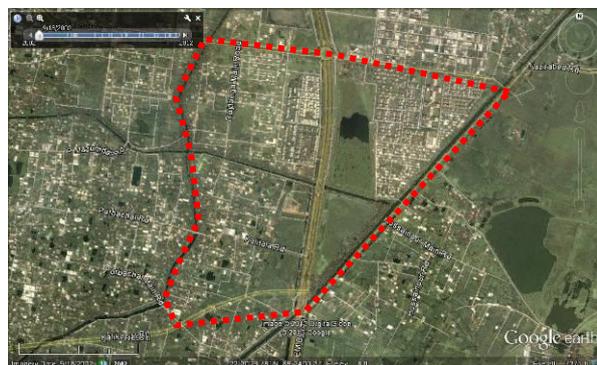

Figure 8 b. East Kolkata Township in 2009.

- Most vacant plots developed.
- Private developers and joint venture companies have developed many gated housing colonies, largely for the middle and upper income groups.
- Many institutions developed on commercial plots

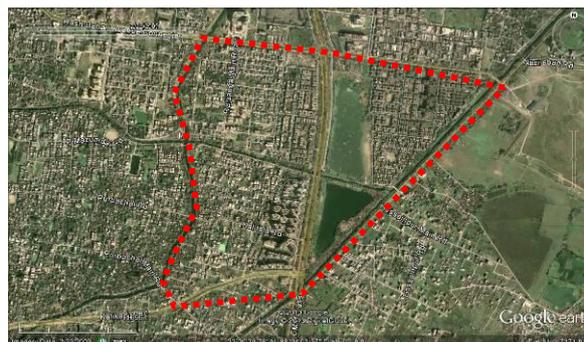

Figure 8 c. East Kolkata Township in 2012

- East Kolkata Township has almost totally developed as a major residential suburb with public transport, schools, hospitals and other social amenities.
- Areas on the east beyond the township area have shown escalated growth, as lower and middle income plotted developments, benefitting from the locational proximity to East Kolkata Township

Property prices in this area were collected from various real estate broker firms and published market scans were referred to obtain old data. The prices of the development in this zone are as follows:

	2002	2009	2012
Typology wise rates in East Kolkata Township and its surroundings	Sale rate in INR/sft	Sale rate in INR/sft	Sale rate in INR/sft
Housing Complexes	1500-1600	3000-3500	5000-7000
Stand alone apartments	1300-1400	2200-2800	4500-5000
Apartments one block behind	1100-1200	1800-2000	3500-4500

- The rate of escalation in housing complexes from 2002 to 2009 was at an average annual rate of around 16%, whereas for the period of 2009-12, the annual rate of appreciation has been around 33%.
- In case of the stand alone apartments, the appreciation in the earlier time span was in the range of 14% annually, and in the next span it was around 26% annually.
- In case of the apartment blocks one block behind, the appreciation was less than 10% annually in the first few years. In the second phase, the appreciation has been the highest in the range of 40% annually.

These observations are significant in revealing the transformation which takes place outside the planned development. With the East Kolkata Township saturated and complete with amenities, the price of residential units around escalate, as they are in high demand due to their proximity to all amenities. The rental rates here are even higher and the people having older houses are seen to renovate them to utilize the full FAR, to capitalize the rental potential.

It is interesting to note that around the late 1980's and early 90's, at the time of introduction of the neoliberal policies, a large private development was sanctioned by the State

Government a block beyond the East Kolkata Township. This township was a high end development meant as a second home for non-resident Indians (NRI) wishing to have a house in their homeland. The 65 acre township is being developed by a consortium of six developers and the land was obtained on lease from the State Government around 2006-2008, at a lease rent of 233 million INR, which was a paltry sum of 3.5 million per acre. Around the same time, other smaller land parcels were transacted in the neighbourhood of the project at around 5.5 million INR per acre. The project has 6 high end residential towers of 75 stories each and is currently being marketed at a price of INR 8000-8500/sq.ft. of built space.

It is ironic that the government in its role as developer had been just and fair and the projects developed by the Government had served the purpose of providing shelter to all. With the change in role of the government, from developer to facilitator, the Government has interpreted its role only as a land broker, leaving the onus of provision of housing solely to the private sector. In such circumstances, in developing countries like India, where the higher income groups also had few products on the shelf to choose from, the private developers would prefer to make huge profits and cater to the highest income group alone.

7. Emergence of a Divided City: causes and consequences

The conflict which arises is in the competition for precious land in the same fringe areas, as documented in the above mentioned case study. In the earlier stages of socialist development, normal market forces would push the lower income residents to the fringes, with Government giving infrastructure at later stages. Post liberalization of the economy, the demand for land in the fringes has increased, with developers seeking to develop high end residential enclaves in these areas, to minimize on cost of land and thereby maximize profits. This distorts the classic bid-rent curve of land prices, and generates smaller peaks at the periphery as well. The fallacy of this entire development is the increasing gap in housing for the lower income groups. Where are they living? How are they affording for urban housing? The creation of informal settlements in more prime locations and creation of slums in dilapidated inner city areas is a distinct possibility, thereby removing the lower income population from the formal housing markets. Along with it is the process of creation of 'reverse ghettos' of opulence amidst the seas of lower income sprawl at the fringes.

To conclude in the words of Amitabh Kundu,⁷ 'a switch over from planning to free market, therefore, has not given any impetus to urban growth'....'This has only helped institutionalize disparity and strengthen the process of segmentation of the cities into rich and poor colonies'.

Urban Agriculture as a Socially Inclusive and Sustainable Post-Growth Urban Regeneration Strategy

Synopsis

The experience of "*New Roots Community Farm*" within the distressed neighborhood of City Heights in San Diego shows how the "Urban Agriculture" approach can provide new integrated strategies for urban regeneration matching social inclusion and physical-economic redevelopment.

1. Urban Agriculture and social inclusion: what role in regenerating cities?

Can the "Urban Agriculture" approach, within the wider framework of "Healthy food policies", innovate urban regeneration strategies and tools while pursuing a virtuous scenario in terms of social inclusion?

Not just a rhetoric question that the authors have been facing, together with a larger group of European and US researchers, since the beginning of a EU FP7 Marie Curie Research Project, still in progress, focused on innovative tools in urban regeneration strategies¹. No doubt it is a quite complex issue and a relevant research challenge, nevertheless it will be argued that it is possible to be moderately optimistic for a satisfying and positive response, but only by matching specific conditions.

Urban redevelopment within economic crisis cities is a contemporary major challenge for public administrations, private investors as well as the increasing kaleidoscope of socially driven stakeholders. However, the imperative of pursuing inclusive urban strategies facing the exponential rising of migration phenomena have been rarely connected to the issue of limiting land consumption and boosting economic, physical and social regeneration in most developed countries. Only fairly recently within the general framework of "urban-rural" relationships, "Urban Agriculture" is emerging as a practice which could prove successful both for giving new perspectives to blighted zones of the post-crisis cities and for tackling social malaise related to the massive migration phenomenon in western economy metropolitan areas.

This paper is focused on reflecting on and assessing how and to what extent Urban Agriculture can drive innovation in urban regeneration strategies, not only in physical and economic terms, but also and mostly in a social cohesion perspective. A specific case study of an integrated initiative run by a non-profit organization in San Diego (State of California), is discussed in order to support such a scenario. The "*New Roots Community Farm*" initiative –

located in a “patchwork community” of immigrants, the distressed neighborhood of City Heights – seems to be particularly significant for its aim of revitalizing “rurban” spaces through the involvement of refugee groups in urban farming, community garden care and the potential of an interesting “chain” of connected activities. The whole neighborhood is considered a “critical food access” area and the main turbine of the initiative, an international non-profit organization, the International Rescue Committee (IRC), worked with other community-based associations, the City of San Diego and the San Diego County Farm Bureau to develop the project on public vacant land.

2. “Healthy food” issue in United States

Across the US, a growing consumer demand for fresh, local, and healthy food is creating new markets for urban food production. Many of these efforts specifically address the need of urban residents who are living in low-income neighborhood to access food. The wider framework such programs are embedded in is to be found in healthy food policies and correct eating habits as a way to tackle serious social illnesses such as high rates of obesity, diabetes and cardiovascular diseases.

Although US food production is far more than sufficient – doubling and tripling consumer’s needs (Nestle, 2007) – the intertwining of malnutrition and access to fresh and healthy food is the main issue at stake. Indeed, not only researches demonstrate the correlation between individual’s health behavior and the social and physical surroundings, but specifically show a relationship between malnutrition diseases and low-income neighborhoods (Morland, 2002). The lack of supermarkets and grocery stores selling affordable, fresh, healthy food may have substantial impact on low-income and minority communities to have equal access to food (Morland, 2006; Flegal, 2002).

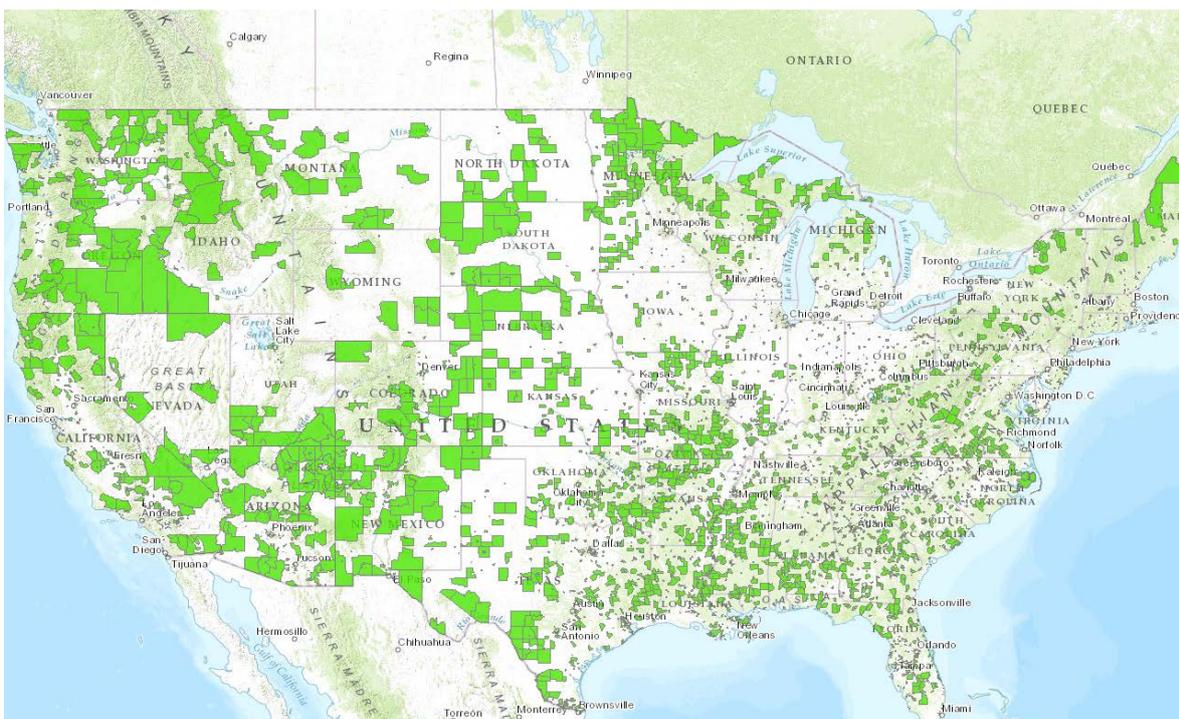

Figure 1: Food Deserts in USA; Source: USDA

Critical food access areas are often identified as *food deserts*, areas “with limited access to affordable and nutritious food”², or *food swamps*, marked by the abundance of unhealthy food sources such as fast-food restaurants and convenience stores. Under USDA criteria defining food deserts³, “about 10 percent of the 65,000 census tracts in the United States meet the definition of a food desert. These food desert tracts contain 13.5 million people with low access to sources of healthful food. The majority of this population — 82 percent — lives in urban areas⁴.”

In this context, the United States is the forefront of community based agricultural and rural practices, not only for the achievement of urban physical regeneration objectives, but also in consideration of the social integration and economic development targets that such initiatives aim to attain. In fact, together with the most known community gardens and retail farms, there is a wide variety of different activities linked to agricultural production and fresh produce which vary from job creation with “commercial kitchens”, food business incubators to specific educational and growing activities and training on culinary arts.

Planning agencies, both at local and regional level, are increasingly using urban and regional plans to address food system issues in a sustainable way. Among them, urban agriculture is one of the topics identified as an “innovative” tool to enhance the food system, economically, environmentally and socially. Defined by Bailkey and Nasr (2000) as “the growing, processing, and distribution of food and other products through intensive plant cultivation and animal husbandry in and around cities”⁵, urban agriculture includes a number of different initiatives both green- and brown-field. These projects are often inspired by non-profit organizations with a variety of goals, including health and environmental issues, job and income creation as well as the development of entrepreneurial skills and the regeneration of distressed neighborhoods. Indeed, as cities spread into suburbs, inner-city buildings and lots are being abandoned or demolished: urban agriculture brings vacant parcels of land back to a productive use in an alternative food supply mechanisms.

2.1 California and San Diego

In the State of California, especially large metropolitan areas are making foodshed assessments to plan for specific interventions. Recently San Francisco, Los Angeles and San Diego are easing procedures and changing plans and zoning codes to include Urban Agriculture. In particular, and as part of the revived attention to healthy food, the *Building Healthy Communities Initiative* granted funds to start the San Diego County Food System Alliance in March 2012. The Alliance's objectives are to strengthen local farms and improve access to good and healthy local food by improving infrastructure and regional food distribution.

Therefore, the Urban Agriculture theme in San Diego is currently very much debated within the wider political framework and cultural shift toward more healthy eating habits and food, especially in low-income communities. Urban Agriculture in its various forms may therefore be seen as a complementary, concurrent element, if not a trigger itself, of economic and social regeneration initiatives in blighted areas and distressed communities. Actions and initiatives related to Urban Agriculture take different forms and are institutionally recognized by the city of San Diego within the municipal code and the zoning code after the amendments adopted in January 2012 which have been funded through a \$50,000 grant provided by the *County of San Diego Health and Human Service Agency* with the aim of increasing access to healthy, local and sustainable nutrition style.

These amendments and new regulations have introduced important novelties and opportunities for Urban Agriculture. Firstly, the introduction within the General Plan of two new categories “Farmers Markets” and “Retail Farms”. Secondly, losing the restrictions on

the keeping of chickens, goats and bees either city wide or in single-family areas and minor amendments to community gardens regulations. Land uses within Urban Agriculture therefore regard *community gardens* and *backyard gardens* mainly for self-consumption and commercial urban farms for production and selling.

Within the amended general plan in San Diego, Urban Agriculture is defined as “the production of food in and around cities for local consumption”. Specific plan's policies aim at an Urban Agriculture system that should be both economically and environmentally sustainable by:

- encouraging the use of specific Urban Agriculture techniques that require reduced land and water use;
- recognizing the cultural and economic benefits of providing opportunities for residents to grow healthy, affordable, culturally appropriate foods;
- developing land development regulations that allow Urban Agriculture uses in appropriate locations and increase opportunities for farmers markets on public and private lands;
- encouraging Urban Agriculture land use in underutilized vacant plots and peri-urban areas;
- exploring potential location for Urban Agriculture land use as part of a long range plan.

3. Method approach and cultural positions

The specific study the present paper is dealing with, has been conducted within a broader investigation⁶ on urban regeneration tools and strategies in the United States, which takes into consideration economic, social and environmental aspects in order to achieve a sustainable and “smart” perspective on cities. Considering the adopted holistic approach to the research and in order to explore the multifaceted nature of the issue, we followed a “grounded theory” approach to fully explore the complexity of the investigation, both at theoretical and empirical level. We adopted this approach both for the whole research model and for case study methodology in order to support the inductive rationale and adjust research hypothesis.

Following the bottom up process, quantitative and qualitative data were collected through several methods and different sources (Glaser and Strauss 1967). This initial empirical investigation is necessary to avoid basing hypothesis on theoretical grounds, and allows for unexpected results to emerge from the investigation process itself.

First of all, a statistical analysis on selected Census Bureau tracts was needed in order to identify useful data on the demographic, social and economic situation of the city of San Diego and its diverse neighborhoods. A review of community plans, regeneration initiatives, zoning and land use were used to layer the planning perspective and define the critical mass of the urban fabric.

At the same time, qualitative data were gathered from interviews with selected stakeholders acting at neighborhood, city and county level, in order to fully understand the complex scaling and intertwining of different driving forces. Municipalities and other local authorities, as well as nonprofit organizations, community-based associations and private bodies were involved to recognize the complex partnership architecture of the phenomenon.

The gradual re-emergence of urban food production can be regarded as a relatively innovative form of urban regeneration able to bring about physical as well as social change.

In fact, urban gardens existed as far back as the early 19th century in England as a way to meet the demand of new immigrant rural workers for urban allotments which were to support low wages and family income (Martin and Mardsen 1999). In the United States, high unemployment rates were tackled through garden programs in the late 19th century in Detroit (Lawson, 2005) and victory gardens were boosted from the government to respond to food shortages during World Wars., Gardens were intended to both provide food and employment but also to assimilate recent immigrants (McClintock, 2010). Today, Urban Agriculture refers to the “growing, processing, and distribution of food and other products through intensive plant cultivation and animal husbandry” in and around cities within the cores of metropolitan areas and at their edges. It is a complex activity, addressing issues central to community food security, involving also recreation and leisure, economic revitalization, health and well-being, beautification and environmental protection (Brown and Carter, 2003).

The influence of Urban Agriculture and community gardens within the literature is described as three-fold; firstly, the ability of promoting sustainability, both physical and ecological; secondly, the socio-cultural potential of community gardens which provide a place for communities to gather, interact and share knowledge and experiences; thirdly, their contribution to education and career development of young adults as well as those adult segments of the population willing to undertake new business activities (Stocker and Barnett, 1998).

Generally, advocates of Urban Agriculture (Smit and Nasr, 1992; Kaufman and Bailkey, 2000; Mougeot, 2000) envision multiple benefits to cities as:

- reducing the abundant supply of vacant, unproductive publicly owned urban land and so enhancing the image of distressed neighborhoods;
- increasing the amount of neighborhood green space and open areas with positive ecological impacts;
- supplying low-income residents with healthier and more nutritious food;
- reducing food insecurity and by improving food intake of households and developing more pride and self-sufficiency among inner-city residents.

On the other hand, detractors identify a series of impediments to the successful implementation of Urban Agriculture projects, which however appear to be more of external limitations rather than limits of the practice itself (Smit, 2001; Kaufman and Bailkey, 2000). Within them are underlined:

- cost and contamination of inner city vacant land;
- lack of resources made available by government agencies and organizations as well as little, if any, commitment to support Urban Agriculture from city officials;
- lack of know-how within communities to cultivate land and grown food;
- difficulties such as vandalism, shortage of staff and lack of market opportunities;
- Urban Agriculture as being aesthetically inappropriate in the city, causing pollution and being anti-hygienic.

Nonetheless, not only a growing number of committees (especially the Community Food Security Coalition) is devoted to respond to these issues, but also planners are more involved in making connection between urban agriculture and the larger food system, as dependent on economic, environmental and social resources (Hodgson, 2011).

For the scope of this work, social benefits of Urban Agriculture were especially taken into consideration. Community involvement in Urban Agriculture’s initiatives provides opportunities for environmental awareness and nutritional education, as well as for social

interaction across diverse range of cultures and age groups, including minorities and immigrant farmers.

Indeed, “Urban Agriculture has always been enriched by the skills and technologies of immigrant populations” (Brown and Carter, 2003), that might already have experience and knowledge of raising and preserving food. In addition, they may bring also new crops from their native countries, providing market niches for cultural food to the benefits of both the host and other countries (Smit, 2001). Because immigrants and ethnic minorities often resides in low-income neighborhoods where accessibility to food is critical, they might become a fundamental resource for fostering and enhancing Urban Agriculture culture.

4. Case study overview

The potential of Urban Agriculture was specifically explored through the investigation of a fundamental case study in San Diego County, California, as it has greatly contributed to the establishment of Urban Agriculture in the city of San Diego as a practice for social as well as economic and physical regeneration. The “New Roots Community Farm” project, managed by the International Rescue Committee (IRC) and located in the neighborhood of City Heights in the eastern part of the city, is most interesting because of the full involvement within the local communities of a group of refugees for the implementation and management of a community garden and connected activities. The case is particularly concerned with the social aspect of regeneration, which involves integration and inclusion of the poor and marginalized, being directed to refugees and former farmers in their country of origin with a wider social impact that represents the main objective of the initiative and whose virtuous effects on the multifaceted local community should not be underestimated.

The discussion of the case study shows how a single Urban Agriculture initiative, carried out by a non-profit organization for a particular target of immigrants, empowers these new residents as producers, consumers and vendors of healthy fresh food and builds local economic development.

Through an intense collaboration with local authorities and other community-based associations, in 2009 the project started on a 2.3 acres land with 85 families participating, and its successful results are now being replicated by IRC nationwide as a way to tackle food insecurity, health problems, and economic hardship through community-based food and farming projects.

The project garnered national media coverage since the visit and the “endorsement” of the First Lady, Michelle Obama, in 2010, as it is considered the first attempt to establish new community gardens legislation in San Diego and, more generally, a new food-related trend especially in low-income neighborhoods. Following a “place-based” strategy, the “New

Figure 2. Michelle Obama visiting the New Roots Community Garden, Chollas Creek, San Diego 2010. AP Photo.

Roots” project attempts to connect a rural framework into an urban redevelopment policy.

4.1 The neighborhood of City Heights

City Heights is one of the largest and most populated neighborhoods of San Diego and it has historically been destination for immigrant communities. Flows of refugees started in 1974 with Vietnamese – followed by Cambodians and Laotians - and continued in the 80's and '90 with resettlements of immigrants from civil wars in Central America, former Yugoslavia and Iraq. At the beginning of 2000 immigrants arrived in City Heights from East Africa, and according to the Census data review 44 percent of the neighborhood's population was foreign-born by that time.

Demographics of the neighborhood reveal a different framework compared to the average of the city of San Diego and cast light on the history of immigration in the area. The city is populated by Whites for about 60%, with other groups ranging from the 7% of African-Americans and 15% of Asians as other major ethnical groups. City Heights has a 32% white, 15% African-Americans, 16% Asians and 29% of “other races”. Also, as common among many developing countries, the population structure is very young and much concentrated in the 5-35 years old group, which means high birth rates and larger families.

Once a dynamic business neighborhood, City Heights experienced a dramatic change since the late '50 with the openings of large shopping malls that deprived little merchant of costumers. The need to attract shoppers back to City Heights was crucial to the approval of the Mid-City area plan in 1965. Indeed, business interests endorsed the idea of a densification of the neighborhood's residential area to broaden customer base. The substitution of multi-family dwellings for single-family residences and the construction of large complexes of trashy apartments changed the aspect of the neighborhood, with increasing problems of viability, parking and public services.

As the population dynamic dramatically changed since the 70's, grocery stores left both because of high crime rates and the rigidity of full-service grocers and supermarkets supply system, making access to fresh food more difficult. The lack of healthy, fresh and ethnic cultural food in the neighborhood had a significant impact on the livelihood of these communities, most of which were agrarians in their native countries.

A study conducted in 2011 casts light on the fact that the whole neighborhood suffers for being a “critical food access” area as far as supermarket are concerned, both in terms of distance from the nearest full-service grocery, and concerning the available grocery retail space. Access to food has become a major issue in City Heights for at least a couple of reason. Firstly, the lack of affordable fresh and healthy food in a low-income neighborhood, where also issues of public and private transportation means are involved. Secondly, immigrants and refugees are used to “cultural food” which may be very difficult to reach in an already underserved area. This has to be taken in consideration, also because the majority of affordable groceries throughout the whole city of San Diego are of Mexican culinary tradition.

4.2 “New Roots Community Farm” project

Aware of these food-related problems in the area, the International Rescue Committee (IRC) – an important international non-profit organization working on refugee's resettlement in US - came up organizing meetings with communities around the issue. Many immigrant families were suffering from high rates of obesity and other health problems due to the lack of affordable fresh and healthy food.

IRC started a bottom-up process working with refugee communities, residents and local groups to tackle food insecurity and malnutrition. They identified a brown vacant public lot and asked the city to farm that land. Because the City didn't had any policy for urban farming on the ground yet, IRC together with residents and non-profit advocates have focused on finding solutions by promoting land use law changes, community gardens, farmers markets and other grassroots initiatives. Significant, in this sense, was the approval of a city ordinance in January 2012 that dramatically streamlined the city's community garden regulations. After several years of bureaucratic process, in 2009 the City of San Diego approved the project and released an "occupancy permit" on the designated vacant plot.

Since many refugees groups were agrarians in their countries, the strategy was oriented towards a better understanding of market dynamics, business and marketing. The New Roots Community Farm is the first of several initiatives put in action by IRC under the broader umbrella of Food Security and Community Health (FSCH) Program. Other initiatives comprise The New Roots Aqua Farm, an aquaponics system that employs a closed-loop cycle of tilapia farming with hydroponic vegetable growing. The Aqua Farm is also a small incubator farm that gives entrepreneurial residents additional space to grow.

New Roots growers, both of Community and Aqua Farms sell at the City Heights Farmers' Market weekly. Also within the same program, the City Heights Community and Remedy Garden is located in the heart of City Heights with 16 gardening plots for community residents and an herbal medicinal garden, where two high school garden programs train youth in urban farming and food justice advocacy.

The step-by-step strategy is to ensure refugees and residents can get affordable fresh organic food to feed themselves and their families but also to gradually introduce them in the food-business. Training programs are organized by IRC and because the community farm has been certified, they can sell their surplus at City Heights Farmers Market and to restaurants, making it a secondary income of a family, especially for women who generally are more involved. Some farmers have turned this activity into a business through a food business incubator located in Pauma Valley, 50 miles into the San Diego County.

From a micro point of view, the initiative concretely acts to meet its community needs, first of all in terms of food security and nutrition. In a "critical food access area" such as City Heights, farmers not only have land to farm and access to fresh and "cultural" food, but also technical assistance, credit facilities and business training to improve their business knowledge. New Roots locally grown food may allow for households extra-income and for a better diet intake. Training programs improve business capacity building and microenterprises are sustained by a number of IRC facilities.

Broadening the perspective, New Roots has spatially widened its impacts through a step-by-step process and is now a network of initiatives serving communities' needs, developing local economy both within the neighborhood and beyond urban borders.

5. Perspectives and open problems

Closing the circle of these reflections and coming back to the initial question, what are the most interesting findings related to the "New Root" case study for arguing for the role of Urban Agriculture within the general framework of Healthy Food policies for regenerating cities in social, economic, physical and environmental terms?

As we argued in the first part, there is no doubt of the increasing success of "Urban Agriculture" initiatives which are to be considered within the general framework of the so called "Healthy food policy", at the moment a core issue not only for developing countries,

but also in US and in general in OECD Country policies and strategies both at central and local institutional levels.

The San Diego “New Root Community Farm” case-study is somehow emblematic of the capability of setting up a pro-active variety of initiatives in terms of actors, partnerships, social value, community involvement, economic sustainability, mixed functions, new identities. However, it would be an illusion to think that such a “recipe” can be imported “sic et simpliciter” into other contexts. In fact, its relevance as a best practice is obviously related to specific conditions of space, time, civic and juridical culture.

Differently from the European context, nowadays in a US atmosphere, and particularly in California, searching for a post-crisis perspective, it seems to emerge a new horizon of project initiatives with a moderately confident vision for re-boosting local economy and pursuing a “fair redevelopment”. San Diego City has General Plan (2008) which was “awarded” by APA in 2010 for emphasizing the “City of Villages” and the multifaceted community dimension. Its sensitivity for Urban Agriculture approach has been stressed by the last amendments (2012) allowing the spontaneous creation of “Community gardens” and “Retail farms” for encouraging a “new deal” in terms of green, smart and socially inclusive city.

The project quality in terms of complexity assured a relevant potential as a catalyst in terms of urban regeneration in its multifaceted interpretations, emphasizing mostly the social, cultural and symbolic dimension without neglecting the concurrent economic, physical and environmental aspects.

The project is somehow part of a more systemic vision in the priority for a revitalization program of the neighbourhood, already in progress by a local non-profit charity (the Price Foundation) and shared by the “civitas”, the public administration and the majority of local stakeholders.

Referring to the regeneration impacts, the Community garden phenomenon can be considered only the “tip of the iceberg”. More complex “critical mass” can be found in the potential of related activities (farmers’ markets, aqua farms, commercial kitchens, kitchen incubators, culinary art training centers, ethnic groceries and restaurants, connected peri-urban agri-farms) which become more and more socially and also economically relevant and offer new opportunities for the inclusion of immigrants and new forms of social cohesion. The success of the initiative is mirrored through the capability of implementing virtuous forms of dialogue among the fragmented identities of the Community; healthy and ethnic food implications can be a powerful vector in terms of programs and perspectives of social inclusion, pro-active education, limited but socially significant economic rebounds.

On the other hand, the New Roots case and other parallel experiences in US underline some problematic issues, weaknesses and threats.

Sometimes it is evident the risk of delaying or paralyzing the “project cycle” due to “dialogue difficulties” between non-professional proponents (i.e. non-profits) and the public government.

The project follow-up by the public administration has the typical advantages and limits of the “Common law” juridical culture: the public sector is in general a sort of “referee” limiting its action to manage the rules while “waiting” the actor proposals; differently from the “Civic law” culture of some European Countries (France, Italy, partly Spain) the public sector is rarely a sort of “turbine” with a more proactive, leading role).

So, coming back to the initial question about the role of Urban Agriculture strategies for regenerating cities, looking at the lesson of San Diego and at the general dynamics in other US realities, it is possible to say that this approach can take on a concurrent, complementary role with intriguing potential if and only if some specific conditions are respected.

Lands and plots devoted to Urban Agriculture should be conceived and planned as activities in integration and not in competition with the “powerful land-uses” in terms of development rights; looking at a post-crisis horizon it’s not rare realizing that community gardens in the inner parts of cities are quickly going to be replaced by new high density development projects as soon as the economic cycle allows developers to pursue new profits filling “vacant” land resources. On this point of view, a low density urban fabric with a relatively huge amount of vacant “interstitial” land can represent an advantage, keeping together Urban Agriculture patterns, open space systems and denser areas.

Urban Agriculture spaces and connected activities should be conceived and planned as part of the “greening strategy” of settlements. Community gardens, urban farms, farmers’ market areas and so on are to be designed as elements of the open space, complex system with its specific features in terms of public parks, private gardens, urban and peri-urban woods, hydrographical, environmental systems of the city and its metropolitan domain.

Notes

¹ This paper is related to the dissemination of the EU research project "CLUDs" (*Commercial Local Urban Districts*), Seventh Framework Programme, Marie Curie Actions People IRSES, 2011-2014, (www.cluds-7fp.unirc.it). The general goal of the CLUDs research project is focused on exploring the potential of new tools for urban regeneration through the strategic role of small retails - handcraft and typical food - in reinforcing the sense of community, reducing transportation costs and contributing to the creation of attractive urban environment, thus increasing private investments. The main axes of the research program deal with the evolution of innovative "Public Private Partnership" forms and "Urban-rural" relationships for regenerating urban deprived areas and their "territorial milieu". The program implementation is based on networking four EU universities (Mediterranea Reggio Calabria, "Sapienza" Roma, Aalto Helsinki, Salford Manchester) and two USA universities (Northeastern University Boston and San Diego State University).

² United States Department of Agriculture (USDA) Farm Bill 2008; in 2011 the USDA definition is: "a low-income census tract where either a substantial number or share of residents has low access to a supermarket or large grocery store".

³ USDA: "Tracts qualify as "low access" tracts if at least 500 persons or 33 percent of their population live more than a mile from a supermarket or large grocery store (for rural census tracts, the distance is more than 10 miles)".

Planning for Health and Sustainability (Low-Fat Cities)

Guy PERRY, IN-VI, Switzerland

ID Number 142

1. Planning for people

The objective of this paper is to demonstrate the increasingly important role that planning and urban design have in fostering the good health of inhabitants of urbanized areas.

While the issues of health of the late 19th century and most of the 20th century were largely related to levels of pollution and contaminants in the air and water, as well as related issues of disease. As populations become wealthier, having access to new technologies and conveniences in the late 20th century and thus far in the 21st, we have new health concerns that are an outgrowth of our new living patterns at the scale of the home, city and regions.

2. Environments for a sedentary lifestyle

Increasingly we live in a technology supported environments. Be it with the convenience of an elevator to go up a building, an automobile to compress horizontal distances, or the Internet to eliminate the notion of distance at all, at least in a virtual world. These modern conveniences are shaping our environment, just as they are shaping us. Yet our bodies have not yet been able to evolve or to be reprogrammed to accommodate our increasingly physically passive lifestyles.

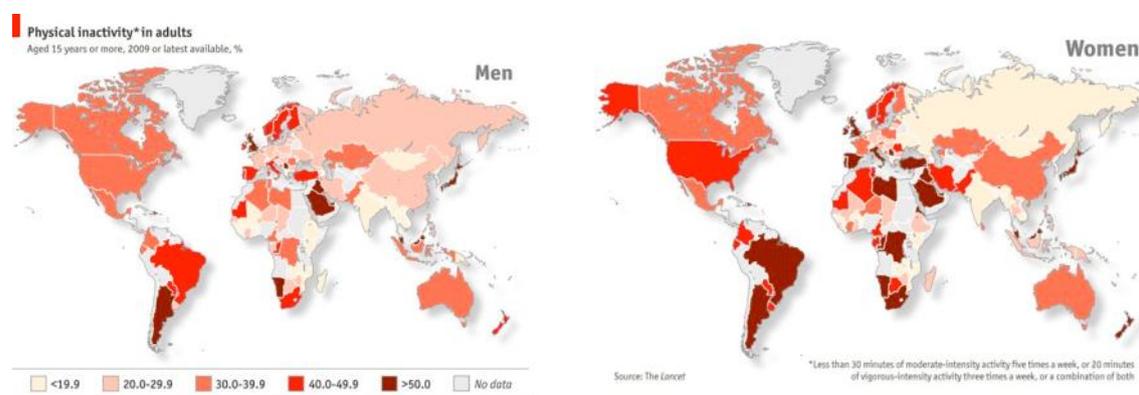

Figure 1: Physical inactivity in adults.

2.1 Increasingly sedentary lifestyle worldwide

Current (2013) research by the NIH (CDC) in the US, UK, China, India and Brazil has charted a precipitous course of an increasingly sedentary population from the last few decades to beyond 2030, that has a direct repercussion on health and well being of humans at a global scale. While increasing work and leisure “screen time” play a significant role in alarming trends of increased obesity, hypertension and diabetes, so does the organization of our physical environment. Our fragmented urban expansion patterns discourage basic living patterns that are healthy for humans and this is especially the case in the expanding areas of cities in rapidly developing countries.

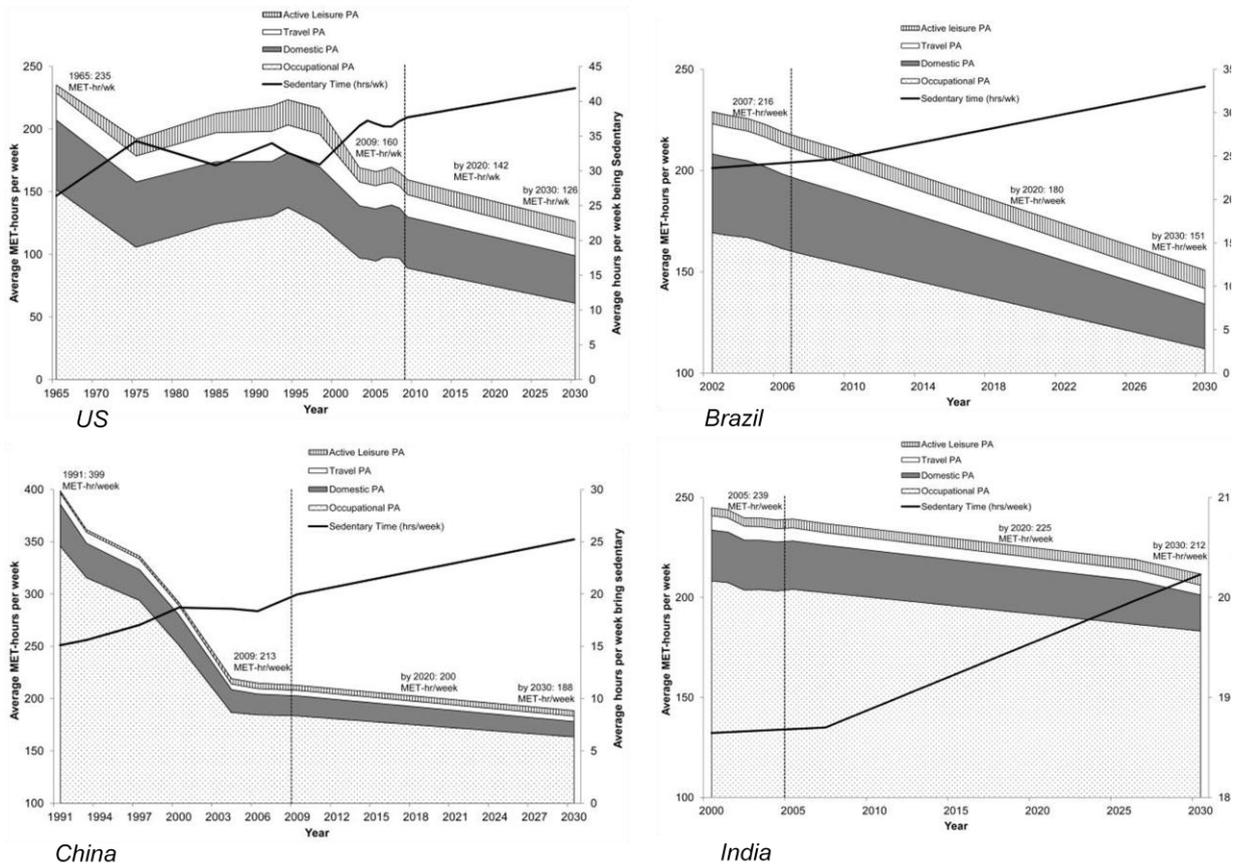

Figure 2: Increasing sedentary lifestyle worldwide.

2.2 Obesity trends in the US and the world

Obesity trends in the US are well known and well documented, although the relationship with physical planning is only beginning to be understood. With 38% of the American population clinically obese, metropolitan areas are now rated as more or less helpful to achieve weight loss. Key factors include: number of people who bike or walk to work instead of driving and access to healthy foods. While planning is not yet perceived as a key part of this equation, both driving time and screen time correlate with increased obesity and related diseases. The US now devotes 17% of GDP to supporting an increasingly unhealthy population.

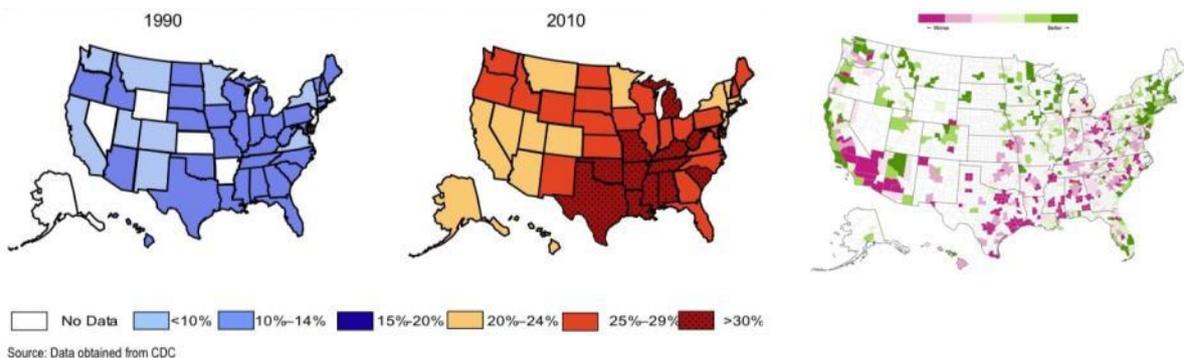

Figure 3: Comparison of obesity trends (in percent) in the US in 1990 and 2010 /left/ Best Metros for Weight Loss /right/

Aspects of a 20th century American lifestyle have been propagated through media and products throughout the world. Television programs like “Dallas”, popular worldwide during the 80’s and 90’s were models of how life would be under capitalism for many transition countries from New Europe to Latin America. A life set between gated compounds, shopping malls, glass office towers.

South Forks is now set in an upper middle class area that has one of the highest school obesity rates in the state. Obesity has less of a link to poverty today, than it had several decades ago. Instead it is increasingly associated with affluent classes. The state of Texas has created a web site, “www.reshapingtexas.org”, which demonstrates the extent to which Americans are aware of their epidemic. Americans now, on average spend over 2 hours each day in their automobile and over 5 hours a day in front of a television or computer screen.

Yet, just as many American’s are becoming more conscious of their unhealthy lifestyles, many rapidly developing countries around the world are now headed in the tracks of the United States of several decades ago. The obesity trend is global. It is a harbinger of other directly related illnesses like diabetes, hypertension and cancer. For example, by 2030 over 25% of UAE citizens will be diabetic and in Brazil 1% more of the population has become obese during each year of the last decade. These trends cannot be explained by changing diets alone.

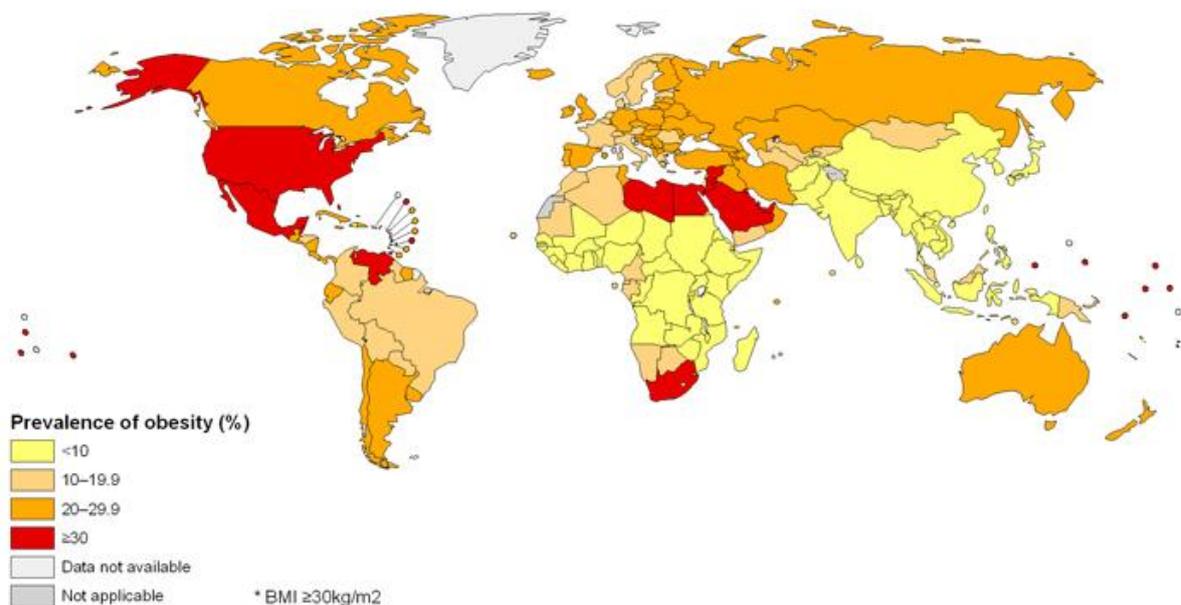

Figure 4: Obesity worldwide.

2.3 Unprecedented Screen Time

Throughout the world, people of all age groups are increasing their screen time: time they spend watching TV or on-line. While Americans remain leaders in Television viewing time, several Asian countries have surpassed the United States in their use of the Internet. The city of Seoul has created a program of “I Will Centers” that have been established to reduce Internet addiction among Children and Adolescents.

Figure 5: Relationship between prevalence of overweight and daily screen time. New headquarter of Facebook.

There is a direct correlation between weight gain and screen time, effectively because of the inactivity that it promotes. It is interesting to observe the kind of isolated urban environment companies like Facebook choose as their home. It is hard to determine whether this is a conscious decision or the pragmatic need for immediate space made possible by the availability of the former Sun Microsystems headquarters. In either case, it is telling of an anti-civic physical world in which the virtual – world may be all too comfortable with.

2.4 Automobile dependence

The United States is perhaps the country most recognized for dependence on the automobile as the main form of short and medium range transport. In addition to averaging over 2 hours a day driving, American cities have largely lost the capacity for allowing people to get around any other way. The lack of density and programmatic diversity within walk able distances simply take waling out of the transport equation. Given that each hour driven per day increases ones chance of being obese by 6%, and each kilometer walked in a day reduces chances of obesity by 7%, it is no wonder that as driving distances extend with the city fabric, that people have trouble keeping their health.

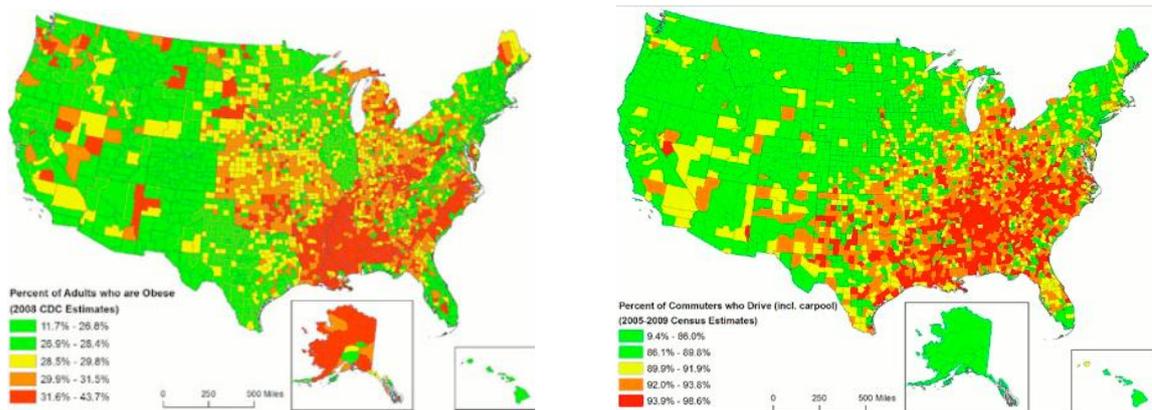

Figure 6: Obesity Rate vs. Driving.

Even new high-density environments China, manage to make their cities, unintentionally, but by design, unfriendly to pedestrian use. Urban edges of “New” European cities fare no better – as if built for automobiles instead of humans. Brazil, with parts the Middle East, are

perhaps are most extreme cases of conscious re-orientation of the urban environment toward the automobile.

Dependence on the automobile and the physical separation of activities has grown at an unprecedented rate in Brazil. For the automobile it is, as with any other country in rapid economic transition: when you can afford to buy one you do. But in Brazil it is also part of official national economic growth policy which might have made some sense during the brief time when Brazil was oil/ethanol autonomous, but now that the growth in number of automobiles has been compounded by the increased distance that they are travelling – a pattern that echoes the United States during the late 20th century, even with increased oil/ethanol production, Brazil cannot keep up with its own domestic demand.

This rise in automobile use has compounded itself in both the urban parts of Brazilian cities and the suburban extensions of those cities. Shopping centers are primarily conceived for those able to arrive by automobile. Prime office buildings have spectacular car lobbies for those who alight from their vehicle. “Urban” apartment buildings anticipate 2 car parking places for a 50 M2 apartment and commonly 4-6 for a 150 M2 or more apartment. The driving restrictions in some cities based on license numbers has had the effect of encouraging households to own more cars, rather than to leave the car at home a day or two of the week.

New homes outside the city also have a standard of 4 to 6 parking places, the assumption being that anyone old enough to drive, needs a car. On the highway from Sao Paulo to Campinas, rest stations reach a new level of integration with daily life: They include multiple banks, shops and restaurants – naturally all drive through.

2.5 Case Studies

Case studies in Brazil and Poland, which analyze existing planning, urban design and living patterns on the urban frontier of cities will serve as a basis. It will examine density, interconnectedness, movement systems, distribution of land uses and microclimates. It will compare specific and intentionally very different urban development projects that attempt to address and remedy the key challenges to health within these urban frontier areas.

3. Brazil / Changing lifestyle in Brazil

In no country has this modern degradation of health been so apparent over the last two decades as in Brazil. A country rightly proud of its ancestral diversity is often said to represent the future of mankind, the ultimate mix of people from all over our planet. Unfortunately, it may also represent another dimension of our future society, that of one that is increasingly sedentary, but not by conscious choice.

Three components of life in Brazil have changed significantly over the last decade: Increased car ownership, Increased numbers of fortress like environments and time spent in front a computer/television screen.

Obesity in Brazilian society has been growing over the past decade at approximately 1% of the population per annum. This is a rate of increase higher than that ever experienced in the US, where 38% of the population is now statistically obese

Diet, usually considered the main culprit in this field, has changed little in Brazil over the last decade and cannot be considered the primary cause for this decline in health.() XXX

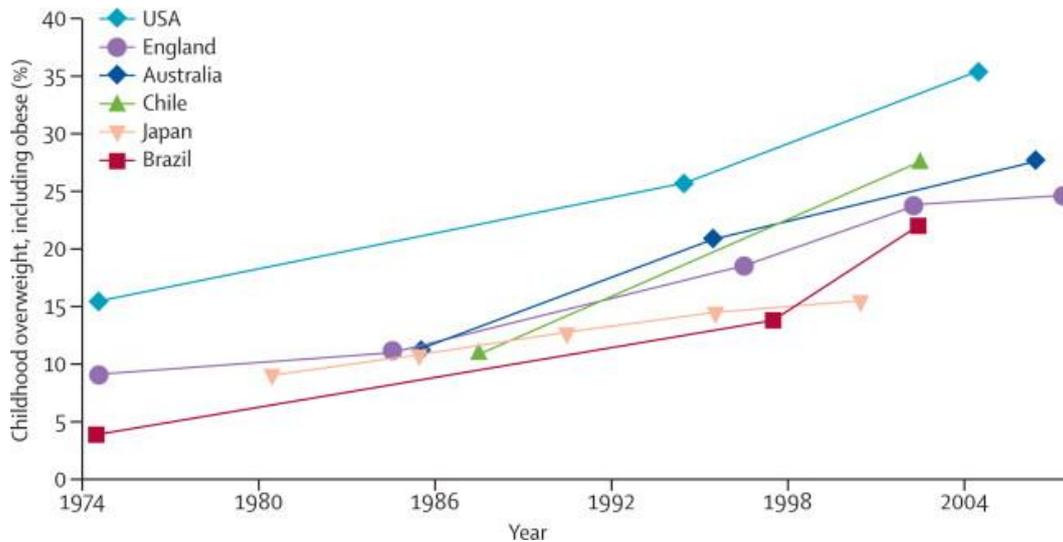

Figure 7: 1% more Brazilians are obese each year during the last decade

3.1 Typical planned urban extension: São José do Rio Preto

A typical example of urban growth may be seen around one of Sao Paulo's satellite cities: Sao Jose do Rio Preto. Following in the footsteps of the Alphaville model, a master-planned series of gated communities pioneered during the 1970's.

Their major sales point is security, in a presumably dangerous environment. They provide a checklist of secondary features like a central green space and athletic areas, usually a football pitch, tennis court and a pool. Lots are sold with building guidelines that allow for a very tight, if sometimes incoherent, build-out. Although the surface coverage of the lots is very high, there is no effort to create a pedestrian scale to the streetscape. In most projects, it is up to the owner of the lot to build a sidewalk, or not. For this reason, it is common for 20 year-old developments of this kind to not have a completed sidewalk network. Some gated communities do away with sidewalks altogether. Cycling paths are a rarity. Streets are broad to privilege driving, even within the community.

The height of the walls both around these communities and between homes is typically 3 to 4 meters. Given the Brazilian climate, this has the effect of cutting off the natural breezes that make much of Brazil such a comfortable climate to inhabit. Once that breeze is taken out of the ambient temperature equation residents are obliged to air condition their environments in order to live comfortably. Temperatures are further increased by a majority of paved public spaces and a very high construction ratio within each building lot.

So much is done to keep the residents from walking within these compounds. With the imposing walls around and gates to enter the communities it is even less imaginable to venture out on foot or bicycle outside the communities.

The net effect is twofold regarding the sedentary nature of life in these places: The dependence on the automobile for any activities outside the home and the deserted character of the neighborhood for residents of all ages. It is simply too far and too uninteresting to go any place on foot. Inhabitants will either drive significant distances to go about daily life, or they will retreat to a virtual world via internet and television in the comfort of their own home.

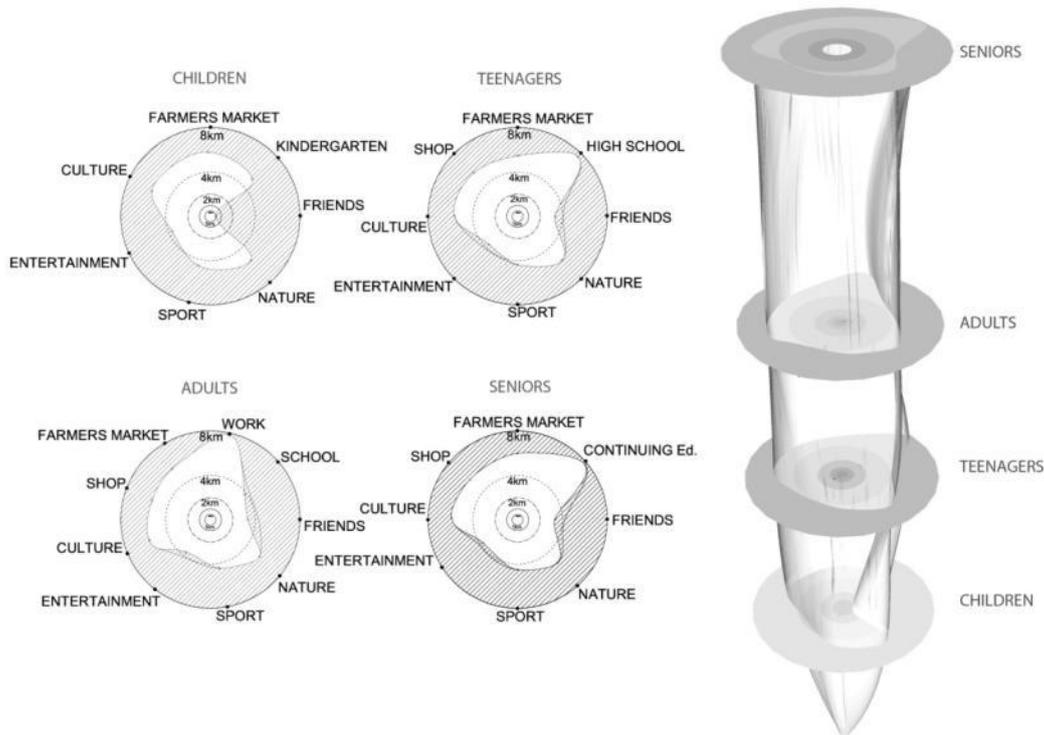

Figure 8: São José do Rio Preto, SP, Brazil Environmental pressures for weight gain /Guy Perry, IN-VI 2013/.

Residents who have moved to these areas from older neighborhoods bear two immediate consequences: a challenge to remain active and reduce their chances of obesity and of social isolation, often compensated by screen time.

3.2 A Typical Urban Extension vs. Health Based Design

The author has attempted to overcome the inherent health pitfalls of the typical Brazilian gated community by planning a community that encourages a more active use of the common spaces and features in and around the community. Focusing on four factors:

1. Proximity and convenience: Instead of creating a military style isolated gate into the community, the entry to the community is set on an entry plaza which provides shops, services, a market and a grade school. While the community remains gated, the message is that security is achieved by creating amenities that service the area, not only the community within the walls.

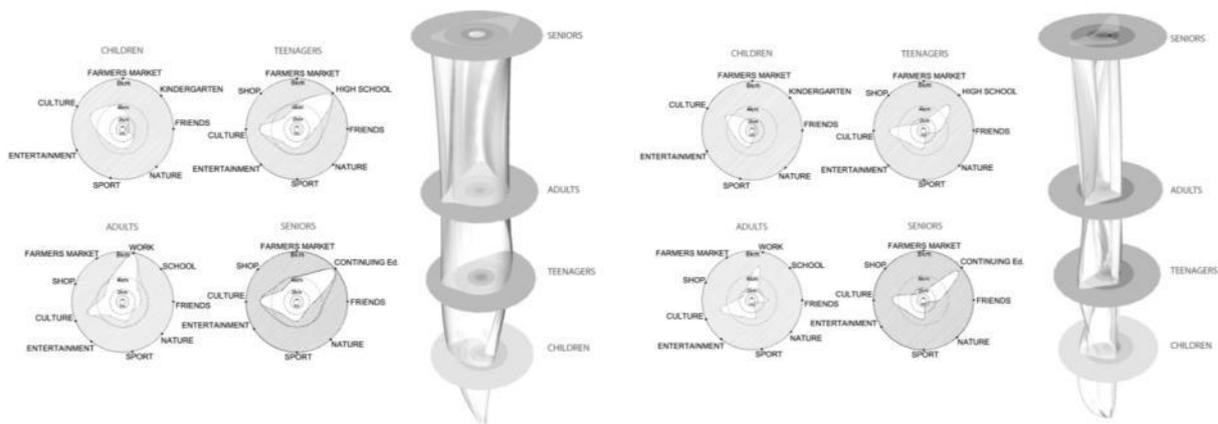

Figure 9: Alphaville (left) & Brisa de Atalaia (right), Sergipe. Environmental pressures for weight gain (below). /Guy Perry, IN-VI 2013/.

2. Focus on human scaled streets and common areas: The streets are conceived with a sidewalk/cycling path from the outset. No parking area is specifically built for the Club-house or beach although on-street parking is possible along the boulevard leading to it. Maintaining the majority of coconut palms provides shading to facilitate walking and cycling.
3. Diversity of housing offer: The community includes a range of housing options from 60 to 600M2. Intended to appeal to different stages in life, without a stigma of economic differentiation.
4. Respect of the existing ecosystem and protection of the coastal microclimate: Existing lake areas are protected, when possible trees are transplanted within the site. Housing set backs from lot lines, along with limitations in wall usage in heights allow ocean breezes to permeate the site.

Figure 10: Brisa de Atalaia, Sergipe

The overall effect is to compress distances to many daily activities and by doing so, get people away from their television or computer screens and out of their cars when they go to make basic errands, social gatherings, partake in sports, or go to the beach. Over 90% of the residential lots have direct access to the beach or lakes. The mild temperatures ensured by maintaining the breeze, the generous lakes and the shade created by the preserved palms will also reduce the thermal shock of going outside. Ideally, the protection of the microclimate will decrease the use of air conditioning for residences on the site, encouraging an indoor-outdoor lifestyle, common to all classes in the region, until recently.

3.3 Brazil conclusions

Comparing three economically successful projects: Sao Jose do Rio Preto (SP), Alphaville Sergipe and Brisa Damha, Sergipe we see the pressure for sedentary life in the first two through the significantly greater pedestrian distances, the quality of the on ground experience which is compromised by missing sidewalks, monotony of the streetscape and the lack of shading. The net effect is an environment that promotes obesity and it's related diseases. Brisa Damha, demonstrates the possibility of building a "Brazilian market" product that contributes to a more active, socially balanced and civically engaging lifestyle.

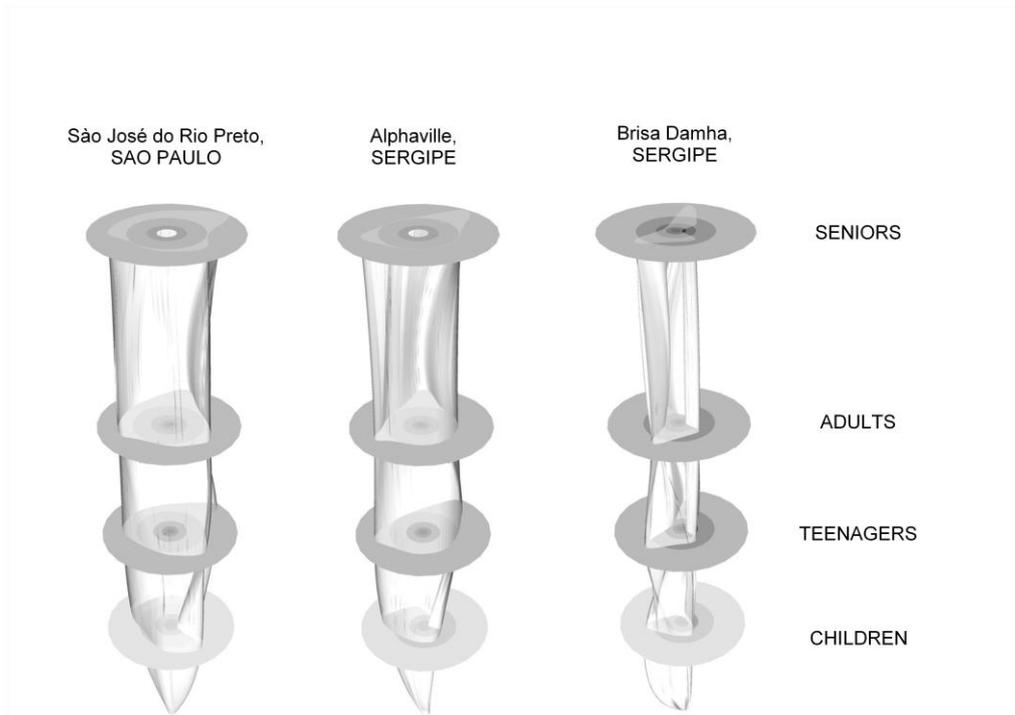

Figure 11: Summary Brazil. Environmental pressures for weight gain. /Guy Perry, IN-VI 2013/.

4. Central Europe and Poland

The Americas may seem like an easy target regarding the relationship of physical urban sprawl and obesity, however, European countries, especially those that have enjoyed rapid growth during the last decades have also showed significant increases in rates of obesity and degradation of health.

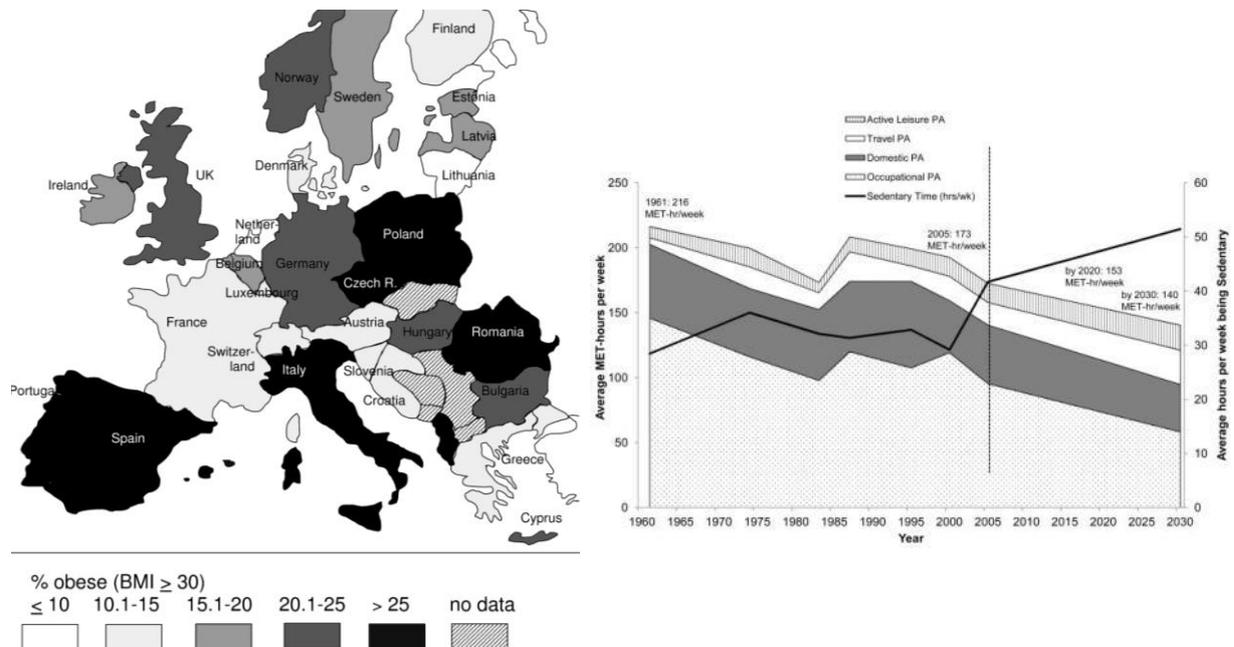

Figure 12: Obesity in Europe. Increasing sedentary lifestyle: United Kingdom.

In the UK, the only European country examined in the CDC study, occupational physical activity is declining at a rate that cannot be offset by an increase in leisure activity. It would require a significant increase in transport related physical activity to come close to striking a physical balance. This is a pattern likely to be echoed by other countries on the continent. While residents of the core of European cities still enjoy, in most cases, a physically vigorous urban environment, the peripheries of those same cities are physically challenging to lesser or greater degrees. Even Vienna, arguably one of the worlds best planned and managed cities, has its sprawling southern suburbs and increasing drive times along the highway corridor to Graz.

4.1 Urban expansion around Warsaw: Targowek-Marki vs. Miasteczko Wilanow

Warsaw has been one of Europe's fastest growing cities during the period from 2002 to 2012. It is worth comparing two distinct ways in which that city has expanded and their potential impact on the health of their inhabitants. Both areas were green fields in 2002, which have been developed rapidly and both are approximately 9 km from the center of Warsaw. The first is the Targowek-Marki area, with a development pattern we may consider typical of suburban development around Polish and Central European cities today. The second is part of the Wilanow district, a planned, integrated, mixed use district that is currently approximately 75% completed.

Targowek-Marki is physically characterized by a series of single use, limited access environments. Each enclave has a vehicular entrance that provides access, and an impression of security for residents. They are comprised of repetitive units that generally sell for nearly identical price points. Enclaves are surrounded by walls of varying height and are purely internally oriented in their organization and design. A resident of such an enclave may have to travel two or three kilometers to reach the "neighbor" or shop on the other side of a fence. Retail development is similarly inwardly focused, but in the form of shopping malls or big box retailers and are surrounded by parking areas larger than the buildings, themselves. Village schools and services are stretched beyond capacities in the face of rapid development. Few offices are located within this area.

Although there are constant programs of highway enlargement through the area, sidewalks and bicycle paths are scarce or nonexistent, making it hazardous to walk or cycle outside of the compounds. When paths do exist they are isolated, unconnected and generally go unused. The area has become nearly 100% automobile dependent for transportation. These built enclaves provide little activity or entertainment for children and teenagers that do not have access to a vehicle.

Miasteczko Wilanow is characterized by high-density development organized as part of the fabric of the city. Each building has a public face along streets and private side within courtyards. A large part of the ground floors of each structure are devoted to commerce and services. An office park, including research facilities and a hospital is constructed in scale with other buildings within the neighborhood. A variety of shopping centers with both an inward and outward orientation serve the neighborhood and surrounding district. Schools for all age groups are clustered within the area. Within the community the John Paul II Museum will be set within Europe's largest church built in the last 200 years. Few fences or gates remain, once construction of a parcel is completed.

Roads and parking areas are carefully sequestered in the area. Over 90% of the parking is contained under the ground level of the buildings. Sidewalks and bicycle paths connect all points in the new district. The paths are so popular that the shared bicycle program, normally reserved for the heart of the city has among its busiest stations within Wilanow. The primary form of movement within the community is on foot. There are over 30 Playgrounds for children of all ages while teenagers have sports facilities within cycling distance. The new

shopping areas are working towards integrating skateboard, BMX, snowboard parks and a skating rink within their developments. A bio and local farmers market has been launched and is highly successful within the community.

2011

Land use Miasteczko Wilanow

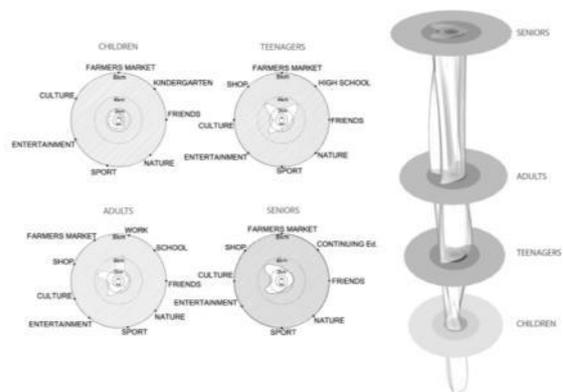

Figure 13: Warsaw, Marki vs Warsaw, Miasteczko Wilanów 2002 - 2011. Environmental pressures for weight gain. /Guy Perry, IN-VI 2013/.

4.2 Preliminary Comparative Data

While both Marki and Wilanow continue to grow rapidly and it is too early to have conclusive health statistics from these areas, several key indicators were revealed by publications of the Statistical Office of Warsaw in 2011. Among them, Wilanow enjoyed the highest birthrate in Poland, a child obesity rate of 0.47 %, compared with over 1% in Targowek - Marki and a adult Neoplasm (Cancer) rate of 0.27% compared with over 0.7% in Targowek - Marki.

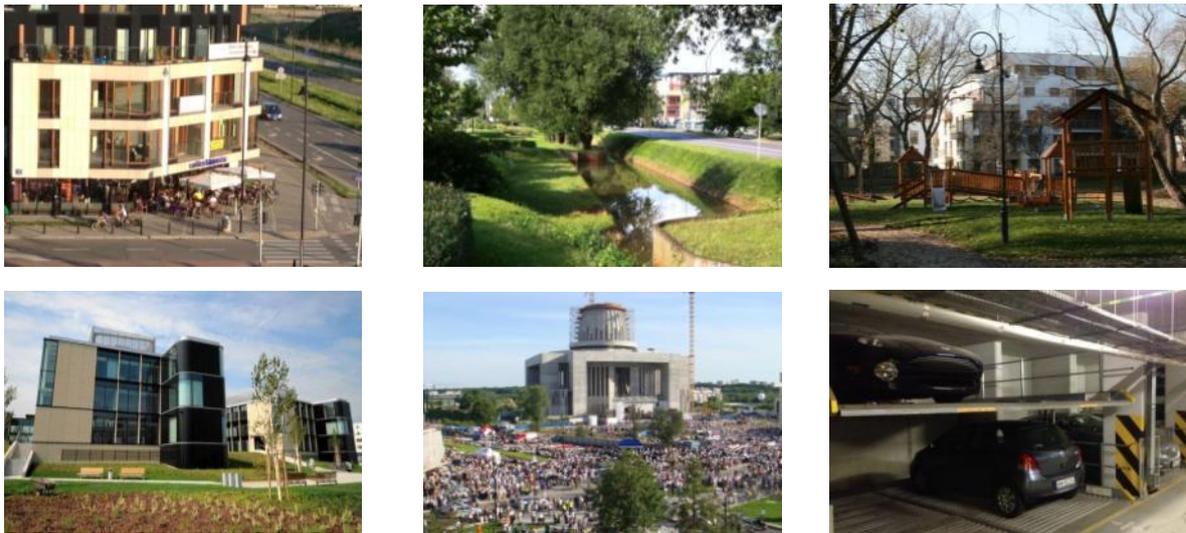

Figure 14: Miasteczko Wilanów 2012

It will be informative to monitor the relative health of this neighbourhood during the next decade. Current indications demonstrate that the district may be on track to create a standard for health driven design.

Figure 15: Miasteczko Wilanów. Public spaces in planning.

4.3 Residual Benefits

There have been a number of residual benefits of the integrated high density planning that are beyond direct health. The Wilanow district enjoys the lowest crime rate in Warsaw. As many visitors say: “it is the only place in Warsaw without graffiti on the walls”. The streets are very public, yet “claimed” by each resident. There is a visible pride when families walk down the first finished, well-groomed streets. Streets that the residents themselves finished to their liking. Miasteczko Wilanow also achieved a record voter turnout for Poland during the 2010 presidential election. The high density of land development, with over 10,000 residents per KM2, allows for the protection of hundreds of farms within the city limits of Warsaw and direct access to open spaces in the countryside which effectively make ideal walking, jogging, cycling and even ballooning environments.

Figure 16: The highest birth rate in Poland (13.25/1000 vs 10.04/1000 in 2010) /Newsweek (July/August 2012).

4.4 Residual benefits

Tackling the very tangible issue of health may also be a way of effectively grappling with general issues of environmental sustainability. Given that environmental sustainability continues to be considered an abstract, non-pressing issue, by most, health, in contrast may serve to reframe these related issue to create a platform for an immediate planning dialogue. The urgent issue of human health, when seen through the lens of planning, will raise awareness that by building more humanly oriented urban environments, we are addressing human environmental sustainability at a global scale as well.

5. Conclusions

Human built environments are becoming increasingly challenging to the health of their own residents. This evolution has crept up on our civilizations during the last decades of the 20th Century in the form of the spreading and segregation our environment often for short-term economic or political gain. The mechanization of our environment, long a symbol of technological progress, may have already gone too far for our own physical wellbeing. That

late 21st century challenge to our health is now being compounded by an increased orientation to a virtual world - one that engages us mentally, but not physically - at least for the time being.

Our own profession is partially, perhaps in some cases, largely, to blame for the physical inefficiencies of our cities relative to human beings today. However, it is not too late for us, especially in rapidly growing environments, to make our built environment relevant by being interesting, vigorous, healthy and environmentally sustainable enough to balance the impact that a parallel virtual world is having on our current and future wellbeing.

Building more humane environments are not only about protecting the health of mankind, they are, it turns out, to protect the "health" of our planet as well.

Strategies on Improving the Attraction of Small Towns in China, Solving Problems Caused by Migration

QIN Mengdi, LIU Guanpeng, Tongji University, China

Peer Review ID: 58

Synopsis

Large population migration has brought China's urbanization rate to 50%. However, with the per capita GDP not increased, the current living standard has not reached a satisfactory level. Up to date, the migrations are mainly from the rural to urban areas directly, thus directly resulting to the increasingly serious rural hollowing and pressures of the cities. This paper presents putting small towns between rural and urban areas as a bridge of population migration. Small towns can form a system together with 'rural' and 'urban', and achieving the healthy flow of population between them. Next, this paper explores advantages and disadvantages of small towns and cities in China, with the goal to enhance the attractiveness of small towns. It suggests that small towns should be concerned to be able to gather population, so that they can contribute to relieving various problems of both rural and urban areas caused by migration. Through research, strategies on development of small towns are put forward. Meanwhile, an actual project of a small town around Shanghai has also been proposed as an evidence of the strategies.

1. Introduction

China's urbanization rate has reached 50% by the year 2010 driven by large-scale demographic migration. Studying the urbanization process of other countries such as France, Germany, USA and Japan, it can be found that the urbanization rate of 50% is an important time point that a series of problems may be concentrated to emerge. For example, the United Kingdom first reached this level in 1850, and came across lots of social contradictions and changes. Now China is facing a similar situation.

Urbanization rate somewhat reflects the trend of migration, and its growth represents economic progress, social development as well as the improvement of living standards. However, problems are also brought such as gaps between the rich and the poor, increasing class contradictions, and also the growing pressure on both energy and environment.

Although China's urbanization rate has reached 50%, the per capita GDP level still has a certain distance from developed countries. This also explains why the current China is still facing many problems in urban development.

Two main problems listed below have been gathered from the study on China's current population migration and the rapid development of urbanization. This paper is derived from these problems, trying to propose appropriate strategies based on them.

1.1 Problems Caused by Migration

Urbanization rate improved from a large number of rural people become urban population. These kinds of massive population movements made demographic dynamic, affecting the requirements of urban space, also making the relationship between city and the environment even tenser. Meanwhile, the unreasonable growth brought pressures within the city on both energy and environment. It also lets the traditional mode of urban development and governance face challenges.

In addition, with a large number of rural migrants coming to the city, rural areas become serious in hollowing. Thus lots of Chinese specialties issues are brought, such as children left behind, workers' posterities hard to go to school, social stability decreased, etc.

1.2 Problems Lies in Current Strategies

Now the Chinese government has taken some measures on dealing with problems brought by migration and development of urbanization. Recent policies by the Chinese government and planners are some kinds of developing rural areas into cities, which may adverse impact on the inherent rural development. Simply applying the development model of urban areas to rural places, not only can't completely solve rural development issues brought by migration, some will even fail to retain the rural population. Problems that happen in the early development time of big cities will begin to appear in rural areas, which may lead to abnormal development of these small and medium towns.

2. Overall Strategy

Thinking problems lies in the Chinese urban development and recent policies through the background that was mentioned above, strategies should be proposed. Current way of almost all migration in China is from rural areas to big cities directly, resulting in a sharp decline in the rural population, and the increase of urban population pressure. Therefore a new way to change current way of migration is needed.

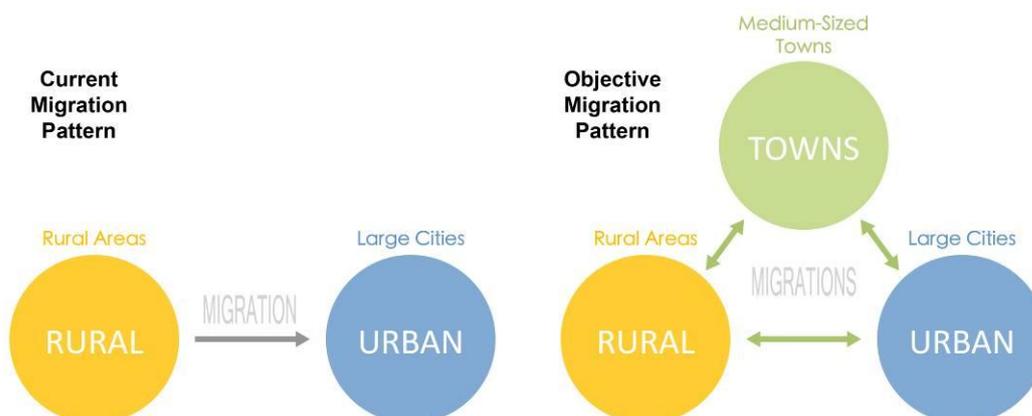

Figure 1: Current and objective pattern of migration
Source: Author's self-drawn

Figure 1 shows the current pattern and objective new pattern of migration. In the current migration pattern, population migration goes only from rural to urban, which makes hollow of the 'rural' and stressful of the 'urban'. By the time we put small and medium-sized towns between 'rural' and 'urban', situation would be changed. If the existence of towns between rural and urban areas can make population migration become a pattern of mutual flow, they will become a whole system and share benefits from each other. Small and medium-sized towns are the most critical parts of the system.

With the help of these towns, population could be attracted so that pressures of big cities would be alleviated and at the same time economic development would also be made. By proper developing methods, the small towns can be made good enough so that people who expect an urban life would like to live here rather than large cities. And at the same time city residents can also be attracted. The most effective way on achieving these is to create a place attractive enough by providing as much as working opportunities for everyone, building

an environmental friendly and sustainable living space, and also forming a place that can provide residents good living convenience the same as that in big cities.

On achieving this small 'town-relied' new migration pattern, improving the attraction of these 'towns' is of great importance. As for the new migration pattern, specific strategies are needed to be proposed based on the study of Chinese small towns.

3. Small Towns in China

Through the development of small towns and their attractiveness increased, problems in urbanization and migration mentioned could be dealt with. Therefore, there should be targeted improvement measures for Chinese small towns on increasing their attraction. And development status and problems of small towns in China area needed to be fully studied. Three main characteristics of small towns in China listed below are gathered from study.

3.1 History of Agriculture

China has a long farming history. The majority of Chinese people have strong emotions on farming, which could be easily seen from the popularity and acceptance of urban agriculture in China at present. People living in the city would be glad if they can have the opportunity to enjoy the farming life and farming experience.

However, currently agriculture in China has low output. And at the same time, industries in the city that have good output are considerable appealing. It can be seen from Figure 2 that agriculture accounts for a substantial proportion of landuse, but makes low output comparing with other industries. This situation has directly led to a large number of rural residents give up farming and come to the city for their development.

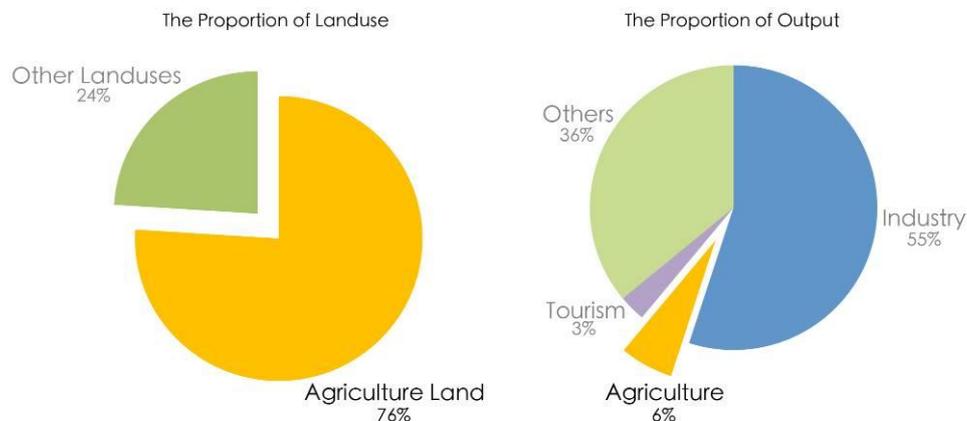

Figure 2: Average percentage of landuse and output of agriculture in China, 2011

Source: Author's self-drawn, data from China's national bureau of statistics

Agriculture in China now has problems on atrophy, downturn and unattractiveness. These can also be utilized to become development opportunities and potential for small towns.

3.2 Lacking of Space Creativity

Most small towns in China have faced a problem of lacking of characteristic space. The development of small town is generally based on the abandoning of their own culture heritage and the specialty of a particular area can hardly be valued and developed. Some of the small towns imitate the development pattern of big cities and expand the land blindly which cause a missing of their self-superiority and characteristic. Thus it is a key to develop small towns with measures adjusting to local conditions and features.

3.3 Public Facilities

Now the situation of imperfect public service facilities in most of China's has become a very prevalent problem. Meanwhile, due to land resource constraints, environmental conditions and some other problems, it is difficult to build some special services and facilities in the big cities. Compared to 'rural' and 'urban', 'towns' which lies between big cities and small villages, has the inherent resource advantage, such as a relatively convenient location, the vast land resources, good ecological environment, etc. However, the advantages of current conditions of the small towns have not been used. Facilities in towns are still far from enough, and some facilities that should be constructed in towns still have not been here.

4. Specific Strategies

Based on the above research on China's small and medium-sized towns, this part respectively formulate specific implementation strategy proposed according to these three aspects. Specific strategies are raised respectively on three aspects: tertiary-industrial agriculture, creative urban design, and building specific facilities, in order to make increasing the attraction of small towns into practice.

4.1 Tertiary-Industrial Agriculture

In terms of industry, Tertiary-Industrial Agriculture should be practiced. China has abundant agriculture cultural deposits which is distinct from other countries. Influenced of this culture and formed in the long run of laboring and life, china rural area has its unique traditions and customs which will absolutely affect the urban space. Therefore protection of agriculture is of great significance. But the current agricultural production value is relatively low which lead to a declining of agriculture and migration of rural population from rural area to urban area especially big cities. Thus it is necessary to improve agricultural output value and try to attract both rural population and urban population.

Small and medium-sized towns tend to have the requirement of characteristic agricultural development and potential. They have intact farming culture. In addition, the crops, followers and trees have the value of the landscape as well as viewing. As the environs of big cities, small towns have the location advantages in practicing Tertiary-Industrial Agriculture.

Therefore, strategies on tertiary-industrial agriculture have been raised, such as inheriting farming culture, making industry characteristics prominent, combining agriculture with tourism, suburbs pension, etc.

4.2 Design with characteristics

Planning and construction of small towns tend to neglect study of style and characteristics of themselves. As a result, the small towns began to blindly imitate the planning and construction ways big cities have, ending up to all the small towns looks similar with each other and all the towns are with no features. Local features are not only able to enhance the small town's taste, but can also have strong social benefits. Characteristics of places are somewhat like their business cards, which can help form people's memories of the city.

As designing for the characteristics, firstly the cultural features need to be found out and highlighted. Characteristics of the small towns are closely linked with their culture, so studies of the towns need to go deep into their own 'mental state' and connotations. As for developing the towns, only by inherit their historical culture, will not let them lose their 'memories'. Only when small towns formed their own culture characteristics, can they own personality, soul and vitality.

Secondly, city features should be formed using natural landscape. Landform varies in different small towns. Some of them have rivers, some have mountains, some have valleys and some have lakes. These are the generous gifts of nature and also the characteristic of a region. To build a town with its own features, the original spatial pattern of the town should be maintained. And it is necessary to preserve the humanity scale of space, beautiful environment of the landscape, and the pastoral landscape

Thirdly, basic tones, colors and architectural styles of the small towns all come from their own characteristics. Unique color and architectural styles tend to give people deep impression. Towns should also pay attention to their basic colors and architectural styles, which can help form their own characteristics. However, small towns in China often ignore this problem: houses look like matchboxes and all have similar heights, rigid architectural styles lack of vitality badly. This requires planners, policy makers and designers adept at exploring distinctive architectural styles with local history features, which might become characteristics of the towns in the future. Architectures are very important parts of elements composing the towns. Each of the buildings is closely related with their characteristics. So improving the quality of construction scheme selection is also of great importance.

Fourthly, Chinese traditional Feng Shui can be used in urban designs. Planning and constructions of the towns can get experiences from the traditional Chinese Feng Shui. Relying on the natural landscape, resource conditions and local characteristics, we can make sure that the towns are purposefully built. A 'breathing' city could be created by proper classical Chinese approach.

4.3 Build Specific Facilities

In China now, public service facilities in rural areas surrounding the cities are generally imperfect. Because of the shortage of land resources, the unsuitable environment and some other problem, the big cities have no conditions to construct some special facilities. While, small towns which are located in the transition region between urban and rural areas have some advantages such as relatively convenient location, rich land resources and a pleasant ecological environment.

Figure 3: Demands by both rural and urban areas of setting service facilities in towns
Source: Author's self-drawn

Therefore, small towns can meet the demand of residents' general services as well as construct some special service facilities such as large pension sanatorium, practice education base, labor camps. These facilities can serve the residents both in rural and urban area. It can be seen from figure 3. With this strategy, small towns can promote their attraction to the population of big cities and offer job opportunities to surplus rural labors

5. Case Practices

The overall strategy on dealing with problems that lies in the Chinese urban development and recent policies, is proposing a new way to change current way of migration with the help of small towns. Next, in order to increase attraction of small towns so that people could come here, specific strategies on three aspects are raised. However, the situations of using these strategies on factual project need to be tested by real practices. Therefore, strategies should be tested and verified in practice of real project, by the proposing of strategies relying on site analysis and applications of these strategies.

In this part, project of a particular small town of this kind has been selected around Shanghai, the largest city in China, as a demonstration and application of all these methods and strategies that have been mentioned. Here is the basic information of it and the proposing and using of strategies.

5.1 About the Project

The selected project is Xiaowangmiao Sub-district of Fenghua City Zhejiang Province which located in the Yangtze River delta economic area. To the north, Xiaowangmiao is 20 km from the urban area of Ningbo and 170 km from central Shanghai, so that it belongs to metropolis suburbs and has the advantages in transportation and development. (Figure 4)

The project is located in the plains and mountain transition area which has gentle slope hills and abundant natural resources, and the ecological environment there is excellent. Until the end of 2011, Xiaowangmiao has 21 administrative villages, 403 villager groups and 33800 registered population including 31,800 agriculture populations, 2,000 nonagricultural populations and 15,000 external populations.

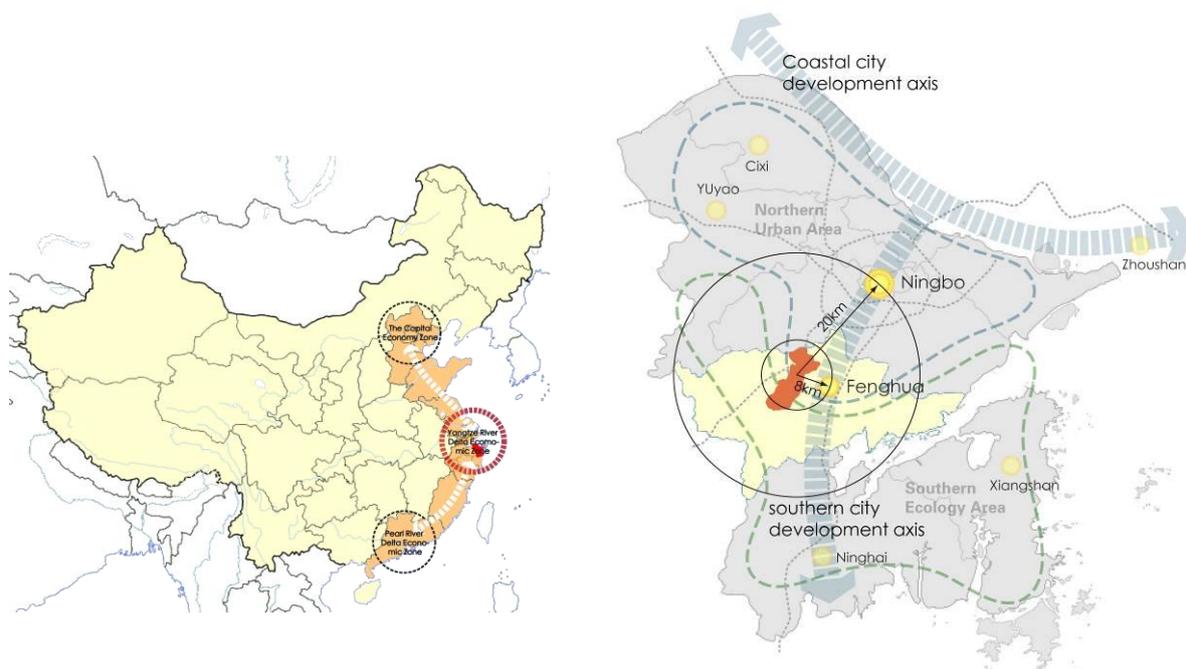

Figure 4: Macro (left) and micro (right) location of the project site
Source: Author's self-drawn

Xiaowangmiao Sub-district is a typical medium-sized town in suburban area that dominated by agriculture industry. Recently years, with the rapid development of social economy, Xiaowangmiao goes into a period of great development and construction. Due to the current

requires of urbanization, new orientation and transition should be planned. So we deepen the strategies that mentioned before and apply them in Xiaowangmiao according to the specific condition of this area.

After studying on the project, we summarized the SWOT analysis of Xiaowangmiao Sub-district as following. (Figure 5)

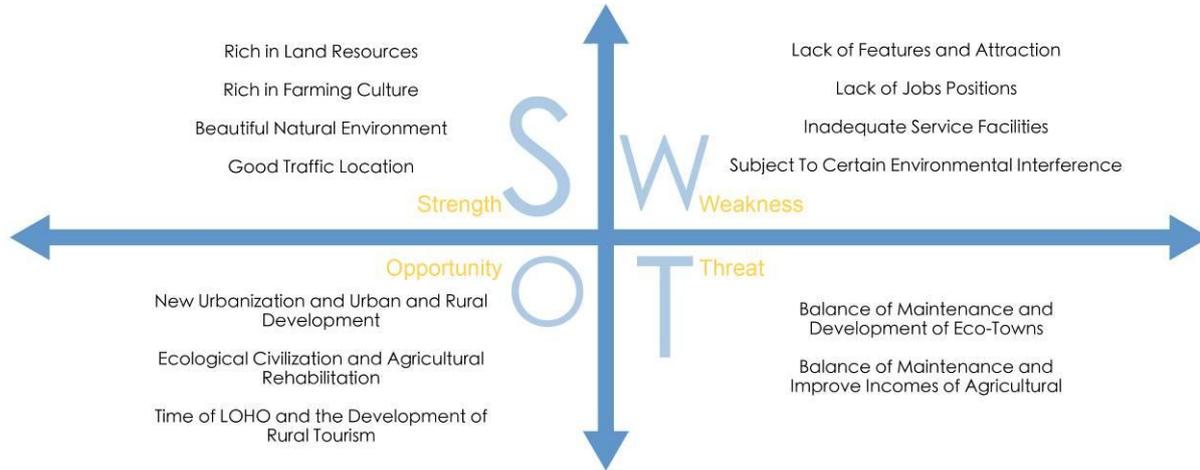

Figure 5: SWOT analysis of the Xiaowangmiao Sub-district
Source: Author's self-drawn

5.2 Developing Ideas

Based on the analysis above, it can be found that Xiaowangmiao is located at the border of rural and urban area where the interaction between rural and urban is relatively strong. It has beautiful rural scenery and ecological resources that big cities don't have as well as development opportunities and advantages of transposition that rural area lack.

Accordingly, this area should be developed as a link between urban and rural area that provide job opportunities and higher quality of life. At the same time, Xiaowangmiao can promote its self-attraction and attract more people in big cities coming here to tour, spend money, have a holiday and even settle down.

5.3 Strategies Applied

5.3.1 Tertiary-Industrial Agriculture

In the aspect of industry, Xiaowangmiao Sub-district has faced following problems.

Firstly, the traditional agriculture economy is confronted with a bottleneck period of development. It is not rational for the land utilization makeup and the benefit is low. As a result, an increasing number of agriculture population engaged in other industries.

Secondly, the simple supply-demand relationship between rural and urban area make the rural area as production units of the city, while the regional and local features have been forgotten gradually.

Finally, rural area can hardly provide enough jobs. Most Surplus Labors go to big cities to find job and leave the old people and children in the rural area which makes the hollow phenomenon appears in the countryside. (Figure 6) All these problems above can lead to the instability of rural society.

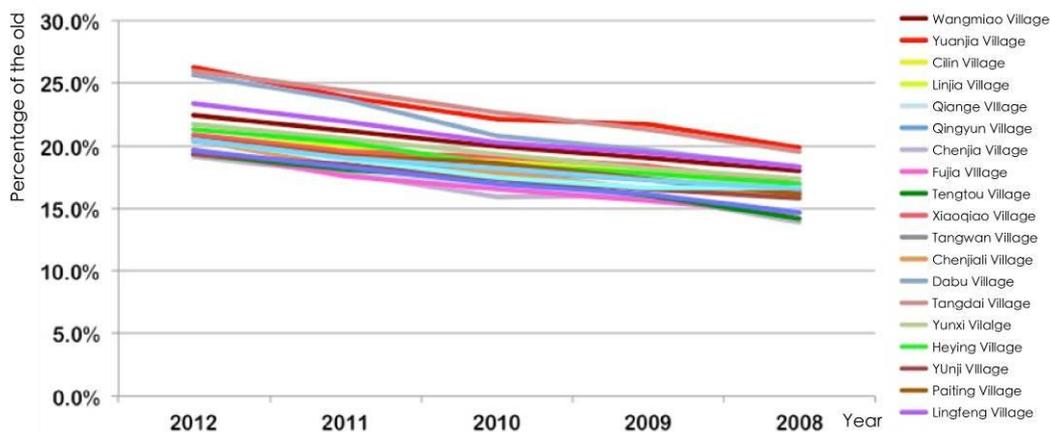

Figure 6: Average percentage of the old in Xiaowangmiao, 2008-2012
 Source: Author's self-drawn, data from China's national bureau of statistics

Fortunately, Xiaowangmiao Sub-district located in metropolitan suburb which is a good condition for Tertiary industrialization of agriculture. It has good natural environment and the potential to make the farmland as a kind of scenery. So, compared with the environmental pollution and damage caused by secondary industry, Tertiary-Industrial Agriculture is a more sustainable method. The intact Folk culture and traditional village that can make a contribution to Driving the development of consumption and services will be advantages in Tertiary industrialization of agriculture.

Therefore, we bring out the strategy of inheriting farming culture, making industry characteristics prominent, theme by agriculture throughout all of the consumer space. This will lead to a mixed mode of Tertiary-Industrial Agriculture including farming tourism, suburban pension, ecological tourism which are based on farming culture, tourism value, nature resource.(Figure 7)

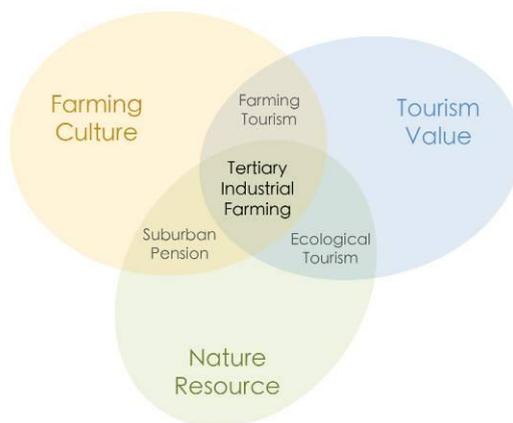

Figure 7: Mixed mode of the Tertiary-Industrial Agriculture
 Source: Author's self-drawn

5.3.2 Design with Culture and Ecology

Xiaowangmiao has excellent Natural ecological environment. It bears a subtropical monsoon climate, and with a maritime climate characteristic. The weather is relatively moderate with an annual precipitation of 1538.8mm and an annual rain day of 174 days. The forest coverage rate in Xiaowangmiao is 68.8%. The air and surface water monitoring report in Xiaowangmiao (2011) shows that many indexes conform to the standard requirement of nature reserve and scenic spot area.

Figure 8: Ecological characteristics refined in Xiaowangmiao
Source: Author's self-drawn

Figure 9: Detailed spaces strategies based on characteristics
Source: Author's self-drawn

Situations of culture and ecology in Xiaowangmiao have been refined. (Figure 8) Analysis of the current ecological conditions has been done with the principle of promoting culture and eco design. According to the advantages and problems of the three features (ecological matrix, ecological corridor and ecological plaque) gathered from the analysis, strategies are put forward also on three aspects: green plaque, green corridor and green production.

‘Green plaque’ is the first space strategy, it means things should be done on restoration of river blockage, increasing water network connectivity, providing biological pathways, keeping reservoirs lie in the mountains, and the flood control and water storage.

The second space strategy named ‘green corridor’. It let us improve the eco-space system, penetrate forest matrix into farmland and villages, also provide biological pathways.

Another space strategy is ‘green production’. It aims at developing tourism agriculture and suburban agricultural supermarkets, creating agricultural theme endowment, as well as expanding agricultural development pathways. While the detailed spaces strategies are showed in figure 9.

5.3.3 Specific Facilities

In the project of Xiaowangmiao, we consider two kind of public facilities: basic public service facilities and regional public service facilities.

There are two main problems of basic public service facilities. First is the lack of facilities and second is the standard of the facilities are relatively low.

In the matter of regional public service facilities, we should take both big cities and Xiaowangmiao area into consideration. People living in big cities often have the desire to live a healthy life and want to experience different culture and way of life. To Xiaowangmiao, it has abundant resources of land, scenery, fresh air, farming culture and so on. These are God-given that the big cities can hardly get. And some of the houses in villages can be rebuilt to some particular public facilities.

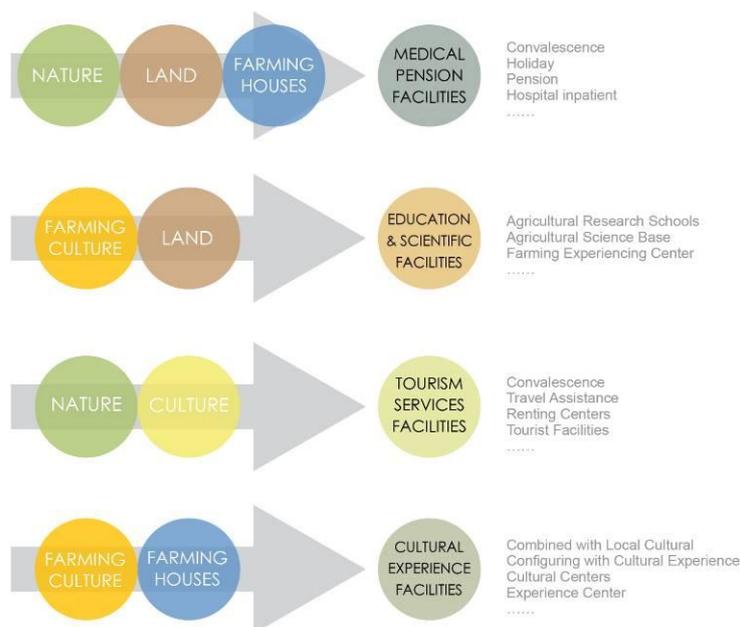

Figure 10: Public service facilities that can be arranged in Xiaowangmiao
Source: Author's self-drawn

Nowadays, the contact between rural and urban area is increasingly close. When we arrange public service facilities for Xiaowangmiao area, we should consider about the two aspects below. One is arranging the basic public service facilities reasonably, and the other is, on the basis of meeting basic needs, construct regional public service that can take full advantages of the resources of small towns and rural area and reach the goal of rural-urban coordinating development.

Based on the analysis before and combine with the actual situation in Xiaowangmiao, we come up with the arrangement of different kinds of public service facilities. (Figure 10)

6. Summary

Strategies are necessary. Through the study of small towns and status analysis of the practice project, it can be seen that it is necessary to develop small towns for attracting the population. In this way, the overall strategies on changing the current migration patterns could make the future development of urbanization healthy and orderly. Moreover, the economic, industrial and social development of the whole urban group can also be promoted. As a result, the urbanization will develop steadily, and so will the growth of economic, social progress, of course as well as people's living standards.

The proposed strategies are useful. Previously, strategies on enhancing the attractiveness of small towns have been presented, relying on analysis of the status of nowadays small towns in China. The Strategies have been successfully applied to an actual project, showing that these strategies have practical significance on increasing the attractiveness. The strategies are gathered through study of the case in which the regional situation and the specific issues lie, so that they are displaying current situation of the development of small towns in China. Therefore, the adoption of the strategies is bound to enhance the attractiveness of small towns.

On the current way of China's urbanization, urban and rural areas are both facing their own problems and strengths of development. At the same time, they can provide some different developing opportunities for each other. How to take advantage of the characteristics of urban and rural areas, and promote exchanges and coordinating development of both areas?

These are the problems that we need to study. Small towns are playing a very important role in this process. As they can help to form a 'three pillars system' together with villages and cities, in order to realize sustainable mobility patterns of population between these 'pillars'. Overall, coordinated development of urban and rural systems would be achieved, relying on establishment of the 'migration bridge' between 'rural' and 'urban'.

Planning Practices Coping with Migration in Backward Area in Western China: A Case Study of Liupanshui City

(Planning towards Migration in Backward Area)

Dan Shao, Ye Mu, China Academy of Urban Planning and Design, China

1. Introduction

Regional disparities are generally greater in developing nations worldwide, and China is an extreme case of sharp divide between east costal area and west hinterland (Polesse, 2009). Inevitably, internal migration in China of concentrating to the more developed east becomes a trend as shown in figure 1, leaving significant out-migration in the middle and west (Zhang, 2012). The amount of migrants nationwide was up to 230 million accounting for 17% of Chinese population (Zhao, 2013). The dilemma is that in out-migration area, outflow is necessary to enlarge the resources possession per person and hence to improve the income, while population scale is still a key factor to persistent development of cities within it.

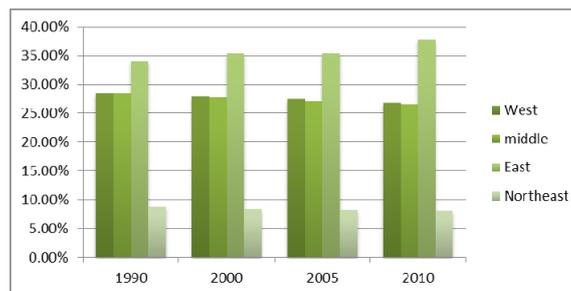

Figure 1: Change of proportions of resident population in four economic regions¹ from 1990 to 2010 (resource: National Bureau of Statistics, edit by author)

Liupanshui is a typical case locating in out-migration area in Guizhou Province in southwest China. It was built according to plans to form a modern industrial city specialized in coal and steel. Rise of cities in west China is usually based on mineral resources under government intervention. The prosperity was started by first immigrants since 1960s. However, markets not favoring the location along with the depletion of resources lead to a declining position. Migration here shifts from net inflow to a concurring situation of net outflow of the region and aggregation to the city. Problems of low urbanization and the widening rural-urban gap are worth attention. A series of plans made by government since 1983 aimed to improve the capacity of the city, and strategies of urbanization were proposed. Also, the planning area extended from the city to the administrative area. These plans play important roles affecting the migration in all aspects. Nevertheless, application of point-axis development (Lu, 1987) and satellite town theories did not accomplish the goal very well of cultivating urban hierarchy to accommodate new residents.

This paper described the achievements and obstacles of the city as a background as well as causes to the migration. On this basis, this paper focused on both demographic changes driven by migration and the planning practices for comparison to review the principles and methods taken. Implication involves that planning practices in backward area, also regarded as the out-migration area, face challenges from expanding the scale of city to blending into the region. Cities within the area have common problems in finding paths and driven forces to urbanization to reduce the gap and to avoid decline.

2. Achievements and Obstacles of the City

2.1 Circumstances

Liupanshui became a prefecture-level city in 1978 combined by three constituent counties, Liuzhi, Pan, and Shuicheng, and was the second established city in Guizhou Province. The administrative area of Liupanshui is approximately 10000 square kilometers with a population of 2.85 million in 2010 (Population Census Office, 2010). Per capita GDP of the region is 17462 Yuan (that is 2640 USD in 2010 exchange rate) rank second place in the province (Guizhou Bureau of Statistics, 2011). Population residing in the city was about 550 thousand, and the built-up area was about 54 square kilometers in Zhongshan District, the municipal district of the city. Measured by urban population and industrial output, Liupanshui is the second largest city in the Province and was designated as one of two sub-centers after the provincial capital Guiyang (Guizhou Provincial Government, 2001). The city has gained great economic success relying on dominant industries including coal, electricity and steel.

2.2 Initiation of Prosperity Led by Government

Liupanshui was built under the guidance of government's "Third-front city policies"² since 1960s. Most of these cities were distributed in traffic underdeveloped areas but rich in natural resources at that time (Huang, 2013). The initiation of the prosperity was led by government through national construction projects and migration policies.

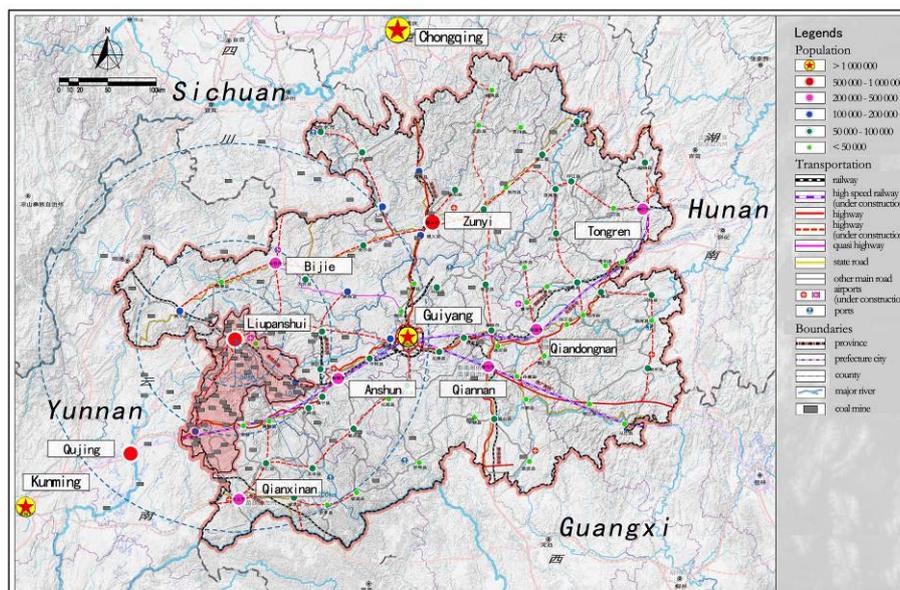

Figure 2: Location of Liupanshui based on the map of main coal producing areas and present situation of transportation in 2010 (resource: CAUPD, edit by author)

As figure 2 shows, the geographic location for coal deposits and closing to iron ore is the primary condition to success. Liupanshui locates in the heart of Yungui Coal Base which is one of the thirteen state coal bases in China and the only one in the region south of Yangtze River. Advantages were created through continuous input on railways by government to ensure competitive prices of the products. Nowadays, Liupanshui is a major rail hub in southwest China, and three railway lines intersect here as shown in figure 2. Migration policies reinforced the scenario above. Immigrants encouraged by government, mainly composed by engineers and skilled workers from north mature industries, turned the newly built plants into operation in a relatively short time. On this basis, the newly built city was started and kept a considerably high growth rate in past decades. Planning decisions and strategies directly determine the structure and morphology of the city instead of forming itself spontaneously.

2.3 Weakening of Advantages Driven by Market

Admittedly that the "three-front" city policies had positive effects on promoting the process of industrialization and increasing number of cities and towns in west China, these implanted ones do not lead to the general development of region. Location is a major obstacle to overcome. Figure 3 illustrates the radiant intensity and economic density³ of Liupanshui and major cities in the surrounding area of southwest China. As shown in the map, areas around Chengdu and Chongqing tend to form urban agglomeration, while capital cities including Guiyang, Kunming and Nanning are their own provincial center. The advantage of proximity to Chongqing distinguishes Zunyi from Liupanshui in the peripheral area.

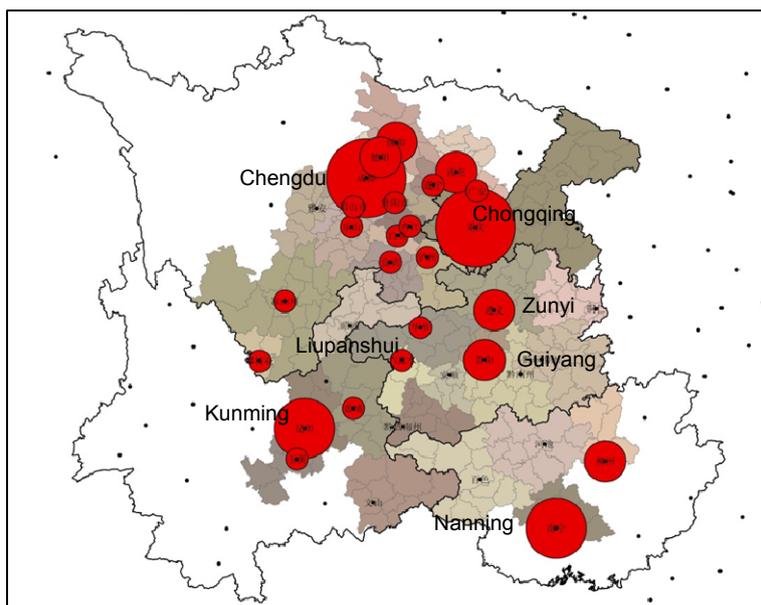

Figure 3: Illustration of the radiant intensity and economic density of Liupanshui and major cities in southwest China in 2010 (resource: by author)

In fact, the gross domestic production gap between Liupanshui and top cities in the province is expanding. The economic share of Liupanshui in the province slightly decreased after 2008 as figure 4 shows manifesting a declining position.

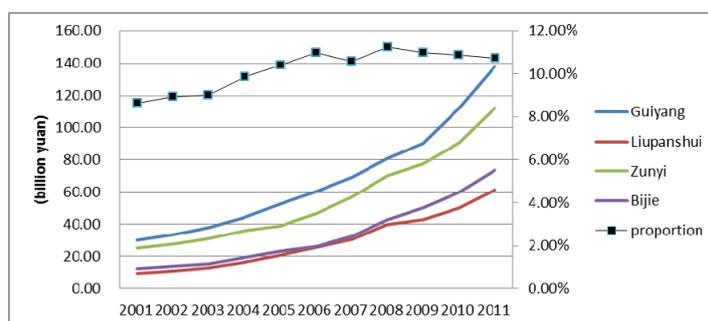

Figure 4: GDP growth of top four cities and the economic share of Liupanshui in Guizhou Province from 2001 to 2011 (resource: Guizhou bureau of statistics, edit by author)

The government shaped location advantages by improve transportation and bring immigrants. However, they are weakened by market from several aspects. First, the perfection of regional transport network relatively lowers the advantage of Liupanshui, along with the depletion of resources result more price competitive coal input from the north. Cheap iron ore overseas is changing southern ports more profitable for steel industries. Meanwhile, the government monopoly for purchase and selling being replaced by free market gradually compresses the

profits together. Recently, consideration on the market trends as well as construction cost leads to an altered straightforward route of the regional transportation including highways and high speed railways bypassing the city as shown in figure 5. Also, relaxation of policies activated migration throughout the country in 2000s, and as a consequence, first immigrants and their descendants are likely to going back their hometowns while local villagers are able to finding jobs in more developed regions instead of the nearby city. Advantage brought by migration is also undermined due to the loss of current and potential urban residents.

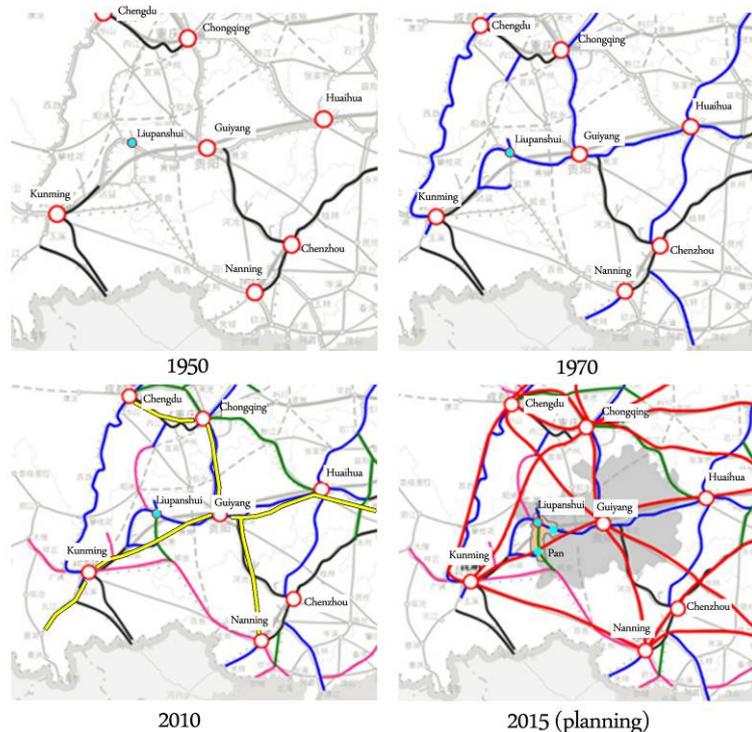

Figure 5: Illustration of the evolution of transportation in Liupanshui and the region (by author)

2.4 Increasing Concern on the Fragile Environment

Liupanshui locates in typical karst area which is extremely ecological sensitive. Increasing concern on this fragile environment becomes an important driven force to out-migration from the point of government. Excessive mining and development activities have already caused irreversible impacts including rocky desertification and pollution of upstream water sources. These harsh conditions are severe constraints to the previous underdevelopment as well as major obstacles to the sustainable development of future.

3. Demographic Changes

3.1 Methodology

Approaches to data of population in China rely on existing statistical systems and institutions mainly including the statistics bureau, municipal public security bureau and family planning commission. Commonly used indicators include registered population, resident population, migrants, temporary residents, etc. In this paper, direct and indirect methods are applied to describe the demographic changes driven by migration.

Direct data are available from the municipal public security bureau in the name of temporary residents which means dwellers with permanent household registration elsewhere residing in the place for more than 6 months, and annual changes of registered population are also

available reflecting part of the mechanical growth. In addition, bureau of labor and social security estimates the scale of migrant workers annually.

Indirect data utilize resources from the statistics bureau reflecting resident population in half a year scope in a certain region. National population censuses conducted about every 10 years are fundamental resource. The difference between registered and resident population can be representative to the scale of migrants. As supplement, the natural growth rate calculated by family planning commission can be used to separate the mechanical growth.

Migration is studied in two different scopes. One is taking the administrative area as a whole to study migration trends in the region. Another one involves analysis of counties within the administrative area to study the distribution and relocation of population.

3.2 Migration: Outflow Trends in the Region

Statistics of resident population is available only in recent years comparing with registered population. For a long time, the migration is constrained due to policies, thus the resident population is very close to the registered. As announced by 2010 population census, the resident population of Liupanshui was 2851.2 thousand, with an increase of 10.7 thousand or 3.90 percent from the year of 2000.

Table 1 shows the comparison of population growth rate and the contribution of natural growth. Although the natural growth rate keeps going down due to the birth control, the population growth rate decreases more significantly. In the period from 1978 to 1990, both the natural growth and mechanical growth contributes to the increase of population. However, the population growth was almost equal to the natural growth in 1990s which means the low occurrence of migration. In the new century, the out-migration should be responsible for the low population growth rate since 2000. Migration in Liupanshui shifts from net inflow to net outflow in past decades.

Table1: Annual population growth rate and natural growth rate of Liupanshui from 1978 to 2010 (resource: Liupanshui municipal government, LPS bureau of statistics, edit by author)

	population growth rate	natural growth rate
1978 - 1990	1.98%	1.33%
1990 - 2000	1.12%	1.24%
2000 - 2010	0.38%	0.85%

As figure 6 shows, the resident population was 134 thousand less than registered population in 2000, and it is reasonable to infer that the net outflow started before 2000. The difference later expanded to 338 thousand in 2010 accounting for 11% of the registered population.

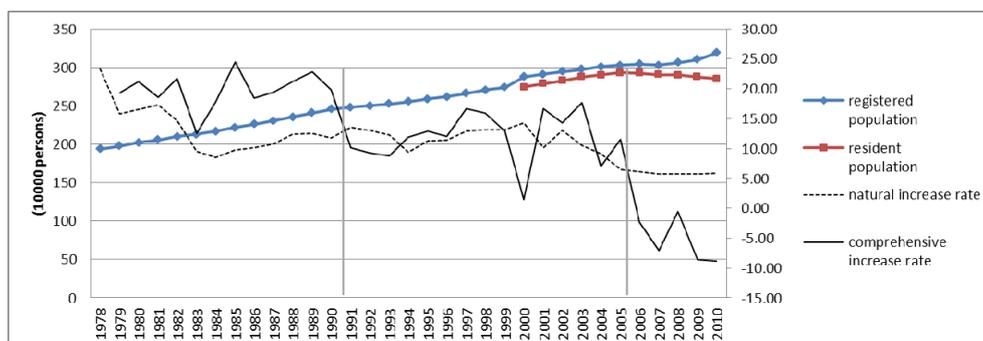

Figure 6: Trends of population and growth rate of Liupanshui from 1978 to 2010 (resource: Liupanshui bureau of statistics, edit by author)

Liupanshui bureau of labor estimates that the total amount of migrant workers residing elsewhere grows from 100 thousand to 335 thousand from 1996 to 2010. Also, commission of family planning gives the number of out-migrants up to 375 thousand in 2009. Given that the number of temporary residents in Liupanshui is about 118 thousand in 2010, the total amount of migrants including in-migrants and out-migrants may reach 450 thousand or 15.8 percent of the resident population. Nevertheless, relatively small part of migration is reflected on the changes of registered population. In this context, annual net inflow population was about 11 thousand from 1980 to 1990, and the number dropped to 4 thousand from 1990 to 1996 and finally shifted to negative in 2008. After all, the in-migrants and out-migrants remain the same at the scale of about 30 thousand from 1990 to 2011 leading to subtle influences on the population growth.

Guizhou is among the provinces with highest proportion of population outflow in the country. As figure 7 shows, population decline occurs in the listing provinces from 2000 to 2010 according to the national population census. Comparatively, Sichuan province output migrant workers earlier than the others and basically achieved balance in recent years despite of the regional wealth's accumulation. In the contrast, the outflow trends of Guizhou province is expanding and has not yet entered a stable stage. The out-migrant population in Guizhou increased 6.14 million with annual growth rate of 14.7 percent from 1996 to 2010, while the number of Liupanshui in the period is around 10 percent. Comparing with the 7.1 million net outflow populations accounting for 17% of the registered population in Guizhou, the intensity of migration of Liupanshui is relatively low.

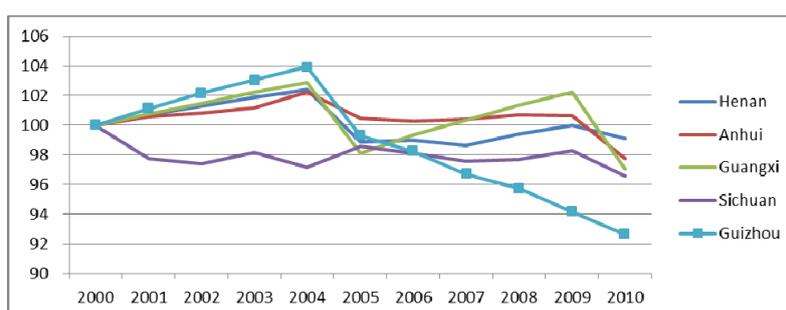

Figure 7: Standardized data of resident population evolvement (base year = 100) of Henan, Anhui, Guangxi, Sichuan and Guizhou from 2000 to 2010 (National bureau of statistics, edit by author)

Few correspondences are confirmed between the intensity of migration and the economy performance indicated by annual growth of GDP or per capita GDP as shown in table 2. The economic growth of Guizhou province keeps exceeding the average level of the country in recent years, and Guiyang is the only inflow region in the province taking the administrative area as a whole. Although the relatively high per capita GDP in Guiyang and Liupanshui seems to be related to the positive growth of resident population, other cities are irrelevant to the conclusion. Generally, cities with higher proportion of migrants featured by more negative population growth relate to the geographic proximity along with easier transport access to the developed regions.

Table2: Resident population of Guizhou province by prefecture level cities between 2000 and 2010 compared with GDP increase rate and per capita GDP (Guizhou bureau of statistics, edit by author)

city	resident population (10000 persons)			GDP increase rate in 2010 over 2009	per capita GDP in 2010 (yuan)
	2000	2010	growth rate		
Guiyang	337.45	432.46	28.16%	14.3%	26209
Liupanshui	274.41	285.12	3.90%	15.8%	17462
Zunyi	713.94	612.70	-14.18%	14.7%	14650
Anshun	252.30	229.73	-8.95%	12.1%	10014
Tongren	374.77	309.24	-17.49%	12.9%	9304

Qianxinan	296.53	280.59	-5.38%	12.1%	10839
Bijie	690.63	653.64	-5.36%	14.6%	9113
Qiandongnan	422.49	348.06	-17.62%	14.2%	8839
Qiannan	379.78	323.11	-14.92%	14.2%	10861
the province	3524.77	3474.65	-1.42%	12.8%	13228
the country	126582	133972	5.8%	10.3%	29706

Distribution of out-migrant destinations are analysed as well. According to statistics from the bureau of labour, destinations within the province accounted for only 20 percent in Guizhou in 2010, while 80 percent migrants left Liupanshui for other provinces mainly in developed east including Zhejiang, Guangdong, Jiangsu and Fujian. The outflow to Yunnan, is mainly formed by migrants from Pan, one of the constituent counties of Liupanshui on the border of Guizhou in adjacent to Kunming as surveyed by the local government. Figure 8 reflects the large scale of out-migrants going to other provinces from Guizhou comparing to average level of west region. Migrants moving within the same city only account for only 12.4 percent of the total amount. Change of registered population manifests the same trend of the predominant interprovincial migration. Ratio of registered out-migrants between moving to other provinces and within the province is about 6.5. As to the not many in-migrants in Liupanshui, 76.9 percent of them come from residences within the province. The implication is that migration contributes rather small part to the local urbanization process.

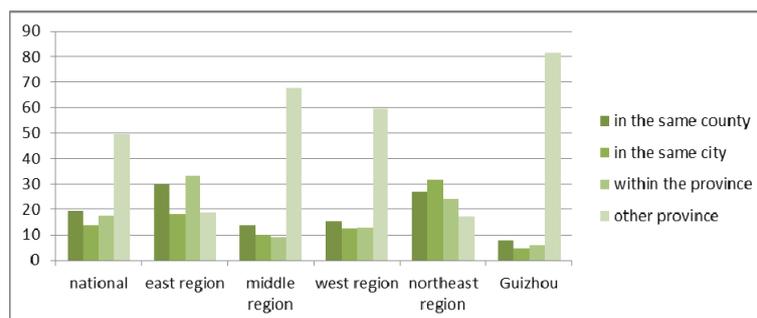

Figure 8: Rural migrant worker flows by regions in 2005 (Agricultural census office, edit by author)

3.3 Migration: Rural-urban Aggregation

The rural-urban aggregation is studied under the premise of the outflow trends in the region as discussed before. Recent master plan of Liupanshui designated the core city locating in Zhongshan district as the center of the administrative area, and Hongguo County in Pan as well as Pingzhai County in Liuzhi are sub-centers (Liupanshui municipal government, 2006). In 2010, resident population in the city is about 550 thousand exceeding the pre-assumed scale of 500 thousand in master plan, while the population of two sub-centers are 110 and 140 thousand under anticipation. Other counties are dispersed in the city with rather small population. Calculated by urban residents, more than 48 of the 94 counties resides less than 2 thousand people which are not regarded as urban areas according to Chinese standard. Rural-urban aggregation in this area is characterized by co-existing polarized development of the core city and balanced underdeveloped counties in wide area.

Figure 9 illustrates the distribution of population density in the unit of county. In the highest urbanized area in the city, population density reaches 7747 persons per square kilometers, and that is 27 times of the average level of the administrative area and almost as much as the same with Guiyang. Meanwhile, counties with higher population density tend to be along major transportation corridors. As figure 10 shows, about 90% counties are going through the negative population growth, while only about 12 percent of these out-migrants move into the core city and Hongguo county in Pan referring to the study above.

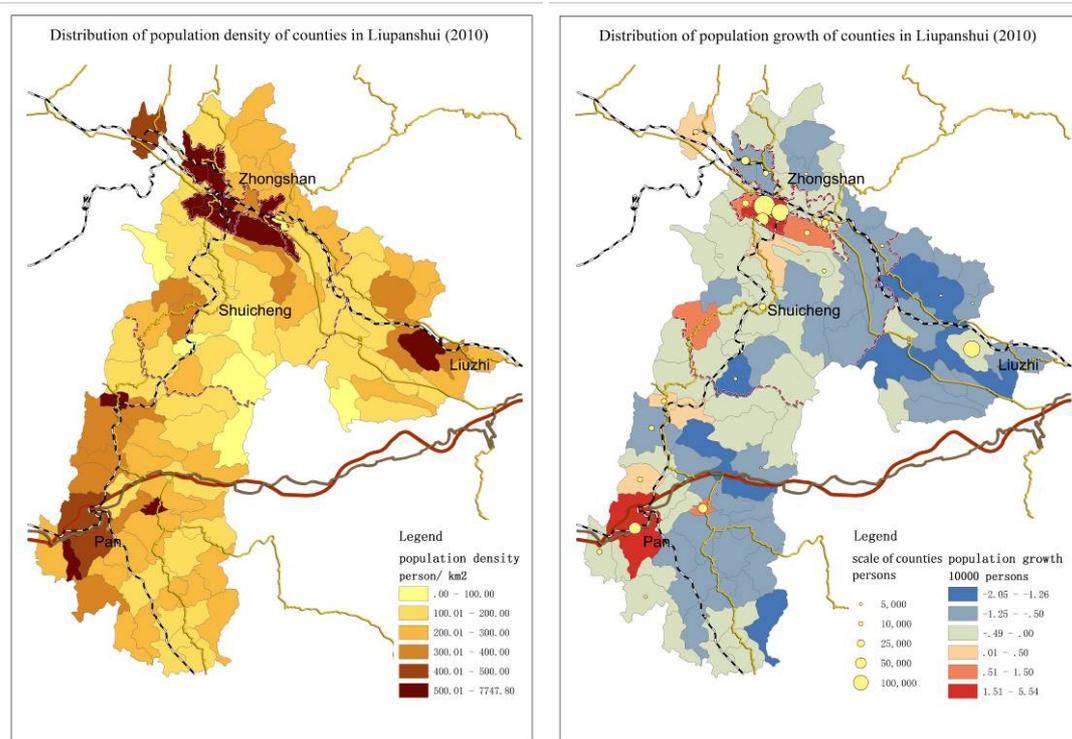

Figure 9: Distribution of population density of counties in Liupanshui in 2010 (resource: LPS bureau of statistics, edit and drawn by author)

Figure 10: Distribution and population growth of counties in Liupanshui in 2010 (resource: LPS bureau of statistics, edit and drawn by author)

Rapid growth of resident population in the city shows that the polarization trend continues. The number increased from 102 thousand or 29.1 percent of total urban population in the city in 1983 to 208 thousand or 44.7 percent in 1996. The proportion then reached 67.4 percent in 2010. Classified by constituent counties or district as shown in table 3, population share of Zhongshan increased 5.11 percent from 2000 to 2010, while the others decreased in the period. Population of temporary residents also increased significantly in Zhongshan with an average scale of half of the whole residents from 2007 to 2011.

Table3: Demographic indications by constituent counties of Liupanshui (resource: LPS bureau of statistics, LPS municipal public security bureau, edit by author)

constituent county/district	proportion of residents (%)		temporary residents (persons)					urban residents in 2010 (persons)
	2000	2010	2007	2008	2009	2010	2011	
Zhongshan	16.52	21.63	25038	31232	50302	67161	59551	491438
Shuicheng	24.72	24.71	10480	8814	9956	12831	13316	18878
Pan	39.02	36.30	20572	22725	28657	27517	30647	176237
Liuzhi	19.74	17.36	3032	1911	2514	5361	10050	130050
total	100	100	59122	64682	91429	112870	113564	816603

Figure 11 shows an investigation on purposes of migration of temporary residents conducted by municipal public security bureau in 2011. Generally, more than 48 percent of temporary residents are engaged in industry despite of the differences between counties. Purpose of migration includes running business, finding work, getting educated or medical care, tourist and so on. Zhongshan or the core city shows a higher proportion on running business and seeking education and others, which suggests more possible attractions to the migrants.

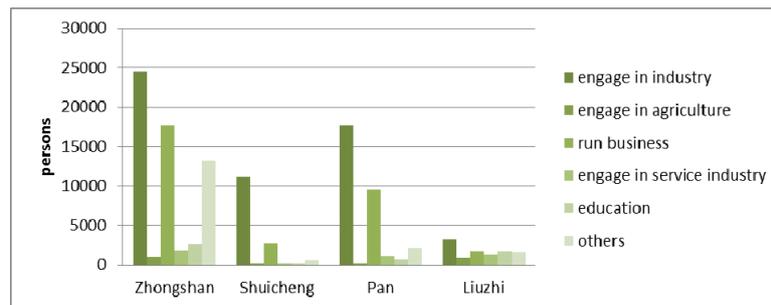

Figure 11: Purpose of surveyed temporary residents of Liupanshui in 2011
(resource: LPS municipal public security bureau, edit by author)

3.4 Confronting Challenges

Case study on the demographic change of Liupanshui proved the limited effect on the development of region stimulated by the implanted city in terms of urbanization. Despite of the concurring outflow trends in the region and rural-urban aggregation, the urbanization of the city remains in rather low level and increase. Generally, urbanization rate in high-income countries are higher than low-income countries which implies positive correlations between regional wealth and urbanization. As to Liupanshui, urbanization rate of 28.65 percent (Population Census Office, 2011) equated to only 57 percent of average level of the country or 87 percent of the province. Per capita GDP in Liupanshui accounts for 60 percent of the state average and per capita income ranked 8 of 9 in the province (Guizhou Bureau of Statistics, 2011). The poor performance is largely because of the location in Guizhou and the weak ties between the city and its populous hinterland. Over 50 percent of the residents are engaged in agriculture while providing only 6 percent of the economic growth indicated by GDP (LPS Bureau of Statistics, 2011). The low productive capabilities reveal the extreme poverty of the agricultural area in Liupanshui.

The accelerating trends of aggregation to the core city along with high incidence of poverty lead to an expanding rural-urban gap. Ratio of income gap between urban residents and villagers increased from 4.1:1 in 2003 to 4.7:1 in 2007. Extra payment from the government reduced this gap to 4.3:1 in 2009 which is still rather high comparing with the average level of 3.2:1 in China (Bureau of Statistics, 2010).

The annual growth rate of urbanization in Liupanshui is only 0.56 percent in the past decade comparing with 0.99 percent of the province or 1.35 percent of the country. Reasons to the slow increase are multifarious. Actually, indicated by proportion of registered non-agricultural population, Liupanshui ranks second place in the province after Guiyang which means the number of original urban residents in the city were more due to the three-front city policies. However, relatively low intensity of migration is corresponding to the slow growth. As a contrast, the proportion of migrants in Zunyi was up to 24.7 percent while the urbanization rate increased 12.06 percent in the same period. Meanwhile, Shuicheng surrounding the city is a state-level poverty-stricken county with a population of 450 thousand below the poverty line of 2300 yuan in 2011 (LPS Bureau of Statistics, 2012), and that is about 64 percent of the total residents. As shown in figure 9 and 10, in the wide area of low population density, the outflow trends are not as clear as Pan and Liuzhi as well which illustrates that poverty holds back the migration. Other reasons including poor education and cultural segregation with local ethnic minorities reduce the local intention to migration. On the other hand, the city did not offer sufficient jobs to new migrants constrained by the dominant coal and steel industries. The scale of workers engaged in mining industries has been around 65 thousand persons for more than 10 years, while proportion of employees engaged in industry raised from 7.83 percent in 2001 to 16.45 percent in 2005 and then dropped to 14.31 percent in 2010 (LPS Bureau of Statistics, 2011). The static change of job opportunities in industries in recent years is related to the continuous fall of resident populations. Additionally, unlike

under government intervention, the migration for the whole household family under market economy can be costly and leading to the temporary and pondering migrants.

Signs indicate that the trends of migration discussed above will continue, and both pull and push factors as often explained to urbanization here are insufficient. Basically, the migration benefits the local development as has been proved many times in out-migration area. While considering the individual differentia, out-migration has raised great challenges to cities. In the region with high poverty occurrence, field surveys also proved that these out-migrants are probably urban residents living in counties who can afford the migration instead of people in extreme poverty sharing limited resources. To understand the confronting challenges and reasons behind is very important to planning decisions.

4. Review of Planning Practices

4.1 Market over Government

In the context of urban planning system in China, master plans are major strategic plans with statutory status set by law. Liupanshui has made three versions of master plans including “1983 to 2000 master plan”, “1997 to 2020 master plan”, “2006 to 2020 master plan” after the economic reform in 1978. Currently, a new version from 2012 to 2030 is being prepared. State's virtual monopoly over urban investment and decision making has steadily eroded which is also revealed in planning practices (Leaf, 1998). First, the revised cycle of plans is shortened from 14 years to 9 years and to 6 years if taking into account the ongoing version. The multi-shareholders in market economy are particularly prone to uncertainty. On the other hand, the corresponding plans especially those involve market development tend to break through the laws regulated in master plans manifesting strong driven forces of the market.

4.2 Setting Goals: Wavering Strategies of Urbanization

For a long time, there is controversy over the strategy of urbanization of giving priorities to large cities or small towns in the state's level. Urbanization even processed backward due to policy guidelines in the 1960s and 1970s. The prevailing view of activating small towns while constraining metropolitans become unified national strategy which deeply affects territorial planning practices in the 1980s and 1990s. In the 1983 master plan of Liupanshui, settling immigrants engaged in mining and steel industry was the primary task. Building new towns based on coal deposit was the main concern at that time. Urban populations in 1990 and 2000 were predicted according to the number of employee in the state industries. Scale of urban residents was considered to be very important, and hence the population gathering in new towns was estimated over-optimistically.

In 1990s, enlightened by the Guangdong experience on loading small-scale industries in counties, impulses on developing small towns were spread nationwide. Generally, new towns planned in 1983 developed under expected and the result was attributed to the lack of inter connections between cities and towns. With the support of a new round of large-scale construction of transport infrastructure since 1960s, integrating the administrative area to cultivate urban hierarchy was the main strategy in 1997 master plan. “Point-axis” theory was the rationale of the urban system pattern—promoting central towns along railways and major roads to foster development axis and town clusters subsequently. Meanwhile, scale of the core city was constrained according to policies. Nevertheless, the development goal of the core city was to build a comprehensive central city of western Guizhou instead of its own service base as proposed before. Multiple industries with all kinds of shareholders and industrial types were encouraged to enhance the diversity and capacity of the core city. Also, a short guidance to the migration of surplus labor in rural area was mentioned. Principle of proximity was applied and urbanization was designed to rely on the migration of nearby rural residents within the administrative area.

Most of the designated central towns developed faster than the others in the period but still less than expected in scale. “Coordinating urban and rural” in 2003 and “building socialist countryside” in 2005 are main guidance of the state in the new century. Urbanization strategy put emphasis on both urban and rural area in 2006 master plan. The goal of urbanization was to consolidate the urban system and to promote share prosperity of both urban and rural residents. As to cities, the core city combined with satellite towns were planned to build metropolitan area, and central towns were dispersed evenly in the administrative area to be centers for the surrounding rural population. Satellite towns would function as decentralized area of the core city as well as attractions to cost sensitive industries. Other central towns located in the hinterland were counted on new roads to develop in the plan. Migrant workers were not mentioned in this version though there were indications. Infrastructures including small-scale irrigation and low-level country roads were planned to alter the poverty of rural area. Combination and displacement of villages were important part of the strategy.

During this period, building roads were turned into the operation of market nationwide. As a consequence, comparing with free country roads, toll highways with high investment and high profits fit the mode better. Hence, the strategies of satellite towns and central towns based on accessible transportation network can never achieve. Also affected by the market, rapid real estate development in the city significantly increased house prices and increased costs of immigrants while the governments still offer very cheap land to heavy industries. The changeable emphasis between cities, towns and rural area tends to distract the urbanization.

4.3 Spatial Structure: Compromise of Urban Hierarchy

Urban hierarchy is a ranking of settlements according to their size and functions, along with the distribution of cities and towns shape the spatial structure. The region of Liupanshui is not a traditional agriculture land, and cultivating urban hierarchy means to explore new towns all the time. Decisions made by plans directly guide the distribution of population within the administrative area due to the following investment on industries and infrastructures. As reviewed before, both 1997 and 2006 master plans rely on pre-procedure of transportation, but different in the thinking of polarized and balanced development. 1997 master plan proposed clearly to concentrate 72 percent of counties to the main transport corridors. The summarized spatial structure of “Two principal axes and one secondary axis of development” was inherited in the 2006 version. Figure 12 shows the evolvement of the distribution of central cities and towns in three versions of master plans.

Industrial park refers to a certain region designed to obtain scale effect within or outside a town. Industrial parks play important roles in providing job opportunities in current China. As to Liupanshui as shown in figure 13, the existing ones are symbolized in red circle, and all the projected parks are willing to load coal chemistry industries. Many of these parks were not built in central towns under the guidance of the master plan, since many of them were decided by external forces including senior government and private investors. The implement of industrial parks show the complicated situation in considering the urban system.

Both plans divided towns into 4 categories within the administrative area, including the center or the core city, the sub-centers, central towns and other towns as shown in table 4. The core city and the two sub-centers were confirmed in the 1983 master plan and were sustained in the following plans. However, the central towns are changeable over years both in size and location. 1997 master plan chose towns close to the central cities to form urban clusters, while 2006 master plan picked new growing point in the low population density area to balance the spatial layout. The reality is that the distribution of wealth of counties is very close to the map of population density. Despite of the general development along the axes, the time distance subjected to terrain prevented the interactions between the core city and sub-centers. The distribution of population growth as shown in figure 10 also proves the not well performances of the chosen central towns. The aggregation trend to core city is keeping and satellite towns as well as central towns in hinterland did not fulfill the expected scale and

function. The figure implies that Pan is more economically active comparing with Liuzhi, the earliest mining community being replaced by Pan in Liupanshui.

The 1997 and 2006 master plan underestimated the outflow trends in the region, and made prediction of rising population according to the historical statistics. Urbanization rate would reach 42 percent or 1.0 percent annually from 1997 to 2020 as proposed in 1997 master plan. As planned in 2006, the urbanization rate would reach 48.5 percent in 2020. The over-sized population combined with the high rate of urbanization led to overestimated urban residents especially those allocated to counties. The plans revised themselves into larger cities along with smaller central towns based on existed conditions, which can be considered as a compromise of the theoretical urban hierarchy.

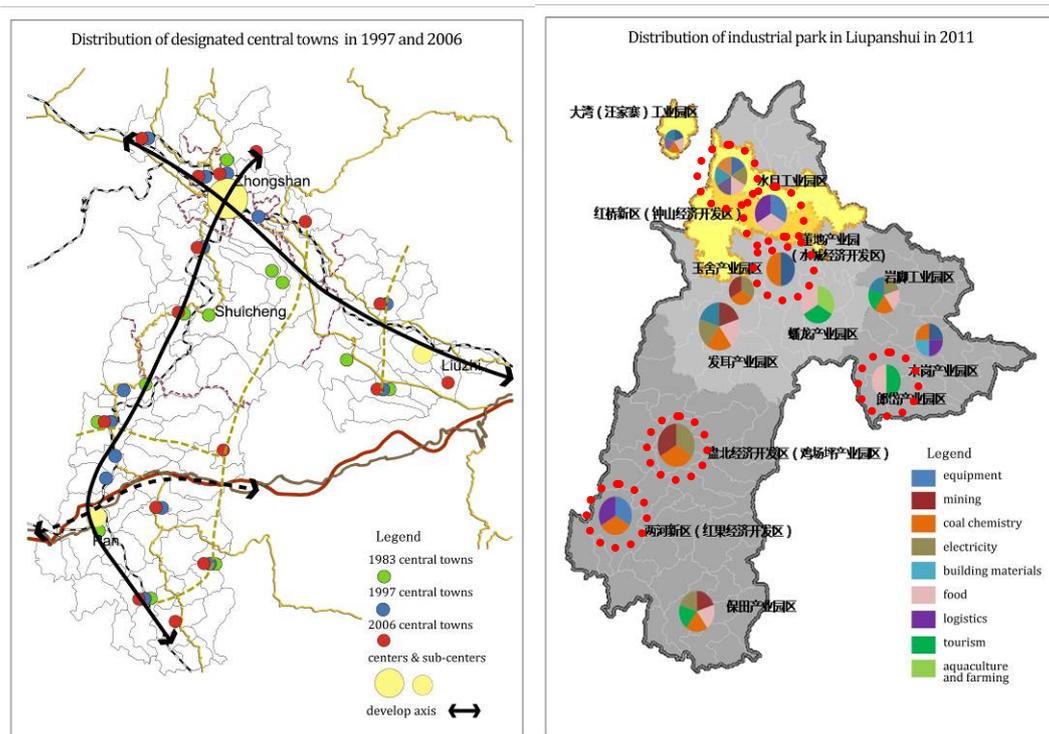

Figure 12: Distribution of designated central cities and towns in 1983, 1997 and 2006 master plan (resource: LPS municipal government D, edit and drawn by author)

Figure 13: Distribution of projected and current industrial parks classified by industrial type in 2011 (resource: LPS municipal government, edit and drawn by author)

Table4: Comparison of urban hierarchy in scale between 1983, 1997 and 2006 master plan (unit: thousand persons) (LPS municipal government, edit by author)

categories	city/town	2000 (1983 version)		2020 (1997 version)		2020 (2006 version)	
		number	population	number	population	number	population
1 st	The core city	1	240	1	450	1	800+100
2 nd	Hongguo	1	80	1	200-300	1	350

5. Conclusion

Demographic changes in Liupanshui are featured by concurring outflow in the region as well as the polarized urban aggregation, and the migration trends are expanding. The dominant out-migration contributes rather small part to the local urbanization. Advantages shaped by government are currently weakened by market, and planning practices need to adapt to the change. To enhance the activity of city and to reduce the rural-urban gap are confronting challenges to sustainable development. From past experiences, planning intervention as a method guiding the population growth as well as the relocation of residents is still effective. In the case of Liupanshui, an implanted city surrounded by extreme poverty in segregation, it is necessary to examine the principles and methods taken according to the specific characters. As to the investment on transportation, the bidirectional effects are worth attention: migration in region with convenient access to transport networks is intensified both on inflow and outflow. Under the background of seeking more balanced development of the country, planning practices in backward area should endeavor to improve the city within the region.

Endnotes

1. Four economic regions refer to eastern, middle, western and northeastern provinces divided by geography. Many indications are summarized by these divisions, and Guizhou is among the 12 provinces in west region.
2. "Third-front city policies" focuses on the defense industry and heavy industry carried out in large-scale industrial constructions from 1964 to 1978 in mid-west China.
3. Radiant intensities were calculated by urban production multiplying urban population. Data resources are from statistical year books, and the map was made with ArcGIS by author.

“Golden pheasants flying out of Mountain Jungle”——Strategy Planning of Urban Space Development under the background of ecological migration, DanZhai, Guizhou, China.

TANG LEI, Jiangsu Institute of Urban Planning and Design, China

ID: 188

GUIZHOU, An inland mountainous province in southwest China. Influenced by natural constraints, its Economic development lags behind for a long time. DANZHAI is located in the southeast of GUIZHOU, with a total area of 940 square kilometers and a population of 173000 people, is a remote, poor and backward key county of poverty alleviation and development work. Due to need of survival and reproduction, fragile ecological environment has been destroyed

MIAO, an ethnic minority that accounts for 85.57% of the population, has primitive simplicity, full-bodied and unique ethnic customs. Their totem is “golden pheasant”. MIAO has seven state-level non-material cultural heritages, such as batik, ancient papermaking, golden pheasant dance, etc. The ecological culture is rich, but is facing the plight of lost

2012, Government of China put forward ‘speed up development, poverty eradication’ slogan under the precondition of ecological environment protection. How can we intense use of limited land resources, accumulate population, leapfrog development, and at the same time ensure ecological security, continue minority traditional culture, is the top issue that the local government is facing. In order to healthy promote urbanization, to promote coordinated development of urban and rural areas, implement poverty alleviation and ecological migration, We completed ‘Strategy Planning of Urban Space Development in DanZhai’

We proposed the following development strategies: 1, Regional coordination and City circle development. 2, Ecological security and Landscape resource Highlight. 3, Cultural heritage protection and Ethnic minority culture propagation. 4, Traditional industry Renaissance and Immigrant employment driven. 5, Policy supports and Immigrants safeguard. 6, Perfect service Completion and immigrants’ requirements realization

1. Analysis of the situation

1.1 Scope of planning

DanZhai is located in the southeast of Guizhou province, west of Miao and Dong autonomous county, has seven towns and 1 state farms, 161 administrative villages, 3 residents committee, such as Longquan, XingRenn, ChangQing, Yang Wu, etc. At the end of 2011, its land area is 937.7 square kilometers, and permanent population is 121700 people. the population density is 130 people/sq km. There are 21 ethnic minorities such as miao, shui, ethnic minority population of 148600 people, accounting for 88.37% of the household register population.

1.2 Characteristics

(1) location: conjugate throat of south sea. (2) topography: the west wing valley deep, more central to the low hilly land. (3) climate temperature: both monsoon climate pleasant and cool mountain climate characteristics. (4) ecological environment, ecological background is relatively fragile, water sensitivity is stronger (5) distribution of river network is dense and water is adequate, mainly facing water shortage problem (6) physical culture resources: rich heritage, distinctive, scattered distribution, lack of organization. (7) quickly gathered the

early industrial development, industrial scale, structure and hierarchy for breakthrough. (8) in the initial stage of urbanization, urban agglomeration ability to strengthen. (9) passenger traffic network traffic inconvenience, lack of cargo transportation, tourist traffic is not sound.

2. Planning appeal

2.1 Macro policy

National ecological civilization construction and the Guizhou province of Dan village across the development request, Dan village walk in the way of development and protection.

2.2 Provincial requirements

Dan village development advantages and qian east development path, the combination of characteristic development is the only way for the development of Dan village in the future.

2.3 Regional responsibility

"are kay MaDan" integration development background, Dan village needs into the area, build regional network, undertake industrial transfer.

2.4 Development of power

Actively use top-down policy support, the external to internal blood transfusion.

3. Goals and Positioning

3.1 Planning objectives

The future out of poverty, build a well-off society in an all-round way, realize the basic modernization forward.

3.2 Ffunction orientation

Projects node, the industrial new city, immigrant district, MiaoJiang holy land.

- (1) Projects node node along the "projects" city in guizhou, geared to the needs of the forefront of the pearl river delta.
- (2) Industrial new city: "are kay MaDan" town groups emerging industrial base.
- (3) Immigrant district: guizhou province industrial migration, poverty alleviation and immigrants, engineering.
- (4) MiaoXiang sanctuary: human-god offerings, qian dong miao culture shows the characteristics of leisure and tourism areas.

4. Philosophy and Strategy

4.1 Development philosophy adhere to the "ecological priority, people-oriented, characteristic development," the new idea.

(1) Ecological priority. According to the climate characteristics of Dan village rainy foggy, and the characteristic of the mountain ecological environment is relatively fragile, build suitable for local ecological environment protection, ecological construction and the system resource utilization, ecological civilization under the background of ecological city and MiaoXiang landscape pattern with the combination of the urban development pattern.

(2) People-oriented. Focus on different crowd demand, taking the advantage of the policy, and guide the local rural population into the city employment and life; Optimize the entrepreneurial environment, accelerate the population flow out; Accelerate industrial agglomeration, and guide foreign population agglomeration; Perfect the supporting environment, guide the immigrant population is relatively concentrated.

(3) Characteristic development. Follow the east region in guizhou province area characteristic development path, to go to adapt to the mountainous, many ethnic minority areas of the interactive development of the new urbanization and new industrialization road;

Protect national and historical and cultural resources, shaping of urban space characteristics, the development of cultural tourism industry, to speed up production city.

4.2 Development strategy - to establish the regional coordination, low carbon ecological, cultural leading, industry breakthrough, traffic guide "five major strategies

- (1) Regional coordination strategy. Dan village should actively draw lessons from the successful experience of the development from coastal developed areas, facing the opportunities brought about by the transformation of development in the province and the state, seeking external motivation. In town "are kay MaDan" ethnic construct multiple poles, multi-cultural, strengthen division of labor, each looking for their own positioning and development path.
- (2) Low carbon ecological strategy. Set up respecting nature, comply with the nature, protect the natural ecological civilization concept, the principle of ecological civilization concept and fully integrated into the whole process of urbanization, intensive, intelligent and green, low carbon new path of urbanization.
- (3) Dan village of the miao culture resources superiority into full play, to carry forward the "tenacity, perseverance," national quality, and the combination of "open, inclusive" of modern society, with good inner quality and positive external image, persistent increase win the future competition of city soft power, leading the city's industrial, economic and social development, show Dan village "dare rushed, pioneering innovation, the pursuit of excellence" of the new look.
- (4) Industry breakthrough strategies. Characteristics of new industrialization road, building and ecological civilization, can significantly increase the employment absorption capacity, characteristic industry to promote the development of county territory economy efficient intensive system.
- (5) Traffic guiding strategy. Through traffic system planning and construction of the perfect, weak shift traffic conditions restricting urban development present situation, the implementation of regional and urban transportation system development guide.

5. Spatial structure and Layout

- 5.1 Land suitability and land bearing capacity. Construction land space is not large, mainly concentrated in the kaili - Dan village along the transport corridor.**
- 5.2 Analysis of population size. Ecological migration, population and industry attracting jointly drive the population growth.**
- 5.3 Spatial organization of the county. "Three", difference development, urban and rural plan as a whole.**
- 5.4 Urban spatial structure and layout. Open construction "area, compact group" of ecological city spatial structure.**

Combining with the characteristics of urban terrain, and the future trend of urban function integration, guide the urban space form "dual-core linkage, surrounded by groups, green heart center, into the green gallery net" spatial structure.

- (1) Dual-core linkage. According to Dan village city development pattern, combined with the old city area and admiralty district function layout, make old city center and admiralty centre two core, the old city center based on the existing public facilities, administrative, business and culture service function, build business and administrative center; Admiralty centre, relying on the new town construction and industrial agglomeration function, focus on developing industries such as commerce, logistics services and business office function, make admiralty business and trade center, promote the city integration.
- (2) Group. According to the difference of Dan village city urban function development, combined with the natural landscape, such as mountains, rivers, natural ecological factors as corridor, is divided into seven groups, to inner loop and outer loop transit passenger in series in each group, including the old city area of central, southern and northern three groups and

admiralty area of integrated services, evergreen, Yang wu four southern industry and industry groups. The old city area of the three groups of old city transformation and is based on creating quality of life as the leading functional group, admiralty district of four groups based on local resources industry transfer, industrial cluster, convergence of developed areas to build production service industry, life and trade in a body's comprehensive group.

(3) Green heart center. Combination of longquan mountain natural mountains, east lake water body such as natural ecological factors as the carrier, based on landscape features and cultural construction, to the east lake and southern mountain areas as Dan village urban greening landscape and cultural tourism innovation core area. Green corridor into a network. Combined with natural mountain, water, steep slope, gully and important landscape greening along the road of building roads, building ecological corridor, the peripheral wedge into the urban ecological landscape at the same time, the construction of urban green networks.

6. Guide and Support system planning

6.1 Ecological security system

(1) Ecological function regionalization. According to the county land use suitability evaluation results and important eco-function areas distribution, combining DanZhaiXian domain distribution of basic farmland, rivers, such as water, drinking water source, vegetation distribution will DanZhaiXian domain is divided into ecological conservation area, the ecological transition zone and ecological looks remarkably three functional areas.

(2) Low carbon ecological guide. DanZhaiXian low carbon ecological construction can be divided into 3 big plates, seven strategies and article 17 of the measures. Three plate refers to "compact" spatial planning, "frugal" resource management and the "landscape" urban construction; Seven strategies respectively for carbon reduction, traffic layout carbon reduction, industry threshold, and solid waste in the utilization of water resources utilization, ecological construction, and improve the micro climate.

6.2 National cultural innovation system

6.2.1 National cultural heritage

(1) Strengthen the miao cultures show. With the aid of public culture platform, such as miao cultures museum, etc., the miao culture systematic and comprehensive introduction and demonstration, let more people be familiar with the miao cultures and love miao cultures, miao cultures. Through the national center for the performing stage, public cultural activities such as open space, leisure square, let miao cultures vivid and naturally integrated into the life.

(2) Organize activities of miao cultures. Through holding all kinds of the activities of the international and domestic miao cultures, such as "especially festival", "new day" festival activities, and art festival, biennale, international BBS, expand miao cultures international influence, Dan village of miao culture awareness.

(3) Protect master miao cultures. Folk arts and crafts masters provide superior development environment and policy support, in the capital, location, personnel, etc., meet the demand of its development. Dan village of miao culture in under the protection of relevant policy can be handed down from generation to generation.

6.2.2 National culture innovation

(1) Promote cultural creative industries. Miao unique artistic creativity, combining miao cultural and creative industries, such as film and television production, publishing, digital animation, art, media, etc., the Dan miao village "golden pheasant" motif. Will Dan village "batik", etc. Combined with modern product design, meet the demand of modern life.

(2) Implement share cooperation mechanism. Change the traditional pattern of families to operate small workshops, e-commerce, promote the joint stock cooperative system mode of operation, from order to raw material supply, design, production, sales, etc., formed a

complete industrial chain. Each village development unique industry, such as stone paper, Carla cage, etc.

(3) Promotion of miao cultures tourism. With the miao culture to build the characteristic tourism, culture and tourism benign interaction, the centralized development of state-level non-material cultural heritage inheritance, key villages of national culture tourism zone, longquan mountain provincial scenic area, east lake scenic area, ancient stone paper culture "Jia Wenhua" tourist scenic spot, longquan lake national tourist areas, mercury ruins of modern industrial development zone, admiralty economic development zone industrial sightseeing tourist area.

(4) Organizational culture tourism, design product line

(5) Development of cultural economy. With cultural structures, investment promotion platform, with introduction of ascension and expansion of the cultural project Dan village cultural strength. Through holding all kinds of large-scale activities, such as the ebo, tonggu mans tube lusheng dance "ten thousand people" and "cultural human-god cup" ox king, king king of birds, chicken type champions and investment promotion project negotiation and signing ceremony, such as the development of cultural economy, make the culture leading economy, gave rise to cultural economy, achieved the integration of cultural tourism

6.3 Characteristic industry development system

6.3.1 Industry positioning

(1) Characteristics of complex agricultural demonstration zone. With selenium zinc agriculture, traditional Chinese medicinal materials planting characteristic agriculture as the foundation, with modern efficient ecological NongYeYuan as a carrier to promote the development of characteristic agriculture; With intensive, highly effective, ecology, industrialization of agriculture development for the concept, build cooperate for the development of agricultural industry processing, distribution, leisure, tourism, etc to support the diversity of industry system, lead the Dan village from simple characteristics of agriculture to complex agricultural transformation and upgrading.

(2) Emerging manufacturing base

With the development of the western region, the eastern industry transfer as an opportunity, to industrial park development as the carrier, thanks to aid advantages, push Dan village into the group "are kay MaDan" town industrial division system. Strengthen Dan village in guizhou, chongqing, the pearl river delta, the beibu bay economic circle of the contact interaction, to admiralty economic development zone as the carrier, actively undertake the eastern industrial transfer, improve industrial, construction equipment manufacturing, characteristics of food processing, biological medicine, electronic appliances, textile and so on as the leading emerging manufacturing bas

(3) Original national culture tourist area. Relying on the national culture resources and natural resources, in hmong culture as the leading, blend in qiandongnan prefecture ecological group of hmong culture, as a whole development, strengthen the regional overall attractiveness. With golden pheasant dance, a stone bridge, ancient paper-making etc. Characteristics of culture as the leading factor, fully tap natural and cultural resources, accelerate the construction of scenic spots infrastructure, actively develop characteristic tourism products, and the surrounding region dislocation development, makes the original ecological ethnic culture communication platform and leisure resort.

6.3.4 Industrial space layout to guide

According to industry resources distribution, current situation and regional demand county industry development space can be divided into northern, central and eastern three characteristic industry development group.

6.4 Modern comprehensive transportation system

Adhere to the principle of coordinated development of transport and land use layout, transportation system skeleton is suitable for the urban land layout, reasonable planning of urban passenger traffic and freight traffic corridor, corridor from the macroscopic structure to prevent traffic conflict. Should adhere to the overall, harmonious and sustainable development, to build intensive urban transportation system, through the establishment of public transport, transportation as one of the diversified individual the coordinated development of urban traffic system, the development of adjust measures to local conditions and transportation network system.

6.5 Basic public service system

Carries on the comprehensive analysis about the present situation of urban public facilities, on the basis of extensive investigation and study, covering urban and rural construction, fully functional, social undertakings and public service system for the livelihood of the people.

7. Implement policies and Measures

7.1 *Set up the system of regional coordination, promote administrative division adjustment timely*

(1) Regional coordination organization. Set up "are kay MaDan" planning committee, joint participation, the relevant government and departments involved in the planning and implementation of land planning, public services, environmental protection, social affairs and other major matters to be agreed upon as a whole. Formulate efficient win-win regional cooperation mechanisms, to implement the regional planning goal and the tasks to each administrative region planning, use low levels of planning content and the specific measures, improve the implementation of the master planning requirements, realize effective cohesion of different level planning.

(2) Regional infrastructure to build system. As a whole and regional transportation network system. Comprehensive consideration for railway special line "are kay MaDan" area, rail transportation, logistics park and urban high-speed outer ring and ring net layout quickly, together build regional transportation skeleton, drive the regional overall development of north-south transport corridors, and reserved space for the construction of vision line network. Network as a whole to build regional municipal engineering facilities. According to the regional natural environment, facilities service ability and the urban development needs, achieve energy, water supply and drainage, electricity, telecommunications facilities and other large municipal facilities construction coordination cohesion, give play to the comprehensive benefit, reduce duplication of investment.

(3) Development of regional tourism system. Unification of regional tourism planning, building "are kay MaDan" tourist thoroughfare. Reinforcement and the surrounding libo, built leishan swallowed the miao, li from banyan area of scenic resource coordination and complementary advantages, give play to the comparative advantage, form a diversified regional tourism routes.

(4) Regional security system. On regional ecological construction, based on the natural environment characteristics and the target of urban construction, unified defined the basic farmland protection areas, water source protection areas, etc. The construction area protection line, to guide the concrete construction and space governance measures are put forward in the key areas.

In regional security, considering flash floods, landslides, debris flow and other natural disasters prevention requirements, partition graded protection measures, over the ground in a high-risk area of residential areas in combination with urban construction plans to move as a whole.

(5) Administrative division adjustments. Timely push Dan village administrative division adjustment city and its surrounding areas (such as township removal, etc.), admiralty economic development zone and uplift Wu Xiang ChangQingXiang) after (including removal,

burn tea industrial park and XingRenZhen take area town and mode respectively. Backward area village relocation and point the project implementation, guide the rural population to urban organic concentration, perfect infrastructure and public service function, promote the urbanization process.

7.2 Strive for national policy support, the construction of the miao cultural tourism innovation zone

(1) Cultural heritage. For the miao culture resources protection and cultural brand applications to provide support for the legislation, funding, application priority policy guarantee, etc. Construction of miao culture show policy, encourage decentralized XiangDongHu perimeter zone partition cluster culture resources, promote the city characteristics, ethnic customs.

(2) Culture to carry forward. Construction demonstration area of the miao culture experience, development of folk art performances, folk art education, nationality, ethnic cultural information of the production process such as industry, the formation of professional management groups and industry cluster.

Miao culture festival activities, which are held on a regular basis to carry out the "east lake miao cultural BBS" and "fair" miao culture, strive to foster a culture of good investment environment, establishing the image of urban culture brand.

(3) Cultural development. Optimize their travel network, set up regional tourism channel node, Dan village cultural tourism into a regional characteristics of regional tourism system. Build in cultural entertainment industry, cultural tourism brand as the core of culture, arts and crafts industry system, build cultural industry chain, and drive traffic, catering, hotel, etc. The development of relevant industries.

7.3 Construction of mountainous industry breakthrough development model in ethnic minority areas

(1) Industry on policy. Clear economic threshold of foreign industry admittance, improve external industry access standards, formulate corresponding transfer policies and regulatory measures to prevent the backward production capacity and transfer to Dan village heavily polluting enterprises. Formulated to promote industrial transfer of land, credit, fiscal interest discount, tax incentives and other preferential policies. To strengthen the construction of market integrity and optimizing trading environment, reduce market transaction costs. Build service government, responsibility government, safeguard the legitimate rights and interests of investors.

(2) Policy of industry transformation. Promote the resource-intensive industry technology upgrades, such as iron and steel casting industry to the high-end equipment manufacturing industry development. Guide development lag industry forms the transformation, such as agroforestry to biomedicine, new energy, environmental protection industries, emerging industries such as transformation. Construction service enterprise vocational education training system and technical research and development institutions, to develop the financial sector, advisory planning, product design and logistics services, producer services form production, the integration of science and education industrial park.

(3) Industry promotion policy. Zinc selenium m, iberico agricultural resources advantage, such as the construction characteristics of agricultural and sideline products deep processing base. Apply for funds and policy support national characteristic industry, the resource advantage into industry advantage, strengthen the development of clean energy, environmental protection industry and ecological resources. Aid assistance to apply for big investment projects at the provincial level, around the core industry of the cluster system, formation of city economic pillar.

7.4 Improve the poverty-stricken areas out of poverty in guizhou and enriching policy system

(1) Immigration policy. Yang Wu Xiang, longquan town of resettlement facilities such as construction, provide a good living environment and the public service condition. Construction of vocational education park, for immigrants in employment post information

and skills training. Future urban development considering industry selection and development zone construction requirements, implement "new immigrants" to "move the industry people", to facilitate immigration to work

(2) Life safeguard policy. After ecological migration into the city and urban residents enjoy the same education, medical treatment, employment, pension and other social welfare policy. Ecological migration after the circulation of right to the contracted management of land, the government will retain its original enjoy national treatment of peasants, agriculture remains the same.

(3) Entrepreneurship support policy. Ecological immigration application startup loan amount will enjoy support, and the corresponding interest preferential policies. The government will according to the immigration self-employment performance give part of the tax incentive policies. Governments at all levels provide appropriate technology and information support for immigrant entrepreneurship.

7.5 Implement a full range of talent services policy

(1) Implementing talent service preferential policies. For the introduction of high-level innovative entrepreneurial talent and are in urgent need of special talents shortage, in the county enjoy household registration, housing families, funding, and employment, insurance, their children to school and go to a doctor to give the preferential policy, title evaluation, etc, and convenient service.

(2) Implementation of personnel salary subsidy policy. According to the talent introduction work contribution and innovation performance, leading role and influence the industry standard, according to give corresponding compensation. To introduce talents of scientific research or work at or above the provincial level awards, give corresponding material rewards.

7.6 Build open inclusive city spirit

(1) Enlightened government image, build open policy environment. Through effective policy incentive and guarantee mechanism to motivate the county entrepreneurial enthusiasm, create a Dan lasting impetus of the development of the walled city. Improve the scientific decision-making mechanism, implementing public opinion reflecting mechanism and working mechanism, formation of Dan village management orderly and dynamic policy environment.

(2) Highlight the inclusive thoughts lead and promote the city construction of humanistic spirit. Dan village tolerance open, advocating development atmosphere, cultivating citizen's social morality, professional ethics, family virtues, and form a unity and mutual assistance in the whole society, the poor, understanding, tolerance, harmony and harmonious social atmosphere, enhance the social civilization degree of Dan village and cultural development level. Set up the Dan village win-win co-prosperity cooperation idea, carry forward the works together, unity cooperation style. Dan village of self-interest and the surrounding interests, partial interests and overall interests, immediate interests and long-term interests, the combination of solid effectively open and mutually beneficial cooperation.

(3) Set up the eclectic, open atmosphere of the city's image. Emancipate the mind actively, advocating all rivers run into sea, upholds the Dan village, learning advanced experience of the developed areas in the open, show Dan village and vigorous atmosphere, open thinking, eclecticism, acceptance, dare to innovation, from the city's image. Will Dan village open inclusive city spirit rooted in production and life practice, into a group of people's consciousness and behavior.

With implements of our Strategy, more and more MIAO migrated from the depth of mountains to new cities, Living and working peaceful and harmoniously. Our Practice has proved that ecological migration can have win-win effect of economy and people's livelihood. Hope it be a good reference for ecological migration in the world.

DANZHAI, a poor county in southwest China has an ethnic minority MIAO, whose totem is "golden pheasant". 'Strategy Planning of Urban Space Development' promoted coordinated

development of urban and rural areas, implemented poverty alleviation and ecological migration, proved that ecological migration can have win-win effect of economy and people's livelihood.

Equalization of Public Service Facilities for Tourist Cities**Equalization of Public Service Facilities for Tourist Cities
- Case Study of Sanya's Downtown Public Service Facilities in the
Planning Process**

Fei WANG, Wei Wei, and Ming LI, China academy of urban planning and design, China,

1. Background and proposition

The achievement of equalization is a core idea of public service facilities for a city. It is also an important way to achieve society justice, reduce the disparity between urban and rural areas, the rich and the poor, as well as other negative impacts of imbalanced development. The approaches to achieve the equalization of public service facilities are quite different, depending on the main function, spatial pattern and population composition in a city.

As one of China's most representative tourist city, tourism has become the pillar industry in Sanya, which is the strongest drive for economic growth and also a major factor impacts its sustainable progress. After ten years of growth, Sanya is experiencing an explosive increase in terms of both its tourist number and tourist production value. Seasonal population agglomeration brings huge challenges to the supply of public service facilities. Problems such as land for public service facilities occupied by the overwhelming development of tourism real estate, inadequate supply and low quality of service facilities for local residents are becoming more and more serious. Under the background of seasonal population vibration and periodic demand variety on public service facilities, how to satisfy the different needs of tourists, migrant people and local residents, taken the population distribution as a point of breakthrough, becomes the primary aspect to rationally allocate the public service facilities in the tourism districts featured by dramatic population change.

2. Problems and cruxes***2.1 The periodical change in demand on public service facilities caused by seasonal population change***

With the proposal of global tourism island construction, as the most beautiful beach scenery all over Hainan Island, Sanya gets astonishing development in the tourism industry. Also, the amount of tourists and migrant people for rehabilitation are dramatically increasing year by year and take large percent in the foreign population. Considering the complexity of population composition and the feature of seasonal tourism population change, through the population census and calculation, the people in Sanya could be divided into three groups by the character of the seasonal movement and stay:

The first group includes about 500,000 people, comprised of local residents including registered permanent residents and floating population, the growth rate of which is comparatively stable. The second group, 200,000 people in all, is migrant people who usually live in Sanya for half a year mostly from November to next April for retirement leisure and rehabilitation. The third group consists of tourists for short-time stay at an average of 100,000 persons a day. Based on the statistics of 12 months in a year, the daily average number in the peak month could reach 130,000 while the lowest is about 70,000.

Equalization of Public Service Facilities for Tourist Cities

Considering these three groups, we have found that the periodical change of people in Sanya is obvious because the lowest amount is about 600,000 while the highest is up to 1,000,000 at the same scale as a city. (Figure 1) As a result, the generic approach of allocating public service facilities is apparently not applicable for we are confronted with 2 completely different urban sizes.

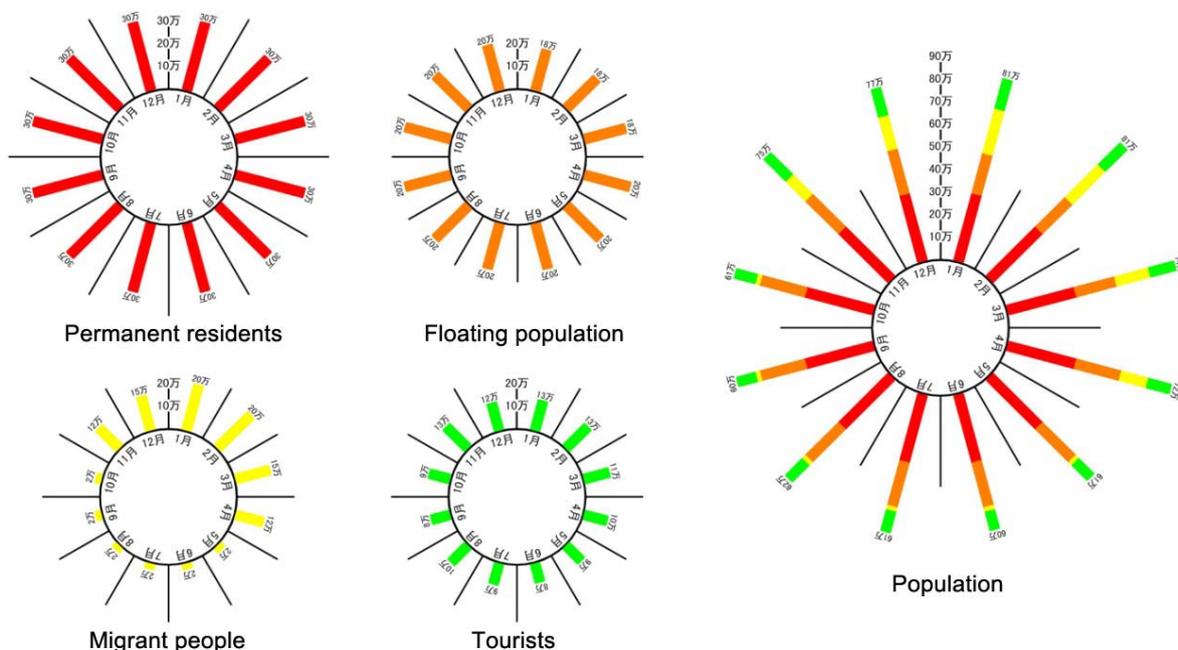

Figure 1: image of demographic composition in Sanya's central urban district (resource: drawing based on related data)

2.2 The land for public service facilities occupied by the overwhelming development of tourism real estate

The real estate has become the pillar industry in Sanya, making huge contribution to the tertiary industry in this area. In 2009, the real estate accounts for 40 percent in the gross value of tertiary industry of Sanya; the number grew to more than 50 percent in 2010. Apparently, this situation is closely related to tourism boom. The development of Sanya's real estate mainly relies on the growth of tourism. That is to say, the overwhelming and mighty development of tourism brings large opportunities and potentials to the real estate. Sanya's housing price, in Sanya in 2011, jumps into the top ten highest ones in the whole country, whose growth sits the first place nationally. From that we can see the development of real estate contributes a large part to the whole city's economic development.

However, some social problems come along with the boom of real estate, for example, the migrant people causing high housing vacancy rate in Sanya up to 95 percent in some residential area; local residents are forced to move to the fringe area of city because of high housing price. Comparing the master plan in 1999 and the situation in 2008, the percentage of residential land increases more than 20 percent while the green space decreases 30 percent, and public service facilities remains almost at the same level. On the data of granted land types from 1991 to 2007, large amount of residential land were sold. Conversely, the amount of public service facilities land goes down. The planned lands for city political center

Equalization of Public Service Facilities for Tourist Cities

in the master plan of 1999 were adjusted for real estate use in 2008; the land for sports center was used by tourism facilities land. It is a specific example to demonstrate the impact of real estate on public service facilities.

Recently, the tourism development has been more focused, which would bring huge and immediate economic benefits while the investment in the fields on education and culture reduced. Taking the advocacy plan of key projects in 2010 as an example, we can see these programs on tourism and real estate are still the top priority. (Figure 2)

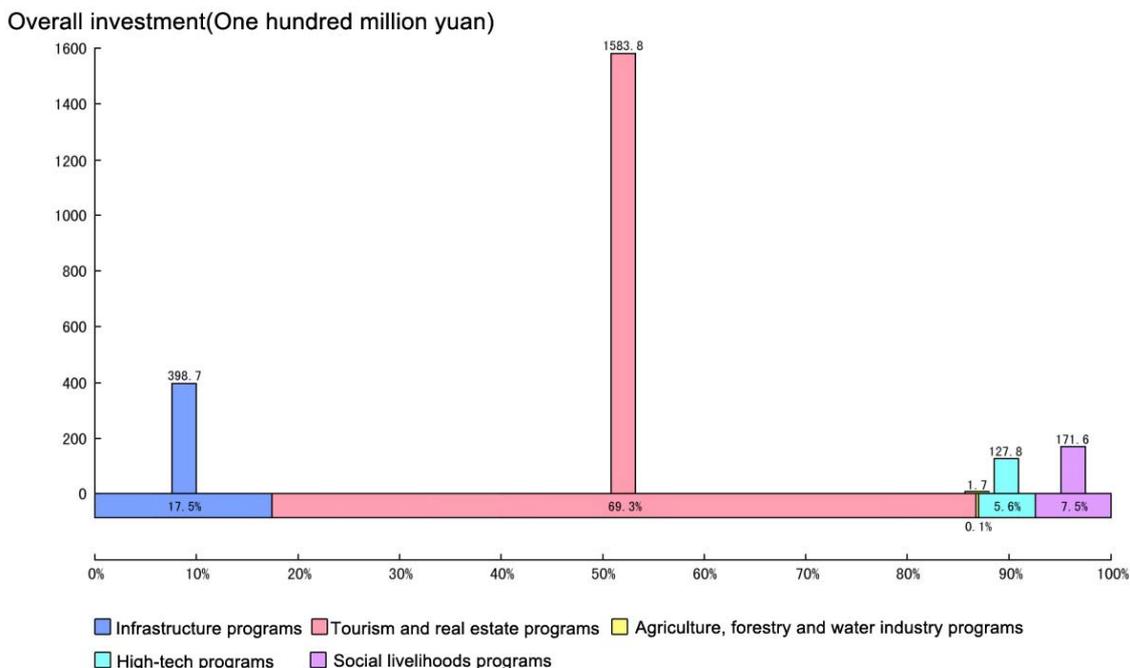

Figure 2: statistics chart of investment in Sanya’s key projects in 2012(resource from: Sanya Sta. Almanac)

2.3 The issue of public service inadequacy and backwardness for local residents is increasingly prominent

With the boom of tourism, the high-qualified waterside resources attract large number of real estate investors. Public welfare and tight profit service facilities can hardly maintain under this market-oriented seaside district. The vitality center designed in the master plan is almost the last high-quality space for public service facilities. At the same time, the good landscape resources in the inland waterfront have been occupied by real estate. (Figure 3)

The old districts renovation in high-quality waterside resources is facing the same problem: local residents move out while many foreigners crowd in. The high-incentive development cannot help to better the transportation in old districts but bring more stress. After renewal,

the facilities will be upgraded to a higher level that will virtually worsen local residents facilities-inadequacy problem.

Equalization of Public Service Facilities for Tourist Cities

The inappropriate renewal to old districts actually destroyed the local culture accumulated for a long time. The time visitors stay in Sanya is shorter than the other scenery resorts in foreign countries (Table 1). One of the most important reasons is that Sanya need more experience and exhibitions about local culture to attract visitors. The visitors enjoy the first several days in the hotel, however when the fresh feeling for the sea view diminished, they of course hope to experience the local culture and way of life, so the holiday resorts that could provide colorful local cultural experience will maintain visitors long time here.

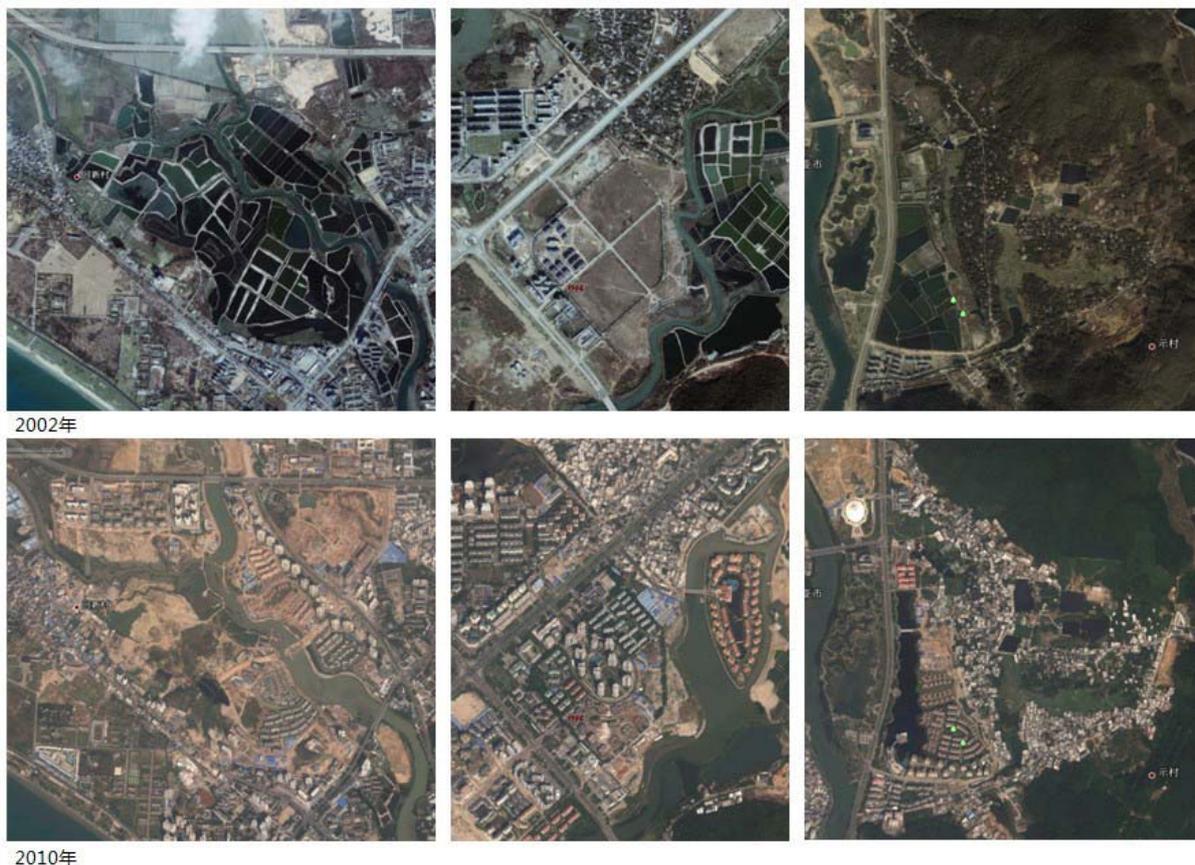

Figure 3: comparison of Google maps on inland waterfront real estate in 2002 and 2010 (resource: Google maps)

Table 1: comparison tourism details in global famous scenery resorts (resource from: Sanya’s master plan)

Global famous tourism resorts	Cote d'Azure		Costa del Sol in Spain	Gold Coast in Austria	Miami	Southeast Asian		Hawaii	Cankun	Sanya
	Nice	Cannes				Bali	Phuket Island

Average stop days	7.4									
Daily spending	€	€	€	A\$	\$	\$	\$	\$	\$	\$

Equalization of Public Service Facilities for Tourist Cities

2.4 The imbalance distribution of public service facilities

From Sanya's spatial development of urban form in recent years, the development of the water overweighs the development of land. From the 1989 to 1999, the city sprawl is mainly along the sea side; from 1999 to 2009, the development came forward in great number of the high-qualified landscape resources inland when the seaside land is continuously been used; after 2008 till now, the high-qualified resources land in old city has been renewed and reconstructed came out one after another.

From Sanya's existing distribution of the public service facilities; the development in central city is much more advanced than that outside of it. The public service facilities concentrated in the center (Figure 4). For a long period, all kinds of public service facilities locate mainly in the old city along the both sides of the river, which largely decide the democratic distribution of different districts. Seeing from the relation between locations of all kinds do public service facilities and migrant communities, the new communities where most foreigners chose to live in show the trend of embracing the area along the both riversides where public service facilities are the densest. These foreigners enjoy the convenience of the public service facilities while contribute less for the city's facilities. The facilities in old city are overused while those in new city are inadequate. This brings several urban problems such as population agglomeration and space density and traffic jam. Using public service facilities to attract population flow is an important way to release the transportation pressure in old city, to lead the completion of public service facilities in new city by placing major construction facilities. Meanwhile, the seaside could be leaf for cultural facilities which could much more present the essential characters of city and provide service for local residents and tourists.

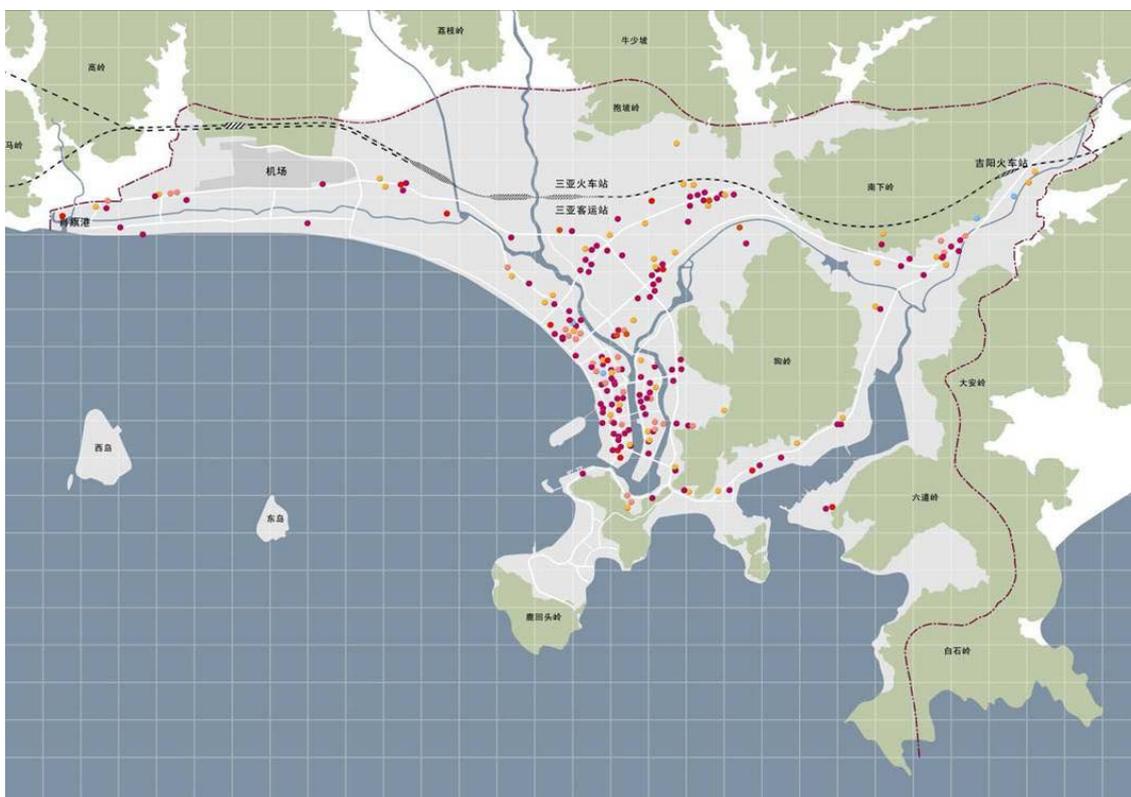

Figure 4: map on Sanya's existing facilities distribution of public management and public service (resources: imaged on data)

Equalization of Public Service Facilities for Tourist Cities

3. Strategies and methods

3.1 The public service facilities zoning by the population distribution

If we analyze Sanya’s urban spatial structure from the view of population distribution, we can find three classes of region: the first is the population agglomeration area in Yalong bay district, Luhuitou mega east sea district and Haipo district, which three districts largely affect Sanya’s urban space structure; the second area highly mix local residents, tourists and migrants people including Jiyang district, west side of river and Sanya bay. These three groups of people correspondingly locate in these tourism districts; the third is the main area where inhabitants and migrant people concentrated including east side of river and Yuechuan district. Sanya’s urban space structure(Figure 5) is clearly collated that the peripheral area function as tourism containing three seaside tourism districts and north face mountain tourism district; the neighbor area consists of three tourism service living districts; the local urban living districts were surrounded by the formal area. From the angel of human usage of facilities, this spatial structure is the ground how we locate public service facilities. (Figure 6)

The core value of public service facilities is to be utilized by people. It is apparent that different people have various demands for facilities, like in Sanya, local residents do not necessarily go in the tax-free shops but cannot live without the food market; migrant people may not have children who need to go to school but hard to avoid to go to hospitals; tourists could stay without the need to see a doctor for several days but must go to have seafood. All groups of people have different needs for facilities and their activity areas differ from the distribution of all facilities, which in fact deny the realizing of impartial principle. So actually, what we try to do is not to achieve the impartial on space but on service, which means all kinds groups could be satisfied.

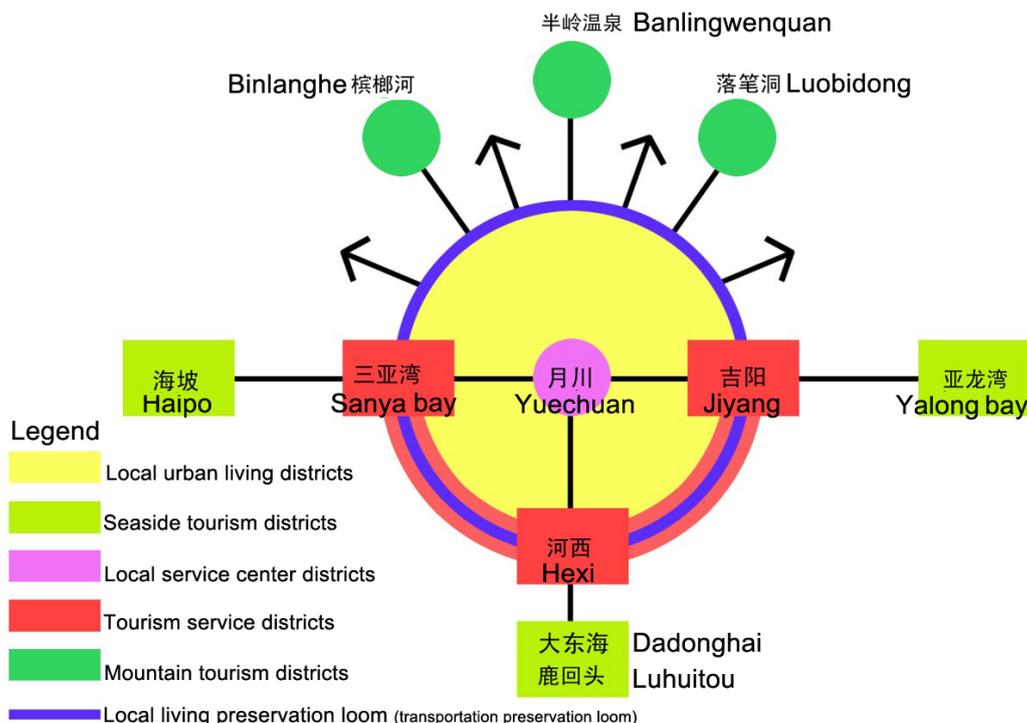

Figure 5: image of Sanya’s urban special structure

Equalization of Public Service Facilities for Tourist Cities

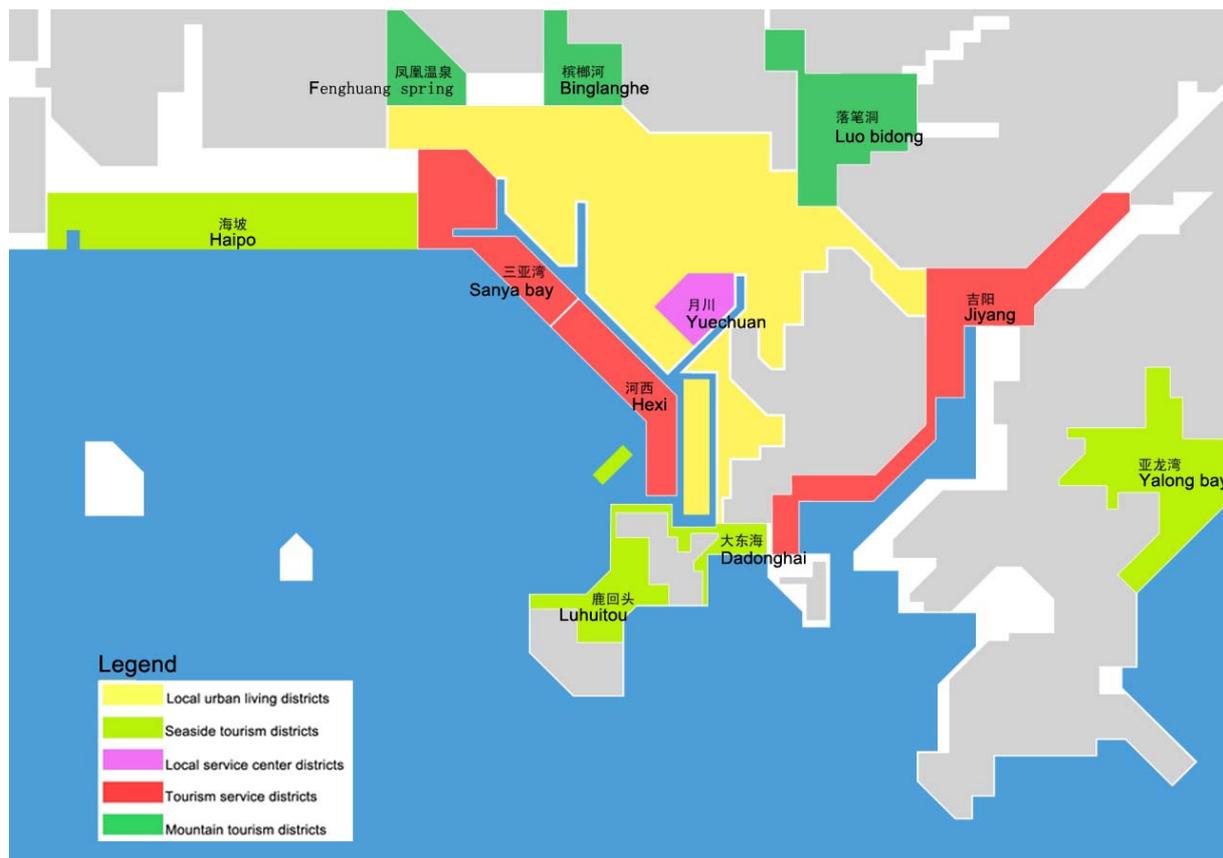

Figure 6: map on Sanya’s existing facilities distribution of public management and public service (resources: imaged on data)

3.2 The classification of Sanya’s public service facilities basing on urban spatial structure

On experience in Sanya and other cities, there are three grades of Sanya’s public service facilities, besides the public construction on city level, the facilities for residents could be divided into two grades in terms of residential district and dwelling district. The facilities on the residential area have direct connection with jurisdiction management as well as the political grade in the future. Within the wards of neighborhood political management range, which could be divided into several communities, the public service facilities both on the neighborhood level and community level could be constructed and assessed by city management departments together with neighborhood management organizations.

Depending judgment on Sanya’s urban function structure, we recommend service centers on city level to be classified on the service subject groups, which two kinds are integrated service centers for visitors and diverse residents and local service centers for local residents. The integrated service centers separately locates in three tourism districts which are featured by retail and catering in west riverside, cultural district in Sanya bay and local landscape style in Jiyang town. Local service centers are Yuechuan district functioning as commercial district and Baolingpo district centered for administration. Differing from master plan, we take Jiyang town as city service center to enhance service quality for Yalong bay and local residents, which would benefit to release old city’s pressure and to extend Jiyang’s urban function. In all, there are five service centers on city level.

Equalization of Public Service Facilities for Tourist Cities

On different service subjects, service centers on neighborhood level could be divided as tourism service centers and residential service centers. Tourism service centers are in Yalong bay, mega east sea district and Haipo; while residential service centers are in north city, Haidong, Jixiang and Hedong. Service facilities on neighborhood level will respond to the management district by municipal district office in the future. Each office will in charge for forty to sixty thousands of people. In all, there are three tourism service centers and four residential service centers. (Figure 7)

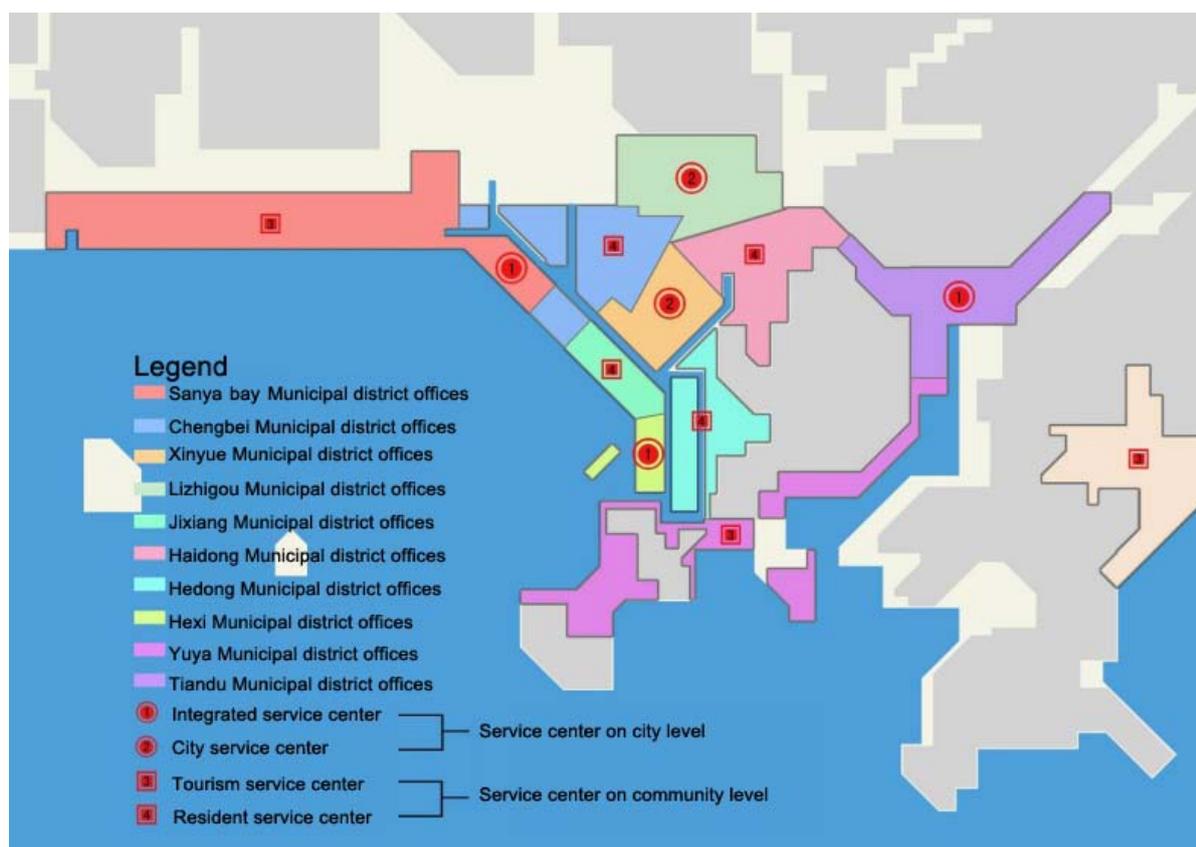

Figure 7: map of distribution Sanya’s graded public service facilities

Service centers on residential sub-district level could be defined as divided neighborhoods based on the rules of six to twelve thousands of population and service radius. Each community can form its own service center. Its specific bound could be decided by each district and town or the probable municipal district office as well as concrete conditions with community residential committees.

3.3 The pointed strategies to Sanya’s existing conditions

With the responsibility to build Hainan’s international tourism island, Sanya still looks no big difference with other Chinese general county towns having several city problems. So we should not only be object-oriented and allocate public service facilities at the highest quality to respond the targets, but also problem-solving-based to find the crux of urban problems, that is how we fix the diseases and prescribe a medicine catered to them, so to speak. The following three points represent how we would do that.

The first is using plans and guidance to overcome uneven distribution, which is aimed to lead the completion of public service facilities in new city by placing major construction facilities.

Equalization of Public Service Facilities for Tourist Cities

We highly recommend central administrative function planned in center of new town, because administrative center has the strongest power on urban layout in all the city government controllable resources, which could also effectively affect other urban facilities gather around to solve impartial distribution of public service facilities. Meanwhile, the seaside could be leaf for cultural facilities which could much more present the essential characters of city and provide service for local residents and tourists.

The second point is to end the real estate sector's strong presence by management, which means strictly enforcing and implementing the plans, to insure public facilities, especially the public service facilities. To build classification of municipal district offices and community residential committees, so that these service facilities on residential level and community level can have clear jurisdiction subjects. The construction, management, operation of these two grades of public service facilities should be connected with the working achievement of municipal district offices and community residential committees.

The third point is to rebalance the people and housing by policies, specifically to make zoning policies on different zoning characters. Within tourism districts, the real estate development types should be restricted mainly in range of vocation and tourism use, only permit for timeshare and property resorts; in the districts about tourism service, encourage family hotels to help more local residents enjoy the benefits from tourism industry. Some percentage of real estate is handed over to government for use of affordable housing. In the local living districts, the dominant function is service for local dwellers' living and working, where development on affordable housing should be incentive.

4. Conclusions and revelations

In conclusion, we explored the effective methods for allocating public service facilities in areas with a complex population composition and proneness to changes. Under the core principle of public service facilities development, we try to establish a specific system plan of public service facilities to represent Sanya's city characters and the achievability of plan production assisting local government to implement and manage. The achievement of equalization of public service facilities is not solely an even distribution of facilities, but to provide public service equalization according to the requirements of different crowd.

To Alleviate Spatial and Social Divisions by Modifying Grids: City Planning and Social Orders in Ancient Multi-ethnic Chinese Cities

Xu Yibo

Politecnico di Milano

1. Introduction

This paper is part of the research into the connection from grid to social orders. It attempts to explore the process of integration of immigrants and the design of grid to alleviate the conflicts between different ethnical groups.

Four cases are presented to explain the process of immigrant integration. The former three are historical examples in ancient China on the 'multi-ethnic' cities. They are the division of clans in Western Zhou dynasty in 8th century BCE, the mix of Chinese and Nordic cultures in 13th century CE and the multi-ethnic Chinese border cities in 19th century CE. The last case is about the transformation of Chinese ghettos in Milan, Italy. Though from different historical strata and location, they all present the issue of Frontier where different ethnic groups meet, trade, conflict and finally integrate.

The article will examine the cases from following aspects: the historical background, the economical, cultural and political conflicts and integration and the grid as spatial tools in creating the space for integration. Four cases share the similar model of social integration. In this process, grid is the physical interference as the reflection of the decision from rulers upon the social orders.

The study is written for planners and governors who are engaged in this immigrant Frontier issues. The lessons from historical and contemporary social integration can provide possible references in the political decisions and the planning of grid.

2. The Initial Spatial and Social Exclusions upon Clans in Ancient Cities

The first chapter is a description on the ancient Chinese tribal kingdom (20th centuries till 7th centuries) when first spatial and social exclusions of clans happened under massive migrations.

The primitive tribal society constructed upon local clans. The hierarchy is simple as families and the cohabitant with alien clans did not exist. This social system existed in ancient kingdoms like Xia and Shang dynasties (20th till 10th centuries BCE) where king is supported and surrounded by royal and noble clans, political and spatially.

Massive migration appeared in Western Zhou dynasty (10th till 7th centuries BCE), clans migrated, conflicted and integrated in different regions. It was the time first *Frontier* happened. Different clans coexisted in one city, strived for limited resources, controlled and excluded politically and physically. Walls are built to demarcate zones and the alien clans were excluded from the king and noble clans. (Loewe & Shaughnessy, 1999)

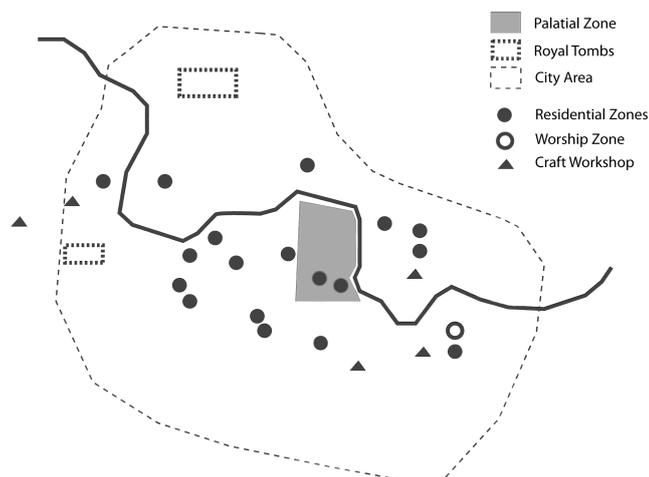

The following cases show that 'to exclude is inevitable initial choice when facing immigrants' even from the beginning of civilization.

2.1 The Centric Layout Capital with Solo Clan

The last Shang's capital, Yinxi (1300 BCE) was an assembly of tribes and small cities with a big area covering 300 thousand hectares. It was on the south bank of Huan River, on a higher terrain near the river. Shang King's Clan territory was in the centre, surrounded and protected by other noble tribes. It existed as gathering point of Shang clansman even after the Dynasty end by Western Zhou Dynasty. (Loewe & Shaughnessy, 1999)

The centric part is the Palatial Zone protected by moats. It was a planned rectangular area with 1100m long south-north and 650m wide east-west. The moat was the symbolic and physical boundary of the royal territory. There was no wall probably due to its strong military forces that multi-layers of Shang clan tribes protected it in the centre. Other handicraft, residence and cemeteries scattered affiliated to each surrounding tribes. Among different functional zones there were vast blank areas probably for cultivation. (Kwang , 1986)

As a capital with single Shang clan, the city did not divide or exclude any groups and zones. All tribes surrounded the king clan in the centre and create a centric layout. This type existed in most tribes (before 10th centuries BCE) when the massive migration did not appear and the mix of clans did not happen. Or to say, it is primitive model before the appearance of Frontier between different ethnical groups. (Xu, 2000)

Caption 1: Plan of Yinxi City, the Centric Layout (Xu, 2000)

2.2 The Capital to Exclude Migratory Clans

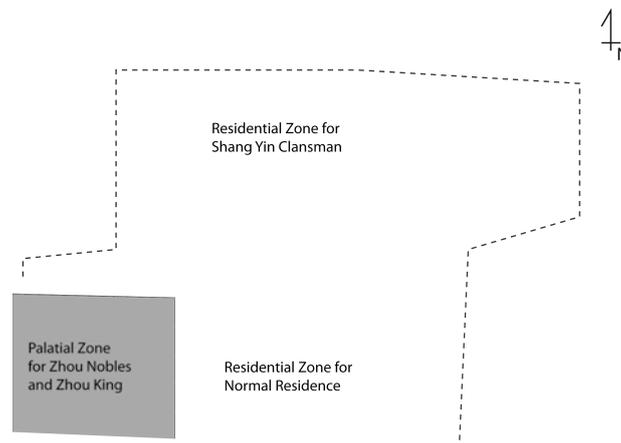

After conquering Shang dynasty (10th centuries BCE), in order to weaken the power of Shang clans and control more territories, King Zhou, the leader of Zhou clan forced Shang clansman to migrate to remote regions, therefore remix the clans in all China. The first migration of different clans happened (10th till 7th centuries BCE). (Loewe & Shaughnessy, 1999)

However, the Shang clansman and other alien clans often made revolts. Thus the previous centric layout was not feasible in sense of safety of Zhou King and his noble clans. In the new capital of Cheng Zhou (currently southwest of Luoyang) a new spatial grid for social exclusion was designed to divide the clans. (Kwang , 1986)

The city consisted of two adjoined parts, on the west was a small palatial city and on the east was a large secular city. They were designed to separate the clans. The west city consisted the palace of King Zhou and other noble halls while the east secular one inhabited

Shang clansman, other migratory clans and the military troops of King Zhou, as a tool to surveillance and control the alien clans. (Yang, 2006)

From the liturgy, the western part also represents the supremacy over the eastern part. In ancient ideology southwest was a symbol of wellness. Nobles preferred to live in the southwest of the city and considered northeast as unlucky. Therefore, to show off the superior rank over other clans, the palatial city was created in southwest with halls and temples on high-platforms. According to this liturgy, the main gates, royal halls all faced eastward. In Chinese, it was called 'Sit in West and Face East', the king overlooking the subjects in the east. (Yang, 2006)

Caption 2: Plan of Chengzhou, the west-east separated city (Yang, 2006)

The above history shows the transformation from solo clan into the multi-clan. The initial spatial and political reactions towards the alien immigrants are to exclude. Walls are built and zones are demarcated to separate Zhou clans and alien clans. In politics the alien clansman are degraded as slaveries and cannot serve army, have lands or enter political discussions. Understandable, it is part of the intrinsic self-protection of human being, whenever there are aliens, the initial reaction is to reject, self-protect and exclude, at scale of social groups.

3. Assimilation of Chinese and Nordic Ethnics in Nordic Cities

In second chapter, we forward the history to the era that central China was occupied by Nordic ethnics, Khitan, Jurchens and Mongolians (11th till 13th centuries).

At first, nomads partly assimilated with Chinese. Cities were built with two foci, one Nordic zone with tent and Nordic halls and the other Chinese zone. Two systems on culture, politics, economy and spatial layout coexisted in one city.

Later on, nomads traded and cohabited with Hans, learnt Confucian liturgies, executed Chinese centralized political systems and finally built cities according to Chinese ideals. The assimilation happened and different ethnical groups learnt from each other. I.e. the famous city Xanadu is the hybrid of Chinese chessboard city and Mongolian naturalism ideology. (Twitchett, Franke, & Fair, *The Cambridge History of China: Volume 6, Alien Regimes and Border States, 710-1368*, 1994)

In these cases, the process of assimilation of locals (Chinese) and immigrants (Nomads) happened in every the aspects including culture, politics and the spatial planning.

3.1 The Nordic Tents inside Chinese Imperial Grid

In the later Northern Song dynasty, a strong Nordic cavalries, Khitan conquered northern China and created Liao Dynasty (907-1125). The social system of Khitan is slavery. The emperors created zones and enslaved Chinese to cultivate lands for the troops and build cities. The first built capital of Jin, the Upper Capital, shows a grid planning with harsh combination of Chinese zone and Khitan zone. (Twitchett, Franke, & Fair, *The Cambridge History of China: Volume 6, Alien Regimes and Border States*, 710-1368, 1994)

This city was built from empty ground in Inner Mongolia. It consisted of two parts, the northern Khitan royal palace and the southern secular Chinese city.

Northern Khitan royal city is mix of Chinese city and Khitan tent. It has a rectangular shape with 2km south-north and 2.2km east-west. In the middle north there is the Imperial City that is a 600 by 300 m rectangular. Four east-west and north-south avenues crossed and shaped a '井' grid. The symmetric axis is the vertical avenue connecting the southern gate of Imperial city towards south. The wide horizontal outside the southern gate was used for the annual Big Court Ceremony. The above spatial characters are copy from Chang'An in Tang dynasty. The only difference was the orientation of halls. Khitan liturgy took east as supremacy. Therefore, except the two big courts, all other halls faced eastward. (Steinhardt, 1999)

While in the northwest plenty of un-built blank grounds existed. These lands are left empty for temporary tents when cavalry noble families visited the emperor. (Yang, 2006)

Southern Chinese secular city adjoined directly to the south of royal city. It is 1.4km south-north and 2.2km east-west. There are one south-north and one east-west avenues with Chinese residences alienated alongside. At each corner of street watchtowers were built to surveillance the Chinese. (Steinhardt, 1999)

Caption 3: Plan of Northern Capital of Khitan (Yang, 2006)

Even though Khitan used Chinese grid style, its capital was still a separation of locals and newcomers. The tents are remained for cavalries. Two foci were built, the northern for Khitan and the southern for Chinese. The social system is still a mix of slavery and feudalism. The liturgies, cultures and political systems were not assimilated but remained as Nordic ones.

3.2 The Combination of Mongolian Naturalism and Chinese Imperial Liturgies: Xanadu

Mongolian emperor Kubilai Khan finally conquered the Southern Song, and established a big empire in the whole territory of China. He created a powerful empire based on feudalism. In 1250, he assigned Chinese architect Liu Bing Zhong to design the northern capital, Shang Du, the Xanadu in the book of Marco Polo. This city became a real hybrid of Nordic naturalism and Chinese imperial grid. (Twitchett & Fairbank, The Cambridge History of China: The Ming dynasty, 1368-1644, Part 1, 1988)

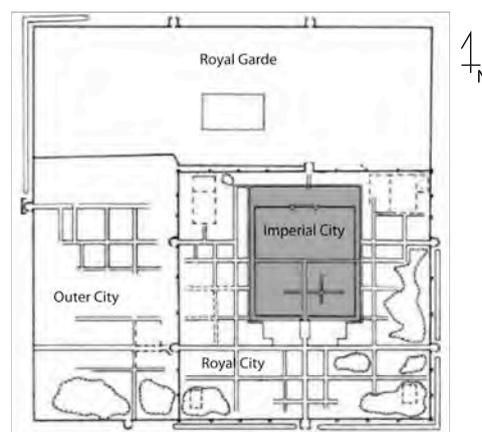

First, Liu created the triple wall system from Bianjing, the capital of Northern Song, with the outer city, royal city and imperial city. The main part is the royal city that contains imperial city. The royal city occupied the major southeast part. The outer city consisted of northern and western parts. The northern part of outer city is the royal garden that linked to the palatial city.

The outer city is a square with 2,200 meters by side. In the southern and western wall there is each gate. A 25 m wide moat surrounded the outer wall. The northern royal garden has no street but gardens with hills. The southern part of outer city contained streets and residential zones. Three east-west avenues parallel in the western part of outer city, like and planned orthogonal chessboard grid as Chang'an from Tang dynasty. The middle avenue connected toward the western gate of inner city.

The royal city is in the southeast, a square with 1,400 meter in side length. There is a central gate in the northern and southern walls and two gates in eastern and western walls. The imperial city is in the northern part of inner city. The symmetric horizontal and vertical avenues are built inside inner city.

The imperial city is a beautiful scenario that contains half garden and half palace. It has groups of halls surrounded by natural elements as hills and ponds. (Steinhardt, 1999)

The assimilation also happened in liturgies. Kubilai Khan is an open-minded emperor who introduced ideas of Confucian, Taoism and Buddhism together into new social liturgies for Yuan dynasty (13th century CE). He followed the Chinese imperial systems, liturgies of courts and conduct traditional Chinese worship ceremonies for sky and ground. And most important, the planning of the city is no longer a separation but an integration for all ethnical groups. No tents, Mongolians, Chinese and other ethnical groups lived together in the outer and royal cities. Xanadu became the standard model for its capital, Da du, which is the foundation of Beijing. (Yang, 2006)

Caption 4: Plan of Shang Du, the Xanadu (Steinhardt, 1999)

The change of Nordic immigrants into Chinese way of living and construction took over 100 years. From Khitan to Mongolian, the process undertook the initial conflicts, slavery and slaughters into trades and finally accepted the liturgies of Chinese, from Confucian to Buddhism. And the eventual assimilation reflected in the creation of grid. The grid represented trend of social changes. From initial thorough exclusion to later integration, this assimilation is clearly shown in Nordic cities.

4. The Powerlessness of Grid Change in Border Cities

In this chapter, we jumped to the border cities in Ming and Qing dynasty (14th till 19th centuries). They are remote from central China therefore special delegations were sent and inhabited in as the surveillance bureau of the city and minor ethnical groups. Normally, the border cities are also the pivotal trading points, the trends of ethnical mix are common as results of economical relationship and correspondent cultural acceptance. Therefore, the forceful divisions of cities from governance may damage the integration of different ethnical groups. (Twitchett & Fairbank, The Cambridge History of China: The Ming dynasty, 1368-1644, Part 1, 1988)

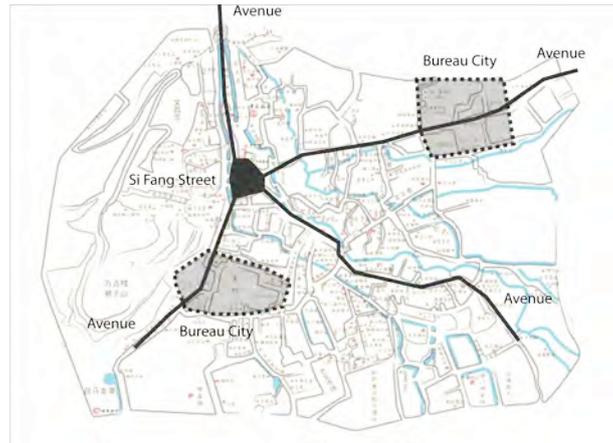

Two cases, City of Li Jiang in southwest linking to south Asia in hinterland and City of Guangzhou (Canton) in southeast as international port are presented. While in these cases, the physical division is powerless compared to the spontaneous willing to communicate between groups. They give us the idea the economical needs and cultural merging are even crucial than the spatial interference.

4.1 The Powerlessness of Political Exclusion and the Prevailing of Spontaneous Secular Foci

Li Jiang Prefecture is in Yunnan Province and served as a trading pivot linking southern China and South-Asia nations. The secular and commercial focus had been Si Fang Street, in the northwest of the city.

While in order to rule the local Naxi minority and other ethnic people, in Ming Dynasty (14th century), a bureau city was built in southwest under a hill for Tu Si, the delegator assigned by central government. This supposed to be a new political focus, separated from the old. Later in Qing dynasty, a new local commander Liu Guan was assigned and new bureau city was constructed in the east. This city became the second political centre. They were walled and separated from secular centres. However, the focus of city never moved to these two isolated cities but stayed in Si Fang Street. The new political centres became leftover peripheries. (Committee of Chronicles of Li Jiang, 2000)

Si Fang Street had been the open market for local and international trades from day to night, Naxi, Han and other ethnical minorities lived closer to the plaza. And the prevailing secular power and hilly topography resulted into a labyrinthine city grid that starts from Si Fang Street and radiate outside in four directions.

Caption 5: Plan of Lijiang (Committee of Chronicles of Li Jiang, 2000)

This case showed the political decision to create exclusion among ethnical groups, if contradictory to the trends of social integration, may fail and the power of trading can boost the spontaneous integration. As well the city grid is more labyrinthine as the result of self-growth.

4.2 The Forceful Exclusion Stopped the Integration and Resulted in the Failure of Civilization

Guangzhou located on the Pearl River. It was called Panyu in Qin and Han dynasties, as the capital of southern provinces till today. In Tang dynasty (7th century), the city was a rectangular with 5 *li* in perimeter with three gates in east, south and west. Till Song dynasty (11th century), it expanded to three conjoined cities: west, middle and east. With increasing residents and international traders along the riverbank, in 1565, the northern cities were combined into one as the bureau and Chinese city. (Committee of Chronicles of Guangzhou, 2000)

In Ming dynasty, Chinese emperors put laws to forbid the international sea trade. Therefore, China closed its doors towards the occidental traders. And in western border, the Ottoman Empire cut the connections from west to east in hinterland. Therefore, the Chinese world cannot communicate with western cultures anymore. (Peterson, 2002)

Later in 16th century, Ming dynasty emperor allowed foreigners to build factories and ports southwest outside the wall of Guangzhou. Guangzhou became a port contained limited zones for international trade. The southern linear city was made as for trading and buffering zones between foreign traders who inhabited outside the wall and local traders. A small island was used as an enclave of western settlements, named *thirteen factories*.

The island was planned by British and divided into long rows. Each row was assigned to each European country for their warehouse, embassies and factories. Compared to Guangzhou, western grids with straight parallel lines was very efficient considering the land division among countries and functional considering the process from transporting, organizing, storing, producing and selling. (Skinner, 1977)

Therefore, Guangzhou had three foci separated, one political Chinese bureau city, one for buffering zone of trade and one enclave for international settlers. According to the imperial law, different inhabitants cannot communicate among each other. Chinese can work in

foreign enclave but the foreigners cannot enter Chinese city. It is a way to forbid the direct communication from newcomers, separate the ethnical groups. (Peterson, 2002)

Caption 6: Plan of Canton (Johnston, 1910)

This divided city is just a miniature on how China isolated itself from the world in 17th -19th century. Chinese emperors stopped the free trading, direct cultural contacts, put strict laws against foreign settlers and built cities into different enclaves. Because of this Sea Block, China lost opportunities to understand and take advantage of the scientific advancements from west, and finally got shocked and destroyed in Anglo-Sino war in 19th century. It has been the lessons for eastern Asians that 'to block the integration' is the bad option from bloody lessons learnt in history.

5. Chinatown in Milan

In this chapter, we come to the contemporary international *Frontier*, to examine the new Chinese immigrants in Milan, Italy. However, the Chinatown in Milan is different from those in other world. The tolerant attitude of Italian government and residents has helped to integrate the Chinese immigrants, and the Chinatown in Via Paolo Sarpi had become part of Milan attractive point.

5.1 The Integration of Chinese Immigrants and Renovation of Via Paolo Sarpi

Chinatown is a quarter of Zone 1 in Milan with the high concentration of Chinese communities and businesses. The Chinese presence began around 1920 with a massive immigration from the Zhejiang Province.

Despite its name, it is different from the traditional Chinatown known in the world. The peculiarity of the neighbourhood is the prevalence of Italian residents for the 95%, compared to over 500 Chinese wholesale businesses that serve peddlers from all over Italy, thus forming a particular area that, according to some, it would be wrong define 'Chinatown' but a Chinese Trading Street inside Italian residential quarter. (Farina, 1997)

At the end of 2008 the municipality made via Paolo Sarpi area ZTL (limited traffic zone), while in 2011 became a pedestrian street, linking from Porta Volta towards Corso Sempione. The Milan municipalities hope these interventions can favour the reduction of wholesale trade activities on street and make the neighbourhood toward effective multi-ethnicity, enhancing both the history and the traditions. (Comune di Milano, 2012)

Of course traditional events occur during Chinese New Year. In 2011, a pair of dragon parade from the main street of the neighbourhood (via Paolo Sarpi) processed from piazza Gramsci at the western end of the neighbourhood, preceded by dances and drum rollers, and attracts a crowd of onlookers including tourists, locals and other immigrants from all parts of Milan.

In recent years, the municipality put two points of Bikemi, the economic city bike rent project, in both ends of Via Paolo Sarpi, to incorporate the neighbourhood in the public service system of Milan. And for the reviews of the newest Milan tourist guides, Chinatown is growing a stronger interest linked above all to the possibility of a different kind of shopping. (Bikemi by Atm, 2008)

Caption 8: The new design of Via Paolo Sarpi, with Bikemi and Festival (Associazione Liberi Esercenti Sarpi, 2009)

In this case, the Chinese community in Milan had grown as a commercial point instead of an ethnical residential area. After 2000, cargos and noise created by Chinese wholesalers aroused the complaints from Italian residents. The initial official sanctions over Chinese traders finally aroused the big protest in 2007. The municipality changed the attitude from 2008, refurbished Via Paolo Sarpi, incorporated it into centric pedestrian system and linked it with Bikemi, etc.

6. Conclusion and Discussion

In the first part, the initial spatial and social exclusion in ancient kingdom based on clans was presented. It showed the inevitable reaction towards the aliens from the beginning of civilization. The second part about the Nordic-Chinese cities show how the nomads learnt from Chinese way on culture, politics and the spatial layout of cities. The two examples in third part are arbitrary divisions of city zone based on ethnical groups are listed. The Li Jiang case did not succeed due to the strong magnet of commercial focus while the Guangzhou

case presented the thorough ethnical, economical and political cut among different groups, which is a miniature representing the failing self-block police of later Chinese empire. The final part the contemporary Chinese immigrant case in Milan gives us a positive example on the mutual acceptance between Italian government, Italian residents and Chinese newcomers in the cultural acceptance and the commercial mutual benefits.

These cases together constructed a general process of integration of ethnical groups into locals: At first, the conflicts happened between locals and newcomers, normally city is designed to facilitate separation and politics is made to limit contact; the economical actions among ethnical groups gradually result into cultural acceptance and mutual communications and eventually the new politics, rules and the space would be changed in favour of better integration of locals and immigrants.

In this process, spatial planning plays as the physical interference as the reflection of the decision from rulers upon the social orders: at first, space is divided to control new immigrants, normally shaped a ghetto spontaneously or politically to avoid direct conflicts among groups. When economic happened between locals and new comers as well cultures mutually accepted, the physical boundaries would break up and facilitate the communication of different communities.

However, the above two spatial tools cannot be used at any time. It depends on the coherence between spatial planning and trends of social integrations; it is unwise to merge spaces of diverse ethnical groups when immigrants just arrived and in reverse it is unsuitable to forcefully separate the mutual accepted groups to stop their future communications. To simplify, spatial change should be in favour of the trends of social changes in order to enhance and stabilize the mutual effects of different ethnical groups.

The four parts can help to understand the process of social conflicts between different ethnical groups. The key of integration is first economy, second culture, third physical merging by grid to make stable mutual coexistence. In this process, the usage of grid is delicate, listening to and observing the will of people, and change the grid by political force. Enhance and facilitate the merging and coexistence. Economy only is not enough, culture only is also in vain.

Therefore, for the political makers, it is necessary to create cultural events to improve economy and culture understanding. For planners, is to ready for the plan or urban renovation project that can increase the accessibility and centrality of the immigrant zone. And give advice for politicians about when and how to start the change of grid. For locals and immigrants, wait and open mind to the new neighbours.

Multi-directional Flows of People In One City: The Case of Istanbul

Burcin YAZGI, ITU, Turkey

1. Introduction

Istanbul as the largest economic and cultural centre of Turkey is an urban lab for varying flows of people. Due to its cosmopolitan structure, the city of Istanbul is a hotspot for analyzing the spatial, social, cultural, economic and political challenges occurring in parallel to the multi-dimensional flows of people. As a city of conflicts and composites, the dynamics within the city make it possible to have different analytical approaches to the city. For a better understanding of the city it is important to be aware of the heterogeneous structure of varying flows of people and their choice of space.

The relation of people and place was a hot topic as it is today and several studies have been done to understand the interaction with various different aspects (Tuan, 1977; Lefebvre, 1991; Massey, 1994; Certeau, 2002; Cresswell, 2004; Simone, 2004). Their reflections into daily life, physically and politically, were also studied (Byrne, 2001; Crang, 2002; Amin and Thrift, 2002; Purcell, 2002; Simone, 2004).

While going through these concepts, there is a third dimension, space, to be considered and a fourth dimension that is the flows of people. Changing experiences and needs of people based on their different backgrounds, can be effective on differentiation of their preferences. The different perspectives of each individual will play a different role in the choice of place and act to move from one to another. The scale of the type of the flow can differ but in this study the flows investigated are the ones for relocation purposes.

There are many more things to understand by exploring the people living in particular places; in the way Thrift (1997) mentions places are the stages of intensity. There is more we can add with a proper approach, keeping in mind that, unique and not similar places with disparate residents adds to the richness of the city (Beyazli and Aydemir, 2008). These places become the spaces for different people from different educational, cultural and socio-economic backgrounds to show their own life practices. This is one of the motivations for the flows. Since Istanbul is a vast dynamic city, it is not difficult to find many locations to talk about the various flow characteristics. Even though it is easy to explore different categories of flow in Istanbul, in order to have a better evaluation of different aspects of flows of people in Istanbul, some spatial representatives/places are selected.

Therefore, two opposing neighborhoods are chosen as sample areas to discuss the changing physical, social, cultural, economic and political patterns in Istanbul. First, Tarlabasi, an old central neighborhood on the agenda of the city/country for several different reasons, and second, Bahcesehir, a new award winning satellite neighborhood.

The forms and properties of the flows of people in these sample areas will be discussed with a qualitative perspective. While trying to understand the dynamics with a comprehensive approach within the concepts of ghost space, lost space, cost space and host spaces of the city, the research is also trying to find the answer for the questions the following questions;

What are the real needs in a dynamic city? What is the interaction between these flows if any at all?

Through the exploration of these relations and the pattern of the flows in the city, it is recognizable that new spatial cultures are added to the city cycle everyday. As a result of these, the terms and the concepts are changing in the city agenda and the city is becoming more complicated everyday. With this study - sensing the city of Istanbul with respect to the contradictions, similarities and complexness of the flows of people - the main purpose to contribute to our understanding of 'the city' or what forms 'the city'.

The organization of the study is as follows. After talking about the background of the flows of people, based on the selected sample areas in Istanbul, the topic will be discussed in depth. These sections will be followed by concluding remarks.

2. Background of Flows

After the basic relation of people, space and place there is the fourth dimension which is flows, the main focus of this study. Istanbul is the largest city in Turkey with a population of 12,573,836 (TUIK, 2007), 2042 p/km population density, living in 39 districts; 14 with an average population of 300.000. As a result, it is not difficult to talk about the spaces between places and/or places between spaces in the city itself. Moreover, it is easy to find various examples of flows in every category (physical, economical, social and cultural), in every stage and scale. Since, places are the sites that have various identities and histories and the processes as in the alternative approach of Massey (1994), it is possible to talk about the potential flows which are based on these places.

2.1 *Tarlabasi through the years*

In Tarlabasi, the residential settlement goes back to the 1850s when the country was in the state of re-form. Implementation of capitalism was the popular topic on the agenda and with a target of economic development. Also cultural and social transformations were ongoing in the country in those days. Physical developments were in the form of new constructions (residential areas, infrastructure, transportation, etc.). Partial plans were the popular solution to the rapid changes. After 1910s until the establishment of Republic, the country was in the top-down modernization process. Population was increasing, new reforms were being applied and the quality of life was changing. Tarlabasi at that period was more trying to gain some aesthetic values. The environment in the neighborhood was good and healthy. Mostly mid-income non-muslim families were living in and the quality of life was high.

After the establishment of Turkish Republic, until the 1950s, the country was facing a transformation into a nation-state. Modernity was the popular term. There were physical changes in the cities as well. Cities were becoming the places of modernity and new perspectives in urban planning were being discussed. Parallel to these developments, it was possible to talk about the differentiation in hierarchy. Tarlabasi in this period was facing an ownership change started by the social structure change. While the non-muslim inhabitants were leaving the neighborhood, new migrants were moving in.

As a result of this in the early 1940s, Tarlabasi acted as a lost space. After this short term - since its habitants (minority groups) moved out and new groups started to live in this neighborhood - it was again in the role of a host space. The first users at that stage were the rural migrants after industrialization, followed by the Kurds escaping from the southeastern part of the country and nowadays gypsies, foreign immigrants (African and Afghan) and transsexuals are the residents of this place (Saybasili, 2007; Candan and Kolluoglu, 2008; Islam, 2009).

The period between 1950s and 1980s was a period that the populist tendencies were active in the state. In economical aspects the investment was mostly in service and industry sectors and in new housing sites. Job opportunities in the big cities were increasing and so too was the population. Migration was the big social issue since it was the main reason of the emergence of slums in big cities, especially in Istanbul. Tarlabasi was struggling with the main road project going through the neighborhood, which separated the area from the lively parts of the city like Istiklal Street and its surroundings. By 1960s the number of the unoccupied buildings were quite high in Tarlabasi area.

After 1980s the country was in the direction of the neo-liberalism. Globalization, post-modernism and transformation were the popular concepts of this era. The important term was 'big' or 'more'. Big organizations, large capital investment, mass housing projects, huge conflicts and big privileges; more illegal settlements, more gentrification processes, more reconstructions are some of the subjects of this period. In Tarlabasi every concept found its reflection in different ways during this period. The proposed road was constructed by demolishing some of the buildings belonging this area, furthering the disconnection of Beyoglu and Tarlabasi. The spatial, social and economic structures in the neighborhood collapsed, triggering a cycle of new collapses. In 1993 Tarlabasi was an 'urban conservation area'. By the 2000s the neighborhood was more than a stepping-stone because half of the inhabitants were home owners. After 2000s with the 'big and more' trend Tarlabasi was the target for the urban transformation projects. Outflows of ethnic groups and inflows of newcomers led to general unstableness and the negative public perception following these resulted in spatial discrimination.

2.2 Bahcesehir

Bahcesehir, established as a satellite city, has a history of only 20 years. The first registered population in this area was 12915 in the year 1997 (Unsal, 2007). The fear of earthquakes, added to the fear of living in the city centre after becoming a globalized and metropolitan city, accelerated the construction of these and similar types of residential settlements, especially in the peripheries of the city. Security being the main promotional element in these housing complexes caused them to be successful in attracting large groups of people. The Bahcesehir project won awards from the United Nations Habitat Conference II in 1996, Canada for new urbanism in 1997 and The American Institute of Architects in 2000.

As Aksoy and Robins mentioned (1997) "their modern space was a clean and orderly environment, quiet and traffic-free, and with the clean air and unpolluted environment that an almost rural environment (located twenty kilometers from the centre of the city) could promise. It could accommodate a purified modern lifestyle, in retreat from everything that Istanbul had become as a consequence of its actual modernization".

Following the modernization and neo-liberal trends, this new modern satellite town was forming an edge city. Nowadays the population is around 50.000 since some other small towns joined to this neighborhood. The demographic structure of Bahcesehir is quite different to Tarlabasi. The inoccupation rate is 1.1%, the rate of having more than one car in the household is 87%, the house ownership rate is 68% and the rate of the inhabitants who have a higher degree diploma is 45%.

After all information given above, it is possible to talk about the different processes that these two different neighborhoods experienced based on the state's agenda and the popular concepts and trends of the era which can be followed in Table 1.

Table 1 – Summary of the multi-dimensional structure

State Agenda	Politic	Physical	Social	Economic	Cultural
1850-1910	<i>Re-form</i>	<i>New constructions New housing areas</i>	<i>Formation of the classes</i>	<i>Target: development</i>	<i>Transformation of the traditions</i>
1910-1923	<i>Top-down modernization</i>	<i>Expansion</i>	<i>Change of quality of life</i>	<i>Improvement</i>	<i>Population growth-multi cultural</i>
1923-1950	<i>Transformation into a nation-state</i>	<i>Reshaping the cities</i>	<i>Migration of non-muslims</i>	<i>Small scale industries-Anatolian cities</i>	<i>Differentiation in hierarchy</i>
1950-1980	<i>Populist tendencies</i>	<i>Emergence of slums</i>	<i>Disintegration of rural class</i>	<i>Investments service-industry sector</i>	<i>Increasing population-hard to be part of city</i>
1980-2013	<i>Neo-liberal direction</i>	<i>Mass housing projects Illegal settlements</i>	<i>Gentrification Big privileges</i>	<i>From industry to information society Large capital investments</i>	<i>Conflicts</i>
Tarlabasi Agenda	Trends-concepts	Physical	Social	Economic	Cultural
1850-1910	<i>Modernism</i>	<i>Good environment</i>	<i>High quality of life</i>	<i>Mid-income families</i>	<i>Non-muslims</i>
1910-1923	<i>Aesthetic Values</i>				
1923-1950	<i>Transformation</i>	<i>Suggestions for the new road</i>	<i>Social structure change</i>	<i>New property tax</i>	<i>Ownership change</i>
1950-1980	<i>Restoration-renovation</i>	<i>Unoccupied buildings</i>	<i>Outflows-inflows</i>	<i>New job opportunities</i>	<i>Rural migrants</i>
1980-2013	<i>Collapse</i>	<i>Spatially collapse</i>	<i>Social collapse</i>	<i>Marginal sector</i>	<i>Cultural collapse</i>
Bahcesehir Agenda	Trends-concepts	Physical	Social	Economic	Cultural
1980-2013	<i>Satellite city - Comfort</i>	<i>New housing complexes</i>	<i>Integration in the borders</i>	<i>Mid-high income</i>	<i>Urban migrants</i>

3. Flows of People in Istanbul: Discussion

Istanbul, as the largest economic and cultural centre of Turkey, is a city of dualities, refractions and polarizations (Keyder, 1999). The history and the users of the city and the preferences of the users change day by day. In addition, important locational points of the city change. New trends, new policies, new technological developments and followed by new types of flows add to the urban cycle. Economical behaviors and socio-cultural values change and as a result of all these, the terms taking place in the urban system change.

We started to talk about the place, space, time, people, flow, non-place, placeless, sense of place, urban space, extra-urban space, host space, ghost space, lost space. The relations, connections, interactions between all these terms gain importance.

With the background knowledge of the explored neighborhoods, this section of the study will focus on the flows happening in these areas (Figure 1). Tarlabasi is a transformed place. In the early settlement years it was one of the desirable locations for people. It was a satisfying host space for the people who are coming from other parts of the city as well as the other countries. After some time, the neighborhood turned into a lost space with the high number of unoccupied buildings and outflows of the non-muslim groups. In these transition years it again gained the host space title but this time from the inflows of people who were not familiar with the city life who prefer to live for a short while, thinking that they would be able to move somewhere better in the city in the later periods as they get used to the system. In the end, Tarlabasi turned into a “compulsory space for those who are excluded from the society” (Saybasili, 2007).

Although Tarlabasi is in a central location it is more like an isolated urban space compared to Bahcesehir, which is an ‘out of city’ settlement. Some projects done in mid 20th century, constructing a new road by destroying the buildings in this area, caused Tarlabasi to be physically separated from the rest of the city. This was not the only obstacle, after this physical edge/border, people/non-residents of this area imputed a socio-economic and socio-cultural border between Tarlabasi and its neighborhood. When you go beyond these borders, what you see will be no more than people trying to “squeeze their bodies into a tiny space in the city, a certain location, a certain geography in the city” (Saybasili, 2007).

In the Tarlabasi area, it is the case that people settle here coming from the other parts of the city, other cities and countries and after some time, these flows can turn into outflows. The other interesting side of these flows are those horizontal ones within the same neighborhood (Figure 1).

While Tarlabasi is struggling with these issues, Bahcesehir is being the host space in an optional way for those who want to form their own new society. In other words, while people living in the Tarlabasi are fighting against not being excluded, the people in Bahcesehir are trying to exclude ‘the others’ in these high cost places.

The situation of course, is a little bit different in Bahcesehir where there are not so many limiting factors. The only type of need referred to this situation can be the need for some differentiation/change (Ozgur, 2006). It is not possible to speak about the infrastructural problems or to notice water and electricity cuts in this rich urban space. The most important problem in Bahcesehir, which has a different built environment, family composition and urban pattern, will be the distance between car park and the apartment. Despite this, the flow types are limited. Most of the inhabitants are coming from other parts of the city. The inhabitants coming from the other cities and countries are relatively less compared to Tarlabasi.

Even though Bahcesehir does not currently have serious problems, the things recognized at first will be different than the things perceived later on. It can easily be described as “non-place; that place is lacking history or do not have distinguishable markers of identity and perhaps most importantly place that can be replicated endlessly in different spaces” (Candan and Kolluoglu, 2008). This can easily make Bahcesehir turn into a ghost space as the same ending Tarlabasi faces.

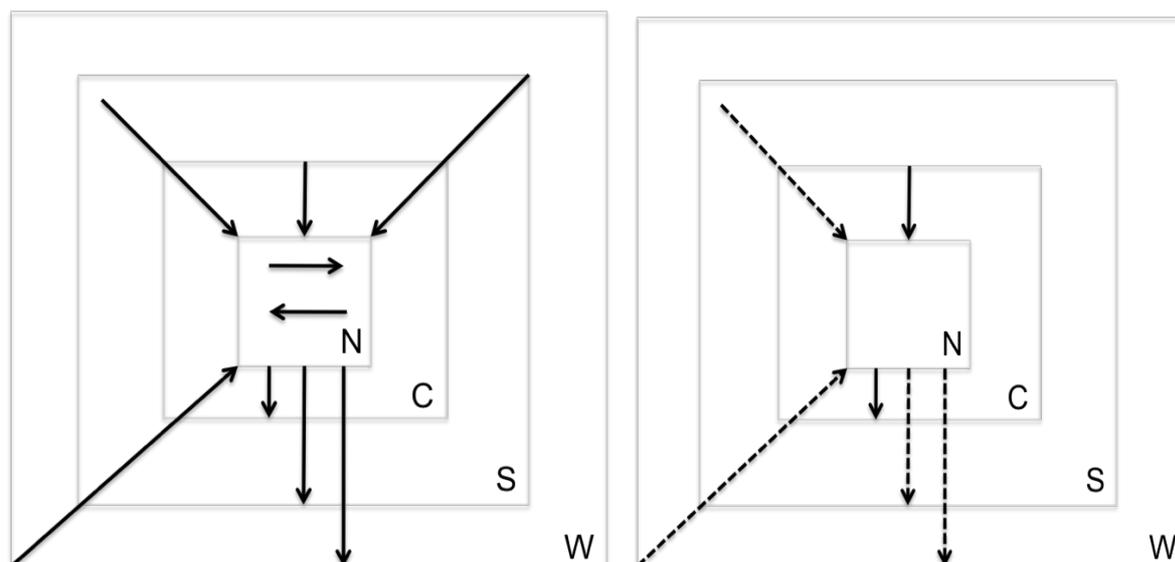

Figure 1 – Multi-directional flows of people in Tarlabasi and Bahcesehir
(N-neighborhood C-city S-state W-world)

According to Byrne (2001) “urban spaces are evolving and changing complex systems”. This cycle will never stop and will go on with all the new flows added to urban system not as an outcome of the city itself but also of the world as well. As the scale or type of the flows change, the cycle of the multi-directional flow will gain a different dimension in the city. The content of the flow which is based on the content of the place will turn into a new spatial concept in the experienced urban life.

The lesson here is that separating into two categories as good or bad, acceptable or unacceptable, perfect or defective and even tolerable or intolerable is not the answer or the solution for the city’s needs.

4. Conclusion

By taking two different examples of urban spaces of Istanbul into account, we can easily agree on the multidirectional flows of people based on the need of relocation and the varying procedures during the movements.

With the city’s changing complicated structure, a new and rich urban space and an old and poor one, which seem to have remarkable differences can actually be considered not different than each other. In the city centre or in the outskirts of the city, in the urban or extra-urban space, they are trying to cover their necessities, permanently or temporarily. The question to be asked is; is it what the city needs?

Each place has its own characteristics and dynamics based on the people, place and flow interactions and we should be able to use the advantages of this mosaic pattern of the urban space. As Cresswell (2004) stated “writing about and researching place involves a multi-faceted understanding of the coming together of physical world (both natural and cultural), the processes of meaning production and the practices of power that mark relations between social groups”.

Historical and social dynamics alter the place-time-flow relations. If we try to understand today’s cities, which include the complexities and contradictions, with this aspect we can easily comprehend the conflictions forming the monolithic. If we can manage to use the

combination of these differentiations then we can discuss about the different level of spaces and flows in the same city, acting as part of the city dynamism.

According to Amin and Thrift (2002) city is “an amalgam of often disjointed processes and social heterogeneity, a place of near and far connections, a concatenation of rhythms; always edging in new directions”. A more heterogeneous approach to city would take into account the multiple perspectives that make up ‘the city’. A singular approach to the city fails to account for urban complexity. In Hansen and Vekaaik (2009) perspective, “The urban is also a way of being in the world and must be understood as a dense and complex cultural repertoire of imagination, fear and desire”.

Following Massey’s (1994) argument, places are not static and they have their own processes. According to Byrne (2001) “urban spaces are evolving and changing complex systems”. This cycle never will stop and will go on with all the new flows added to urban system not as an outcome of the city itself but also of the world as well.

With new flows, it is not easy to say what is right, what is good and what the necessity is. When you try to understand the condition of these different urban spaces including different groups of people existing in the same city border at the same time, you can only have new question marks in your mind. Which one is for the real needs, which is the needed one, which of them is the valid solution? As we all agree, getting an answer for these questions will not be easy as place, space and people are all connected and they affect each other in the form of flows; also the answers we get will be subjective and relative as the type of flow change.

From Rate Growth to Quality Improvement: Promoting Policy System for New-Urbanization in China

(From Rate Growth to Quality Improvement: Promoting Policy System for New-Urbanization in China)

Cheng YU, Huazhong University of Science and Technology, Wuhan, China

Jinfu CHEN, Huazhong University of Science and Technology, Wuhan, China

Xi YANG, HSBC China Beijing Branch, Beijing, China

1. Introduction

After reform and opening-up in 1978, China's urbanization developed rapidly. Although the rate of urbanization varies in different regions, the average rate reached 51.3% (2011, National Development and Reform Commission). After the financial crisis in 2008, Chinese Government recognized that urbanization could drive domestic demand (Fang, 2010), and promote China's economy development status. Therefore the Chinese Government focused on urbanization development increasingly and widely.

However, fast development of society and economy, during the past 30 years, forced the urbanization of China to face depletion of environmental resources, unequal income distribution, shortage of welfare and other issues. Meanwhile, both Central China's emerging strategy and the strategy of Resource-conserving and Environment-friendly Society lead China's urbanization to a new development direction. New urbanization, with a lot of discussions (Qiu, 2010; Cao, 2001; Wen, 2000; Zhou, 2006; Yang, 2012; Song, 2006; Zhang, 2009), simply is more concerned about the quality of urbanization, including environmental quality, living standards of immigrants, as well as the level of industrial development.

Different with developed countries, urbanization in China is promoted by local government (Qiu, 2010). In developed countries, process of urbanization is bottom-up development and synchronized with the industrialization. However, in China, policies are the most important influencing factors on urbanization. Therefore, related policy reforms could help to resolve the contradictions in the process of urbanization development. Nevertheless, new urbanization might promote reform of urban comprehensive competitiveness and coordination of regional development models, so as to realize the harmonious development of social economy and resources environment.

2. Literature Review

2.1 Research on China's Urbanization

In China, urbanization has a large number of research foundations. On China's authoritative academic research sites, CNKI, keyword 'urbanization' could be found 79,128 related literatures, and these literatures can be roughly divided into two categories.

One is the research on emerging issues of urbanization. Cao (2001) argues that reform of traditional Chinese household registration management system has to be conducted due to it has already constrained the economic and social development severely. Wen (2000) believes that the highly capital intensive industrial, urban and rural areas "isolation" policy, as well as the single national investment of city-building approach has hampered China's urban development. Zhou (2006) indicated that Chinese scientific statistical standards brought out the recent abnormal growth of urbanization. Moreover, he also believed that China's

urbanization should avoid "excessive urbanization" the development issues. Yang (2012) indicated that ecological and environmental problems may become a major bottleneck to restrict the development of China's economy, and it will also become a turning point during fast development of urbanization. Song (2006) analyses the relationship between urbanization and cultivated land in China, he believes that China's urbanization led to sharp decline in the number of cultivated land. In addition, he considered incorrect relationship between urbanization and cultivated land would trigger catastrophic consequences.

Another type of literature is a study on how to promote the development of urbanization. Zhang (2009) analyzed the relationship between demographic structure and socio-economic development, and demonstrated China's "unlimited supplies of rural surplus labor" is undergoing transformation. Thus urbanization rate level of China's overall growth will be slowed, and this moderation period provided the time opportunities for urbanization quality improvement. Sun (2005) pointed out that the different nature of urbanization between China and Western countries. Furthermore, China's urbanization must be combined with its own historical development and present situation to draw up an appropriate policy. Gu (2009) analyzes characteristics of urbanization in China and noted that the key of China's urbanization is the resettlement of migrants. Moreover, governments should protect the requirements migrants, thus allowing it to stabilize at urban living and improve lifestyle changes.

2.2 Research on New-Urbanization

In fact, new urbanization is the improvement to the old notion and the content still contains the land, population, industry and other aspects of transformation from rural to urban. Hu (2005) thought that it should be consistent with China's current national conditions, but also distinct from the traditional town concept and the crucial point is to improve the level and quality of development of urbanization in China. Peng (2010) explained in the paper that the new urbanization should contain four ideas: intensive and ecological mode, multi-functions of cities and towns, rational urban system, integration of urban and rural development. Qiu (2010) shared the view that, in China and Western countries, there is a clear difference in urbanization development. Moreover, new urbanization is various kind of issues on energy, labour, mobility, historical and cultural aspects. Fang (2010) shows that the urbanization Rate, in China's urbanization, should be synchronized with the quality to enhance the whole development process. Wu (2009) indicated that lack of market economy affected the healthy and orderly development of China's new urbanization, so the Government will need to participate effectively in the development of urbanization in China with limited intervention. Mei (2011), after analysing China's pension insurance and health insurance systems, considered that unify urban and rural social safeguard standards and strengthening social security for rural migrants could promote the transition from traditional urbanization to new notion. Qiu (2012) proved that the relationship is close between China's economic-social development and urbanization, and system security is essential to new concept.

From the related literature, consensus could be found in several ways: 1) urbanization in China had to face issues such as environment, resources, social equity; 2) urbanization in China and other countries have different realities and various development methods; 3) policies on urbanization development impact is huge because of China's highly centralized political system. However, previous studies only focused on an individual policy instead of analyzing of comprehensive policies for China's urbanization.

3. Methodology

3.1 Case Study Selection

In this paper, the study case will analyze the current China's urbanization situation based on a representative sample of Hubei province. Firstly, in China, Hubei province has the right to

test policy reform, because it is the central region to implement "rising of central China" and "construction of two-oriented society" strategy. Therefore, in promoting the development of urbanization, Hubei province has the certain policy advantages compared with other provinces in China. Secondly, geographically, the level of urbanization in Hubei Province is average level, as Hubei is located in central China and its levels of economic development is between China's developed areas in Southeast and the backward areas in Northwest. Finally, in Hubei Province's urbanization process, there are a large number of semi-urban people. Thoroughly, these people work in non-agricultural trades in cities and they are not as a citizen into the urban life of the city, because these people still own farmland in their hometown as the China's population management system. Overall, this phenomenon is a typical feature of current urbanization in China, and it is also the key to understand China's current urbanization.

3.2 Data Survey

In the preparation of studies, we examined the 13 cities in Hubei Province, 28 counties and 57 towns. * These samples cover the whole levels of large, medium and small cities in Hubei province.

During investigation in these cities, relevant statistics have been collected, including the number of the population, economic development data, cultivated land, infrastructure investment, as well as the number of migrant workers, and so on. This information could be helpful to understand the different level and a different location on the carrying capacity of the urbanization of the city and the ability to attract the migrants from rural to city area.

3.3 Interviews and Questionnaire Survey

If the rationality associated with urbanization policies and difficulties in policy implementation were to be learned, relevant department director would have to be interviewed, including urban construction sector, population management, industry sector, and so on. On the other hand, questionnaires in rural areas could be useful to understand the real situation of agricultural production and farmers' real ideas of migrating to cities.

4. Findings-Main Problems in Urbanization

In Hubei Province's history, level of urbanization has grown rapidly through a series of policies and development strategies. Through interviews and statistical data, there are a series of problems of urbanization in Hubei province. More specifically, key policy factors, raising these issues, are including population management policy, land management policy, and administrative policy dimensions.

4.1 Population Administration Policy

In 2003, Hubei Province has promulgated the views on the deepening the reform of the household registration management system to provide that "in province-wide abolition of agricultural household register, the nature of non-agricultural household register,referred to as ' residents in Hubei household register 'collectively. Public security organs could manage household and migration registration uniformly in accordance with the relevant provisions ", " basic requirements for household register access is lawful permanent residence and relatively stable sources of professional or legal life ", " for farmers entering the town to settled in, employment, social security, housing, schooling, joined the army and citizens alike. " However, due to the province's reform progress is uneven and

relevant economic-related policy reforms does not fit, the household registration system in Hubei province have been unable to efficiently boost.

Lack of appropriate social security system is a major factor to result in urbanization reform cannot be made effectively. During the process of implementation, lack of financial support has delayed the weakening process of dual population management reform. In fact, reform of household registration system has to brought out public service requirements increase. However, it is difficult to provide all migrant farmers a full range of social security based on the financial situation of most towns in Hubei Province. Nevertheless, in a certain sense, equalization agricultural land could be the substitution for social security operating system missing. Therefore, the capability of providing good public services and protection to attract the farmer migrants would affect the rural population management system reform achievement, not the problem of avoiding releasing the household registration system in Hubei province. Specifically, industrial underdevelopment, lack of industrial development ability of small towns, a large number of unemployment and limited tax revenue become the substantial reasons of reform. Moreover, The current financial and taxation systems, no provision of financial resources for local governments, exist crucial problems on perfecting the social security system and providing the necessary financial support.

4.2 Land Management Policy

One aspect, the lack of rural-land transaction system restricted the development of agricultural industrialization and the real transformation from rural to urban residents. Due to land property rights body is not clear, farmers' land contract right is not stable. Furthermore, existing circulation of farmland property right exists only in small sizes, low degree of private deals between farmers or deals with villagers' committee assistance, but these deals are absent of legal safeguards. Therefore, farmers transfer out of the rural areas and agricultural production only by abandoning farming. However, the difficult condition, inflexible circulation of rural land, restricted the transfer of rural labor force and led to farmers engaged in non-agricultural industries were unable to cut the links with the rural land (Zeng, and Li, 2009).

On the other hand, the urban-rural dual system of land use prohibited rural collective land to participate in urban construction land-building and this system limits the efficiency of intensive land use. In case of unclear property rights, rural collective construction land cannot be allocated equally in the market mechanism and necessary space set in the process of urbanization could not be completed neither. In particular border of urban-rural areas, people maintains a right of the rural land, but most of them work in non-agricultural trade. However, within the framework of the existing land system, more agricultural land become non-agricultural land by expropriation or requisitioning and this behavior is inequality of urban and rural development rights.

4.3 Public Administration System

The management system, municipal government administering county-level Governments, limits the development of County economy. This system began in 1980 and its purposes are to solve the drawbacks of the City-State, urban-rural divide, and share part of the provincial government and departments. Also, this system could help to reduce provincial organizations in dealing with urban problems and contradictions in the pressures and responsibilities. Studies have proved that some prefecture-level cities really play a "leadership, radiation" role to narrow the urban-rural gap gradually, but some cities still are far from any achievements (Pang Mingli, 2007). Excessive government level might have the following disadvantages: (1) Information between different level of government agencies is difficult to effectively communicate in a timely manner.(2) Power easily transferred in wrong way by separation mode and local ownership could not be guaranteed effectively. (3) Multiple levels of government organizational structure do not guarantee grass-roots power and treatment

sector. Moreover, the structure is not conducive to the mobilization of city (County) and the enthusiasm of the local governments, and it is leading to reduce effectiveness in government management.

5. Reform of Hubei's New-Urbanization Policy System

5.1 Unified Land Market Management System in Urban and Rural Areas

Land, as a factor of production, clear property rights could help farmers to benefit from agricultural land and more chance to obtain capital. The circulation of Land is the transfer of land contract in fact. Moreover, governments should expeditiously implement transfer measures of land contractual operation to ensure that farmers realize scale operation. In accordance with the law under the principle and voluntary, the Government should allow and encourage farmers to transfer the land by contract, subcontract, lease, Exchange, transfer and joint-stock methods. At the same time, relevant departments should be explored on mortgage schemes of management right about cultivated land and forestlands, to enhance the farmers' capacities in the area of financing and to raise the level of industrialization of agricultural production.

Central Government explicitly provide that "establishing and perfecting land contractual operation right transfer market", "towards the establishment of construction land in urban and rural unification market, made of rural collective construction land according to the law, in accordance with the planning and State-owned land on the premise of equal rights." "Unification of city and countryside construction land market can play a fundamental role on land resource allocation and give an equal national treatment for farmers and urban residents. Therefore, a variety of approaches for construction land must be formed clearly and quickly to build an open, fair, standardized land transfer-trading platform.

5.2 Incentive Financial and Taxation System

In 1994, the central tax distribution reform aimed at resolving the central fiscal crisis and expanding the central fiscal control. However, this change only clarifies the financial relationship between Central and provincial government, and also causes the local fiscal revenue up layer upon layer and downward transfer specific matters progressively. In detail, local governments assume the functions of the expansion of income sources and the lack of spending power. This current situation is easy to break the grass-roots local government fiscal balance, and caused local governments (counties and townships in particular) fiscal crisis. In the identified land framework of the current Constitution, local government uses the "management" way to get huge amount of land transfer income. Moreover, this behavior provides local government opens up a large financial source and fully financed by the local governments themselves. Thus the grass-root Governments would collect cultivated agricultural land in large scale, as well as increasing the cost of city life.

Therefore, reform of the current tax system needs to adjust the structure of distribution share, and increase the share of taxes for grass-roots Governments. Furthermore, the government should increase their financial autonomy and make land operational income to include in the financial budget.

First, on a regional level, tax reforms needed national efforts to increase financial support to Hubei province. The strategy, Resource-conserving and Environment-friendly Society, must be implemented with high standards. Furthermore, Hubei could not sacrifice the ecological environment for the economic growth, because ecological environment could contribute to the sustainable development of the region and the country as a whole. Therefore, central government should support Hubei Province by more financial resource than other provinces and accelerate the process of the new urbanization.

Secondly, related departments should determine the object of transfer-funds and pay more attention on the areas of high demands on environmental protection especially. In Hubei, high requirements for ecological environment limit the economic development in many cities, including mainly Western, North-Eastern and South-Eastern Mountains. Thus it is necessary that more financial support for these areas to ensure the local people's living standards and safeguard social justice.

Finally, the Central Government pointed clearly that steady process of urbanization needs to improve urban comprehensive carrying capacity to play a driving role of urban versus rural. However, in Hubei Province, most of the town's financial troubles are around public service centers in rural areas. Therefore, higher-level Government must step up financial support to the small town and let the transfer payment system be the main way to guarantee the provision of basic public services in cities and towns.

5.3 Progressive Residential Permit System

Many other Chinese provinces are gradually being developing residence permits as a measure of population management system and making the original household registration system has improved. Residential permit system, in Guangdong, Shanghai and other provinces, is not only buying threshold or having a high-tech job to have the living permit and the system should set residence social security insurance period as fundamental concerns.

Current Hubei province household registration reform should focus on the following:(1) people can apply for a residence permit with legal work, shelter, steady income and living condition.(2)people can have the basic social insurance rights(compulsory education and free primary health care) like a local citizens, if they paid tax and had no criminal record.(3)people can have social assistance eligibility, such as minimum living wage and affordable housing, only after they paid a certain amount of social insurance and taxes. (4)In large cities, like Wuhan, some special industry employment qualifications can be released with gradual conditions.

5.4 Regional Cooperation of Public Management System

On the basis of 'province governing county' administrative structures and strategic space arrangements, Hubei province should explore more ways to build a system of the regional joint governance. The particular governance aims to achieve the greatest degree of resource mobilization through multiple group's dialogue, coordination and cooperation. In addition, effective governance could complement shortages of market exchange and above-down government control, and ultimately achieve 'win-win' comprehensive social governance purpose. Finally, the governance would play a crucial role in promoting regional cooperation, enhancing regional competitiveness, accelerating democracy process and promoting administrative reform.

Hubei province could divide different economic area into a number of joint governance areas by industrial clarification, natural condition and target location. Then, ' Joint Commission', with all counties and cities in the same right platform, could discuss various subjects of coordinated development within the settlement area. Moreover, this commission would solve industrial isomorphism and low-level repeated construction effectively. At the same time, it could not avoid that regional blockades, market segmentation and unhealthy competition issues could come out from their own benefits.

6. Conclusions

In china, urbanization is a product from economic-social development and reform of urbanization could provide a direction for growth of urbanization's quantity and improvement

of urbanization's quality. To conclude, new urbanization reform should include four important ideas--land use, household registration administration management and taxation system. Firstly, land use management and social security system should be equal between urban and rural areas. Moreover, equal land use system need to establish ' fairness' in land use and ideas of land circulation, also need to treat property rights of rural land evenly. Nevertheless, social security system could be implemented to achieve social insurance evenness. Secondly, reform of population management system might link up with perfection of social security system to restore the essential role of household registration administrative measures. Finally, reasonable decentralization and reduction of management layers could improve the management efficiency in new urbanization reformation. Reference

Endnotes

* According to *China Urban and Rural Planning Law*, administrative region consists of four levels--Province, City, County, and Town.

Estimation of the Water Resource Capacity of Chinese Cities and Megalopolises in the Future Urbanization

(Estimation of the Water Resource Capacity of Chinese Cities and Megalopolises)

Danming ZHANG*, School of Architecture, Tsinghua University, China
 Anrong DANG[§], School of Architecture, Tsinghua University, China

1. Introduction

With 30 years' fast and stable development, China has become the second largest economy, meanwhile, the national water consumption has increased 1.37 times from 1980 to 2010 (Liang,1998; NBSC,2011), which undermines the sustainability of China's current and future development. As one of the primary influential factor, the accelerated urbanization has contributed much to the water consumption increase of China in the past 30 years (Liu,2012; Shen, Liu,2008; JIANG,2009). In 2011, the urbanization ratio of China has firstly reached 51.3%, however, predicted by the United Nations (2012), the accelerating phase of Chinese future urbanization will generally finish around 2035-2045, which means urbanization ratio reaches 70%(Figure 1). Consequently, in the future, the on-going urbanization process will continue to influence the structure and gross amount of water demand in Chinese urban area (Liu,2012; Shen, Liu,2008).

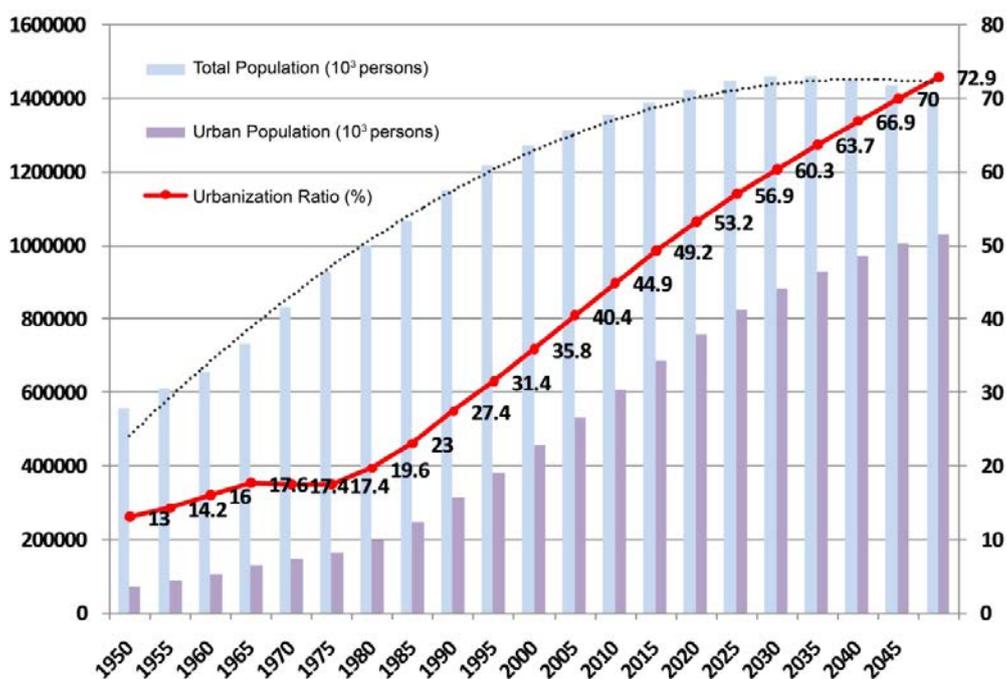

Figure 1: Historical and predicted urban and the total population of China(1950-2050)
 (Drawing by the data of UN World Urbanization Prospects2007)

As water scarcity and regional maldistribution is always the dominant constraint for Chinese development (Jiang,2009; Shen,2008), facing the future trend in urbanization, Chinese current issues related to water resource will be much severer, such as the extra investment

on water conservancy facilities, the contradiction among multiple megalopolises in water resource allocation, and the further over-exploitation of groundwater in some urban area etc. Accordingly, water resource is one of the central factors to consider for the urbanization and the accompanied population redistribution process in the future. Specifically, the 656 county-level (and above this level) cities will be the foremost locations to settle the emigrated rural population and transmigrated urban citizens (Figure 2).

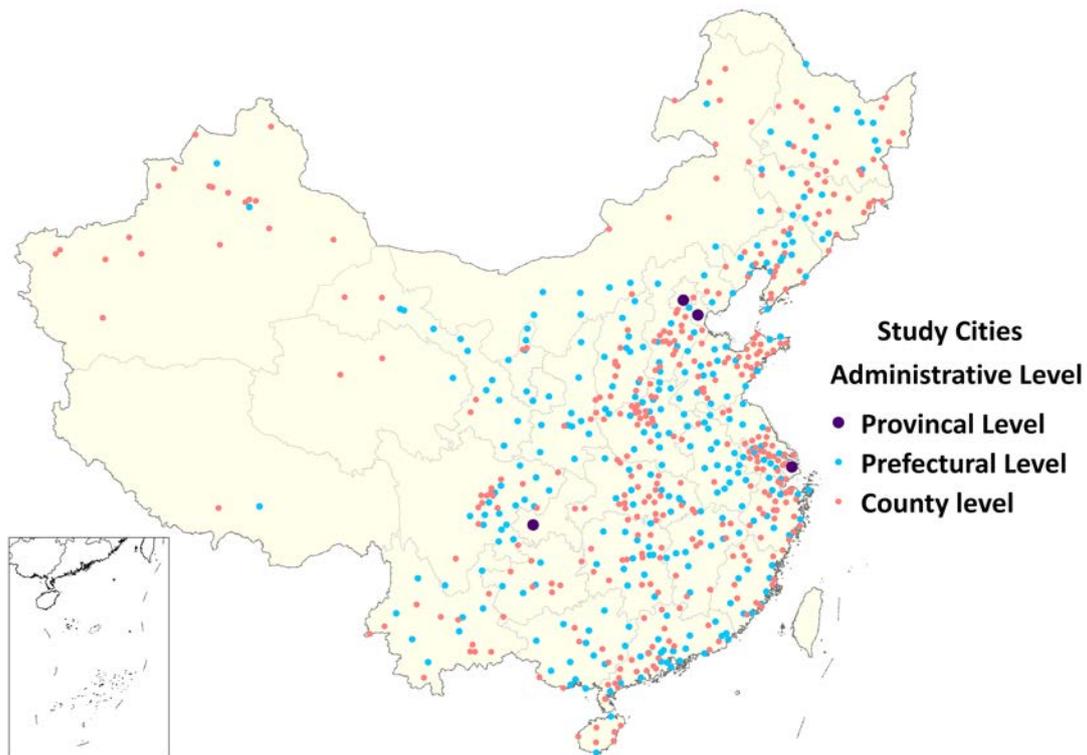

Figure 2: Spatial distribution of the 656 county-level (and above this level) cities of China

To facilitate the potential population migration process and to benefit its social and economic development in the long run, China has issued several national spatial strategic planning, including the “National Urban System Planning(2006-2020)”, and the “Major Function Oriented Zoning”(Figure 3), which are sponsored and implemented by the Ministry of the Housing and Urban-Rural Development(MOHURD) and National Development and Reform Commission(DNRC) of China respectively.

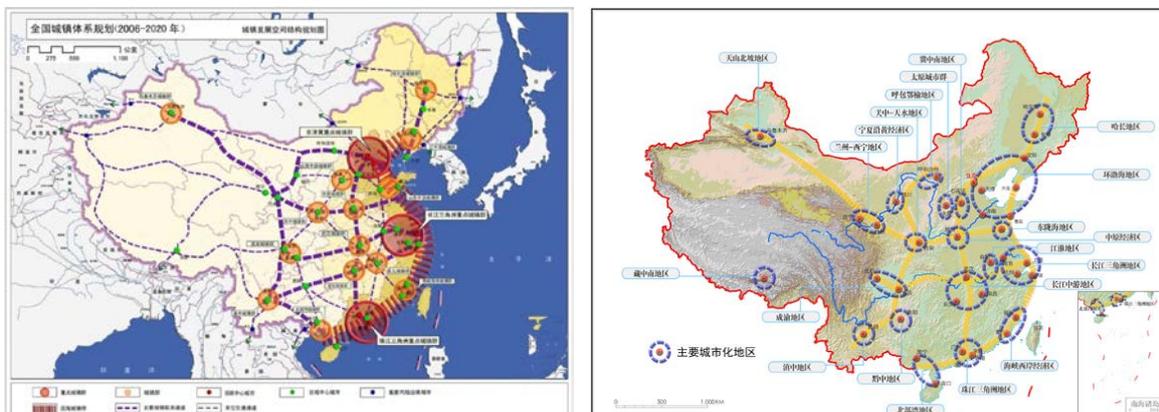

Figure 3: Important national spatial strategic plans of China

In these national spatial strategic planning, there are 22 megalopolises or mega-regions that are proposed and encouraged to accommodate the newly emigrate rural population with both central governmental fiscal resources and supportive policies (Figure 4). The candidacy of these 22 megalopolises is generally based on their existing advantages and future potential in industrial accumulation and economic development, while the plausible environmental constrains or impacts, especially in water aspect, have not been cautiously discussed or fully emphasized.

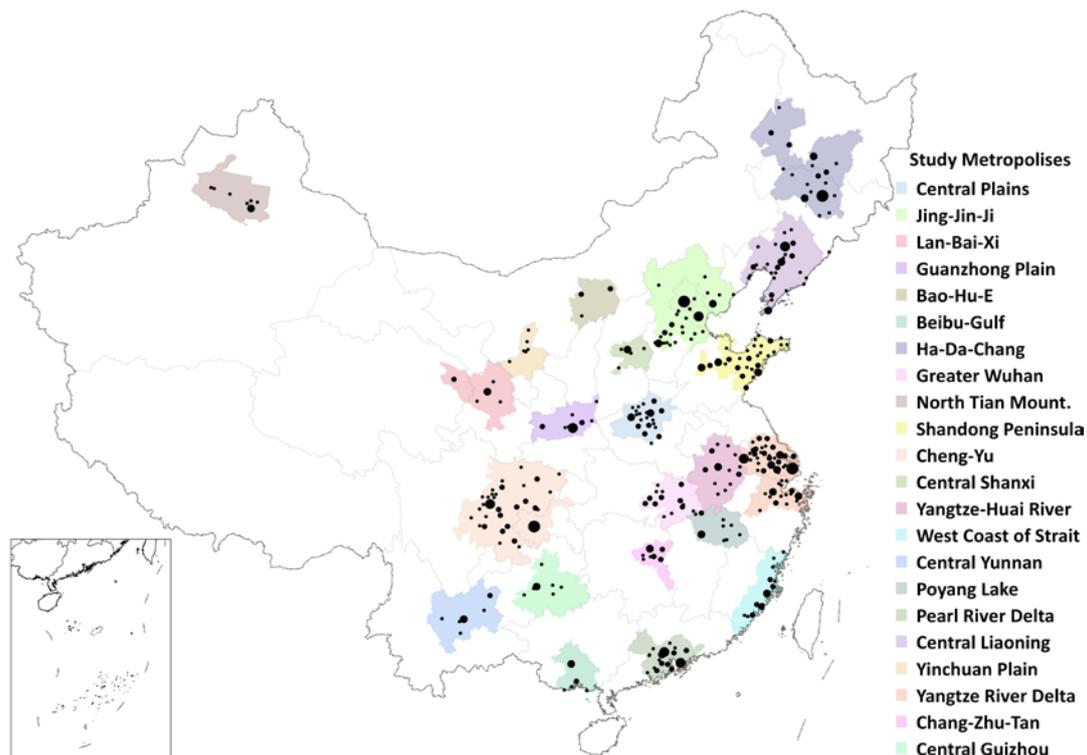

Figure 4: Spatial distribution of the 22 proposed megalopolises for Chinese future Urbanization

At present, there are two thirds of Chinese cities are suffering from water insufficiency, and about 100 cities are extremely lacking of water supply. During the future urbanization process, the enhancing demographic and economic density in some urban area will further boost the water consumption of Chinese urban area (Shen,2008), and this process will aggravate the shortage condition in water resource of most cities as well. Nevertheless, most existing studies have basically discussed related issues on the national or regional scale from the perspectives of the water resource sector, but little research has focused on the scale of urban level and the potential demand and influence of Chinese future urban development to water resource management.

Accordingly, This paper intends to estimate the water resource capacity of Chinese cities and to suggest the potential strategies for those cities in responding to the challenges during Chinese future urbanization. Based on the water-related statistical data from *China City Statistic Yearbook* and public statistical reports of the study cities, this paper intends to utilize the approaches of spatial analysis and spatial statistics to estimate the water resource capacity of the 656 Chinese county-level (and above this level) cities under the stress of future urbanization process, which will help to identify and indicate the potential and feasibility of Chinese cities to accommodate the newly emigrated population from the rural area and the suitability to further accumulate or develop related industries. In addition, this research will also estimate the water carrying capacity of the 22 megalopolises as a whole in the future population accumulation process.

The remainder of this paper is organized as follows. In the next chapter, we introduce the methodology. Respectively, Section 3 and 4 discuss water resource background and water consumption condition of the study cities. Section 5 calculates water resource potential or population overload ratio of the study cities, while Section 6 summarizes the water resource carrying capacity for population of the study megalopolises. The paper ends with a brief conclusion of our study and practical suggestions for decision makers.

2. Methodology

As mentioned above, the goal of this work is to analyze current water resource conditions of the study cities and offer suggestions for the population accumulation of these cities and the corresponding megalopolises in facing future urbanization. When referring to water resource condition, it is always related to water resource abundance, population density and water consumption structure and efficiency, which interactively determine the potential, equilibrium and dynamics of water resource endowment and water consumption. Thus, analysis and discussion about the dynamic of population density, structure and efficiency in water consumption of the study cities will be the prerequisite to raise the suggestions for the future development of the study cities and the 22 supported megalopolises. In consequence, issues about water resource background, water consumption conditions, water resource potential and overload ratio, carrying capacity etc. of the study cities will be analyzed through the steps below (Figure 5).

Firstly, the approaches of K-means cluster analysis will be employed to classify the study cities into different categories based on the representative factors elected in each analysis. Further, based on the data of water resource amount, current population, water consumption amount of the study cities, the Method of Comprehensive Water Use per Capita, Water Carrying Capacity Index(WCCI), and other indicators are utilized to evaluate the potential or the overload ratio of the study cities and to estimate the water carrying capacity for population of the study Megalopolises. Finally, suggestions will be concluded based on the above analysis.

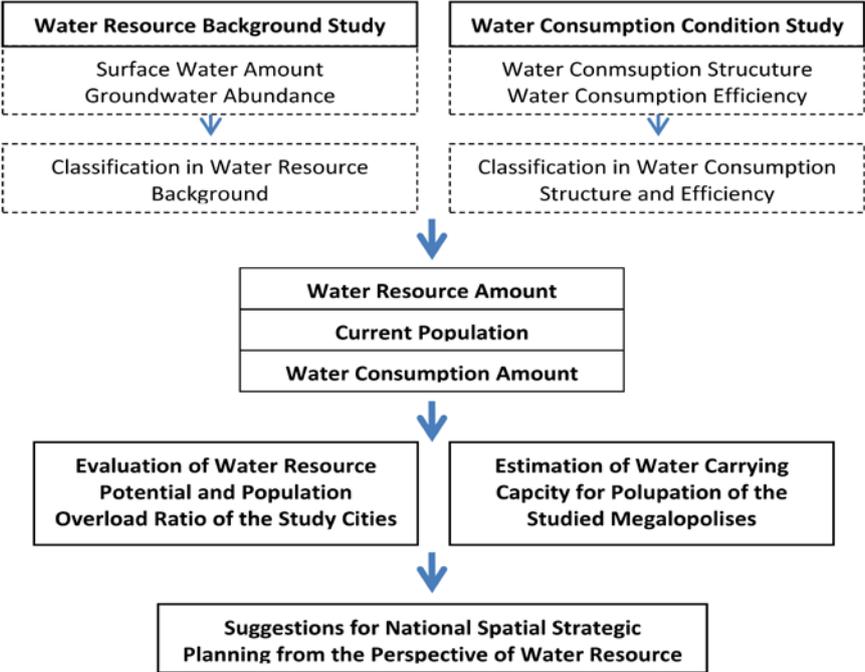

Figure 5: Framework and main procedures of this study

3. Water Resource Background Study of the Study Cities

As the broad land territory and diverse geographic characteristics of China, the natural endowments in water resource among the study cities are different. In this research, we intend to categorize the patterns of different cities in water resource richness through analyzing two factors, and that is the average annual precipitation and the abundance level in groundwater resource.

3.1 Average Annual Precipitation of the Study Cities

Precipitation is a sufficient factor to indicate the water resource background of a region. In this paper, annual average precipitation dataset in the national database of “*Data Sharing Network of Earth System Science, DSNESS*” is utilized to evaluate the surface water richness of the study cities. This dataset is processed and interpolated based on precipitation observational time-series data(1950-1996) and from almost 1915 rainfall stations distributed nationally, by the Institute of Agricultural Resources and Regional Planning, CAAS.

Based on the calculation with the spatial dataset referred above, the surface water conditions of the study cities can be summarized as follows. There are 33 cities with a rainfall depth below 200mm and 22 cities with the rainfall between 200-400mm, which are subordinated in water resource richness. Secondly, there are 242 cities are located in the region with a moderate rainfall condition between 400-800mm. Besides, there are 143 cities with a rainfall depth between 800-1200mm, and the precipitation of the left 216 cities are over 1200mm.

Through the above categorizing analysis, except for those cities located in the western arid region which has relatively worse surface water condition, most of the study cities are close or over 800mm. Accordingly, from the perspective of city location choosing, most of Chinese cities are settled in the regions with moderate or sufficient surface water potential(Figure 6).

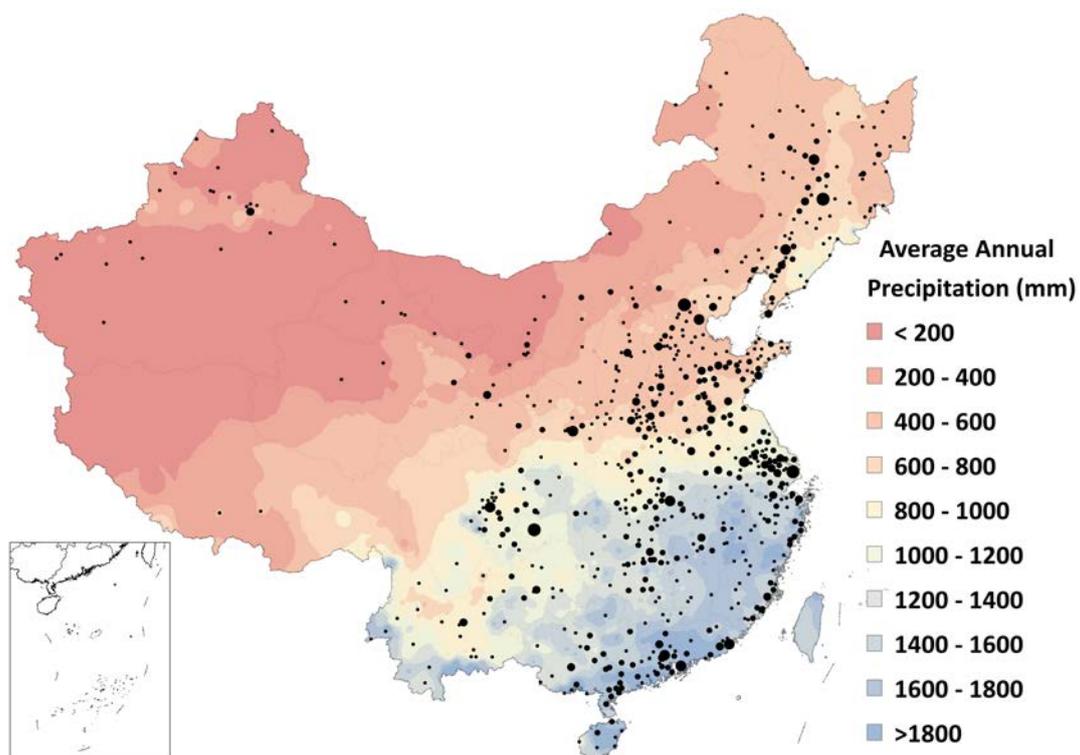

Figure 6: National average annual precipitation distribution and the location of the study cities

3.2 Groundwater Abundance of the Study Cities

According to incomplete survey, there are 400 cities that groundwater takes up more than 30% of their total water supply, and this demonstrates that the abundance of groundwater is also significant in determining the water utilization patterns of most Chinese cities. Consequently, this paper also identified the groundwater condition of the study cities through the “*Chinese Hydrogeological Information Spatial Dataset* issued by “*National Land-Resource Scientific Data Sharing Platform*”. The study cities are classified into 3-level (high, medium, low) categories based on their groundwater abundance (Figure 7). According to the above classification, most of Chinese cities’ groundwater resource is limited and the quality is about 420, while only around 150 cities have abundant groundwater resource comparatively.

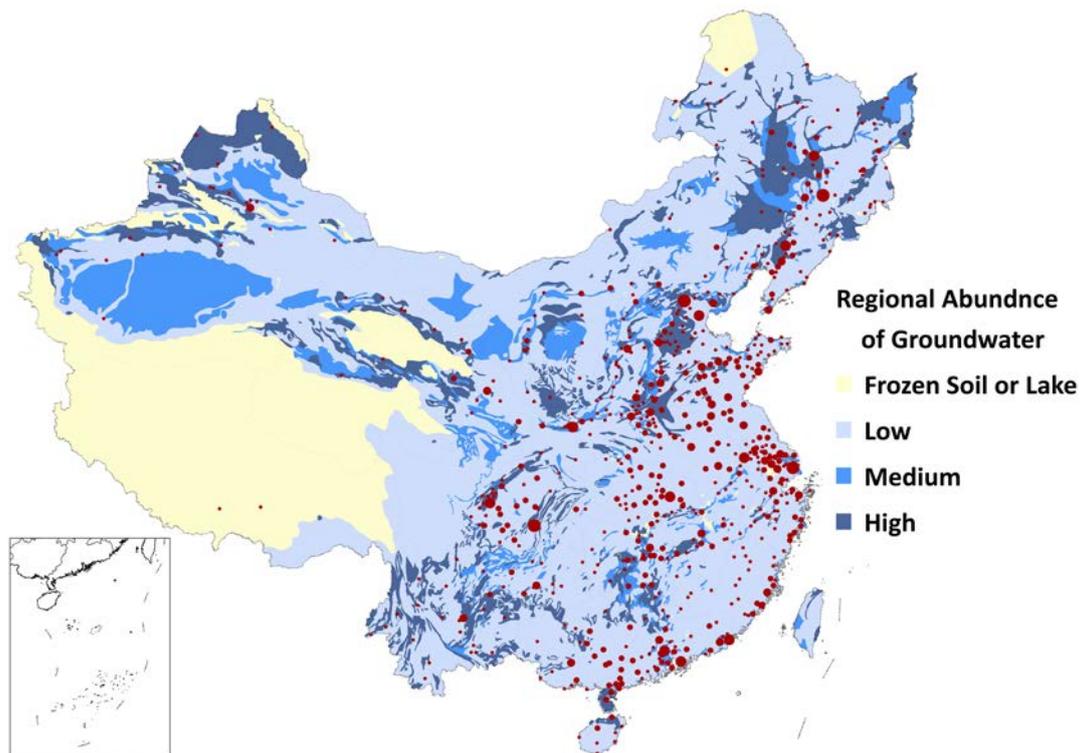

Figure 7: Groundwater-abundant-level spatial distribution of the study cities

3.3 Water Resource Background Classification of the Study Cities

When combined the two factors by K-means cluster analysis, the study cities can be classified into 9 categories that will represent the characteristics of their water resource background. The 9 categories include: High level in surface water and high level in groundwater, low level in surface water and low level in groundwater, medium level in surface water and medium in groundwater etc.(Figure 8).

From the spatial distribution pattern of the study cities, in terms of water resource background characteristics, it can be easily identified that there are two dominant types. The first type is high-level in surface water & low-level in groundwater, and these cities are mainly located in Anhui, Jiangsu, Fujian, Guangdong, Guangxi, and Hainan provinces, while the other type is medium-level in surface water & low-level in groundwater, which are mostly distributed in Jiangsu, Hubei, Sichuan, Guizhou, Anhui provinces. Comparatively, the cities in the other categories are relatively diffusively distributed.

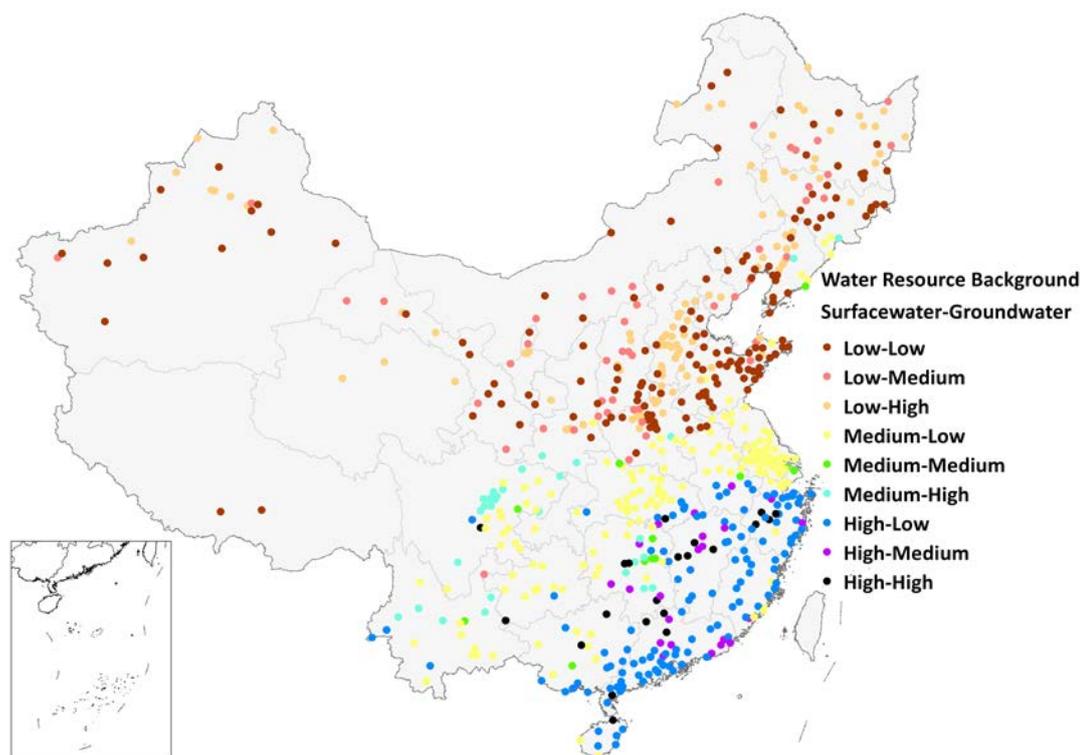

Figure 8: Water resource background classification of the study cities based on the factors of precipitation and groundwater abundance

4. Water Consumption Condition Study of the Study Cities

Water consumption structure and efficiency of the study cities contribute to the explanation about the current amount and future trend of water consumption, therefore the analysis towards these two aspects will help to understand the future dynamics of water demand of the study cities, and it is also the basis for providing suggestions in industry selection and population accumulation for the study cities and the related megalopolises.

4.1 Water Consumption Structure Classification of the Study Cities

Water consumption structure varies depending on different study objectives. From the urban perspective, water structure always includes the water consumption in industries, public service and household use. Hence, this research elected the above three influencing factors to identify the characteristics of the water consumption structure of the study cities through K-means cluster analysis in the statistical software *SPSS20.0*.

K-means Cluster analysis helps to classify the study samples by calculating the spatial distance, correlation coefficient or similarity coefficient of the samples in an N-dimensional variables' space. K-means cluster analysis is advanced in calculating speed and processing large amount of data, but its weak points are that the count of clusters should be predefined, and the final analyzing result highly relies on the features of the predefined cluster centers.

As mentioned above, the goal of this analysis is to identify the relative relationship of the study cities in industrial water consumption, public service water consumption and household water consumption, such as one use is dominant and the other two are subordinated, or the three water uses are nearly equal to one another. The identification of these relationships will be used to understand the mechanism of water demand dynamics of the study city and for raising specific suggestions.

Based on the above description, the analysis should firstly define the amount of clusters. With the general analysis towards the statistic frequency distribution of the study cities in the above 3 aspects, both industrial and household water consumption should be divided into 3 levels, while water consumption of public service should be divided into 2 levels (Figure 9). The pre-classification is based on the natural break classification method(Jenks), and the final cluster count is calculated as 13.

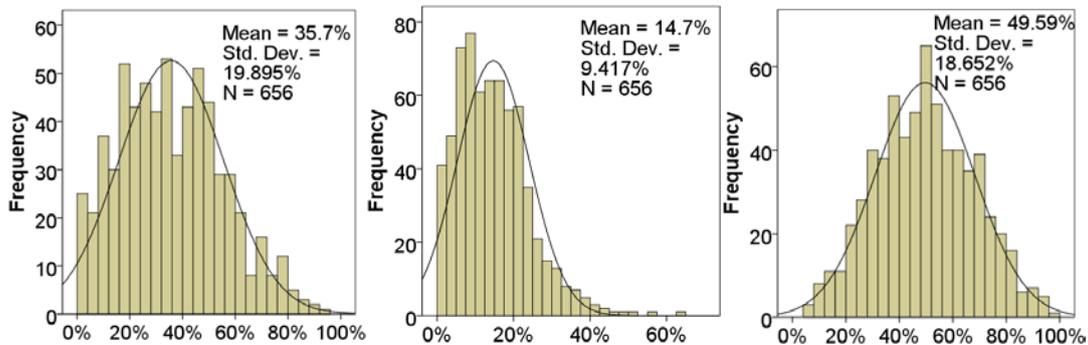

Figure 9: statistic frequency feature of water consumption in industry, public service and household

The result of K-means cluster analysis shows that there are 6-7 major categories that have a large number of cities, while the other categories have only around 20 cities.

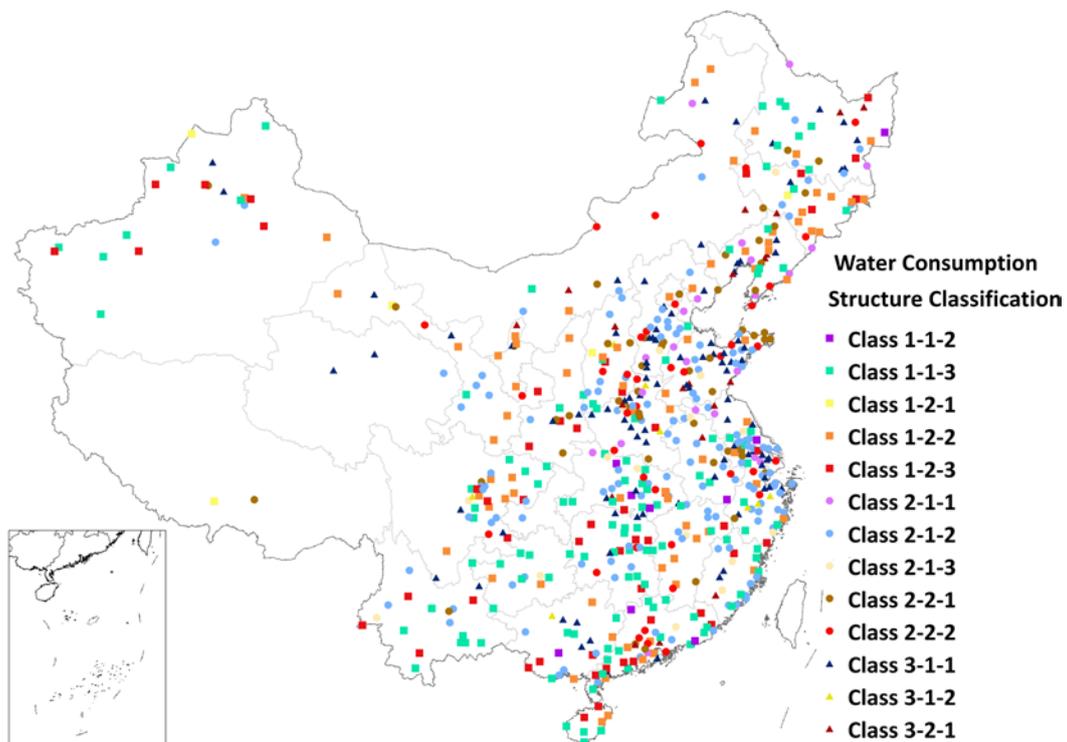

Figure 10: Water consumption structure classification of the study cities

The characteristics and final cluster center of specific categories of the study cities in water consumption structure could be referred in Table 1.

Table 1: Cluster centers and city amount in water consumption structure of the study cities

Name of the Categories	Final Cluster Centers of Water Consumption Structure			Count of Cities
	Industries	Public Service	Household	
2-1-2	42.6%	8.3%	49.1%	140
1-1-3	5.7%	8.1%	86.2%	119
3-1-1	80.5%	6.0%	13.5%	97
1-2-2	5.3%	45.6%	49.1%	78
2-2-1	39.7%	24.2%	36.1%	52
1-2-3	11.4%	20.8%	67.8%	51
2-2-2	29.9%	19.7%	50.3%	39
2-1-1	51.7%	10.1%	38.2%	22
3-2-1	55.4%	19.9%	24.7%	20
2-1-3	18.1%	7.9%	74.0%	16
1-1-2	29.5%	9.6%	60.9%	9
3-1-2	66.8%	6.1%	27.0%	8
1-2-1	20.3%	30.2%	49.5%	5

4.2 Water Consumption Efficiency Classification of the Study Cities

The improvement or falling behind in water consumption efficiency will influence the potential of the study cities in water carrying capacity. In this study, we choose 2 factors to assess their efficiency. That is water use per capita GDP which mostly reflect the efficiency in industrial water use, while the other is leaking ratio of water supply which can represent of efficiency in household use. Similarly, K-means cluster analysis method is also utilized for this analysis, and the two factors are both divided into 3 levels based on their quantity by the Jenks method before the K-means analysis. The cluster counts finally is calculated as 8, and the K-mean analysis result is shown in Figure 11.

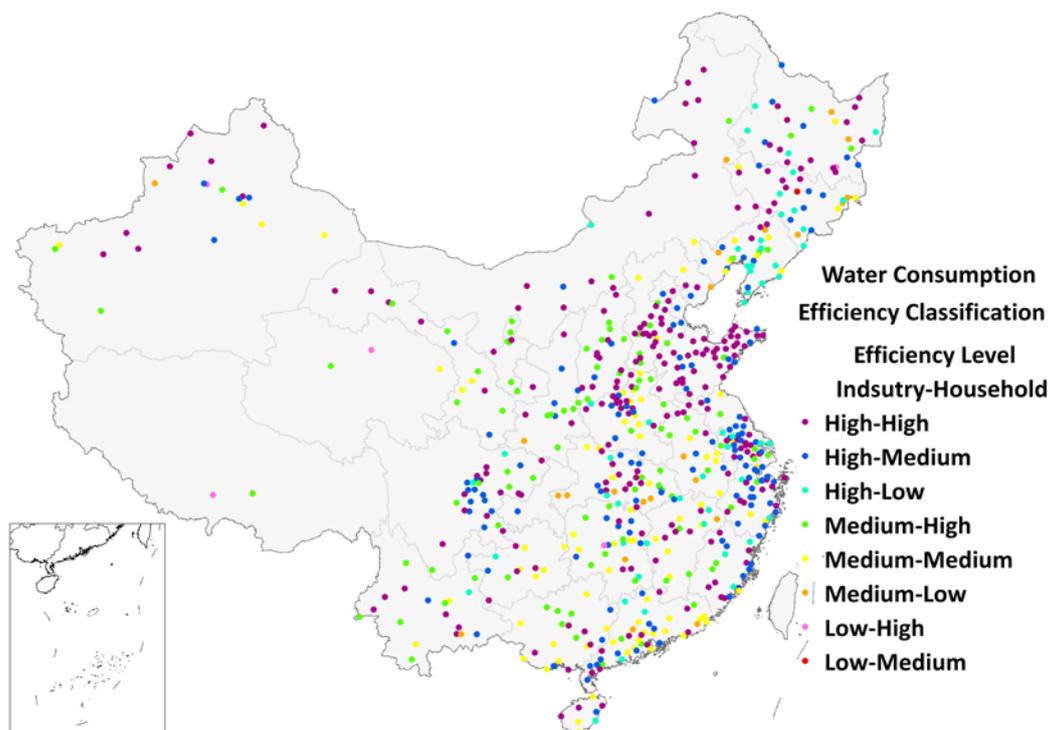

Figure 11: Water consumption efficiency classification of the study cities

Through the clustering analysis, there are 5 classes in the 8 ones are dominant classes, which are with relatively more cities. The rest classes has less cities included, and mostly is with around 20 cities. The analysis result tells us that most of the study cities are both highly efficient in industrial and household water consumption, and some others are classified into the types of high-medium or medium-high (Table 2). In consequence, from the perspective of water consumption efficiency, there is limited space left for most of the study cities to improve, unless revolutionary technical paradigms emerges and broadly utilized.

Table 2: Cluster centers and city amount in water consumption efficiency of the study cities

Name of the categories Efficiency in Industries- Efficiency in Household use	Final Cluster Centers		Count of Cities
	Water use per capita GDP (m ³ /10000yuan)	Leaking Ratio of water supply(%)	
High-High	6.68	9.3%	239
High-Medium	13.99	11.2%	141
High-Low	21.44	12.4%	53
Medium-High	42.26	9.5%	102
Medium-Medium	30.80	11.9%	92
Medium-Low	96.70	14.1%	23
Low-High	82.30	4.4%	5
Low-Medium	185.49	9.3%	1

5. Water Resource Potential or Population Overload Ratio of the Study Cities

Water Carrying Capacity means that, under different social and technical conditions, the amount of population or economic development a city or watershed can sustained (Zhu, Xia et al., 2002). There many methods to evaluate the water carrying capacity, including multi-criteria analysis, tendency analysis, comprehensive water use per capita, system dynamics, fuzzy evaluation etc. (Duan, Chen et al., 2010; Sun, Zheng et al. 2006; Zhu, Xia et al., 2002).

In this study we apply the approach of comprehensive water use per capita referred by related scholars (NPFPC, 2009; Zhang, Feng et al. 2008). The key of this method is to analyze and determine the comprehensive water use on average for a single person, which mostly includes household, public service, industrial, and environmental use etc. Internationally, 500m³/capita is considered as the benchmark of severe water shortage, and this value is fixed as comprehensive water use in this analysis based on the consideration of Chinese actuality. Besides, the equations of this method are as follows.

$$WCC = W / W_{pc} \quad (1)$$

$$WCCI = P_a / WCC \quad (2)$$

$$R_p = (P_a - WCC) / WCC * 100\% = (WCCI - 1) * 100\% \quad (3)$$

$$R_w = (WCC - P_a) / WCC * 100\% = (1 - WCCI) * 100\% \quad (4)$$

In (1), **WCC** is water carrying capacity of the city (the unit is persons); **W** is the total available water resource of the city (m³); **W_{pc}** is the comprehensive water use on average (m³/capita)

In (2), (3), (4), **WCCI** is water carry capacity index, which indicate the potential of future water supply or overload condition of population in terms of water resource; **WCC** is water carrying capacity of the city; **P_a** is the actual population of the city (person); **R_p** is the population overload ratio of water resource of the city; **R_w** is water sufficiency ratio of the study city.

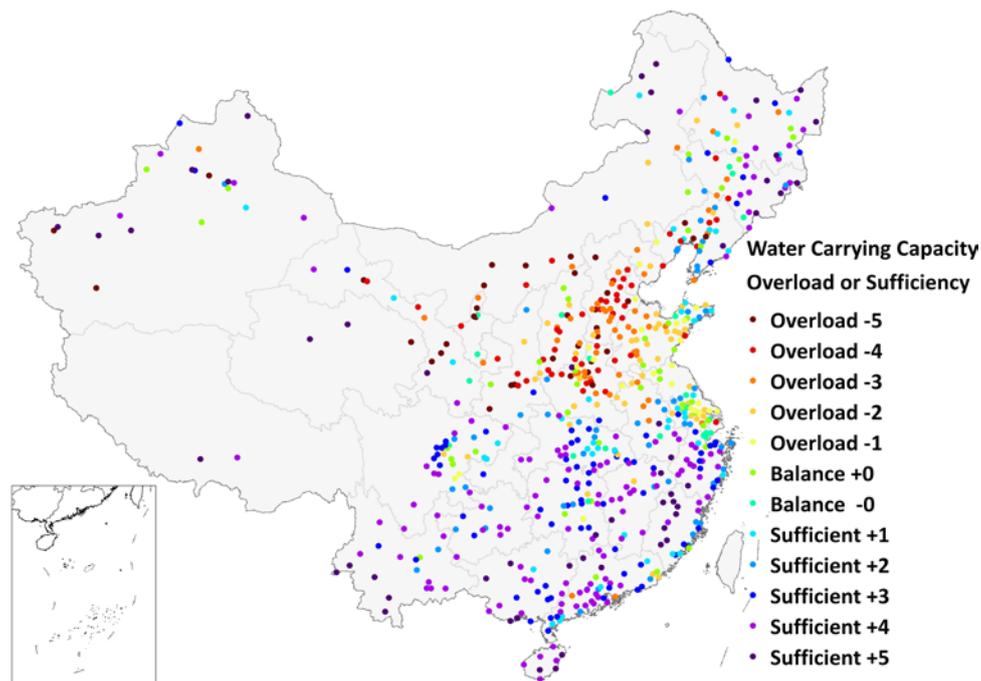

Figure 12: Water resource potential or population overload ratio of the study cities

In general, the analytical result shows that most Chinese cities are still relatively sufficient in water resource (Figure 12, Table 3), while there are 265 overloaded cities, which takes up 40.4% of the total cities, and only 144 cities have been over one time of the calculated capacity and just less than 90 cities have surpassed twice of the capacity. Comparatively, the overloaded cities are also highly concentrated spatially, which mostly distributed in Hebei, Shanxi, Henan, and part of Shandong, Jiangsu provinces etc..

Table 3: Indicator calculation and classification in Water Carrying Capacity of the study cities

Categories	Carrying Capacity	Indicators of Water Carrying Capacity			Count of Cities
		Water Carrying Capacity Index (WCCI)	Population Overload Ratio (Rp)	Sufficient Ratio of Water Resource (Rw)	
Water resource Sufficiency	+5	<0.1		Rw>90%	53
	+4	0.1-0.3		70%<Rw<90%	131
	+3	0.3-0.5		50%<Rw<70%	81
	+2	0.5-0.7		30%<Rw<50%	60
	+1	0.7-0.9		0%<Rw<30%	44
Generally Balanced	+0	0.9-1.0		0%<Rw<10%	22
	-0	1.0-1.3	0%<Rp<30%		45
Water Resource Overload	-1	1.3-1.5	30%<Rp<50%		26
	-2	1.5-2.0	50%<Rp<100%		50
	-3	2.0-3.0	100%<Rp<200%		56
	-4	3.0-6.0	200%<Rp<500%		51
	-5	>6.0	Rp>500%		37

6. Water Resource Carrying Capacity for Population of the Study Megalopolises

Based on the above analysis of the study cities, we further make a summation to the 22 megalopolises that are supposed to be the centers for population and industry accumulation during Chinese future urbanization. In the 22 megalopolises, the highest potential ones to sustain future population, from the perspective of water capacity, are Ha-Da-Chang, Cheng-Yu, Pearl River Delta megalopolises, which can absorb 50 million more people in the future. The secondary level megalopolises in future water capacity are Beibu Gulf, West Coast of Strait, Poyang Lake, Greater Wuhan, Chang-Zhu-Tan, Central Guizhou, which can sustain 10-20 million more population if needed. Besides, even part of the cities in Central Yunan, Yangtze-Huai River, North Tian Mount megalopolises has appeared to be overloaded in capacity, there is still relatively great potential capacity for them to receive and accumulation more people if considering the city clusters as a whole (Table 4, Figure 13).

Table 4: Population overload condition or future potential in water capacity of the study megalopolises

Megalopolis Name	City Count	Count of overloaded cities	Overloaded population (10 thousand)	Count of sufficient cities	Further carrying potential (10 thousand)	Net population Capacity (10 thousand)
Ha-Da-Chang	17	6	559.1	11	-5438.4	-4879
Cheng-Yu	31	8	423.9	23	-5014.6	-4591
Pearl River Delta	17	1	620.9	16	-4894.0	-4273
Beibu Gulf	5	0	0.0	5	-2223.2	-2223
West Coast of Strait	14	2	93.3	12	-1919.6	-1826
Poyang Lake	9	1	98.8	8	-1707.4	-1609
Greater Wuhan	16	2	39.9	14	-1369.1	-1329
Central Guizhou	7	0	0.0	7	-1069.2	-1069
Chang-Zhu-Tan	7	2	112.8	5	-1094.3	-982
Central Yunnan	6	1	31.5	5	-683.8	-652
Yangtze-Huai River	13	4	371.0	9	-829.2	-458
North Tian Mount	8	4	106.5	4	-371.2	-265
Central Liaoning	28	13	1327.8	15	-1417.2	-89
Yangtze River Delta	50	22	2828.5	28	-2835.6	-7
Yinchuan Plain	6	5	199.4	1	-0.5	199
Bao-Hu-E	3	3	282.7	0	0.0	283
Lan-Bai-Xi	5	4	380.2	1	-13.6	367
Central Shanxi	5	4	379.7	1	-1.9	378
Guanzhong Plain	8	8	775.0	0	0.0	775
Shandong Peninsula	30	22	1273.4	8	-155.8	1118
Central Plains	23	21	1436.9	2	-7.6	1429
Jing-Jin-Ji	27	27	3294.0	0	0.0	3294

On the contrary, for the overloaded megalopolises, Jing-Jin-Ji has extremely surpassed the capacity of the region, and all the cities included in the megalopolis has crossed the baseline of water carrying capacity of the cities. The amount of overloaded population in Jing-Jin-Ji megalopolis is around 33million. Secondly, the megalopolises of Central Plains, Shandong Peninsula, Guanzhong Plain are also heavily overloaded, and the overloaded population are

about 10 millions. Besides, the megalopolises of Central Shanxi, Lan-Bai-Xi, Bao-Hu-E, Yinchuan Plain are also experiencing, relatively lower, pressure from water capacity.

For Yangtze River Delta, Central Liaoning megalopolises, some of the cities are overloaded in water capacity, while some other cities still have huge potential to carry more population in the future.

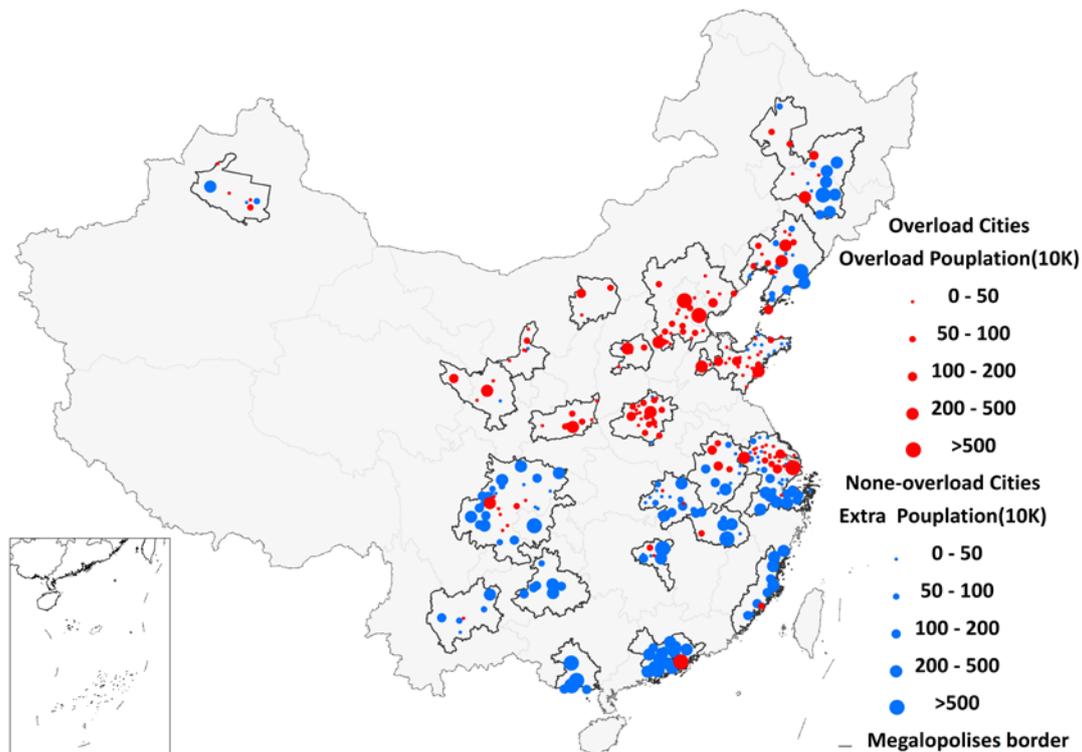

Figure 13: Population overload or future potential in water capacity of study cites and megalopolises

7. Conclusion and Policy Implication

Compared with the most existing studies, the prospect contribution of this paper is to study the water resource related issues, including water resource conditions, water consumption structure and efficiency, water consumption amount and water resource carrying capacity, in a much finer spatial scale(city level) and from the perspective of urban studies. By identifying the potential water resource capacity and constraint factors of different cities, suggestions about population potential and megalopolises' developing and water management policies are raised to lead Chinese urbanization process towards a more sustainable pattern.

Through the study result, we can initially conclude that, for the studied Chinese cities and especially the 22 focused megalopolises, the cities located inside Pearl River Delta and Cheng-Yu megalopolises should be the national central urbanization emphasize compared with the other two primary ones (Jing-Jin-Ji and Yangtze River Delta), from the perspective of future water carrying capacity. Combined with the consideration about social and economic development, Greater Wuhan, Western Coast of Strait, Chang-Zhu-Tan megalopolises should be more supported with encouraging policies and central governmental fiscal resources to spur the future accumulation in population and industries, as they are also advanced in water carrying capacity. Besides, Beibu Gulf, Poyang Lake, Central Yunnan, Central Guizhou megalopolises could also be relied on in receiving more newly emigrating population from rural area in the future, even the economic development of these megalopolises are relatively subordinated.

In the future studies, there are still many aspects to be improved. Firstly, more water carrying capacity analyzing methods could be utilized to reflect the condition of study cities and megalopolises from various perspectives. Secondly, classification analysis in water consumption structure and water consumption efficiency should be combined with the analysis in water carrying capacity, which will offer more practical conclusions and suggestions for the study cities and megalopolises. Furthermore, because most of Chinese policies are based on the cost-benefits in economics, it would be necessary to conduct cost-effective evaluation to the study cities and megalopolises based on the estimation of overall efficiency and benefits of the accumulated population and industries in specific cities or megalopolises when considering the potential pulling effect from water resource or other related environmental aspects.

Increasing Cities and Shrinking Regions **(Increasing Cities and Shrinking Regions: Migration in China's Urbanization—** **—Cases from Sichuan and Henan Provinces)**

Li Zhang, China's Academy of Urban Planning & Design, China

1. Migration and China's Urbanization

In the past 30 years, China has put forward the urbanization in an amazing speed. From 1978 to 2011, the level of Chinese urbanization increased from 17.92% to 51.27%, urban population increased from 172.45 million to 690.79 million. The urbanization level increased 1.01% one year and population in city and town grew 15.71 million per year. The Urbanization is an inevitable end of migration from countryside to city. Likely, high-speed urbanization in China accompanied with a huge amount population migration as well. In the past thirty years, natural growth rate of urban population was less than 10% (National Bureau of Statistics of China 2012a); thus the main part of Chinese urban population growth was the migrant population from countryside to city.

Under the special household registration system in China (that is, agricultural population and non - agricultural population registration system), some of migrants from countryside can become non - agricultural population which means permanent residence in city while others can only obtain employment without the registered non-agricultural Hukou, which are called rural migrant workers. From 1978 to 2010, urban registered non-agricultural population increased from 152.30 million to 459.64 million (National Bureau of Statistics of China 1999, 2011); while rural migrant workers increased from 20 million in 1983 to 242.23 million in 2010 (National Bureau of Statistics of China, 2012b). Both population increase caused the rapid expansion of urban population in China. According to China's Sixth Census in 2010, there were 231.31 million flowing people in cities and towns, which accounted for 34.5% of Chinese total city residential population. The rural migrant workers who cannot obtain permanent residence have become a very important part of Chinese urban population. Since these people cannot completely integrate themselves into urban society only being migrant population between cities and countryside, inadequate urbanization (Tang 2009, Hu SL2012) comes into a specific phenomenon in China.

There are two moving directions of migrant people: movement to nearby cities and to long-distance cities. According to migration workers monitoring and investigating report 2011, number of migration workers from countryside to nearby cities was 88.88 million and the number of long-distance movement migration workers was 153.35 million in 2010. The census 2010 of China indicates, there were 260.94 million migration people in 2010, 15% of them was moving inside the city they registered in, 52% was moving inside their registered province, while 33% was moving from their registered province to the other province. Data from these two different sources fit well, and both indicate total amount of Chinese migration population has already reached 0.22 billion and above.

For across-province migrants, developed provinces or cities like Guangdong, Zhejiang, Shanghai, Beijing and Jiangsu etc. are the main destinations. Relatively economically undeveloped but with huge population provinces are the headstream such as Anhui, Henan, Sichuan, Hunan, Hubei, Jiangxi etc. The across-province emigrants from Anhui, Henan and Sichuan were above 8.6 million (The Census Office of the State Council and National Statistics Bureau of China 2012).

Thirty years of huge population migration has gradually caused the reconstruction of population distribution both in urban & rural areas and in east and middle-west regions.

2. Growing Cities and Shrinking Regions—Population Reconstruction in the Middle-west Provinces of China

Middle-west provinces are the main source of emigrants in China. Since 2012, author of this paper had been participating into two important regional and city planning projects, City System Plan of Sichuan Province and Xinyang City Master Plan in Henan Province. Analysis of historical population development and forecast of future population distribution are major elements in these projects. And a new population phenomenon in middle-west provincial migrating was found, that is the phenomenon of increasing cities and shrinking regions.

2.1 Sichuan Province

Sichuan is one of most populous provinces in the west of China. It also has the largest emigrating population in the west provinces. Since the large - scale development of China's western region from 2000, a large number of infrastructure projects were put into western regions. Meanwhile, preferential policies in terms of tax and industries were given to the western region(Chen SZ2010). In this context, Sichuan Province had entered into the rapid growth period of urbanization since the year 2000. From 2000 to 2010, the urbanization rate of Sichuan Province increased from 27% to 40%(The Census Office of the State Council and National Statistics Bureau of China2002, 2012), and the average increase rate is 1.3% per year. However, the population structure changes more complexly along with the rapid growth of urbanization.

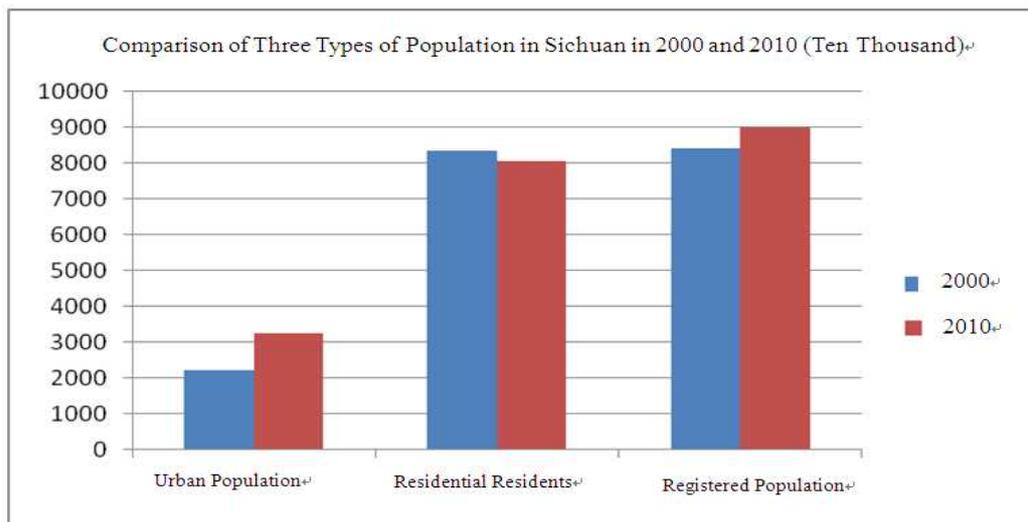

Figure 1: Comparison of Three Types of Population in Sichuan

From 2000 to 2010, the urban population of Sichuan Province increased from 22.23 million to 32.31 million, the residential population decreased from 83.29 million to 80.42 million, and the registered population increased from 84.02 million to 89.98 million(The Census Office of the State Council and National Statistics Bureau of China2002, 2012). During the ten years, the registered population was relatively stable while the residential population was decreasing, which means a large number of people moving out to the other province. And the net outflow population number increased from 3.67 million to 9.57 million. Then, the rapid-growth urban population was in great contrast with the decreasing residential population. The reason why urbanization rate grown so quickly is, that the decreasing residential population was used as the denominator of urbanization population.

In Sichuan Province, there are 21 city areas which centered around the core cities and form into uniform administrative unities and economic areas. As figure 2 showed, 16 of 21 city areas had the similar shrinking phenomenon of residential population as Sichuan Province. There are only 5 areas different from Sichuan Province. One is Chengdu, the economic center and capital of Sichuan Province. The other three are Aba, Ganzi and Liangshan areas, which locate on the edge mountain regions of the administrative districts of Sichuan Province (The Office of the Population Census & Bureau of Statistics of Sichuan Province2002,2012).

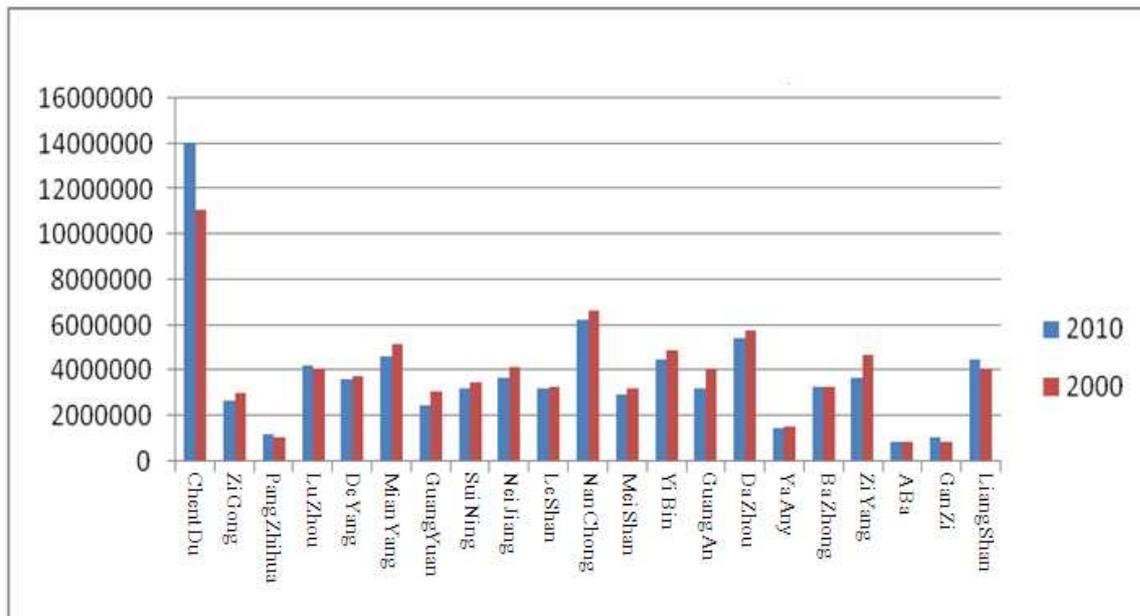

Figure 2: Comparison of the Residential Population in Different Areas of Sichuan
Data source: 2000,2010 census of Sichuan Province

The emigrant phenomenon was more serious when compared the registered population with the residential population of each city area. Apart from Chengdu city, all the other city areas had population shrinking phenomenon with less residential population than registered population. However the urban population in all the areas had showed a trend of rapid growth.

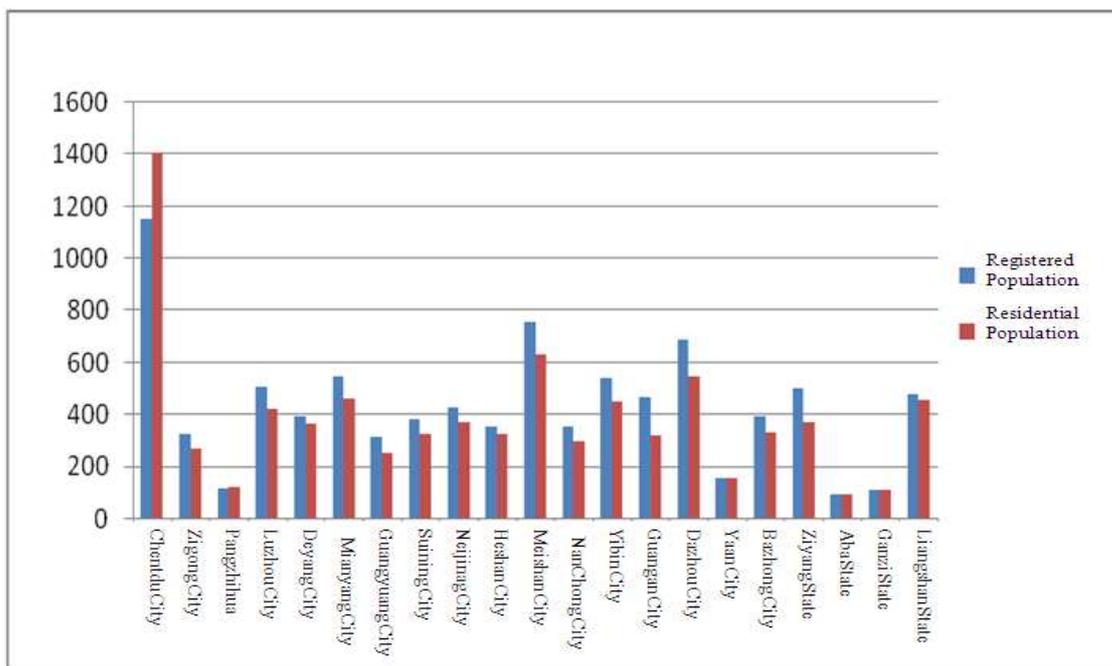

Figure 3: Comparison of the Registered Population and Residential Population in 2010
Data source: 2000,2010 census of Sichuan Province

2.2 Xinyang City in Henan Province

Henan Province is both populous province and large emigrating province. Xinyang is the southeast city of Henan Province with registered population of 8.46 million and residential population of 6.11 million. The net emigrating population is 2.35 million, accounting for 28% of the total registered population. From 2000 to 2010, the registered population of Xinyang

increased from 7.66 million to 8.46 million, while the residential population reduced from 6.53million to 6.11million (Office of the Population Census of Xinyang City2002, Xinyang City Bureau of Statistics & Office of the Population Census of Xinyang City 2012).

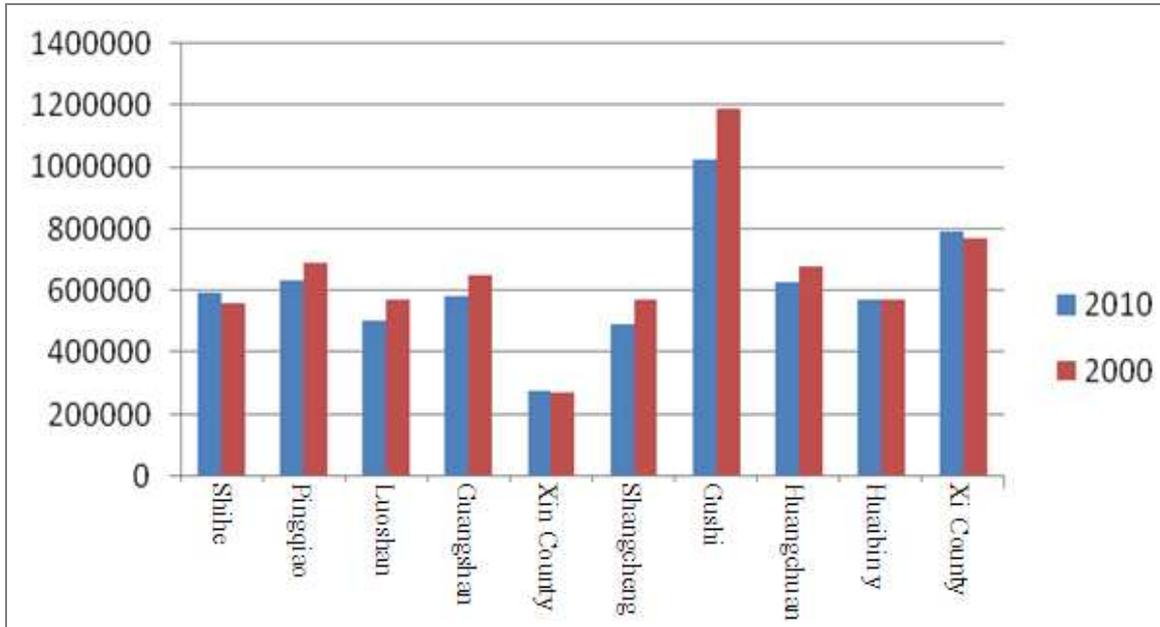

Figure 4: The Residential Population of each area in Xinyang's Jurisdiction
Data Source: 2000,2010 Census of Xinyang City

Prefecture-level Xinyang City possesses two districts and 8 counties. The situations of population distribution of these districts and counties are alike. Most districts and counties has occurred absolute loss of residential population. On the contrary of residential population' loss, the urban population of each area had a trend of rapid growth.

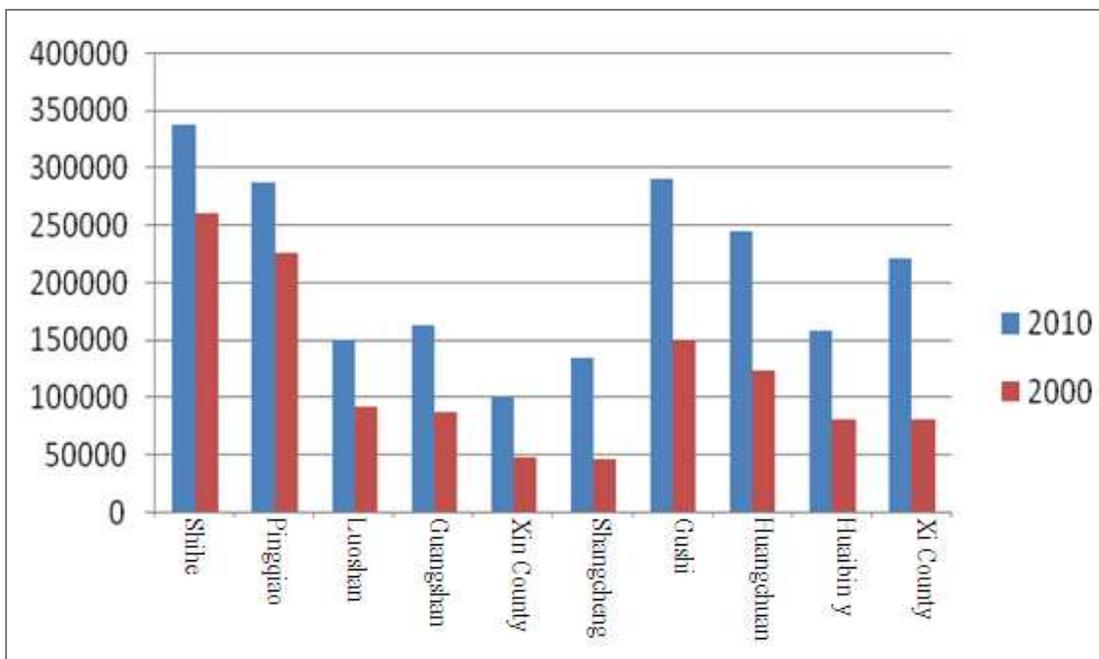

Figure 5: The Urban Population of each area in Xinyang's Jurisdiction
Data Source: 2000,2010Census of Xinyang City

Xinyang is adjacent to Anhui and Hubei province. We can see that the population loss phenomenon in almost the whole surrounding areas in Henan, Anhui, Hubei and Shanxi province with the exception of the capital cities, Zhengzhou, Wuhan, Hefei and Xian city. The aggregation and loss of population in central cities and surrounding areas constitute the spatial pattern of increasing cities and shrinking regions.

Generally speaking, no matter in Sichuan Province or in Xinyang city area, the loss of people includes two aspects: Firstly, the massive emigrating population caused the residential population less compared with registered population. Second, the residential population had the trend of absolutely decreasing.

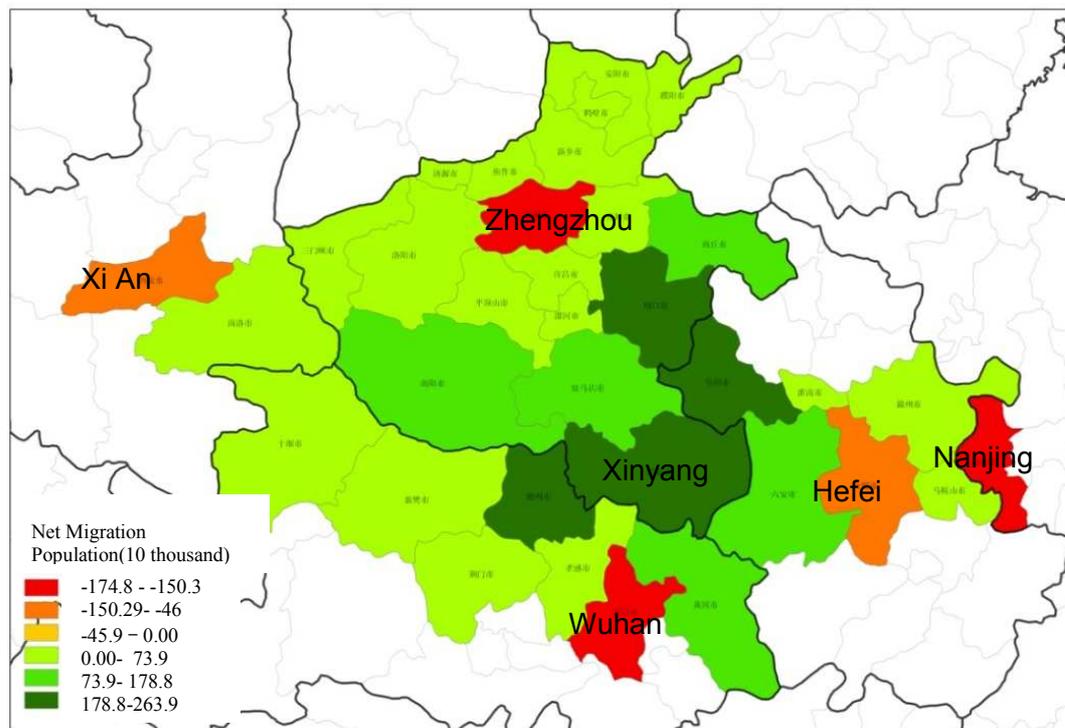

Figure 6: Population Loss and Aggregation Pattern in Xinyang and its Surrounding Areas (2010)
Data Source: 2010 Census of China

3. Population and Economy Analysis of the Shrinking Region

The impact of population migration on the society and economy is an important research topic in the fields of sociology and geography. Domestic academic circles have carried out extensive researches. From the perspective of the impact on the regional development, one view is that the population flow can enlarge the regional economic disparity (Hu 1995, Duan 2005); the other view is that the population flow can narrow the regional economic disparity (Liu 2001, Wang 2001). The above researches are analysis of the whole country using the province as analysis unit. In this article, the view focus on Sichuan Province, analyzing the residential population and the average GDP per person in 2000 and 2010 so as to measure the impact of the population distribution and change trend on the economy and other aspects.

3.1 The Rising Centralization of the Population

For the province with large outflow population, the population flow from the backward areas to the developed areas inside and outside of the province, causing population reconstruction. The Lorenz Curve was prepared according to the census data of 21 cities and regions of Sichuan Province in year 2000 and 2010.

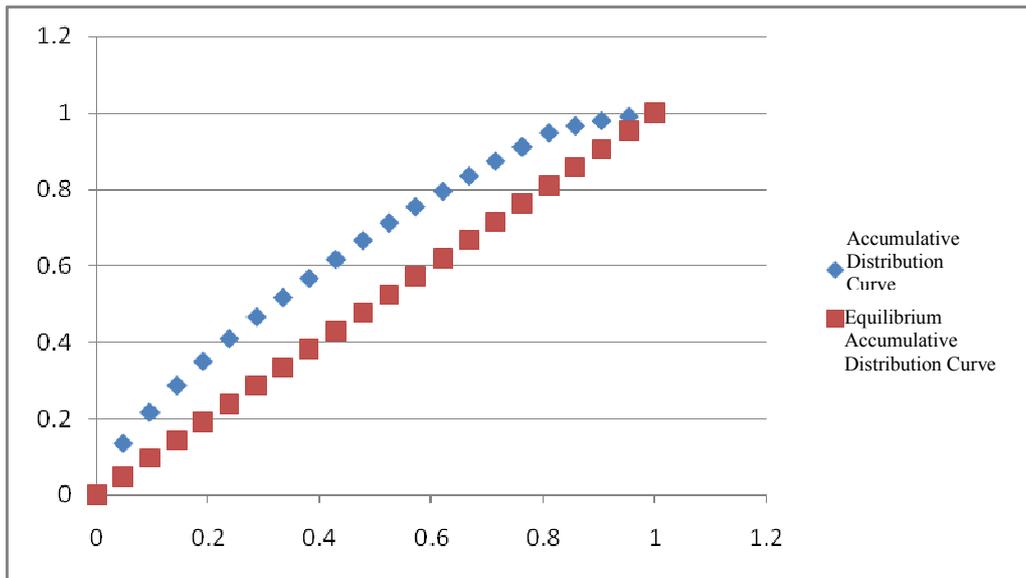

Figure 7: Lorenz Curve of Population Distribution 2000 in Sichuan Province

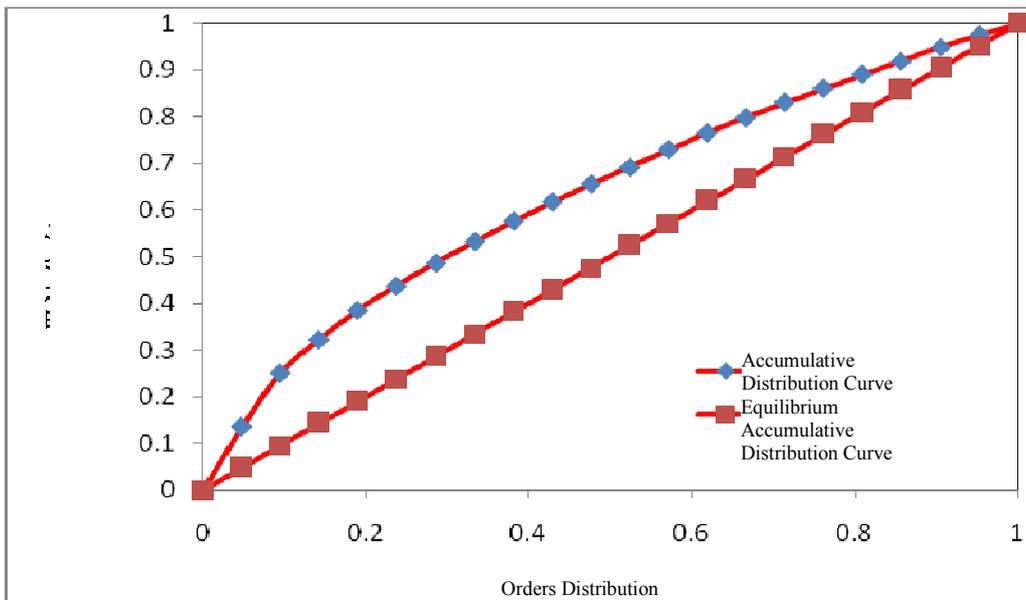

Figure 8: Lorenz Curve of Population Distribution 2010 in Sichuan Province

Using the index of concentration (the equivalent of Gini coefficient based on Lorenz curve) and equilibrium (based on entropy definition of Shannon information), measure the changing trend of population distribution (Chen YG2010). From year 2000 to 2010, the centralization index of Sichuan population increased from 0.298 to 0.327, but the equilibrium coefficient decreased from 0.951 to 0.938. The largest city Chengdu has the population proportion increased from 13.5% to 17.5%. Comparing with the second largest city Nanchong, the population scale of Chengdu rose from 1.66 to 2.24. The population of the province is further concentrating into Chengdu City.

3.2 The Distribution of Economic Growth Level being Even

On the condition of population spatial reconstruction, what happened to the economic growth levels in different cities and regions of Sichuan province? Using the per capita GDP in 2000 and 2010 to draw the Lorenz curve so as to describe the changing trends of the economic growth levels.

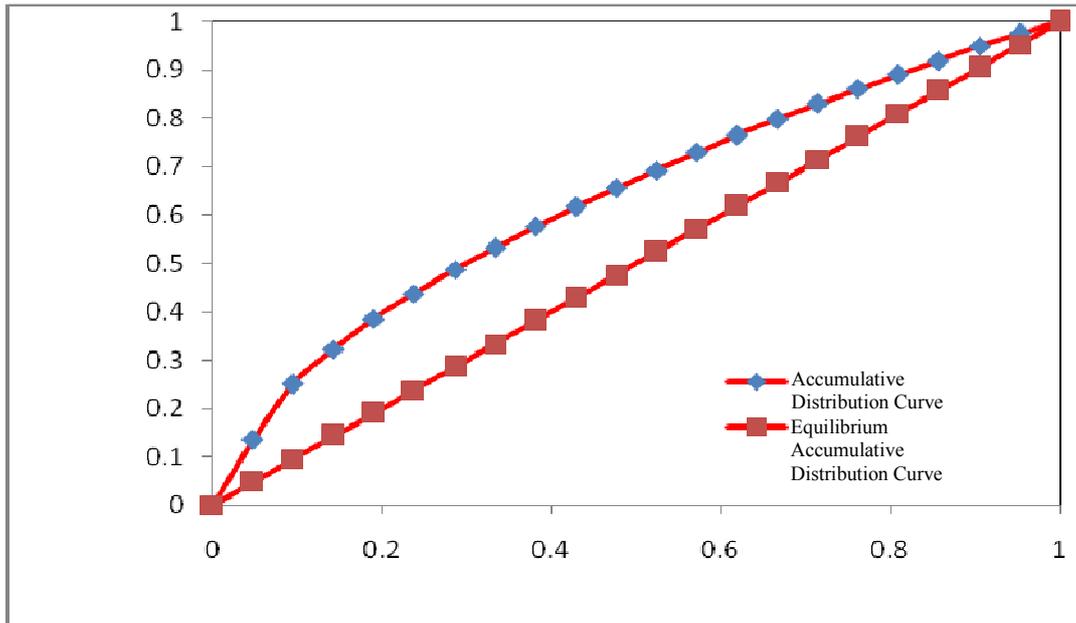

Figure 9: Lorenz Curve of per capita GDP2000 for the Cities and Regions in Sichuan Province

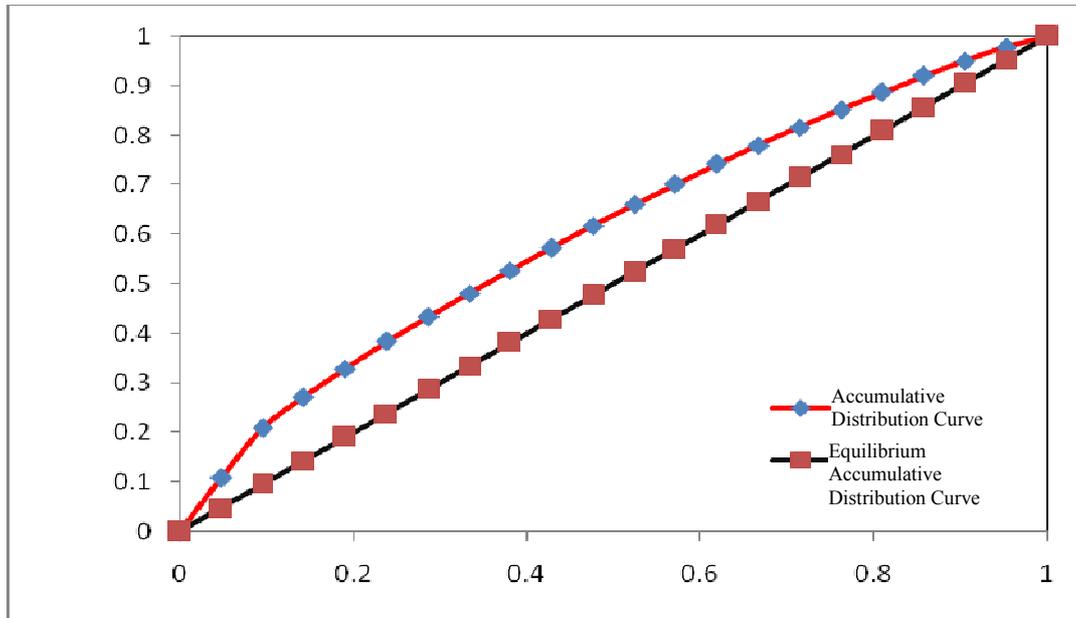

Figure 10: Lorenz Curve of per capita GDP2010 for the Cities and Regions in Sichuan Province

As the above Exhibits shows, the space between the cumulative distribution curve and equilibrium distribution curve of per capita GDP narrowed from 2000 to 2010. The centralized index of per capita GDP decreased from 0.281 to 0.222, the equilibrium increased from 0.956 to 0.973, which showed that the difference of the average output per person has narrowed and the economic growth level in different regions and cities tends to be even.

3.3 Regression Analysis of Population and Economy Distribution

The centralized population and the even distributed per capita income showed that population may flow due to the uneven distribution of the per capita income. Using population absolute growth rate, per capita GDP in 2000 and 2010, the absolute annual growth rate of per capita GDP, relative annual growth rate of GDP, population in 2000 and the unique nature of the city (The provincial capital and minority nationalities area capitals should be represented by “1”, the rest should be represented by “0”) as the dependent variables, carry out the multiple linear regression with SPSS. Only three variables retained which were per

capita GDP in 2000, the unique nature of the city and population in 2000. So the standard regression model is:

$$\text{Population growth rate} = 0.482 * \text{GDP2000} + 0.499 * \text{special city nature} + 0.299 * \text{population2000}$$

It can thus be seen that:

(1) The nature of the city has the greatest impact. The standard regression coefficient is 0.499 and the corresponding partial correlation coefficient is 0.739. The population of Sichuan mostly migrated into the provincial capital city Chengdu, and the minority nationalities are migrating into their respective regional capitals.

(2) The second important factor is the per capita GDP in 2000. The standard regression coefficient is 0.482 and the corresponding partial correlation coefficient is 0.707. Sichuan population has a trend of migration into the city having high in average GDP per person.

(3) The population in 2000 also has some impact. The standard regression coefficient is 0.299 and the corresponding partial correlation coefficient is 0.537. This showed that the area with larger population has more attractiveness to the migration population.

What deserves attention is that the model only reflected the factors that affected the migration of the population in the last ten years in Sichuan Province. The per capita GDP in 2000 affected the migration of the population, but the average GDP per person in 2010 has no obvious impact because the impact of year 2010 can only be showed in the future after year 2010. Provided that the differences of per capita incomes lead to the population migration, what impact does it have on the population migration with the narrowed difference of per capita income, what will happen when the centralization of residential population has risen.

3.4 Emigration's Impact on the Society and Economy of the Shrinking Region

(1) Imbalance of population's age constitution and lack of labor resources

The young male workers are the main part of migrant, and the age and sex structure will get imbalanced after they moved out. Female, Children and the elderly are left behind to form the new population so the dependent ratio gets high and the sex ratio gets low. The young labors are in shortage.

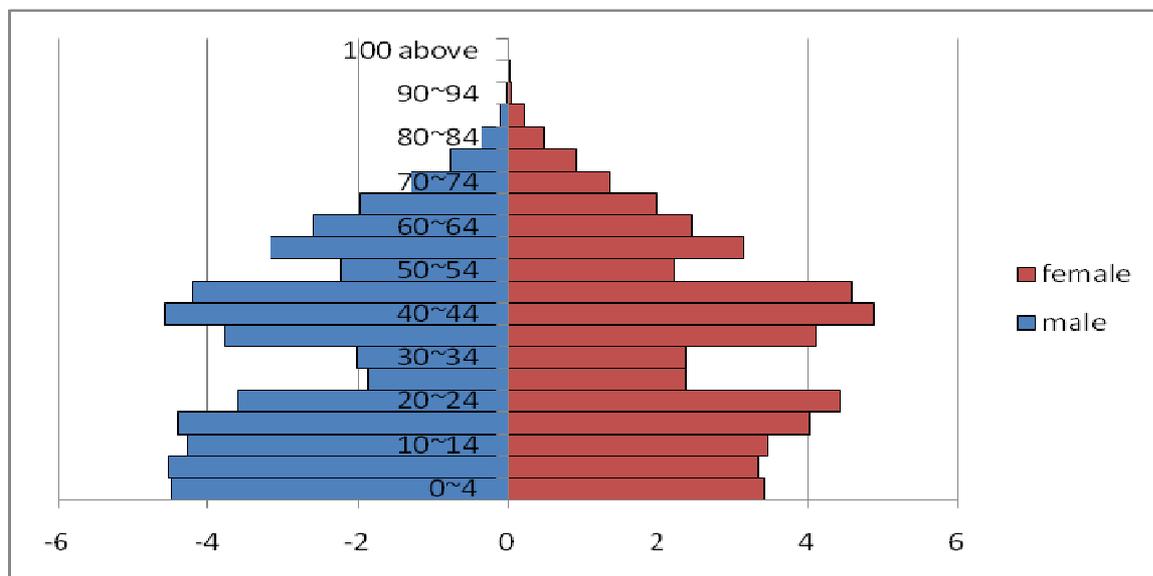

Figure 11: The Age and Sex Structure in Xinyang City (2010)
Data Source: 2010 Census of Xinyang City

According to the 2010 census of Xinyang City, population at the age of 0-14 years old account for 23.51% of the total population, population at the age of 15-64 years old account for 66.96%; and population above the age of 65 years old account for 9.53%. Compared with the national level, the population of Xinyang at the age of 15-64 years old is lower by 7.5%.

The population of Sichuan at the age of 20-34 years old accounts for 19.6% of the total population, while the population at this age stage in the whole country account for 24.4%. The dependency ratio is 49.3% in Xinyang, 38.73% in Sichuan and 34% in the whole country. Large-scale population flow-out leads to sex ratio decline. The sex ratio of Xinyang in 2010 is 100.77, which is lowered by 5% compared with the sex ratio of 2000, and lowered by 4.5% compared with the national average level of 105.2. The sex ratio of the total population of Sichuan is lowered to 103.14 from 106.98 in 2000, and is lower 2% than the national sex ration.

(2) Considerable economic gains and huge social costs

In the process of urbanization, the traditional agricultural society is inevitably transformed into the urban society with the rural population migrates into city and town. However, the rural migrant workers have paid high cost of the society while got better economic condition under the special Household registration system in China.

The moving population would find new jobs out of the rural areas which means the rural labor force can be fully used. With the increase of rural family income, the life of the farmers has been improved and countryside got some new impulse because of funds, technologies, experiences taken back by rural migrant workers(Cai&Bai2006). However, the outflow population causes the rural population aging and the education problem of the left-behind children(National People and Family Plan Committee2012). The talents in the rural migrated and the labor force is in shortage in rural area, which is not conducive to the agricultural modernization. The huge migrated population result in the gradual depression of the rural society(Ma2006). The migrant workers cannot enjoy the equal living conditions of the city residents and the same level of social securities. For the same incomes, they have to pay more social price of family separation, spirit wandering and belonging sense missing.

(3) The negative impact on the economy of population loss area began to appear

Generally speaking, the population migrating from the low income area into the high income area and from the insufficient jobs area into the adequate jobs area is conducive to the overall national economic growth and can maximize the utilization of the human resources. The recent study carried out by Xiaomin Du et al(Du2010) showed that the migrant workers made contribution to the economic growth of the East China, but for the West China, the migration caused mild decrease which means the negative effects of the labor force outflow has began to show up in the local area.

Locateing in the central region of China, Xinyang City is at the beginning of reply to the coastal industry transfer. There are a large number of young migrant workers immigrating out of Xinyang every year, and now the local newly emerging industries face problems of labor force shortage and high cost labor force. The labor force costs 150 yuan per day per person in Xinyang City which is equal to the construction worker cost in Beijing¹. This will increase the cost of the improvement in the developing areas and slow down the economic growth steps.

4. Prospects and Suggestions

4.1 Prospects of China's Population Migration Pattern

China is now in an important transition period of social and economic development. The export-oriented economy of the coastal areas is being affected by the international economic crisis, and the industrial development has a trend to move from the coastal areas over to the inland areas, which will guide a new population migration pattern.

Shown in Chinese Migrant Workers Monitoring and investigating Report 2012, the rural migrant workers working in the East China account for 64.7% of the total amount in 2012, which is lowered by 0.7% than last year; the migrant workers working in the Mid China account for 17.9%, which is increased by 0.7% than last year; the migrant workers working in the West China account for 17.1%, which is increased by 0.4% than last year. The migrant workers working in the Pearl River Delta and Yangtze River Delta respectively account for 23.1% and 20.1% of the total amount, respectively lowered by 0.9% and 0.8% than last year. Along with the rapid growth of mid and west China, The incomes of the rural migrant workers

in different areas tend to be equal. The attractiveness of Pearl River Delta and Yangtze River Delta to the migrant workers is in gradual decline.

The migration population of Xinyang area is 930,000 in 2000, and reaches 2 million in 2005 and 2.36 million in 2007. And after 2007, the migration situation became steady without increasing and the rapid growth trend of population outflow(Xinyang City Human resources and Social Security Bureau & Xinyang City Migrant Workers Office 2012). “Affected by the economy environment this year, the main strategy of our company has been adjusted from “Stable, Healthy and Developing” to “Stable and Healthy”, “Developing” is no longer the company’s goal”, citing a Beijing construction project leader who is in charge of organizing migrant workers from Xinyang.

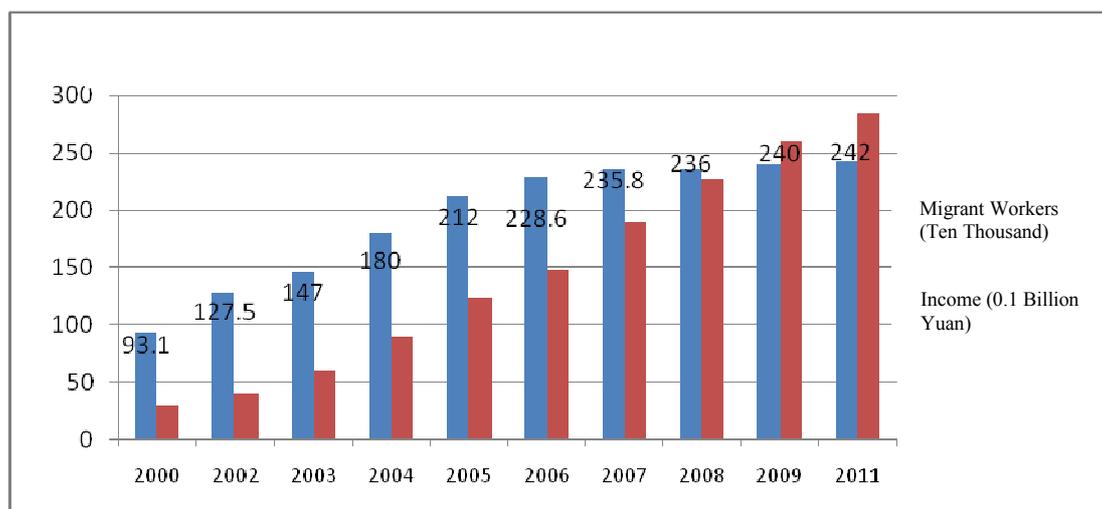

Figure 12: Migrant Workers Amount and Income Status From 2000 to 2011 of Xinyang City

Shown from the questionnaire survey to Xinyang migrant workers in construction and food service industries in Beijing, return to the local county town in Xinyang was the main direction of the rural migrant workers in the future. More workers prefer to stay in Xinyang if the same working opportunities are provided.

It is predictable that the massive migration workers' pattern in China will be changed along with the adjustment of the Chinese industrial distribution and the economic growth focus moving westward. The rural migrant workers growing older will return to their native areas and join into the construction of the local city and town. The newly increased migrant workers will mainly search jobs near their home town and get used to the new life of nearby cities or towns, where can realize the unification of the real urbanization with local citizen identity.

4.2 Suggestions for the Coming Migration in Urbanization

(1) Encouraging the migrant population flow back

The local government should realize the significance of human resources to the long-term development of local economy. They'd better encourage the migrant population flow back instead of encouraging the export of the labor sources. Then the rural migrant workers can realize their urban dream in nearby cities and towns instead of being the “amphibians person”(Qin2008) between rural and urban.

(2) Implementing of spatial equilibrium strategy

In the past, un-equilibrium strategy was dominant in the regional development and regional planning(Li2009), which leads to the migrates concentrated into capital cities, centre cities and large cities, causing increased housing price, resources shortage, traffic congestion and a series of urban diseases. According to the questionnaire of the migrant workers, the main direction of the rural migrant workers return is the county towns/cities. These towns/cities both have the advantages of low costs and perfect social networks. To cope with this return trend, the relatively balanced spatial development strategy should be adopted. Multiple centers' development strategy should be encouraged more that single center development strategy in the urban and regional planning.

(3) Strengthening the industrial development in urbanization

Industry development is the driving force of the urbanization. In the past ten years, the urbanization focused too much on the real estates and the infrastructure construction, and the industries development was neglected. The job opportunities and the income disparity are the primary reasons that attract the migrant workers. To draw the rural migrate workers back, the local government should change their focus on the development of real economy to create more job in cities and towns, which is the strategy of “keep urbanization and industrialization interact together”(Hu JT2012).

(4) Accelerating the step of City System Reform

The last strategy is to accelerate the city administrative system reform, change the city management system from the top to the bottom. Through this system reform, the local cities can make their own decision for their development without the intervention of higher cities for their own interests. Specifically, the reform include the system of city leading counties, opening the system of county changing to city etc. When grass-roots city development rights are respected and most county towns improved the living condition, the moving people can go back to their home town and stay forever.

5. Conclusion

The massive migration from countryside to city helped China to become an urban country in an amazing speed. However, there are more than 0.22 billion rural migrant workers moving between cities and countryside which leads to not only the inadequate urbanization of China but also the reconstruction of population.

Migrant directions included both the movement from countryside to nearby cities and the movement from countryside to long-distance cities. Most of the out-flow areas faced the loss of residential population while the local city/town still in growth. So the phenomenon of increasing cities and shrinking regions lies in different scales of county, prefecture-level city and province in Chinese West-Middle regions.

Mathematic analysis of population and economy in population loss area shows the centralization of the population has risen, while the distribution of per capita income tends to be even. The factors of the city nature, per capita GDP in 2000, population in 2000 have great impact to population growth rate of different areas.

Migration's impacts on the population loss areas are complex. While achieving the economic gains to rural family and area, the social costs of emigration seems higher and longer. And the negative impacts on the economy of the population loss area begin to appear.

China is facing the transition of social and economic development which will lead to the change of migration pattern. The massive and long distance flowing will be gradually replaced by the nearby migration. Local cities/towns will be the main settling place of rural migrant workers.

Finally some suggestions are given to cope with the coming migration in urbanization, such as encouraging to draw back the migrant population, implementation of spatial equilibrium strategy, strengthening the industrial development, and acceleration the step of the city system reform, etc.

1. The Phenomenon of Migrant and Returning Home at the Stage of Rapid Urbanization in China

China is at the stage of rapid urbanization. Large number of people from the rural area in the West is moving to relatively developed urban region in the East, especially to metropolitans such as Beijing and Shanghai. In the year 1975, China surpassed the US and became the country with the largest number of urban population; this situation is predicted to persist for a long time. Joseph E. Stiglitz, a Nobel laureate in Economics, claims China's urbanization, together with the Third Industrial Revolution, are the two events that shaped human development in the most profound manner in the past century.

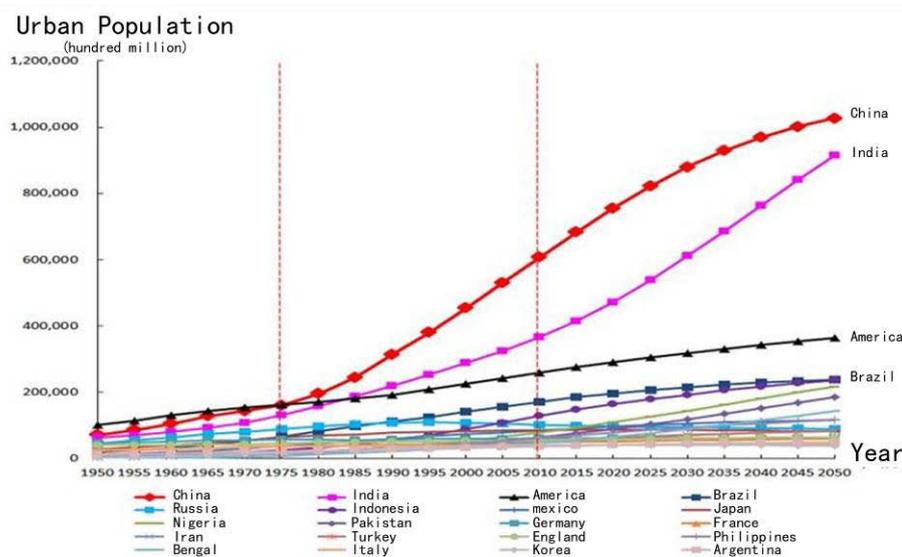

Figure 1: Top 20 Countries with the Largest Number of Urban Population: Population Changes by Year

Source: United Nations, 2010, *World Urbanization Prospects: The 2009 Revision*

The 2008 Global Financial Crisis led to the unemployment of 20 million migrant workers as well as pushed the structure change of urban economy. Traditional industries in the coastal region is moving to a saturated states, therefore economy of these cities requires structure changes. At the same time, the Middle and the West faces new opportunities because of the growing domestic market. With economic opportunities dispersing from the East to the Middle and the West, migration workers are moving back to where they are from. This trend brings significant influences to both their hometowns and their destinations. It is crucial for the destination cities to have sufficient housing, medical and education services to prevent social segregation and other social problems. The home cities also need to develop their infrastructure to cater for the returning migrant workers.

2. Brief Introduction of the Migrant Population of Beijing and Xinyang

Beijing is one of the biggest gathering place for migrant workers in China. By the end of 2012, Beijing's resident population is 20.69 million, of which the foreign resident population is 7.74 million, more than one-third of the resident population. Furthermore, in the foreign resident population, the migrant workers account for 84.4%. In recent years, Beijing's foreign population growth has become a major factor in the resident population growth. During the period of 2001-2012, the foreign resident population in Beijing has increased 5.11 million, an average annual increase of 465000 people, with an annual growth rate of 10.39 percent, far higher than the average annual growth rate of 3.72 percent of the resident population during 2001-2012. The proportion of Foreign population in the resident population has increased from 19.0% in 2001 to 37.4% in 2012, which means that in 2001 one out of five resident population is foreign population, while in 2012 to become one in three.

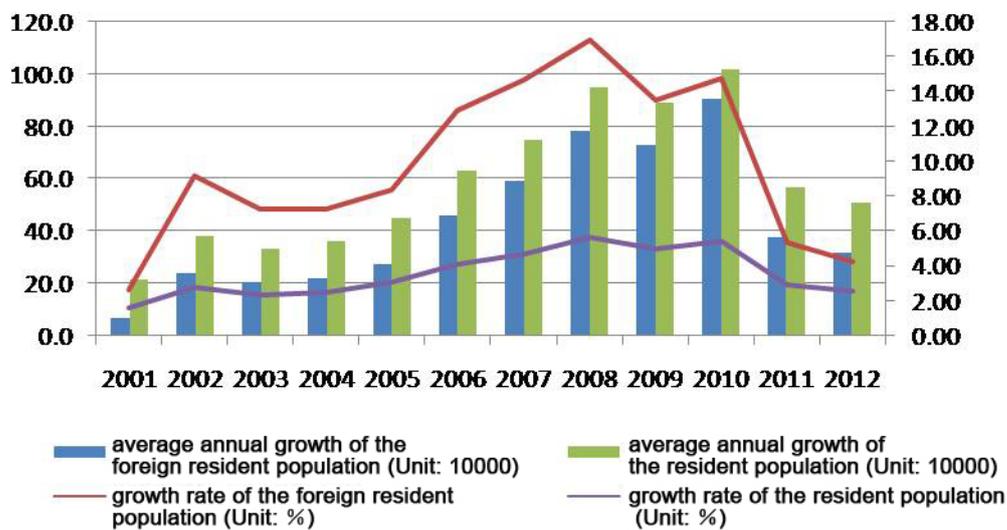

Figure 2: The Trends of the Foreign Resident Population and the Resident Population In Beijing

Source: the Project of Capital Regional Spatial Development Strategy

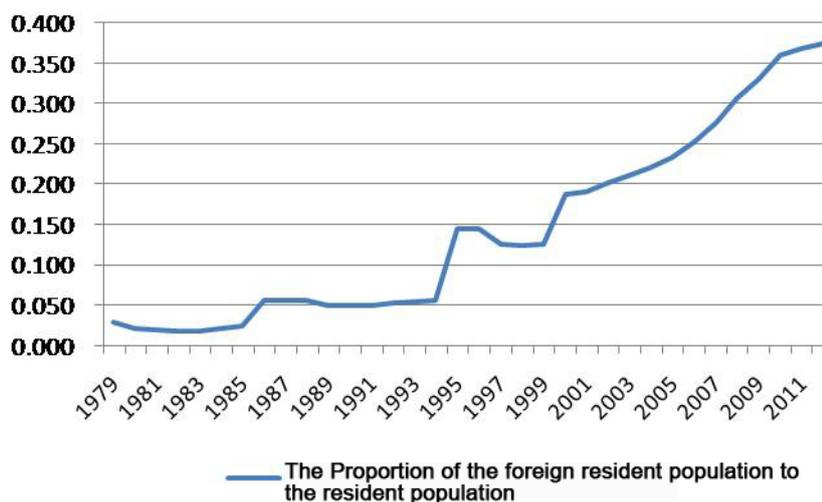

Figure 3: The Proportion of the Foreign Resident Population to the Resident Population In Beijing

Source: the Project of Capital Regional Spatial Development Strategy

Henan Province is a large labor-exporting province in China, and Xinyang is a large labor-exporting city in Henan. In fact, labor economy has become a prominent feature of Xinyang. From the year of 1990, the outflow population in Xinyang has gradually increased, especially after 2000, the outflow population growing from 1,170,000 in 2000 to 2,400,000 in 2010. The migrant workers from Xinyang mainly flow to the eastern developed regions, especially megacities such as Beijing and Shanghai. For Beijing, Hebei and Henan are the largest source of migrant population, and the migrant population from the city of Zhangjiakou and Xinyang respectively ranks first in these two provinces in Beijing.

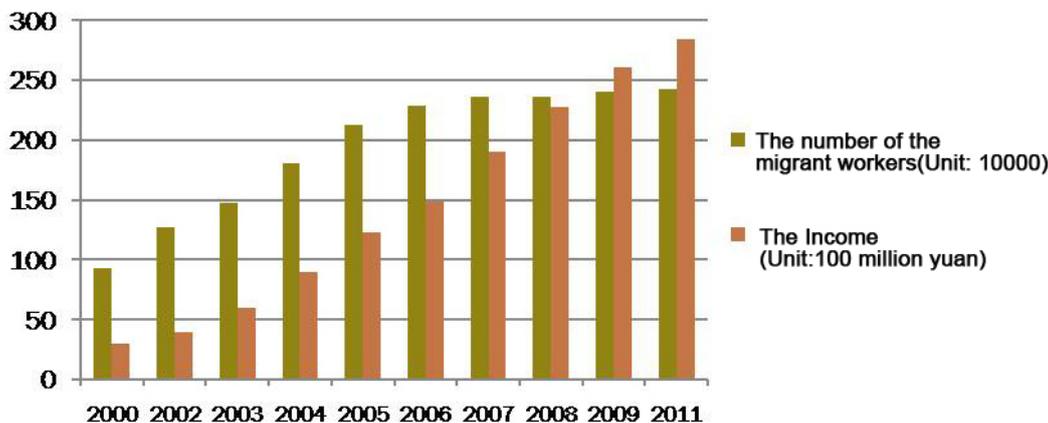

Figure 4: The Number of the Migrant Workers of Xinyang and The Migrant Workers' Income

Source: the Project of the Master Plan of Xinyang City

In a word, Beijing and Xinyang are respectively typical labor import and export cities. Beijing is one of the important destinations of Xinyang's outflow population, and the population from Xinyang also accounts for a large population in Beijing's migrant population. The author has participated in the Assessment of the Master Plan of Beijing City project (2011) and the Beijing 2049 research project (2010), and now is compiling both the Projects of Capital Regional Spatial Development Strategy and the Master Plan of Xinyang City. So, on the basis of the above projects, this paper takes Beijing and Xinyang as the research object, to study the migrant personnel flow's impact on urban planning.

3. Research Method

The research steps are as follows. Firstly, the author sent out questionnaires to the Xinyang migrant workers in Beijing to investigate their working and living conditions and their willingness of returning home. Secondly, the author did statistical analysis of retrieved questionnaires, and analyzed the living space of migrant workers both in Beijing and in Xinyang using GIS software, to find out the characteristics and problems of the spatial distribution.

In July 2013, we had a discussion with migrant workers from Xinyang who work in Beijing, and conducted a week-long survey. At last, a total of 100 valid questionnaires were collected. The respondents contain construction workers, restaurant waiters, engineering staff and other industry practitioners.

4. The Working and Living Situation of the Migrant Workers From Xinyang In Beijing

4.1 Statistical Analysis of the Questionnaire

Through statistical analysis of the questionnaire, we have a certain understanding of the migrant workers' working and living situation in Beijing.

According to survey statistics, respondents with college education and above accounted for only 25%, the majority of migrant workers belong to the low educational attainment. For the purpose of coming to Beijing, 80% of respondents indicated their purpose is to increase revenue and improve their living conditions, and they certainly achieved their purpose. But at the same time, asked if Xinyang and Beijing have the same job and income if they would choose out of work, more than 2/3 of people said they would not. Although compared in Xinyang, respondents' income has increased, but in fact, respondents monthly income is still below the average wage in Beijing (2012 Beijing's average monthly wage is 5,223 yuan). Half of the respondents monthly income is between 3000-5000 yuan, and more than 3/4 of respondents monthly income is below 5,000 yuan.

As to the status of marriage and children, 72.5% of respondents are married and have children, and 2/3 of married migrant workers' spouses and children live in Xinyang. It shows that the majority of migrant workers are separated with their families, which is caused by a variety of causes. Firstly, most of jobs offered for migrant workers in Beijing are manufacturing workers and construction workers, and these industries need more male employees, and less female. Secondly, migrant workers' children to school in Beijing is quite difficult and costly. In addition, the cost of living for a family in Beijing is far higher than a person. We had a further investigation of the respondents with the spouse and children in Beijing, and found that their children have chosen Beijing's general schools and key school, but not schools specially for the migrant workers' children. In response to our surprise, the respondents indicated that the quality of education in schools specially for the children of migrant workers is much lower than Beijing's general schools, not to mention the key schools, and the respondents who brought their children to Beijing from Xinyang have relatively high income levels, so they would rather spend more sponsorship fee to send their children to the general and key school.

In the living space distribution, the respondents mostly live in the regions between the Fifth Ring Road and Sixth Ring Road or in the suburban counties close to the center city in Beijing. In the choice of the type of housing, more respondents live in sheds, dormitories provided by the company or rental units in city villages. Most of the living conditions of migrant workers are very poor, such as the construction workers. Eight people live in a 10 square meter room, and the fan, the air conditioning and other facilities are not allowed to be installed.

In the entertainment and leisure activities, 40 percent of respondents said no leisure activities, and in the remaining 60% of the respondents, more than half would rather play cards with colleague or read books and go net surfing at home, only 10 percent of the respondents said they would go to parks, museums, cinemas, theaters, fitness facilities and other entertainment facilities. For most of the migrant workers, Beijing's leisure and entertainment consumption is too high, and most of the facilities are concentrated in the central city, for the migrant workers living in urban fringe areas too far away.

Asked about the difficulties of working and living in Beijing, the most common answers are the high property prices, high rent and serious air pollution, followed by lower income and costly medical care. Overall, Xinyang migrant workers in Beijing face with high living cost of the city, but get less income than the average of Beijing. They live in the urban fringe, difficult to integrate Beijing's colorful urban life, but also to endure the pain of separation with their families.

4.2 Spatial Analysis

To learn more about Beijing's migrant workers spatial distribution and accessibility of public facilities, we use spatial analysis for further study.

Capital Regional Spatial Development Strategy, the project the authors are participating in, has done spatial analysis on the proportion of the migrant population in different regions of Beijing, which shows that most of the migrant people live in the regions between the Fifth Ring Road and Sixth Ring Road, followed by the regions between the Fourth Ring Road and Fifth Ring Road and the suburban areas outside but close to the Sixth Ring Road, which is approximately consistent with the results of the questionnaire survey.

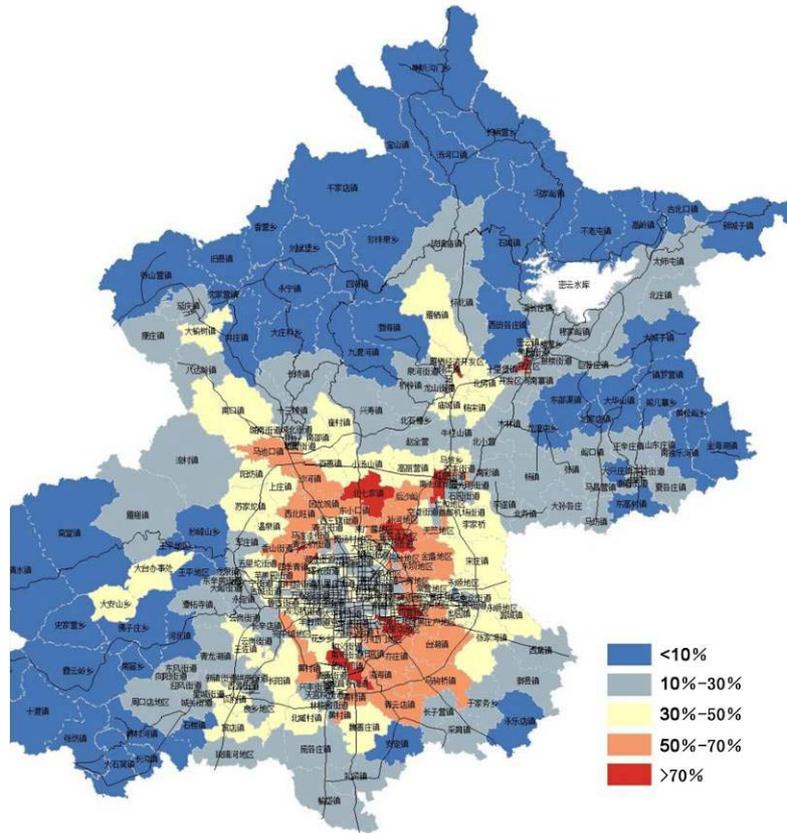

Figure 5: The Proportion of the Foreign Resident Population to the Resident Population

Source: the Project of Capital Regional Spatial Development Strategy

In order to study the accessibility of public facilities of different circle layer regions in Beijing, we selected a typical sector region, surrounding Beijing Metro First Line and Ba-tong Line within the Sixth Ring Road in the east area of the city as the study region. We took residential quarters (including city villages) as the basic research unit, the samples from the website- the Beijing Real Estate Transaction Management Network (www.bjfdc.gov.cn), and city villages from the Google map. We divided the residential quarters for different groups, including villas, highest-price commercial housing, high-price commercial housing, low-price commercial housing, lowest-price commercial housing, affordable housing, old housing before housing reform, the traditional courtyard houses, city villages, etc. Then we drew a figure of residential spatial distribution. In the public service facilities, we selected metro, primary school, hospital, business and park as the study object and drew figures of the distribution of the public facilities. Next, with the help of the method of shortest distance of ArcGIS, we calculated the average shortest distance to the public service facilities for each housing group. The smaller the shortest distance values, the more accessible the public services are. The results find out that the accessibility of public service facilities from the city center to the edge shows gradually decreasing feature. Therefore, the accessible of public service facilities in the urban fringe areas where most migrant workers live is relatively poor.

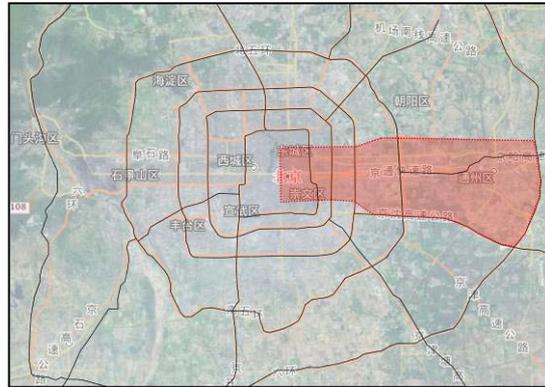

Figure 6: The Study Region

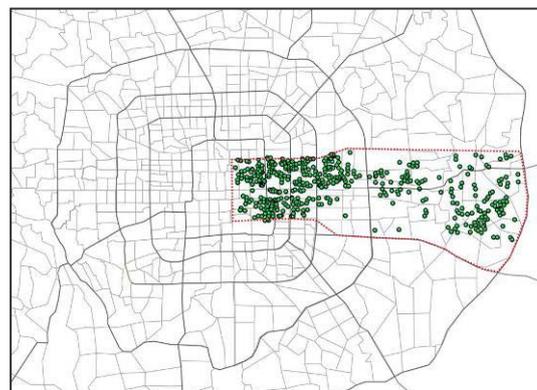

Figure 7: Spatial Distribution of the Sample Residential Quarters

Figure 8: Spatial Distribution of the Public Service Facilities

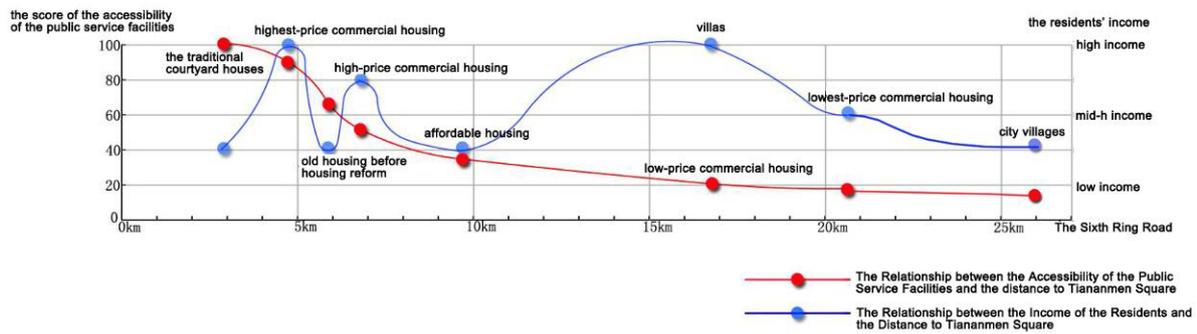

Figure 9: The Accessibility of the Public Service Facilities and the Income of the Residents of Different Groups

5. The Migrant Workers' Wishes, Trends and Motivation of Returning Home

The main purpose of the migrant workers working in the big city is to improve the income and improve their lives. 69% of peasant-workers go into the big city(Beijing) from Xinyang city in order to increase income and improve their living, according to the results of questionnaire survey. If there are the same income in Xinyang city, 68% peasant-workers won't choose to go out as a migrant worker. Also some migrant workers (20%) of Xinyang is the purpose of learning ability, opening field of vision, looking for better development. Small percentage of rural migrant workers (9%) is for the purpose that his family and himself live in the city and become city people, for the realization of urbanization.

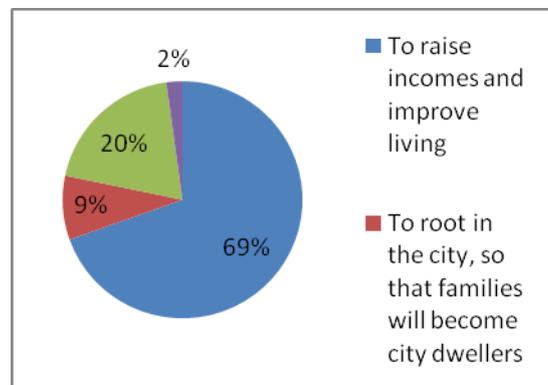

Figure 10: The purpose of migrant

The willingness of the migrant workers went back to hometown is strong, and the trend is obvious. Through the questionnaire survey, we found that 87.5% of migrant workers plan to leave Beijing, only 12.5% of the migrant workers plan to take root in Beijing. Migrant workers more tend to choose back to small city center or back to the villages and towns, after they leave the big cities. Questionnaire survey results showed that 46% of migrant workers will go back to Xinyang city center, 26.8% of people choose to return to villages, 14% back to the county towns, and a few people choose going to other urban development. Survey results reflect that at present most of the migrant worker plan to leave big cities, back home in the small and medium-sized cities and towns.

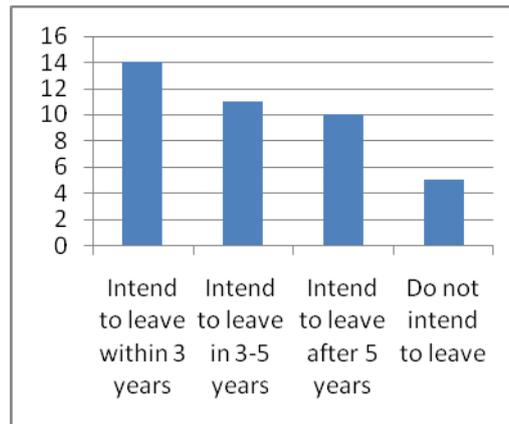

Figure 11: When would you leave Beijing

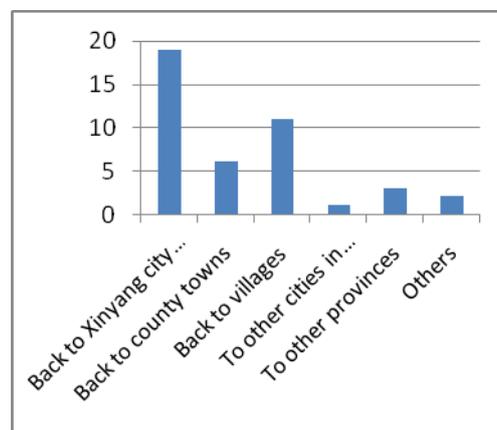

Figure 12: Where will you go after you leave Beijing

The impetuses of migrant workers returning home are that migrant workers are unable to reunite with their family. China's urbanization process is largely driven by the young rural migrant labor force. Because the cost of living in cities is higher, workers often work alone into the city, his family members are left behind in rural areas. Migrant workers flow between urban and rural areas, in a state of "migratory birds" which is used to describe half of urbanization. Left-behind in rural areas is "386199" (women, children and the elderly), so there is a lot of problems. Through questionnaire investigation, we found that main problems of rural migrant workers face are that they cannot be united with their families and that their children and old people can't get good care. The primary reason of migrant workers return home is want to reunite with my family (45.4%), followed by the good environment and little pollution in Xinyang(20%).

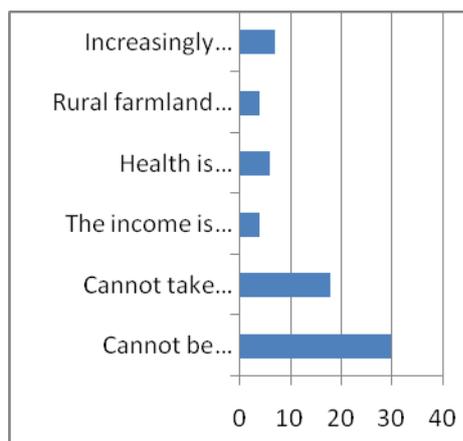

Figure 13: the main problem of migrant workers

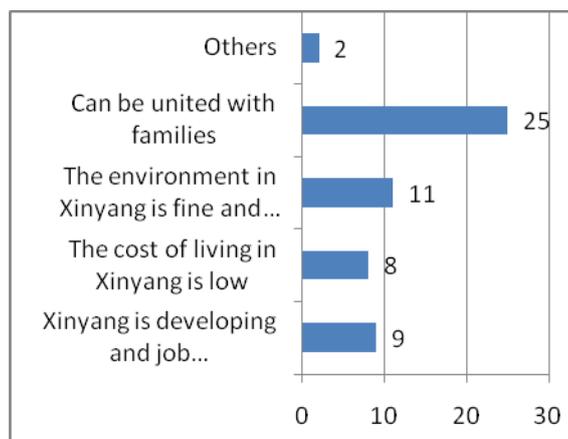

Figure 14: The reason back to Xinyang City

6. Conclusions and Suggestions

6.1 The Trend of Returning Home

Through the above analysis, we know that the main reason for the migrant is to improve income. Most of the migrant workers are planning to return home and work in their hometown in a few years. Migrant workers generally are plagued by apart with family for a long time. Area like Xinyang that people are going outside should provide a better working and living environment to attract migrants returned to census register area. China's urbanization has experienced 30 years of development, and the governments gradually change mind force from attaches great importance to the speed of urbanization to pay attention to the quality of urbanization. Under the new background, "migratory birds" urbanization is unsustainable. On one hand, migrant workers cannot enjoy the city, and are separated from their family, on the other hand it brings overpopulation problems in big cities. Migrant workers are stable employment and settlement in small or middle cities and towns is the trend of the times.

6.2 Suggestions for Beijing

Firstly, migrant workers need relatively low-cost, decent living space and basic living requirements. Beginning in 2009, Beijing began to implement the policy that migrant workers can apply for public rental housing residence. Public rental housing income limits for a single person is not more than 2000 yuan monthly, and for a family is not more than 3000 monthly. But for most of the migrant workers, whose monthly income is 3000-5000 yuan, they are not content to the income limits, but it's also expensive to rent ordinary housing for them, so they choose the city villages or the basement. Beijing should further refine the affordable housing policy, for different types, different income groups to develop multi-level affordable housing policy, to solve the housing problems of the sandwich layer. In addition, to alleviate the growing problem of residential segregation, we recommend introducing the living mode of

"big mixed with small settlements" which some scholars have proposed. We believe that this mode can not only better alleviate Residential Segregation, but also adapt to market mechanisms, and has a strong operability, either. This mode requires inhabited land planning to achieve mix of residential area, which means that in the the city and community level, the residential areas avoid over-concentration of homogeneous populations, while in the residential quarters and neighborhood level, the quarters maintain homogeneity, both for easily neighborhood development and construction, and the establishment of a sense of belonging and identity.

Secondly, as to the education problem of the migrant workers' children, although there have been a number of schools for migrant workers' children in Beijing, but most schools' teacher quality and hardware environment are much lower compared with the general schools in Beijing. Even if there are a few schools with better conditions, but some of them are also facing policy limitations and shortage of funds. As large population from Xinyang in Beijing, there are several schools run by people from Xinyang, such as Jingyuchen Shool, which has relatively much better conditions than other schools for migrant workers' children, and has been identified as "Beijing Private School Specialty building" project pilot schools by the Beijing Municipal Education Commission in 2007. But this school still faces a serious problem of insufficient funding, and the situation of the teachers's income equal to the restaurant waiters' leads to serious teacher job-hopping phenomenon. Beijing should strengthen the implementation of the support and relief policies for the schools for the migrant workers' children, or try to make the general schools or key schools open campus or affiliated class for migrant workers' children to solve their children's schooling. In addition, with the evacuation of the functions of city center, Beijing should further implement the equalization of public services.

In addition to the concern for basic needs of life, but also we should concern about the cultural and spirit demand of the migrant workers, to provide welfare or low cost entertainment space for them. Such as for construction workers, construction site can regularly show movies or provide the creation space such as chess room, video halls and so on.

6.3 Suggestions for Xinyang

Xinyang should create conditions (employment environment, living environment, public services, infrastructure, etc.) to attract migrant workers to return home, to provide a good environment for them.

Most people would give top priority to the beautiful landscape environment as the advantages of Xinyang, which is the most mportant factor that attracting people to go back home for development. Therefore, urban planning and landscape construction of Xinyang should put environment protecting on the first place. About half of the respondents chose economic and industrial development as the most needed improvement area, so we can conclude that backward economic is the biggest factor to cause the outflow. Followed by nearly 1/4 of the respondents chose public service facilities construction and ecological environment construction and parkland as the most needed improvement area. Therefore, in the future urban development of Xinyang, we should protect the beautiful Landscape first, and seek a development path which is harmony with the natural. And we also should strengthenthe construction of medical, education and other public service facilities.

For the choice of living space, more than half of respondents wished they can purchase their own housing in Xinyang urban district, especially in Yangshan Area which is in rapid expansion recent years. This shows that most Xinyang migrant workers prefer to live in urban district with good public service facilities. On the choice of housing types, each with about 40% of the respondents selected multi-storey buildings and high-rise buildings. The residential land planning shoud provide diverse housing to meet the needs of different groups.

1. Introduction

Regional differences in economic development always drive the expansion of human migration activity. China is witnessing a large-scale population migration since the 1990s, as the migration control policies are gradually adjusted and eased. According to Report on China's Migrant Population Development in 2012, every year about 200 million people flow back and forth between the towns and villages periodically in the last five years. Large-scale migration exerts a remarkable influence on both the output areas and input areas. Shanghai is the economic center of China and the central city of the Yangtze River Delta city region, which plays an important role in the global economy. During the past decades, Shanghai has been undertaking the role of regional population input area.

The rapid increase in the population of Shanghai is mainly characterized by two features in the 2000-2010 decade. Firstly, population growth occurred mainly in the outskirts of Shanghai, especially in developed suburban cities, like Jiading, Minhang and Songjiang District. The population inflow rate of these three districts is over 150% (Figure 1). The notable growth of population is mainly contributed by migrants. In 2010, the population of people from other provinces has increased to 8977 thousand, increasing 193.6% compared with the amount in 2000. This rapid growth trend began in the late 1990s, while the population growth of natives over the same period was relatively stable (Figure 2). According to the latest statistics from the end of 2012, migrant population has increased to 9602.4 thousand, accounting for 40.3% of the whole residential population. Among them, more than 70% are rural workers.

With intense growth of the population in Shanghai as well as the lacking of construction land in the central city in the late 1990s, Shanghai has learned from the concepts and practices of new towns abroad. The urban system of Shanghai consists of one central city, 9 suburban cities (including Jiading) and 60 suburban towns according to the comprehensive plan revised in 2006, namely "1-9-6-6" system. The government hopes to strengthen the suburban cities and towns to evacuate the over-crowded population in the central city. But comparing to the foreign new town, most of the suburban cities and towns founded on the base of former counties or townships have long histories, absolutely not "new".

Both the local farmers' migration from villages to towns or suburban city and the migration of people from other provinces have produced a profound impact on the development of suburban towns and the spatial structure of suburban city as well. As an important component of the whole urban system of Shanghai, the urbanization process and urban development issues of suburban towns deserve some attention. This paper selected one of the suburban cities, Jiading city, as a case of empirical research. Several towns and villages within jurisdiction were discussed. The first part introduced the theoretical framework and analysis methods of this study. The second part was the detailed empirical study. The situation of migration and social structure were introduced first, and then we analyzed the issues of suburban towns in urbanization, public services, social governance, rural landscape, etc. The mechanism of these issues was discussed later. And the third part put forward some solutions to these issues and then drew the final conclusion.

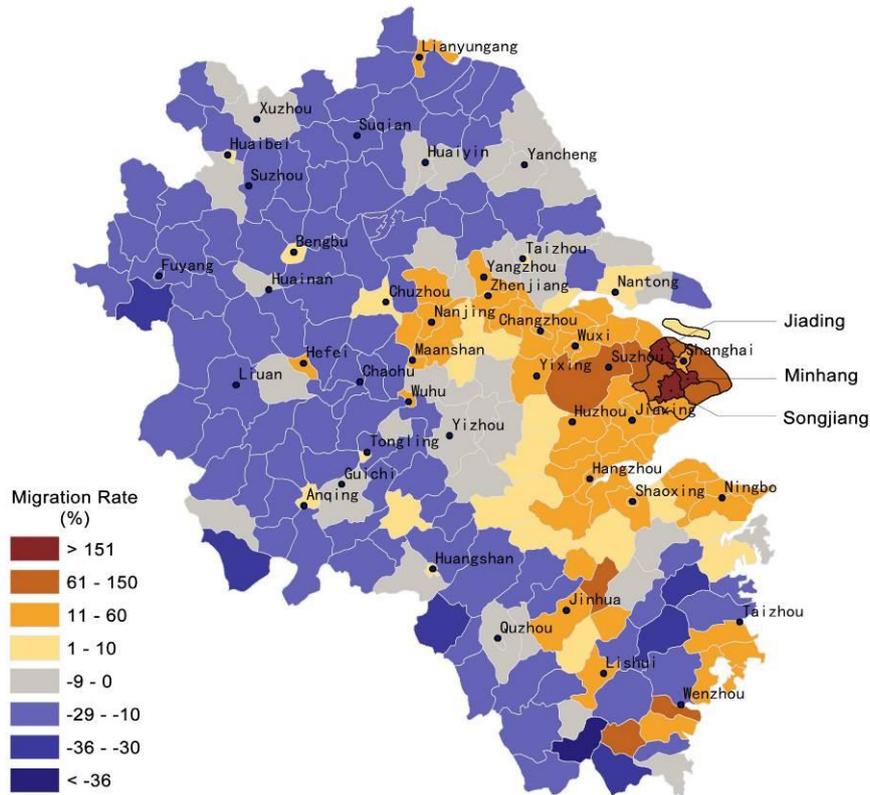

Figure 1: Shanghai, Jiangsu, Zhejiang and Anhui region's population migration (2010)

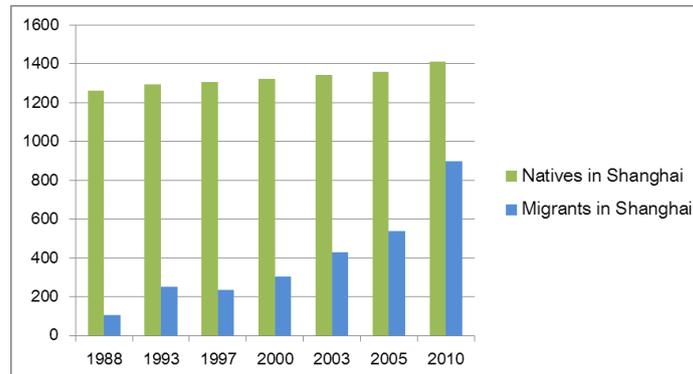

Figure 2: population growth of natives and migrants in Shanghai since 1988

2. Research method

2.1 Theoretical framework

Based on the classic migration law proposed by Ravenstein in 1885, the rural-to-urban migration is realized step by step. Farmers near the city move to the city first, so the rural area around the city becomes a vacancy, which makes it possible that rural population from remote areas can fill this vacancy. Through this process, the attraction of cities gradually spread to the edge of the city. The natives move out and the former living space become a "demographic vacancy zone" to attract new migrants. This is the first population "two-way flow" model.

This model will be expanded and used to explain the internal and external migration in suburban cities of Shanghai (Figure 3). Internal migration is presented by "Village - Town - City" progressive migration, namely the local residents can purchase real estate in towns and cities to achieve the "village - town", "village - city" and "town - city" residence changes. In recent years, great efforts have been made to develop high-quality public

service facilities and real estates in suburban city, leading to a rapid population growth there. And the suburban cities have been absorbing the population from the suburban towns, rural area and even the core city of Shanghai. So local farmers generally tend to choose "village – City" migration, rather than "village - town" migration. Meanwhile, because of the potential bonuses of holding rural household registration, those who have been living and working in cities still hold rural household and they tend to stay in the cities on weekdays and enjoy their holidays in rural area.

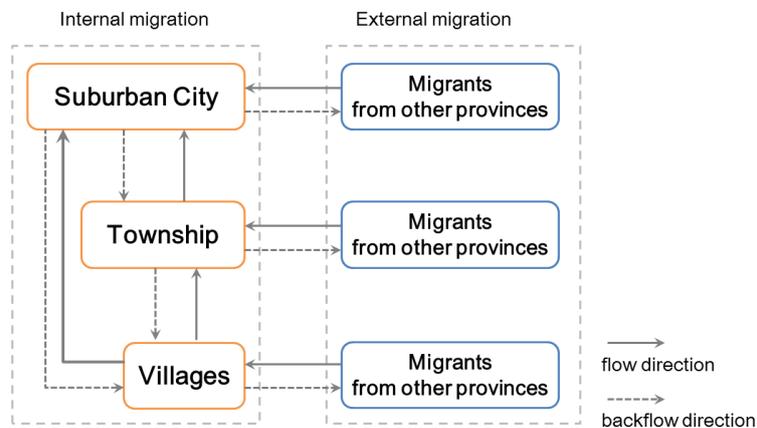

Figure 3: population "two-way flow" model

Many migrants from other provinces came to Shanghai to earn a better life, forming the external migration. Suburban towns' industrial development provides more jobs and attracts substantial population inflows. In addition to employment opportunities, the cost of living is also a vital factor considered by these migrants. Suburban towns and villages become the first choice for them to sojourn in because of migrants' low income and the low cost of living in towns and villages. "Vacancy zone" has also provided the living space for the migrants coming from other provinces. Rental housing in the villages produces mutual benefit between local farmers and migrants. The "two-way flow" migration had resulted in the dramatic changes in social structure, influencing the social and economic development. We try to analyze and interpret the issues of suburban towns from this perspective.

2.2 Case selection and analysis method

Jiading city which owns a profound history of nearly 800 years, is selected as a case study. Jiading County was set up in the Southern Song Dynasty (AD 1217). In 1958, Jiading became a county of Shanghai from Jiangsu Province through the adjustment of administrative division by State Council. In 1992, Jiading became a suburban district of Shanghai. Today, the administrative area of Jiading includes 7 towns (Anting, Malu, Nanxiang, Jiangqiao, Xuhang, Waigang, Huating), 3 street committees (Jiading, Xinchenglu and Zhenxin), Jiading Industrial Park and Juyuan New Area (Figure 4), consists of 126 neighborhood committees, 147 village committees, 2034 villages. Jiading city is positioned as an important node city within Yangtze River Delta. "1 core + 2 clusters" are the key constructing area of Jiading city. "1 core" means the center part of the city, including Jiading and Xinchenglu Street Committees, Jiading Industrial Park (southern part), Malu town and Juyuan New Area. "2 clusters" are Anting cluster, and Nanxiang Jiangqiao cluster.

The relevant census data and statistical yearbooks were used in macro-level analysis, while micro-level research was mainly conducted through field surveys of the township and village and interviews with residents.

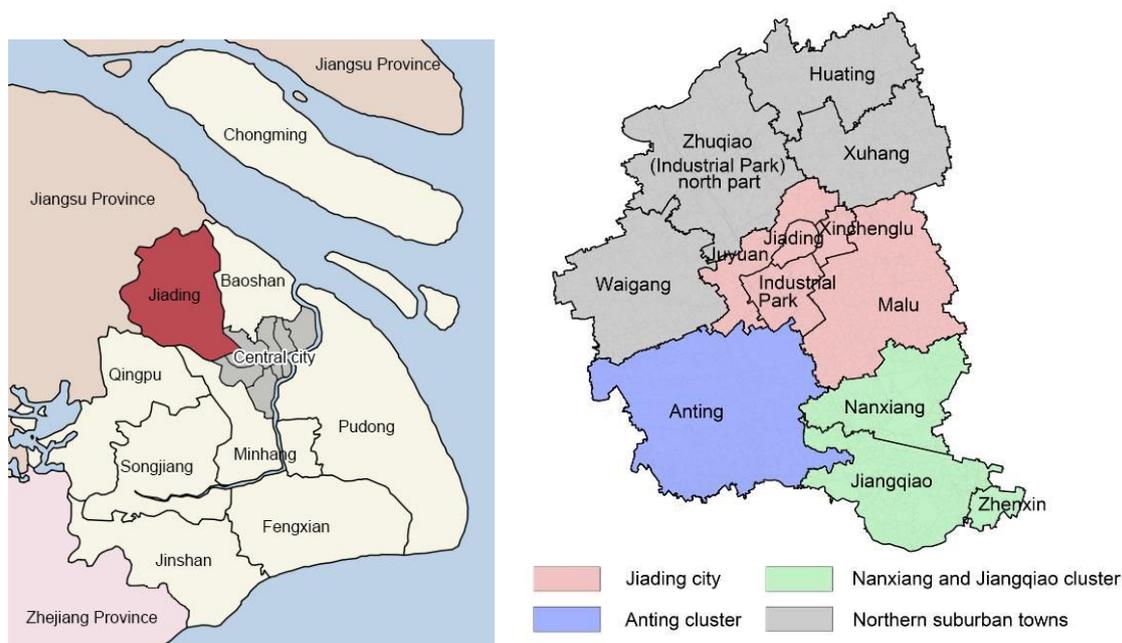

Figure 4: the location and internal administrative division of Jiading city

3. Case Study

3.1 Population migration and social structure transition in Jiading city in recent years

Before 1990s, the scale of internal migration in Shanghai is relatively stable because of the strict policy constraints. People who move from village to towns and suburban city achieve their identity transformation mainly through marriage, schooling and other means. With the rapid economic and social development after the reform and opening, especially after the housing system reform in 1990s, rural people can purchase the urban real estate to become new citizens. Driven by the early welfare differences between the rural and urban household registration, such behaviors increased. In the past 10 years, the development of real estate in Jiading city has made it possible for rural people to settle in city. As the social welfare gap between the rural and urban household registration has been gradually reduced and the bonus of the rural identity appears, many rural people choose to retain the rural household registration. They may live and work in cities, but they will never change their identities and abandon what they own in their original villages including the farmland and house site, etc. On the other hand, with the expansion of downtown area of Jiading and the construction of suburban towns' industrial parks, a lot of village land were transformed into urban construction land. Many farmers passively moved to Jiading city, and the household registration and employment were transformed correspondingly.

In addition to the internal migration, the external migration continues to grow with the rapid economic development in Jiading, especially the boom of manufacture. According to the latest demographic census, 1471 thousand people live in Jiading in 2010, among which 828 thousand are from other provinces. The amount of migrants is far beyond the natives. In 2000, only 162 thousand migrants live in Jiading. 89% of these migrants come from rural area in other provinces. In terms of the age structure, most of the migrants are of prime-working-age, slowing the aging process in this region (Figure 5). Most of these migrants are of low-level education, 77% of the population are uneducated or just have finished their primary school or junior middle school education. Migrants who have got bachelor degree or above account for only 2.84% (Figure 6). In addition, the vast majority of migrant workers distribute in manufacturing, construction, retail and wholesale trade, accommodation and catering industry and other low-end industries.

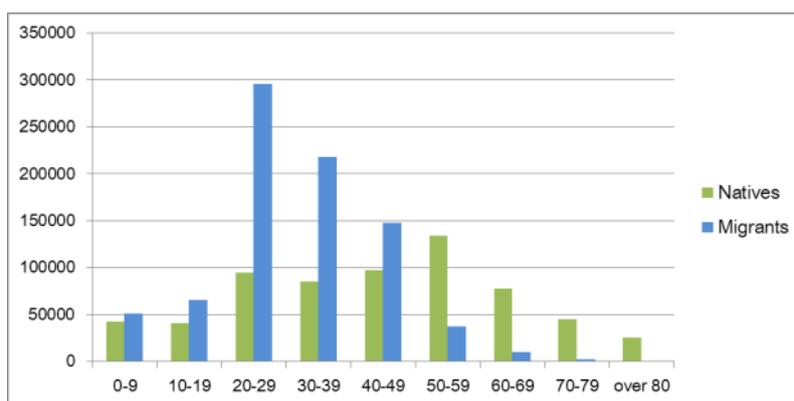

Figure 5: the comparison of age structures of natives and migrants in Jiading

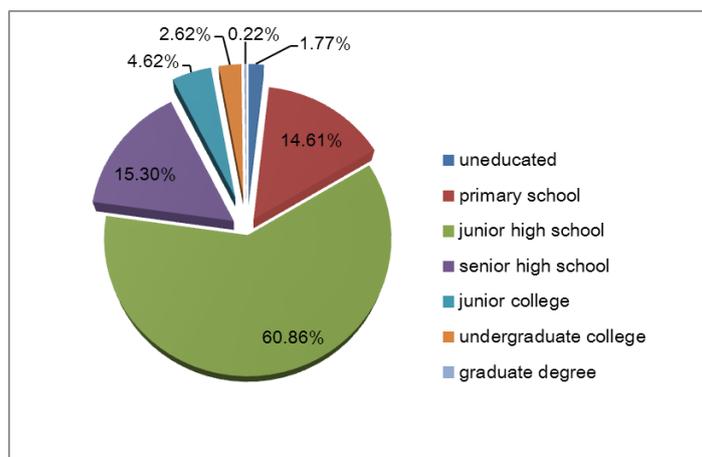

Figure 6: the foreign resident population level of education

Jiading District was listed as an important industrial, scientific and technological satellite suburban city by Shanghai government in 1958, which laid its early industrial foundation. Since reform and opening, the accelerated economic development, especially in the manufacturing industry, attracted a large amount of migrant workers. So the migration dynamic is industry-driven. Since 2000, Jiading becomes a key suburban comprehension city in order to evacuate the dense population of Shanghai central city. Urban construction and public service facilities are also highly valued in addition to industrial development, so living quality and city scape have been greatly improved. Migrants come to Jiading not only to make more money but also to enjoy the good public services. So the migration dynamic is both industry-driven and welfare-driven while the local rural people’s migration is driven mainly by high-quality welfare in Jiading city.

3.2 Issues of the development of suburban towns

Migrants from other provinces have become the majority of inhabitants of Jiading in the past 10years. In terms of quantity, they are the "protagonist" of the city. These young labor force have made significant contribution to the economy development of Jiading, providing a primitive of capital accumulation and making up for the local insufficient labor supply. In this process, a lot of problems have emerged in suburban towns. Many industrial zones which are just in the administrative area of suburban towns attract a lot of migrants. Most of the migrant workers live in villages nearby, not being able to enjoy the urban life. The place they live in and that they work in are totally different. Driven by the different level of public services provided by Jiading city and suburban towns, the local people in rural area are eager to have good public services in Jiading city, which further expanding the imbalance between supply and demand of public service facilities. The great increase of migrants also bring burdens to the social governance of suburban towns and villages, the intersection of natives and migrants sparked a lot of social contradictions. Since both the local

population and migrants are not of the "Entire Migration", the social structure of rural area is not stable and the autonomous capacity of villages decreases. The physical environment of rural areas features a sharp decay. These problems will be discussed in detail hereinafter.

3.2.1 Urbanization lags behind economy development

The industry of Jiading is scattered in each suburban town. The economic growth is mainly driven by secondary industry rather than agriculture in each town. As can be seen from the above-scale industrial output value (Table 1), the suburban towns have solid foundation for industry development. Since the GDP of each administrative unit has not been published, above-scale industrial output value and agricultural output value are used to characterize the industrial strength. The industrial output value of suburban towns is not low. Especially the industry strength of Zhuqiao town where Jiading Industrial Park (north part) is located leads the city's townships.

Spatial unit	Administrative unit	Above-scale industrial output value	Agricultural output value
Jiading city	Jiading	260244	0
	Xinchenglu	5214	0
	Juyuan	312239	1159
	Malu	4356024	7609
Anting cluster	Anting	8230165	8830
Nanxiang and Jiangqiao cluster	Nanxiang	1681236	1746
	Jiangqiao	1823061	3277
	Zhenxin	3134	0
Suburban towns	Xuhang	1474829	21582
	Zhuqiao	6391473	31095
	Waigang	1322556	28765
	Huating	602879	25122

Table 1: industrial output value and agricultural output value in 2012 (10 thousand yuan)

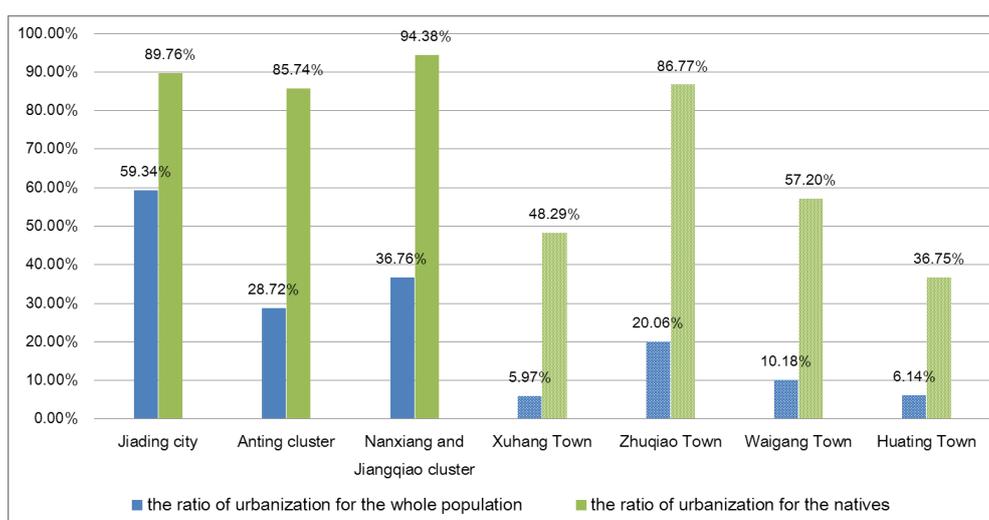

Figure 7: the ratio of urbanization for the whole population and for the natives

Despite the high level of economic development, the level of urbanization in suburban towns is relatively far below that in Jiading city (Figure 7). People who live in

rural area are considered rural population by the statistical department. So those migrant who work in town and live in villages are counted in rural population, resulting in a relatively low rate of urbanization. Through the ratio of urbanization for the natives, we can easily infer that most migrant workers live in rural areas of suburban towns (Figure 7).

Most of these migrants do not work in agriculture, but in the industrial park, so the urbanization rate is underrated. But it's also not appropriate to count these typical "semi-urbanization population" in urban population. Limited by their income level, most of them choose to live in poor-quality but cheap rental housing in villages (Figure 8). These houses are lack of separate bathrooms. Migrants live tough lives in the Chinese style "slums".

Figure 8: the rental housing in rural area of suburban towns

In addition, the industrial parks and suburban towns are split in space and function, lacking of good connection. Public services and commercial facilities are not sufficient in industrial parks, which give birth to a lot of spontaneous informal market to provide catering, retail and other commercial services for industrial workers. Because of the lack of updates and maintenance, the space quality of townships is just declining. The inadequacy of support systems and lack of updated power have restricted the healthy development of suburban towns.

3.2.2 Low level of public service provision in suburban towns

Over a long period of time, the public service provision levels are similar in each town and the spatial layout is flat. The educational, medical facilities covers the whole administrative area of suburban towns, and people can get long time education from kindergarten to high school education and basic health care services. Since 2000, along with the public service facilities construction in Jiading city, public service facilities show a polarization trend. The supply capacity of public service facilities in towns gradually weakens, while the public services supply level of Jiading city continues to strengthen. New high-quality schools and hospitals were set up in Jiading city. By 2012, Jiading No.1 Senior High School is the only key high school in Jiading defined by the Shanghai education department. From the composition of students enrolled in 2010, namely where they had their junior high school education, we can see most of the students came from Jiading city, Anting cluster and Nanxiang and Jiangqiao cluster. Very little students had their junior high school education in Xuhang, Zhuqiao, Waigang and Huating town (Figure 9).

The sharp difference stems from the agglomeration of high-quality education resources (both in hardware and software) in Jiading city. The education quality in suburban towns cannot be compared to that in Jiading city in terms of teachers, hardware and other aspects. Another factor can't be ignored is that migrants students who do not own local household registration are not allowed to participate in the entrance examination in Shanghai. In recent years, the migrant students account for a large proportion in primary and junior middle schools in towns. For example, over 60% of the students in Loutang primary school located in Zhuqiao Town are children of migrant workers. The natives are reluctant to send their children to these schools full of migrant children for the quantity of local students in these

towns' public school is limited. Though these public schools have already enrolled many migrant children, it cannot meet the needs of all school-age migrant children. So 14 private primary school were set up for these migrant children to receive basic education.

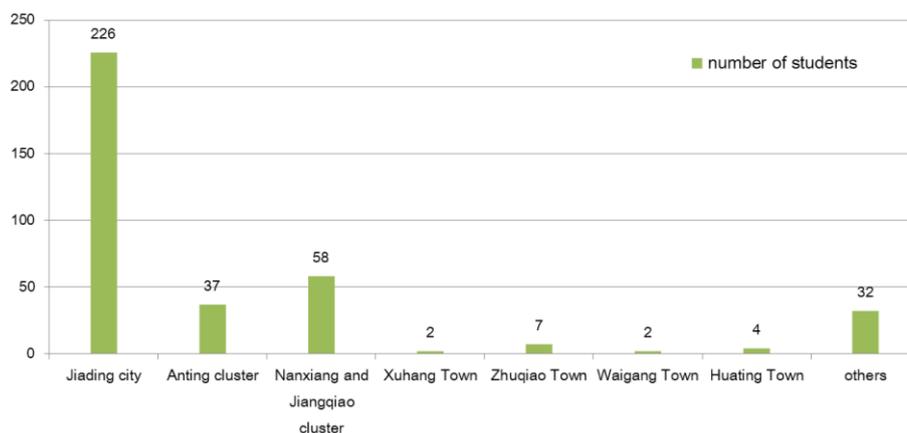

Figure 9: composition of students enrolled in 2010 by Jiading No.1 Senior High School

The expanding gap of the public service quality between Jiading city and suburban towns is becoming a key drive for the natives to purchase housing in Jiading city to let their children receive high-quality education. In this process, the social segregation thus forms.

3.2.3 The arise of social conflicts increase the burdens on social governance costs

Massive floating population increases the difficulty of social governance, directly bringing great pressure on public security, city management, etc. Social security has aroused public concern because immigration crime has become an important restrictive factor to the social development. According to the data by Jiading Prosecutor's Office, among all the accepted crime cases, 84.8% of them were immigration crime in 2007. This proportion continues to enlarge in recent years (Cheng and Wang, 2009). Although the number of migrants who conduct crimes is very small, it has greatly disturbed the social order and affected people's sense of security. Despite the explosive growth of floating population, the corresponding growth of the number of administrative staff seems very inadequate. Taking the police as example, there are 1,400 policemen in 2000, and in 2005 the number reached 1,500. While at the same time, the floating population has increased from 26 million people in 2000 to 52 million in 2005, an increase of 100%, increasing the police department's workload and difficulty.

In the micro-level rural surveys, social conflicts and security has become a topic of great concern to local villagers. Pan Village (Figure 10), located in Zhuqiao Town, is an example to reveal the problems of rural area in suburban town. There are currently 26 families, including 56 natives living in the village. According to the village leader, around 158 migrants rent housing to live in the village. The migrant population has greatly exceeded the local population. About 10 years ago, there were only a dozen migrants here.

Figure 10: the layout of Pan Village

The local interviewees said they were concerned about the security condition and they had to frequently check whether they had locked the door. To prevent theft, cash and valuables are not safe to put in home. In Chinese traditional countryside, people don't need to close the doors at night because people are familiar with each other, namely "acquaintance society". But such state has ceased to exist after the inflow of migrants. The conflicts between landlords and tenants often emerge due to some trivial matters. Some crimes conducted by migrants did happen in the past few years. The migrants are discriminated in villages. Some of the migrant interviewees said that once the landlord or other villagers lost some belongings, the migrants were always under suspicion. The innocent migrants are therefore "stigmatized", and they think it's unfair, but helpless. The massive influx of migrants as well as the young people moving out from villages have brought great change to the social structure, and the original "acquaintance society" is broken, which reduces autonomy ability of villages.

3.2.4 The physical environment of rural areas features a sharp decay

The social structure is totally changed in some major holidays, like the Spring Festival. In these days, 80% of the migrants will go back home and stay around one month. At the same time, people who have the ability to move out of the village will also return to spend New Year with family relatives. Therefore, the social structure shows a seasonal replacement process. Migration also affects the rural character and physical environment. On one hand, those young and capable people have moved out or just return on holidays, the self-renewal ability of the rural area is diminished. The rural housings were mainly built in the 1980s to the 1990s, so most of the housing has been very dilapidated. Furthermore, driven by the temptation to rent, the local villagers try to build more cottages on the ground or transform the first floor of their main house to provide more rental housings. We found that every household had built several rental housings in the past decade. Each house has the average of 5 rooms to rent, and few families even have as many as up to 20 rooms (Figure 11). Since the existence of market demand and interests, this phenomenon is difficult to forbid. The Government is also very clear that migrant workers cannot rent such low-cost housing in the formal market. If the government dismantle these illegal buildings rigidly, it will not only stimulate the conflicts between local farmers and government but also affect the industry development of Jiading city. However, profit-seeking behavior of individuals has brought in the overall decline of physical space in rural area. On the other hand, the rental housing is just a temporary residence for the migrant workers. The lack of local identity will not restrain their misconduct to the physical environment, like littering, spitting, etc.

Figure 11: inner space of rental housing in rural area

With the gradual increase of migrant workers, the potential market demand is gradually emerging. Some migrants start to operate grocery stores, providing basic commodities for the residents around (Figure 12). During the investigation, we found that these grocery consumer groups showing a significant geographical features, namely people from one specific province will only consume in the store operated by people from the same province. These informal organizations are very cohesive. Various social groups formed their own sub-culture, giving rise to conflicts and collisions in the traditional enclosed village.

Figure 12: spontaneous formation of commercial facilities

3.3 Interpretation of these issues

3.3.1 Administrative power conduct a great effect on the urban and rural development

In China, the urban construction is always influenced by administrative power. Suburban towns are always neglected by the government, while the government has attached particular importance to the construction of suburb cities, like Jiading, in the past decade. Anting cluster and Nanxiang-Jiangqiao cluster are also valued as these areas are adjacent to the central city of Shanghai. The northern suburban towns can hardly obtain permission for construction lands from superior government. Over the years, some towns have no public construction projects involving education, health care and other social undertakings. The migrants living in the villages around the township cannot get high-quality public services. The level and quality of urbanization lags behind the economy development. New industrial projects in these towns have taken up a lot of farmland and village land, but most of resettlement sites are in Jiading city, which makes a lot of local villagers move to Jiading city. Suburb towns can hardly attract local people to live there.

Although the construction of suburban city is very important, suburban towns are also key units of the urban system in the process of the spatial structure optimization.

3.3.2 Incomplete "two-way flow" migration causes the instability in social structure

For the migrants, they come to Shanghai for better economic benefits and good public

services, but it's hard for them to complete the total migration and become "urbanized". First, they cannot adapt to the local culture and language immediately and they have to endure the exclusion of the natives. They tend to choose spontaneous isolation, namely living in those informal social groups formed by people from the same place, and then some similar "ethnic enclaves" are formed. Under this process, the traditional rural society has changed from the original closed community into a heterogeneous community composed of several isolated social groups. They hope to receive an ethical and social exchange and mutual assistance through these spontaneous formation of "social circle". In fact, for those just moving in Shanghai, this is also a special kind of social capital (Zhang, 2008). Although many migrants have settled and gradually adapted to the local life, but it is difficult to achieve complete assimilation. On the one hand, they will face some institutional barriers for welfare, leading to social group segregation. On the other hand, the traditional Chinese people have deep local complex, so they cannot totally leave their hometown where the elders live, that's why there's always large scale transport during the traditional Spring Festival.

For the natives, they want to enjoy the urban life and convenient services and facilities, but also hope to return to the quiet villages at the weekend to enjoy the countryside life. The local people is not willing to give up their rural household registration and homestead. In fact, there lacks of formal withdrawal mechanism. In many rural families, only the elder people hold rural household registration. When the elderly die, although the government can legally reclaim homestead, housing as the attachment of homestead can be inherited by their children.

4. Discussions and Solutions

In this part, we put forward some suggestion for the future development of suburban towns.

4.1 *Welfare enhancing is the priority of urbanization*

Aspirations for a better life is the motivations of migration. The migration dynamic is both industry-driven and welfare-driven in Shanghai suburbs. The living environment and public services in suburban towns should be enhanced, otherwise these suburban towns can hardly attract high-level talented persons to work and live there, which will affect the process of industrial structure adjustment and optimization. High quality of public services and service levels will also attract local peasants to live in towns. So welfare enhancing and people-oriented idea are always the priority of urbanization. A good township will also support the industry development.

4.2 *"Smart shrinking" strategy should be implemented in rural area*

In Shanghai, most of those who hold rural household registration are hardly engaged in agriculture. According to the statistical data, the agricultural income of rural family is less than 5% in average. Their lifestyle is almost the same as those living in cities. The gradually reducing number of farmers will finally result in the shrinking of rural areas. Despite the dwindling number of farmers, the housing area continues to increase. It can be inferred that farmers tend to build more housing even if they do not live in, they can rent these housing to migrants. In fact, some rural area is never traditional countryside scenes. For those chaos and dilapidated rural area, "Smart shrinking" strategy should be implemented. Farmers should be guided to abandon the homestead in rural area and live in new housing in towns provided by the government. At the same time, those migrants living in villages cannot be ignores. The government should increase the supply of low-priced housing market.

4.3 *Self-management system of migrants is expected to be explored*

The invasion of migrants changed the original social structure in suburban towns and rural areas. The increase of conflicts between natives and migrants and the difficulty of social governance cannot be ignored. Self-management system of migrants should be explored to

guide these migrants to integrate into local communities. They should be allowed to participate in community management. In this way, the self-management organization will guide them regulate their own behavior, which is helpful to avoid social conflicts and promote harmony.

5. Conclusion

Suburban towns have become main settlements for migrant workers under the circumstance of "two-way flow". In the process of dramatic social structure transition, the development problems of suburban towns emerged. The root of the problem is both related to the neglect of suburban towns by the superior government and the incomplete "two-way flow" migration. Facing with these dilemmas, we argue that the welfare of migrants should be valued and people-oriented idea should be always the priority in urbanization process. Public service facilities and physical environment in suburban towns should be strengthened to attract more local people to live in towns. The self-management system for migrants should be explored to avoid social conflicts and promote harmony. Considering the lasting decline of rural population, "smart shrinking" strategy should be implemented in some decaying villages.

It is a common way to redistribute urban residents through the development of suburban cities and towns, but it becomes more complicated in this migration age. The case study of Jiading illustrates the importance of analyzing the migration and social structure transition process to figure out the mechanism of these problems.

“Utilization Analysis of Baghdad City Urban Waterfront”

Alwehab, Abdelwehab
University of Baghdad, Iraq

Synopsis : Urban waterfronts are vital components of the urban landscape for cities with such areas. There are legal as well as planning implications for optimizing land uses within. An essential element to a successful policy for developing land strips along the river basin is a clear definition backed by a legal framework. A review of number of examples from different parts of the world indicates no universal approach to dealing with areas adjacent to water bodies . A survey of land uses along the waterfront of the city of Baghdad clearly indicates underutilization ,which constitute a social and economic loss to urban residents.

1. Introduction

Urban Waterfronts for cities that are dissected by rivers are among the most important natural resources possessed by these cities. Benefits provided by the river to the city can not be confined to aspects of aesthetic and recreational advantages ,but extends also to the economic and social aspects, so dealing with areas adjacent to river banks pose critical issues and should be of interest to urban planning professionals and the general population of the city alike.

The continual increase of urban residents in general generates pressure on land through competition between various and sometimes incompatible land uses. The clearest form of competition is evident in the increased demand for land for uses that offer higher financial returns directly at the expense of uses that provide free public service to residents. The banks of the rivers in cities may be among the most obvious losers in such a competition, given the limited supply versus high demand on the ground within this land strip given the natural attraction characteristics for a wide range of economic activities. Among the principal goals adopted by decision-makers with respect to urban waterfronts is that these banks should be available primarily to provide efficiently for the needs of the city's environmental, economic, social and entertainment demands of city residents, in order to maximize benefits that are sustainable for generations to come .

2. Objective of this research

The main objective of this research in its first part is to review a sample of policies that must be followed to deal with waterfronts within urban areas. This objective through presenting an overview of international case studies of selected cities which successfully dealt with this aspect. The second part of the research is an attempt to assess the uses of the land adjacent to the Tigris river waterfront within the city of Baghdad, and evaluate the compatibility of current land uses to planning, legal, and urban design policies. The evaluation is in light of existing and declared statutes and policies put in place in order to achieve maximum benefits, and allow the proper exploitation of waterfront at various levels of development potential.

This article in general is trying to tackle the following questions: -

- . What are the appropriate land uses of urban waterfronts.
- . What are the principles that guide urban design of land adjacent to the river.
- . What are the existing Laws that govern land uses within waterfronts in Iraq.
- . What is the nature of land uses adjacent to the Tigris River in Baghdad.
- . The conformity of the current land uses to declared planning and legal requirements

3. Research hypothesis

The research assumes that there is clear imbalance in the utilization of the waterfront contrary to legal and urban design objectives laid out in legislations and urban master plans within the city of Baghdad. This condition is due to the lack of a clear policy and vision in dealing with these critical areas that are of utmost importance for a city like Baghdad, which is situated within the dry arid climate region. In addition, the research assumes that the current land uses do not reflect the optimal use of these spaces, and thus is reflected negatively on the environmental, economic, and social development of the city. For the purpose of testing the hypothesis, a land use field survey was conducted and results were analyzed through the use of the geographic information systems (GIS) technology to derive indicators supporting the hypothesis.

4. Urban Waterfront Definition

There is no specific definition agreed upon of the concept of urban waterfront. Reviewing the literature on the subject highlighted several definitions of public waterfront in urban areas. Among those is the definition of Breen & Rigby 1994 which views the water front as "the urban edge of the water in cities and municipalities of all sizes, and water can be a river, lake, Sea, Gulf or channel that includes a wide range of uses such as wildlife reserves, or cargo ports, which can be planned in an integrated projects, or scattered with random order over long periods of time due to multiple owners. Waterfronts also can include buildings that are not on the Water directly but linked visually and historically to it through a wider project." Many of the waterfront definitions river has dealt with it from the standpoint of functional use as reported by Glazer & Delaporte 1980 that describes the waterfront as the harbor area within urban areas, and is located on the coast and along the rivers and be the final point for water shipping channels.

Any definition should be derived from local conditions of the river basin, as well as the functional nature of visual and historical aspects of these waterfronts. Therefore, we find that the Department of irrigation and drainage in Malaysia has defined the waterfront as the urban space that fall within fifty meters from both sides of the river's edge, While Kenyon 1968 presented a description of river waterfront as the area adjacent to: -

- A. Shipping ports used on a large scale.
- B. Located within walking distance (305 meters) 1,000 feet from the water's edge.
- C. Falls within the ordinary scope and fabric of an Urban area.

Furthermore, for the purpose of issuing waterfront land use regulations, the City Planning Department of the city of New York has been identified the waterfront as the distance extending from the water's edge at its highest level all the way to a depth of 244 meters (800 feet) inland. This distance is set since it represents the common length of city blocks. In addition, it represents the maximum distance to maintain the visual corridors to the river waterfront.

Iraqi laws define waterfronts in general as the distance from the water edge at its highest level extended 100 meter inland, where certain restrictions are placed on permissible uses

within the 100 m strip of land. This definition will be adopted by this article to analyze land uses within the selected study area of Baghdad's waterfront.

5. Dealing with Urban Waterfronts

The Relationship between waterfronts and cities is usually a historic one. Rivers were one of the most important modes of transport, and waterfronts were important commercial sites for the supply and export of goods of all kinds in addition to being areas for the enjoyment of nature. Over time and with change of technology this relationship has undergone considerable transformations ranging from periods of recovery to shrinkage in importance, and to revival of the role of these waterfronts to be an integral part of the physical structure of cities.

The outlook of river waterfronts evolved in historic cities and generally passed through three phases.

Phase one is the pre-Industrial Revolution, where they were treated from an environmental perspective and rivers were considered essential supplements to the survival of human settlements on its banks did not take into consideration the consequences of dealing irresponsibly with water as a precious resource.

Phase two is the stage of the Industrial Revolution, where the relationship with the river in the cities based on the utility and the river considered as one of the inputs to the industrial process, which was done in accordance with market mechanisms.

Phase three is the current stage namely the post-industrial revolution where the relationship between the river front and city dwellers has taken an aesthetic perspective serves mainly recreational and entertainment activities and dealing with the river became according to social pressures and diverse desires of the population.

Urban waterfronts are a vital part of the national heritage, and these areas hold the historical roots of this heritage, and provide an important natural outlet in crowded urban areas. In many instances these waterfronts contain a vast untapped territories which can be a nucleus to re-generate and revitalize urban areas and provide some of the best opportunities for urban renaissance. The desired outcomes of waterfront renewal should not be measured through the number of jobs generated or realized increase in the price of real estate property, but also requires the need for a broader perspective and long-term impact that can be accessed.

The Issue can be complicated which require to strike a balance between appropriate land uses and functions. The intention here is not to create mixed uses mixed ,or finding giant projects with a variety of land uses. There are experiments carried out by many cities around the world to revive the its waterfronts, including the mega project of Canary Wharf in the city London, where some believe that the project is not sustainable and tabbed enormous investments within a short time span, while other projects may take an entire generation to accomplish. Perhaps one of the most important lessons learned from projects of this size is the need to follow parallel development of the vast river bank within a reasonable period of time.

General principles for any initiative to deal with the river and the waterfront in order to achieve sustainable development are: -

- Simulates the spirit of the place and location but connected to the city as a whole.
- Look unique in its design and not a duplication.
- Provides sustained public spaces and elaborate design.
- Respect the city's history and architectural heritage, but while avoiding the reproduction of the past.

- Integration with the surrounding areas and linking the waterfront with rest of the city.
- Easy and a short access distance from surrounding districts.
- Respond to the nature of demand for these areas and maximize the existing potential.
- Take advantage of the waterway for entertainment purposes and practical aspects.
- Attract uses that offer added value of feeling secure and calm generated by the presence of water.
- Protect and improve water quality and natural life

Research and contemporary studies on the development of waterfronts started since the sixties of the last century, including a study of Hoyle in 1960, and Kenyon in 1968. The research continued to expand in the eighties, and nineties to include other topics including water transportation, impact of politics and urban planning on waterfronts such the study of Gordon in 1996, and Fanstein in 2001. The impact of architecture on the waterfront was looked at in the study of Maline in 1996, and the impact of urban design as in the study of White in 1993. Other studies discussed the relationship between the development of waterfronts and its integration with the city from the perspective of urban planning as in the study of Meyer in 1999, and Hoyle in 1989.

Other studies have addressed the relationship between the waterfront river and water body next to it, for example, the study of Lynch in 1976, has designed the exploitation of the river on the basis of the degree of integration between waterfront and water as part of a more comprehensive study of rehabilitation (River Baramana) in Australia. As a result of the diversity of uses land along the river, the waterfront was divided into three main uses (housing, employment, and recreation areas) and created three levels of integration, namely, (high, medium and low). Results of the study confirmed that about half of the occupants of the waterfront have used the river or acknowledged its importance in their district, while others did not give this issue any importance.

6. International Waterfront Planning

To get acquainted with policies adopted by major cities in the world with significant waterfront areas, New York city comprehensive waterfront plan "Reclaiming The City's Edge" is selected. The plan is prepared by the Department of City Planning in the city in 1992 to regulate land uses within the waterfront, where the plan provided a clear vision of the form that waterfronts should be on in the twenty-first century to include the following: -

- Parks and open spaces with ample and diverse activities to be made accessible to residents of the city and surrounding areas.
- Enable people to swim, fish and use boats in clean water.
- Rehabilitation and care for natural sites.
- Industries related to the water must be brought back to prosperity in specific locations serviced with efficient infrastructures.
- Ferries cross the city back and forth, integrated with an interconnected systems linking bicycle paths and pedestrian corridors to ease traffic congestion and air pollution.
- Creating a panoramic vistas to enjoy the beauty of rivers.
- Meet the housing needs of the city through housing projects and job opportunities catering to different levels of income in an attractive setting.

The plan organized the waterfront into four main functions of the waterfront, namely: -

1. Natural waterfront consists of beaches, wetlands and wildlife sites and critical ecosystems and the waters of the river itself.
2. Public waterfront includes parks, squares, piers and sidewalks and public areas which provide visual contact with the water.

3. Working waterfront water-related industries as well as water transportation.
4. Redevelopment waterfront include land uses that have been changed recently or areas that are used in an inefficient manner and have the potential to achieve a positive addition when changed.

This categorization system determined that 30% of the should be allocated to the natural waterfront, and identified 100 sites within the waterfront to be Public. In addition, the plan proposed the rehabilitation of 50 public park as well as transforming 25 public street to end at the waterfront. 40 site were selected to create corridors and spaces for public use surrounding commercial and residential sites. The plan also proposed the establishment of between 50,000 and 70,000 housing units within land parcels that will be re-zoned. The working waterfront will occupy six specific sites with a total area of 2,555 acres.

One of the most important objective of the Comprehensive Plan of New York City is to promote uses that have direct relation and should be close to the river's edge, so the plan proposed three land use categories within the waterfront : -

- Water Dependant Uses, which must be adjacent to the river, including marinas, harbors, repair of boats , water transport ,recreational buildings, beaches and fishing piers.
- Water Enhancing Uses include mainly recreational and cultural uses including retail trade and Leisure, which promotes universal access and comfort to the public. Other uses can be added such as sports centers, museums and galleries, parks, museums and galleries, parks, games, swimming pools, hotels, and restaurants.
- Non Water Related Uses which do not require a water location and their presence near the water edge do not add to the value of the waterfront, and the ability of the public to enjoy the public side of a river, examples parking fields, warehouses, Industrial installations, private residences and office buildings.

One of the most important characteristics of this plan is to emphasize the principle of free public access to the waterfront which is considered as precious resource to the city. It was a major goal of this plan to secure and maintain corridors to ensure freedom of access. Thus, the plan recommended that 15 - 20% of any use on the front river should be kept at the disposal of the general public. This ratio were approved to strike a balance between the desire of the city's residents to enjoy the waterfront, and the cost of maintenance and the provision of public amenities ,as well as costs borne by investors for the development of some waterfront sites.

7. River Waterfront in Iraqi legislations

Tigris River occupies a special place in the history of the city of Baghdad, where the river is closely linked to the urban fabric and the waterfront is one of the most important components of the natural landscape of this fabric and a point of stability which gives the city its distinctive character. The river is basically the central nerve of the city and an essential hub of Baghdad where both sides grow almost equally around it. The forecast contained in the "Perspective of Baghdad 2030" issued by the Mayoralty of Baghdad anticipates that residents of the city of Baghdad will reach 9.88 million by the year 2030. The perspective emphasized on the great importance of the Tigris River within the urban landscape of the city, and regarded as one of the symbols of nature affecting the shape of the city and has a large dominance on the climate and general environment. To talk about a number that is close to 10 million people living within a city which already suffers from great pressures over the land , and more particularly in the provision of environmentally friendly spaces and aesthetically pleasing to activities of recreational, social and cultural nature. These facts place a paramount importance on developing efficient land use management policies , where the waterfront must be given a special attention due to its limited supply and competing demands.

A number of Laws and regulations were issued prescribing the manner of dealing with land adjacent to rivers in Iraqi cities in general, and the city of Baghdad in particular. The Baghdad city master plan law that governs land uses within the city, prepared by the Polish firm "POLSERVICE" in 1971 is valid till the present. The plan which is a legal document stressed that the presence of the Tigris River is one of the most important features of the city of Baghdad, and its multiple curvatures add beauty and distinctive personality to the city, hence considers the Tigris River as the backbone of the city.

In this sense, the master plan regarded the "Tigris River Belt Zone", which is a strip land area with a width of about 2-3 km along the Tigris River.

The city of Baghdad Master plan has divided the Belt Zone within the city into three sectors. These sectors are:

1. The northern section represented by the Green Zone north of the city which includes orchards, parks, forests, and residential areas including Adhamiya sectors and Kadhamiya.
2. The central section represented by the central area where business centers, and associated activities are located. It represents the heart where all other functions are tied to.
3. The Southern Section represented the region south of the city where Industrial Services, activities and storage are located.

On both sides of this belt (Tigris belt), self-contained residential sectors were designed, and connected to the river belt from one direction and to surrounding external areas from other directions.

The master plan proposes taking advantage of the waterfront through the creation of a diversity of land uses on its banks. The vision includes creating multi-story housing sites, as well as parks, tourist attractions, hotels, restaurants and pedestrian paths. In addition, the plan proposes linking the river banks to inland areas through green corridors that lead directly to the waterfront. The plan also proposed the creation of a rapid river transportation network to utilize the strategic location of the river right in the middle of the urban fabric to facilitate movement of passengers. Needless to say that hardly any of the vision presented in master plan has been realized due to protracting military conflicts within the country.

The Building Controls of the city of Baghdad which regulate design and construction according to the zoning plan has merely recognized land uses in the area of Abu Nawas street adjacent to the Tigris River. This street represents only a small portion of the waterfront, and thus ultimately left the majority of the waterfront unregulated. In paragraph 2,2,3,1 of the controls, land uses in the street were restricted to residential and tourists related activities, where building heights should not exceed three times and half the size of the land parcel and a maximum of five stories. New construction must not exceed three stories. With regard to determining land uses along the Tigris River within the city limits of Baghdad, the Master Plan has indicated that building controls should be in accordance to the Shores Utilization Law.

The "Shores Utilization Law" No. 59 of 1987 is a legislation issued by the central government, which regulates the exploitation of shore land areas of the River Tigris and Euphrates, and its neighboring territories, as well as securing passage of flood water, and prevent pollution regardless of the type of relationship to property land rights.

Article III of the Act states the following:

"It is not permitted to use any land covered by the provisions of this law for agriculture, planting, or create a project, or to build without the approval of the Ministry of Irrigation and the Ministry of Agriculture."

The Law separated the land adjacent to the river into two parts. The first is the river bank which is not exposed normally to floods even during high water levels, and the second

section is the low elevation land below the river banks which can be considered as a beach that can experience periodic floods.

Article IV of the law identified certain permissible uses of land behind the river bank. Uses permitted are orchards, cultivation of seasonal crops, and the construction of housing for owners of these parcels conditional to the fact that no permanent structure can be erected less than one hundred meters from the river edge. The beaches which are the lower elevation exposed land area can be exploited according to the law for seasonal crop cultivation and the establishment of tourist public buildings conditional to the fact that the beach width is not less than one hundred and fifty meters.

The shore utilization law, however, gave waterfronts within urban areas a distinguished characteristic, and authorized municipalities to regulate land uses within city limits in accordance to the vision and needs of their land use master plans.

The Mayoralty of Baghdad in its outdated "Land Use Mater Plan" reiterated the compliance to the articles of law 59 as far as exploiting the waterfront without taking advantage of the leverage empowering municipalities to formulate their own waterfront land use code.

Nonetheless, given the specificity of the city of Baghdad as the nation's capitol, Regulation No. (2) for the year 2000 was issued by the central government to be known as "Regulations to Prevent Encroachment on The Tigris River Trim Line within The City Limits of Baghdad".

These regulations stipulated vacating 15 meters strip of land from the river basin edge (Trim Line) inland. Thus, this 15 meters strip is considered as the river's right of way for the purposes of river monitoring, maintenance and dredging. Furthermore, in the year 2000, Regulation 121 was issued prohibiting the construction, or granting any building permit within the river Trim Line.

The "River Trim line" stated in these regulations is the distance confined between both sides of the river basin which allow the maximum water discharge within the city Baghdad of 3000 cubic meters per second in waterfront segments where river banks is not veneered with stone. In segments where the river bank has stone cladding, the trim line is therefore the distance between the stone retaining walls edges of the river banks.

It is evident that the Iraqi legislature, as well as physical plans has stressed the importance of the waterfront in urban areas in general, and within the city of Baghdad in particular. Land uses adjacent to rivers are of exceptional value to the urban fabric, and must be dealt with in an extreme caution so as to keep this limited strip of land accessible to the general population, and put it into the best uses in order to maximize the potential offered by these areas for social, economic, and environmental development.

8. Field survey of the Tigris river Waterfront

For the purpose of testing the research hypothesis, the central section of the Tigris waterfront within the city of Baghdad has been selected as the study area. The area extends from the new Adhamiya bridge to the north until the Jadiriya bridge to the south as shown in figure 1. The total length of the waterfront along the study area is about 13 kilometers. Within this strip of the river, most of Baghdad's districts that are characterized by intensive land use are located on either side of the study area. Functions include residential, commercial and governmental, in addition to spaces that are currently untapped. To identify the nature of land uses, a comprehensive field land use survey of the river bank within a 100 meters strip of land from the edge of the river was undertaken. This distance is stipulated in the law of Shores Utilization law No. (59) as mentioned earlier.

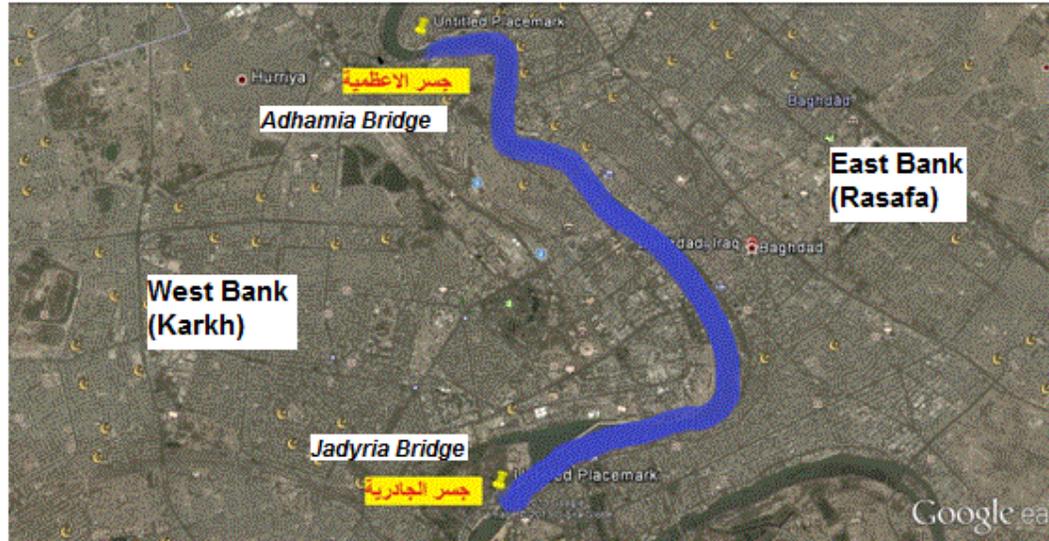

Figure 1 Waterfront area of the Tigris river under study

Through the survey it became clear the existence of eight major land use categories within the study area. The uses are residential, governmental, religious, green open spaces, untapped spaces, commercial leisure activity, streets, in addition to a single area which is an artificial lake created within a short distance from the river edge as seen in figure 2. The total area under study within the 100 meters depth of the waterfront was 3039180 square meters, or around 304 hectares. The study area is subdivided into eight segments with each segment represents the area confined between two bridges. The study area starts from Adhamiya bridge to the north of the city, and ending at the Jadiriya bridge to south.

Figure 2 Jadyria Bridge- Suspension Bridge segment of the study area

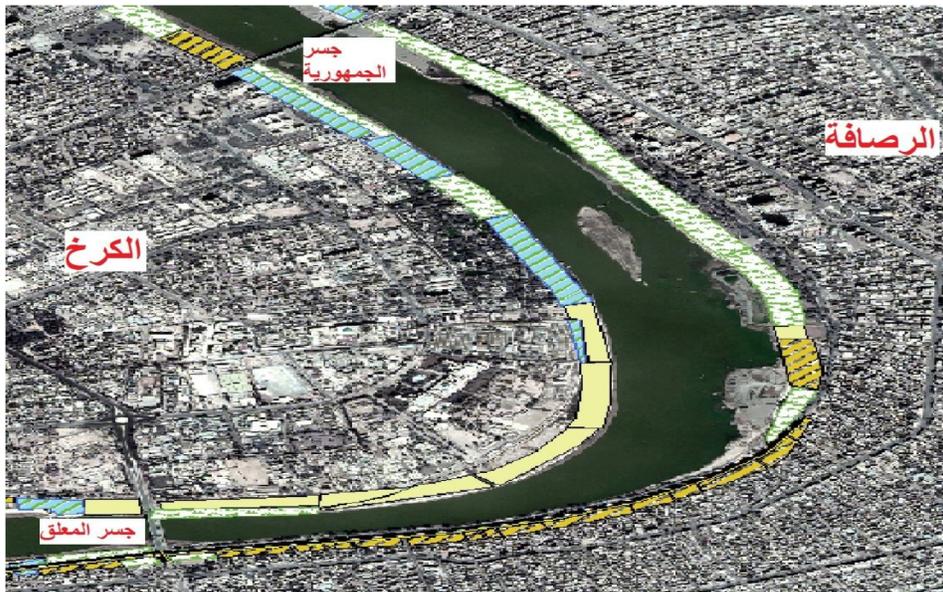

Figure 3 Suspension Bridge - Republic Bridge segment of the study area

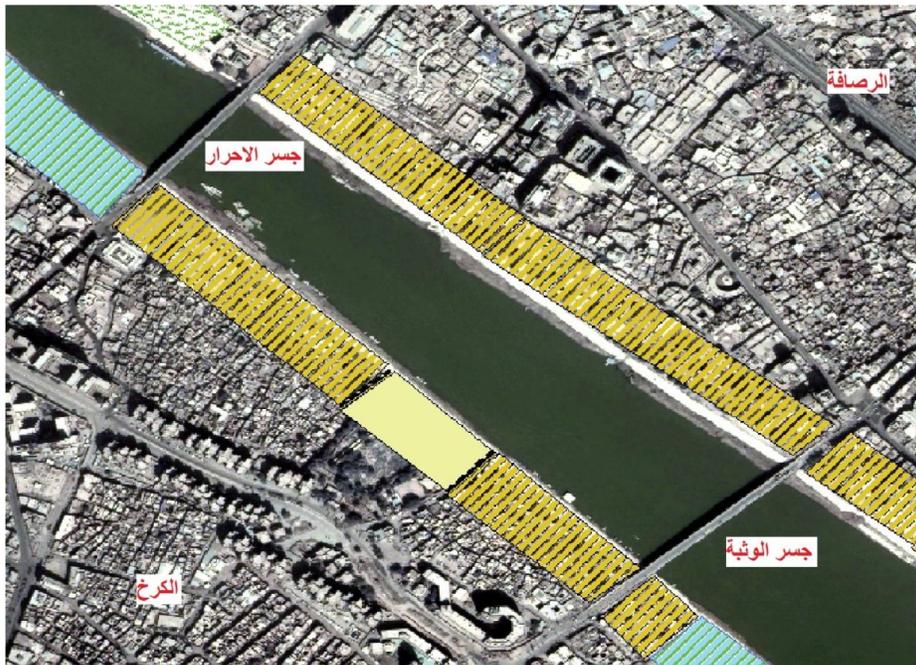

Figure 4 Ahrar Bridge – Wathba Bridge segment of the study area

<i>Study Area Segment</i>	<i>Left Bank,m²</i>	<i>East Bank,m²</i>
<i>Jadyria Bridge- Suspension Bridge</i>	<i>322554</i>	<i>267922</i>
<i>Suspended Bridge - Republic Bridge</i>	<i>375215</i>	<i>533199</i>
<i>Republic Bridge - Sinak Bridge</i>	<i>55371</i>	<i>56772</i>
<i>Sinak Bridge – Wathba Bridge</i>	<i>59619</i>	<i>60101</i>
<i>Wathba Bridge – Ahrar Bridge</i>	<i>95489</i>	<i>102374</i>
<i>Ahrar Bridge - Bab Al Mo'adem Bridge</i>	<i>91674</i>	<i>110785</i>
<i>Bab Al Mo'adem Bridge - Sarafiya Bridge</i>	<i>202723</i>	<i>135921</i>
<i>Sarafiya Bridge - Adhamiya Bridge</i>	<i>238176</i>	<i>313640</i>
<i>Subtotal</i>	<i>1440821</i>	<i>1580714</i>
<i>Total Area</i>	<i>3039180 m²</i>	

Table 1 Total land area of segments along a 100 meters wide strip of waterfront

Analysis of the data generated from the survey has shown that the private residential land use which reaches 39.83% of the 100 meters land strip is the most dominant use within the study area along the edge of the river as shown in Table (2). The segment with the highest green open space designed for public purposes is shown in figure 3, which is waterfront confined between the Suspended bridge and the Republic bridge. It can also be seen that in certain segments of the study area the majority of land uses are residential with limited public access to the river bank for non residents of these districts as illustrated in figure 4 referring to the segment between Ahrar and Wathba bridges.

Water Body %	Religious %	Streets %	Government Buildings %	Green Open Space %	Recreational %	Untapped Areas %	Residential %	Study Area Segment
4.18	0	2.03	0.65	1.39	2.64	1.90	6.63	Jadyria Bridge - Suspended Bridge
0	0	0.49	4.30	11.56	0	6.72	6.83	Suspended Bridge - Republic Bridge
0	0	0.00	0.80	1.22	0	0.00	1.68	Republic Bridge - Sinak Bridge
0	0	0.00	1.33	0.00	0	0.00	2.62	Sinak Bridge - Wathba Bridge
0	0	0.00	0.00	0.00	0	0.82	5.70	Wathba Bridge - Ahrar Bridge
0	0.15	0.00	3.88	0.47	0	0.00	1.13	Ahrar Bridge - Bab Al Mo'adem Bridge
0	0	0.16	1.51	4.18	0	0.00	5.87	Bab Al Mo'adem Bridge - Sarafiya Bridge
0	0	0.05	0.00	8.30	0	0.40	9.37	Sarafiya Bridge - Adhamiya Bridge

Table 2 Land Use categories percentages per study area segments

Government buildings have a share of 12.46% of the waterfront, while recreational areas exploited commercially did not exceed the rate of 2.64% of the total area. Streets running along the waterfront and within the 100 m strip occupied about 2.74% of total area, while religious buildings did not exceed the rate of 0.15%. An artificial lake adjacent to the river and within a walking distance from the river edge led to the loss of up to 4.18% of the waterfront due to lack of public access to either the lake or river. Figure 5 summarizes the rates of land uses and overall within the study area.

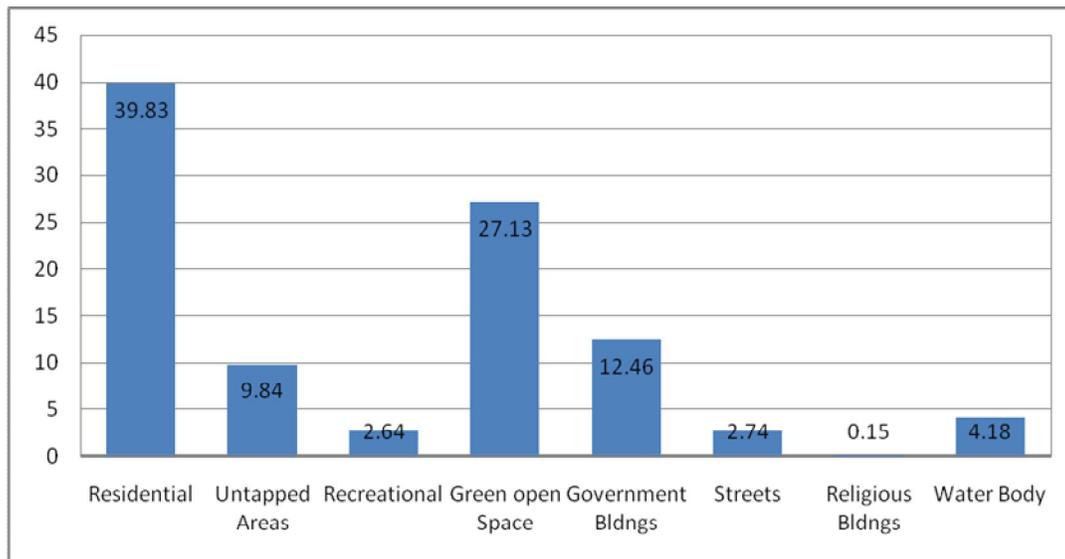

Figure 5 Land use in the study area

9. Conclusions

Initial indications of this study show clearly a defect, and imbalance in the nature of land uses within the waterfront under study resulting in missed development opportunities whether recreational, environmental, or residential; not only for citizen of Baghdad in particular, but to the local economy of the city in general. The most prominent feature of this imbalance is the low percentage of leisure areas that exploit the river to provide a breather to the city's population. In addition, the high percentage of private residential use dramatically reduces the chances of exploiting the waterfront for public interests, and limit the freedom of access to the river bank.

the Proportion of green open spaces with just over a quarter of the total area constitutes a low rate for a city located in a dry and arid climate region, thus limiting chances of creating favorable micro climate zones. The presence of governmental uses on the river is not justified since their presence is not necessary in these sites, and limit utilization to a few hours in the day time, thus depriving the population of these spaces for the most of the day. The other issue that exacerbates the problem is the creation of an artificial lake within walking distance of the river bank while at the same time inaccessible to the public. This peculiar practice resulted in the loss of approximately 5% of the waterfront.

Analyzing the results of the survey indicates that approximately 10% the waterfront is still unexploited despite the apparent lack of green and recreational areas along the river.

Furthermore, the analysis indicated that the nature of present uses and urban design of parts of the waterfront does not enable access to the general public, as well as limiting visual contact with the river which in itself is a moral and physical loss to residents.

10. Recommendations

The apparent inefficiency in the handling of land use functions along the waterfront requires the development of procedures and legal frameworks to reduce the loss of the significant benefits offered by the presence of a historic river which passes into the heart of the urban

fabric of the city of Baghdad. Procedures that must be implemented to improve the existing situation vary in terms of financial cost and the time period to achieve them. Among the measures recommended:

- Developing a special urban design scheme for the waterfront strip in the form of a master plan, and building controls specifically for this area in order to regulate land uses, as well as height, bulk and density of structures
- The preparation and implementation of a specialized management commission with financial and legal support from the central and local government due to the extreme importance of Baghdad as the political and economic federal capital .
- Urban design principles and practices should give priority to land uses promoting recreational, environmental, and open green spaces uses over other land uses.
- Achieve easy access to the river through a redesign of the transportation network surrounding the river waterfront so as to achieve connectivity, and facilitate access to water vistas.
- Guarantees free public access to river banks throughout the day and night.
- Expanding existing areas which afford spaces free of charge to the public for recreational purposes, provide shade from the elements, and employ public sculptural arts to create attractive public spaces within the strip adjacent to the river.
- Increase compliance of current land uses the vision and objectives stated in the city's master plan and laws in force.

Synopsis

This paper examines how heritage places and spaces are protected and managed to enhance historical artifacts in Ile Ife, the 'Cradle of Humankind'. It suggests traditional historical planning tools as a re-vitalization planning strategy to preserve, manage and protect the sacred groves, monuments, traditional and religious landmarks that already exists.

1. Introduction

The term "Cultural heritage" by Hero Network (2010), refers primarily to the physical or "tangible cultural heritage" which includes monuments, groups of buildings and historic sites that are considered worthy of safeguarding for the future. The Article 1 of the World Heritage Convention (1998) defines the definition of terms as follows:

- Monuments: architectural works, works of monumental sculpture and painting, elements or structures of an archaeological nature, inscriptions, cave dwellings and combinations of features, which are of outstanding universal value from the point of view of history, art or science.

- Groups of buildings: groups of separate or connected buildings which, because of their architecture, their homogeneity or their place in the landscape, are of outstanding universal value from the point of view of history, art or science.
- Sites: works of man or the combined works of nature and man, and areas including shrines and archaeological sites which are of outstanding universal value from a historical, aesthetic, ethnological or anthropological point of view.

Places and objects may qualify as “heritage” because of their historic importance, because they are rare, they provide an opportunity for research, are particularly representative of a type, have aesthetic appeal, are evidence of creative or technical achievement, or have associations with social groups or significant people.

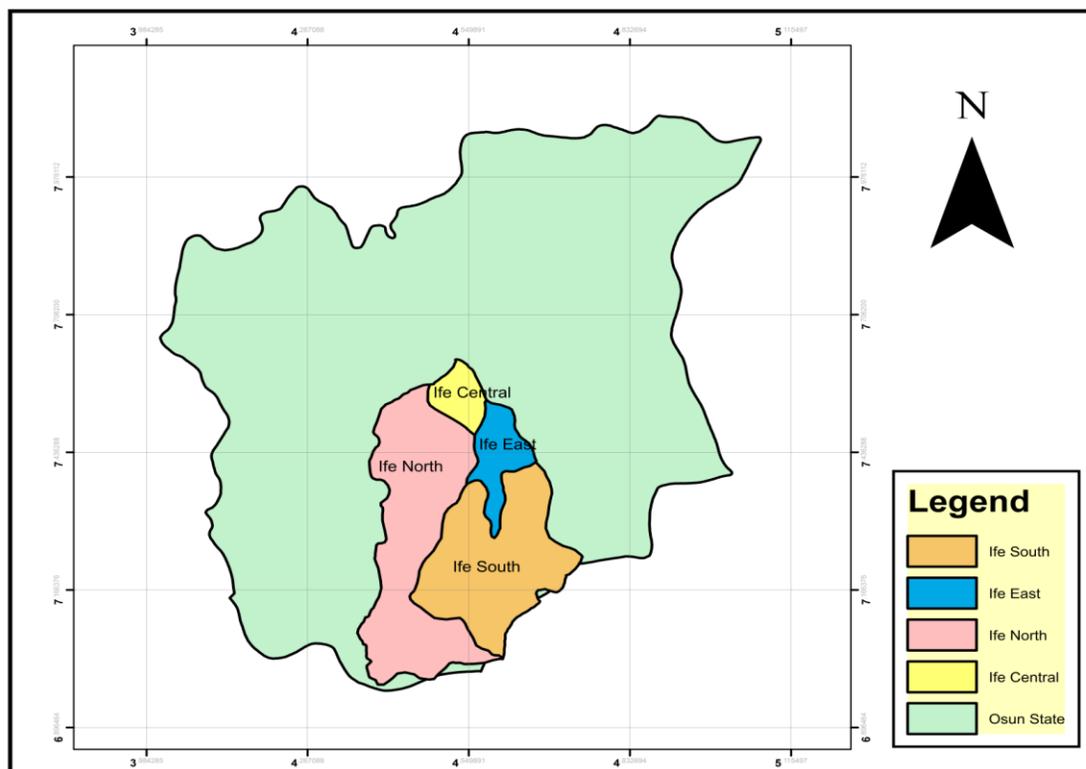

Figure 1: Ife Town in Osun State Context

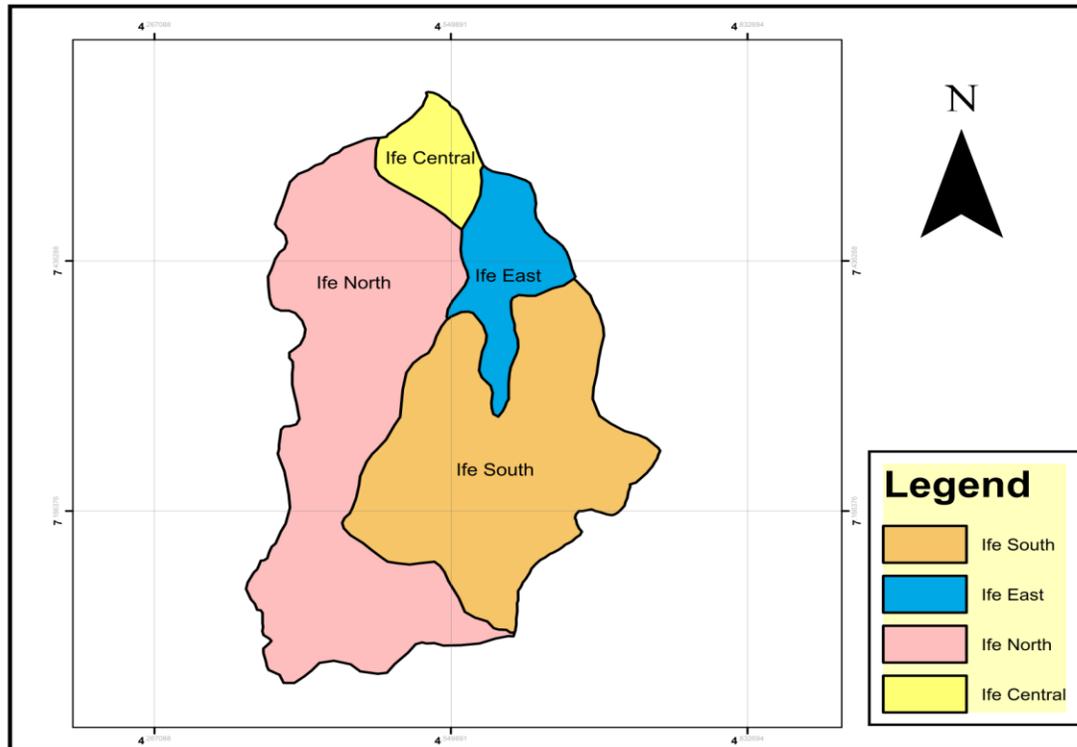

Figure 2: The Four Local Governments in Ile-Ife

Ile-Ife, also called Ife town, Osun state, southwestern Nigeria is one of the larger centres and probably the oldest town of the Yoruba people. It is considered by the Yoruba to be a holy city and the legendary birthplace of mankind and was held to have been founded by a son of the deity; Oduduwa. Ile-ife is located in the present day Osun State, Nigeria. Ife is about 218 kilometres northeast of Lagos. The town lies at the intersection of roads from Ibadan, Ilesha, and Ondo. Ile – Ife is located on longitude 4.60E and latitude 7.50N, with an elevation of about 275 metres above the sea level (Appolos, 2012). Physically, according to (Omotoso Eluyemi, 1986), the city of Ile – Ife is surrounded by a chain of seven hills namely Oke – Ora, Oke – Araromi, Oke – Owa, Oke – Pao, Oke – Ijugbe, Oke – Onigbin, and Oke – Obagbile. As a result of these hills, the town itself was built in a bowl – like physical layout which provides it with security.

Historical nodes of Ife comprises the traditional inner core with the Oba's (King's) palace, the Enuwa square, Ifa temple and the Ife city museum; the Obafemi Awolowo University (OAU formerly, University of Ife) campus, which constitutes a magnet for much of the town's labour force; the Mayfair-Sabo-Lagere commercial corridor; and the Sacred grooves or natural virgin forests that epitomize the tradition of the Ife indigenes. However, there are three clearly-

distinguishable locations where noticeable urbanizing development is taking place in Ile-Ife, each with its own unique characteristics. These are; the OAU Campus; the Mayfair-Sabo Commercial Spine; and the Inner Core. While these areas are distinct in themselves, they also are inter-related and likewise inter-dependent.

The Obafemi Awolowo University (OAU) campus epitomizes the best traditions in modern physical planning and architecture, in the West Africa region. The campus portrays good infrastructure and facilities planning and management, and general foresight. All roads (servicing the academic and administrative core area, students' halls of residence and staff quarters) are tarred; the whole campus is linked to the electrical grid (in addition to having its own independent power-generating plant); the Opa Dam is a local expedient for generating potable water to all nooks and crannies of the campus. (Osasona et al, 2009)

The Mayfair-Sabo Commercial Spine is the commercial nerve of the city. It is a 3-kilometre stretch along the Ibadan-Ilesa inter-urban road that passes through the centre of the town. What businesses had fitfully been practiced closer to the traditional core, had gradually migrated to this area for vibrancy. Today, not only has this been further entrenched, commercial activities have gradually spread, ribbon-like, along this axis: forward to Sabo (and beyond), towards the Ilesa end; backwards to Mayfair (towards the OAU campus), in the direction of Ibadan (Osasona et al, 2009). Small-scale as well as large-scale retail businesses are carried out in this zone. It also houses big investment houses (various banks, petroleum stations) and schools.

The Inner City Core is the traditional heart of the city. The city centre comprises the king's (*Ooni's*) palace, the Enuwa square, the Central mosque, the Oke mogun Shrine and other developments. In the early 1990s, the Enuwa square which was originally a place used for communal meeting; where the people gather and are addressed by the king from the storey building facing it has been transformed into a park with a full-size statue of Oduduwa at the centre of it. New constructions have also taken place and other buildings have also been modified from time to time; such as the Ife City Museum, the Ooni's palace and the Ifa temple amongst many others. The city core helps to conserve the cultural heritage of Ile-Ife.

Ile-Ife has undergone growth in various forms. It has grown from a small town with a legendary evolution into a city over the years and these changes has resulted in the following:

1. Encroachment- Some open spaces and sacred lands have been encroached upon, so also sacred lands. For instance, the ore groove which formerly covers about 5 hectares

in the past has been reduced to about 4 plots of land.

2. Religion and Western Education- Increase in people's western belief system and the influence of education has reduced participation in festivals, rituals and ifa followership. Also, the use of cognomen; commonly called '*oriki*' among the Yoruba people has been lost as many people now disregard the idea. The influx of foreign culture has depleted the traditional belief system. Now the greater percentage of people in the community practice Christianity or Islam and this has greatly reduced trust in the traditional culture and its practices.
3. No Proper Documentation- history has been lost due to lack of proper documentation and even where they exist, there are discrepancies from one place to the other.
4. No Proper Demarcation of heritage sites- the heritage places in the past were not fenced. In the ancient times, '*peregun*' as it is been called in Yoruba was used to fence heritage sites. Wherever '*peregun*' is used as demarcation, such place is identified as a sacred land. And due to lack of fence, these sites have been either encroached upon, misused by people who do not know about it and some materials even stolen from such places. It is in recent times that some of them are being fenced.
5. Loss of value of the heritages- much value is not placed on heritage sites anymore due to the influence of urbanization. Modern adventurous sites like cinemas, galleries, beaches have reduced visitation to heritage places.
6. Change in Architectural design in use- In the past, buildings were patterned after the Brazilian building style but now, the European style is being used. Courtyards was what was obtainable in the past and this fostered communal life, but now, the flat system is being operated and this has disintegrated communal life.

Time changes. Technology marches forward. Cultures differ from place to place. So also, rapid urban change is reforming the city and its ancient heritages. The cultural heritages which gives the beauty of the past a place on the exhibition stage of the new world are gradually being wiped off, the forest reserves and farmlands which supports the sustainability of a place and food security within its borders are being encroached upon, urban renewal schemes are taking over the city centres that used to be the heart of other activities and development. Hence, the need for heritage planning.

2. Methodology

Data for this study were elicited from two different sources that is primary and secondary sources. The primary sources include two set of satellite imagery covering the study area for 1986 and 2013. The imagery of 1986 was obtained from global land cover facility on path 190 and row 55 while that of 2013 was obtained from goggle earth. The imagery of 1986 and that of 2013 were subjected to unsupervised and supervised classification respectively using ILWIS (Integrated Land Water Information System) Software. Sample Sets were created on both images for proper assessment by the researchers. The sample sets created are; Bare Surface, Built-up Area, Marsh Land, Vegetation and water Body. The two maps show the level of growth of lfe.

The secondary sources of data include published and unpublished journals; and other related materials obtained from the Planning Board of the lfe East Local Government and the lfe city Museum.

Source: Author (2013)

Figure 3 and 4 shows the level of growth of Ife while figure 5 was used to show the changes that has occurred between 1986 and 2013 as pertains to the built up areas in Ile-Ife. The blue represents the extent of the built up areas in Ile-Ife as at 1986 and the red shows Ile-Ife in 2013. In the year 1986 the built-up area of Ife was 25.13Km² while that of 2013 is 77.74Km². Increase in development and human activities led to the decrease in vegetation and increase in bare surface/degraded land from 2.13Km² (1986) to 28.62 in 2013.

During a consultative forum with some elders and ‘Emeseres’ (palace guards), they identified some heritage sites in Ile-Ife and the maintenance strategies already put in place to preserve them. Festivals celebrated in Ile-Ife include the “Olojo” festival (Owner of the day) usually celebrated by the indigenes in honour of the revolutionary deity “Ogun- the god of Iron” and the 401 deities that resides in the ancient city of Ife; the “Edi” festival is celebrated once every year for a period of seven days, a period to discipline thieves, and the “Ifa Agbonmiregun” festival usually done first week of June, every year (where ifa priests from the whole world come together) with the aim to unite Ifa followership and also to integrate part of vibrant and prosperous community on peace.

Heritage sites in Ife total about 62 (Ife city Museum Records,2013); with several grooves, forests, shrines, temples and staff, some of which include; the Yemoo groove, Olokun groove,

Osara shrine, Yeyewara shrine, Igbo Irudi sacred forest, the ifa temple and the Oranmiyan staff. Traditional historical planning tools are employed to serve as a re-vitalization planning strategy to preserve, manage and protect the sacred groves, monuments, traditional and religious landmarks that already exists.

The management practices set in place to preserve these heritage sites include the following:

- Fencing: Fences have been built round many of the heritage sites to prevent encroachment of people and activities into such places. The Enuwa square (directly opposite the Ooni's palace) which has been re-modelled into a Park for example is now well fenced. Also, the Oke Mogun Shrine (south of the Ooni's palace) and the Ile Oduduwa (west of the Ooni's palace) has been fenced.
- Improved documentation: Emphasis is now being laid on documentation of the past history that were captured and properly retrieved, present day happenings, yearly celebrations and festivals. Also, the Ife museum Planning department acquires and preserves articles, journals and publications that captures Ile-Ife city cultural and physical planning activities for easy access in planning and for future references.
- The management of heritage sites by overseers and priests: To achieve this, priests were appointed over each of these heritage sites to manage and protect it. And it is these priests that organize festivals and celebrations that pertains to the heritage site they have been assigned to.
- Modification of sites and usage: A good example is the Enuwa square that used to be a communal meeting ground but which has now been transformed into a park to generate income. Even the Ogun Shrine that used to be just a symbolic tree (at the foot of which the rituals were performed), has been integrated in a refined way into the modern City Hall complex. The palace grounds and museum have not been left out: modifications and new construction (particularly of modernist structures) have taken place, and periodic face-lifts also (Osasona et al, 2009). This provides a good ground for tourism and helps to generate income for other developments
- Planning Guidance by regulating new development in the old town area to secure heritage sites from communal demands: New developments are controlled through planning rules so as to preserve the heritage sites in the old town area from encroachment due to urbanization. Modifications are made to the heritage sites and renovation allowed, but, new developments are not encouraged. This is evident in the areas surrounding the *Ile Oduduwa* and the *Ifa Temple* within the city core.

4. Recommendations and Conclusion

Education, awareness and enlightenment should be heightened so as to foster strong identity of citizens with their cultural heritage sites. The Museum as the repository of culture and tradition is in the best position to organize trainings to acquaint people of the community as well as indigenes both home and abroad with the heritage sites and the purposes they serve to help preserve the cultural values from one generation to the other. This can be achieved by organizing workshops and trainings within the local community, and increased publications from the Department of Planning, Research and Publications in the Museum.

Beautification attempts should be increased within the city core by the planning Authorities to encourage and also increase tourism. Gallerias, cinema houses, and more parks should be introduced to attract more people. Also, some heritage sites still lie open with no proper enclosure, one of which is the *Ifa* Temple and thus, the surrounding is unkept with animal feaces littering the area. So also, the entire landscape of the city core is characterized by buildings with old tattered brown roofed buildings and some dilapitating ones. Upgrading and renewal of these buildings will further help to promote a pleasing environment for visitors and likewise add value to the cultural heritages.

To further preserve the cultural heritages situated in Ile-ife, the traditional planning and management tools should be strengthened by the Planning authorities of the town and to curb the increasing effect of urbanization on heritage sites, encroachment into the city core should be prohibited; there should be increase in awareness and publicity of the cultural heritages in the town to inform indigenes, citizens of the country and foreigners of her cultural values to enhance tourism.

The sustainability of the environment is significant in guiding against the resultant effect of a gasping city and in doing this, valuation method comes to play. Valuation in the sense of evaluating the importance and benefits of these city centres and their existing landmarks, the forests and farms that are gradually been taken over by urban sprawl and the environmental hazards that results from improper management. It is worthy of note that rather than leaving these areas to degrade or be wiped off and forgotten due to gentrification effect, a number of benefits springs from the improvement and conservation of these regions such as income generation from tourism and celebration of ethnically symbolic ceremonies which attracts trade and developments and investors. The conservation of heritage places makes an important

contribution to environmental, social and economic sustainability and also helps in regional development.

Heritage landmarks need to be protected because they constitute valuable assets (cultural and environmental capital) within the community. Protecting the cultural identity and heritage of Ile Ife helps to:

- Preserve a sense of history for future generations,
- Enrich new developments,
- Promote community identity,
- Historic landmarks and
- Guide planning activities such as zoning, development control and conservation policies and these helps to shape the rapid expansion of the city.

“Historic preservation or conservation seeks to enhance, preserve and retain the symbols of the past” (Olufemi, 2001:390). Although expansion of the urban environment is inevitable but, in exploiting our environment, there is need to effectively conserve and safeguard it.

Based on mitigation and adaptation viewpoint in water sensitive city- A case study in land subsidence area in Yunlin, Taiwan

Hsueh-Sheng Chang, National Cheng-Kung University, associate professor in
Department of Urban Planning, Tainan, Taiwan

Tzu-Ling Chen, National Cheng-Kung University, Ph.D student in Department of Urban
Planning, Tainan, Taiwan

Abstract

Excessive urbanization, unbalanced water usage, and land use out of control result in serious planning failures. Urban development has changed land-use coverage directly which affects overall water cycling and eventually leads to flood disaster. A thorough consideration of water balance and spatial planning might become significant urban flood mitigation strategy. Owing to the geographic features and climate condition, we propose to apply water balance concept into a water sensitive city like Taiwan Yunlin, and further construct water safety (without flood), water satisfaction (reasonable ground water withdrawn), and water environment communities. A coupling model of urban water balance on land use change can analyze the relationship between land use development, anthropogenic activities and water cycling, and further simulate different scenarios to propose appropriate land use patterns while achieving water safety, water satisfaction, and water environment communities.

Keywords: water cycling, water balance, spatial planning

1. Introduction

Global climate changes has speed up and strengthen disasters frequencies and scale (Kleinen & Petschel-Held, 2007), such as tsunami in Southeast Asia in 2004 and Japan in 2011. A myriad of planning failures including excessive urbanization, unbalanced water usage, and land use out of control result in the increasing of surface run-off and the change of water cycle. In fact, urban development changes land-use coverage directly which affects overall water cycling and eventually leads to flood disaster (Beighley et al.,2003; Haase et al.,2009). Hence, international organizations, both European Union Framework Programme (EUFP) and World Meteorological Organization (WMP) started to integrate water adaptation approach, water cycle concept and water balance in land use plans. And cities came out various flood managements integrated into comprehensive land uses planning such as water sensitive cities in Australia, living with water and room for the river in Netherland, and making space for water in England.

Taiwan has confronted critical flood resulted from urbanization with a typical imbalanced land use and water environment planning in previous days. Under complicated relationship between land use change and water balance, the issues is required involving various

professional fields such as hydraulic engineering, civil engineering urban planning etc. Risk management, of spatial planning, emphasized that restriction should be worked out in high risk zones such as flood plain area, river buffer zone, and flood tendency area (Coeur & Lang, 2008; Böhm et al., 2004). Hydraulic engineering stressed flood management by utilizing model simulations and facilities location analyses to appraise non-engineering flood mitigation measures (Water Resources Agency, Ministry of Economic Affairs, 2008). In fact, a thorough consideration of various professional fields while practicing water balance might become significant urban flood mitigation strategy (WMO, 2010).

The concept of water balance can be divided into three categories. The 1st category discusses the driving forces of land resource and land use change affected the imbalance on water cycling mechanism, such as precipitation, evapotranspiration, runoff, infiltration etc.(Emmerling and Udelhoven, 2002; Collin and Melloul, 2003; Deal and Schunk, 2004; Haase et al., 2007; 2009). The 2nd category emphasizes the importance of water management in various land uses, such as drinking water, rainwater, waste water (Pauleit et al., 2000, 2005). The 3rd category analyzes water and energy under different climate conditions (Grimmond, 1986; Mitchell, 2004, 2008).

There was various research integrated water balance into land use change simulation, such as Markov Chain Model, Cellular automatic Method, Logistic Regression, Artificial Neural Network (McColl and Aggett, 2007 ; Liu and Seto, 2008 ; Kamusoko et al., 2009 ; Shen et al., 2009). Sivapalan (1996) predicted impacts on hydrologic cycle of deforestation through water balance model in Australia basin. Guo (2002) discussed water sensitivity under global climate change. Bormann (2006) evaluated the effects of under different land use scenarios. A coupling model of urban water balance on land use change can analyze the relationship between land use development, anthropogenic activities and water cycling, and further simulate different scenarios to propose appropriate land use patterns while achieving a water balance land use planning to further knock down negative environmental impacts (Dwyer and Childs, 2004).

This study initially identifies the cause and the consequence of land subsidence and flood disasters in Taiwan Yunlin County, and then uses physiographic inundation-drainage model to forecast flood disaster under various return periods. We are testing flood disasters under diverse scenarios and trying to evaluate the benefit of considering both traditional flood prevention works and land use plan. Ultimately, the integration of water balance model into land use plan is looking forward to mitigate present natural disaster caused by civilization and further reach the equilibrium between urban development and natural environment.

2. Issues identification in study area

Our study area is located in the middle of Taiwan (see Figure 1), and the topography stretches across coast and plain. A general elevation is below 10 m along the west coast area,

and an elevation is below sea level in some specific area in the west-south coast. In the case of champaign, flat terrain results in flood disasters during torrential rain.

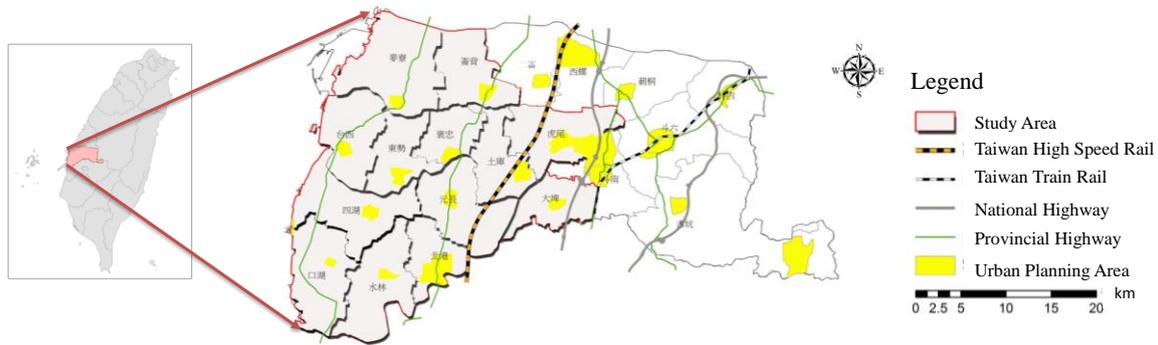

Figure 1: Study area

In addition, the encouragement of rice plantation with inappropriate irrigation systems results in the excess ground water withdrawn. There are over a hundred thousand wells and are mostly used for irrigation. The physical condition and excess ground water withdrawn led serious land subsidence problem. There were two states of land subsidence happened, along coast area and inland area (see Figure 2). In the period of 1992 to 1999, serious land subsidence happened along the west coast. Started from the year of 1996, land subsidence moved into inland area which might affect the operation of Taiwan high speed rail (Taiwan HSR) (see Figure 3).

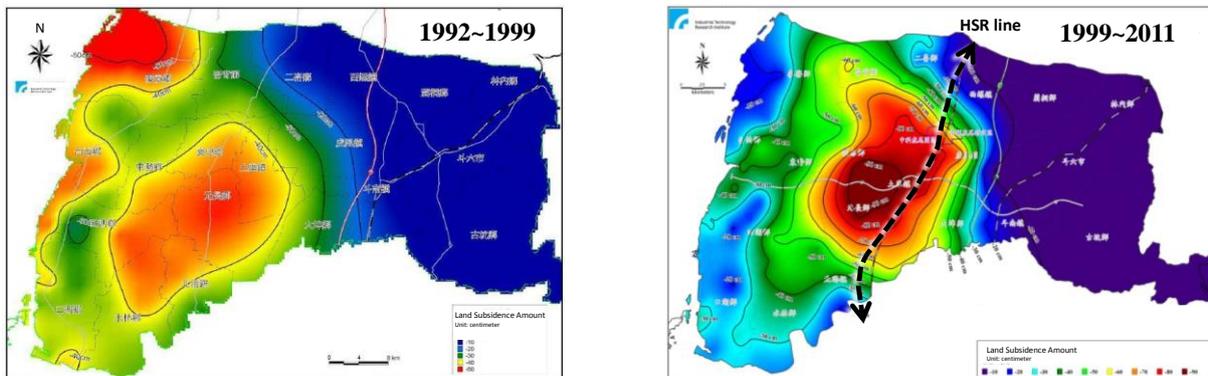

Figure 2: Land subsidence rate comparison between different time period

Figure 3: Land subsidence affected area

The flood investigation results (Council for Economic Planning and Development, 1996) identified various flood risks in our study area, including latent flood area, constantly inundated area, flood sensitive area and so on (see Figure 4). It is likely serious land subsidence with sea level rising under global climate change might result in much serious flood disasters (see Figure 5).

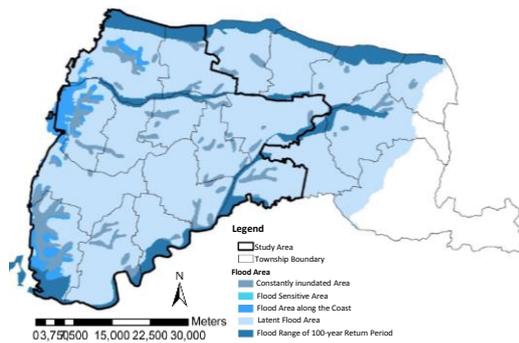

Figure 4: Latent flood area

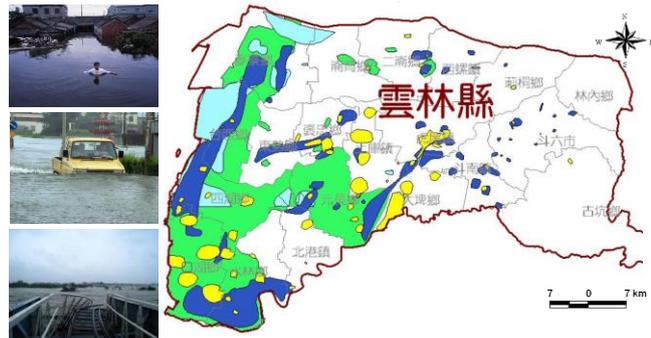

Figure 5: Flood disaster affected area

To radically resolve land subsidence issue in water sensitive city like Taiwan Yunlin, there have been cooperation across sectors in both central and local governments while focusing on distinct professional fields such as spatial planning, regulations, industrial developments, coordination, water engineering and public participation. In fact, not only cross sectional cooperation but the practice in land use management is more momentous. The idea of this paper is to testify the importance of land use plan on flood disasters and further get to the equilibrium of civilization and disasters.

3. Planning concepts in water sensitive area

Our overall framework starts with flood risk simulations and gets forward to proposing land use strategies based on flood simulation results. There are three scenarios (see Figure 6) in our flood simulation process, type A is under similar climate tendency (with land subsidence, sea level rising, wave and rainfall change) without any flood prevention works, type B is under traditional flood prevention works and type C is land use plan with water balance concepts such as fallow farmland and wetland as reservoirs and multi-purpose floodwater facility.

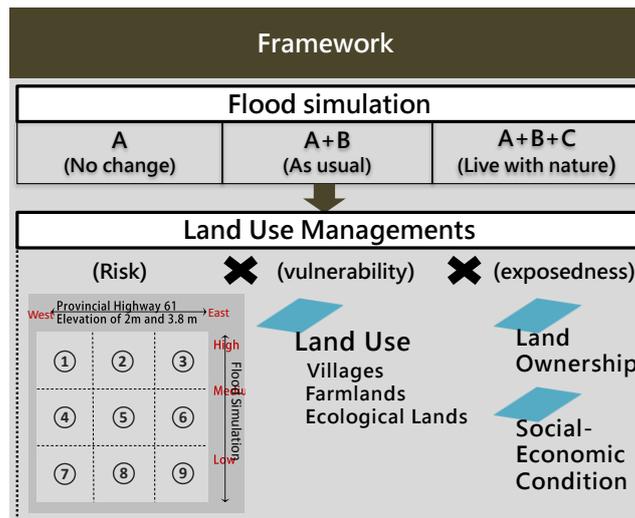

Figure 6: Research framework

3.1 Flood simulation framework

We apply physiographic inundation-drainage model to simulate flood disasters based on irregular grids (grids are divided according to roads and river). Digital elevation model, soil map, land use map, river basin and road system maps are inputs in our flood model, together with future climate change impacts on sea level and rainfall (see Figure 7).

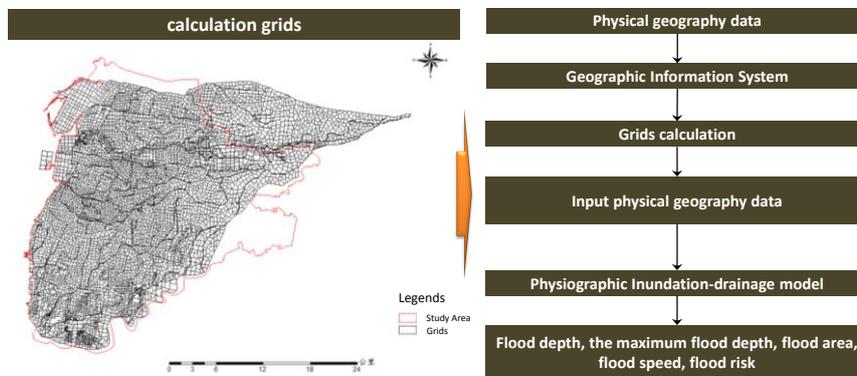

Figure 7: Calculation procedure

In the 1st scenario, we forecast climate change impacts based on historical records of land subsidence, rainfall and sea level in the beginning. We then simulate flood risks according to land subsidence amount in 2038 (see Figure 8), rainfall forecast (see Figure 9) and sea water level forecast (see Figure 10).

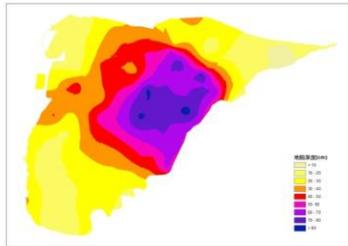

Figure 8: 2038 land subsidence amount

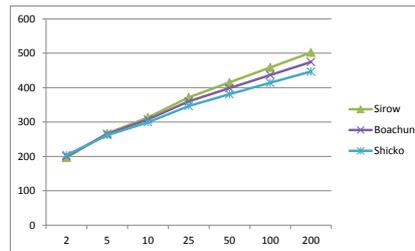

Figure 9: Rainfall forecast in various return period

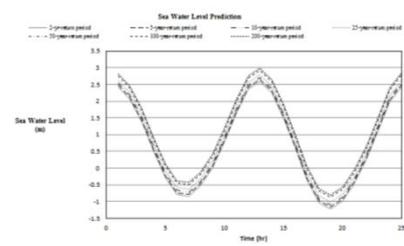

Figure 10: Sea water level prediction

In the 2nd scenario, traditional engineering flood prevention works (see Figure 11) such as drainage, dikes, pumping stations and detentions under various status (operation, under construction or planning) have been included.

In the 3rd scenario, we designate fallow farmlands and wetlands as multipurpose reservoirs (see Figure 12). Since the depth of fallow farmlands and wetlands is different from traditional reservoirs, so we here assume the capacity of fallow farmlands and wetlands are 70% off for flood water storing.

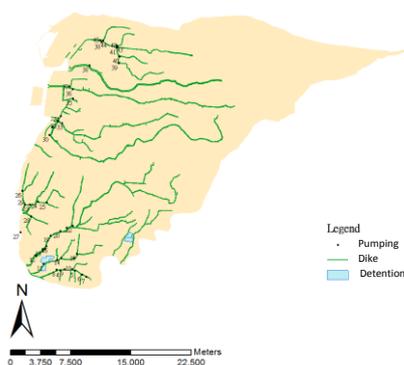

Figure 11: Traditional flood prevention works

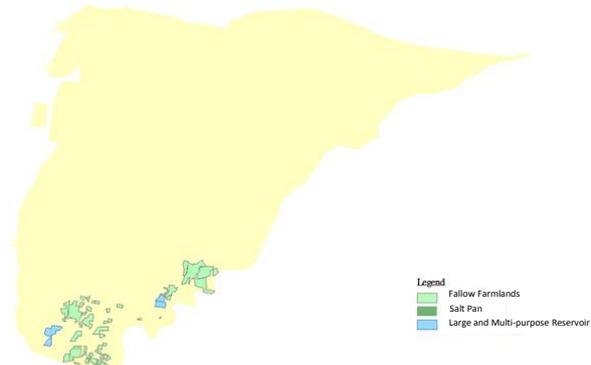

Figure 12: Land use plan with water balance concepts

3.2 Land use adjustments

We then base on elevation of 2m, provincial highway 61 (average height is 3 or 4 m) and 3.8m (the boundaries have been defined by central government based on land subsidence rate and sea level, and have been referred to other research projects in Taiwan), and flood simulation results (the results can be divided into 3 categories, high risk, medium risk and low risk) to propose land use adjustment strategies (See Figure 13).

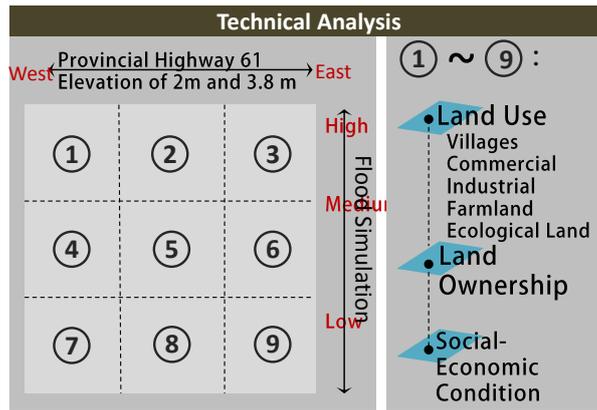

Figure 13: Land use adjustment framework

4. Result

4.1 Flood Simulation Results

Comparing to the 1st scenario (see Figure 14) and the 2nd scenario (see Figure 15), traditional flood prevention works are able to mitigate flood slightly under flood range of 5-, 10-, 25-year return periods for those engineering works came out mostly based on flood range of 50-, 100-, 200-year return periods. Therefore, our study area in southern west part has the most obvious mitigation benefit by constructing dikes, pumping stations and other traditional flood preventions works.

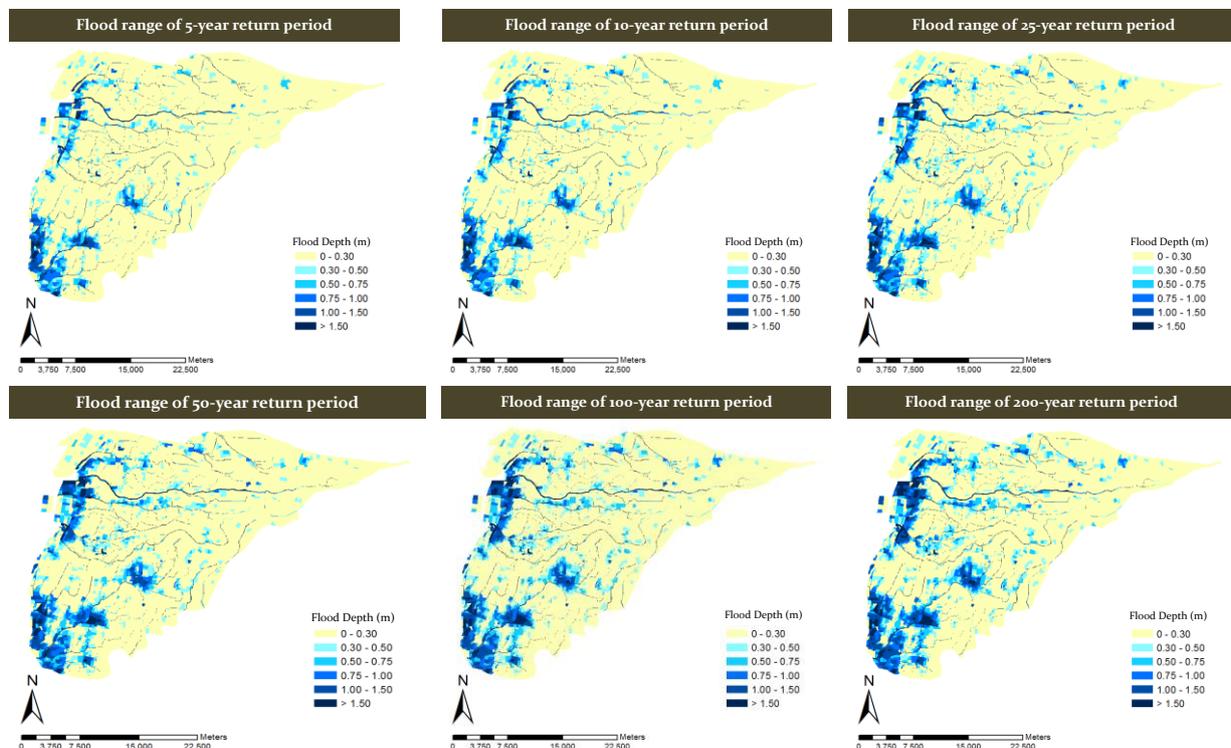

Figure 14: Flood range of various year return period under 1st scenario

Comparing to the 2nd scenario and the 3rd scenario (the integration of existing and planning traditional flood prevention works and other adaptive land use for detention) (see Figure 16), flood disasters have been improved conspicuously along the west coast under flood range of 5-, 10-, 25-year return periods for there are large amount wetlands. In addition, in inland area and upper stream region, we propose fallow farmlands as multipurpose reservoirs. Hence, flood disaster area is able to improve both along the coast and inland area under flood range of 50-, 100-, 200- return periods.

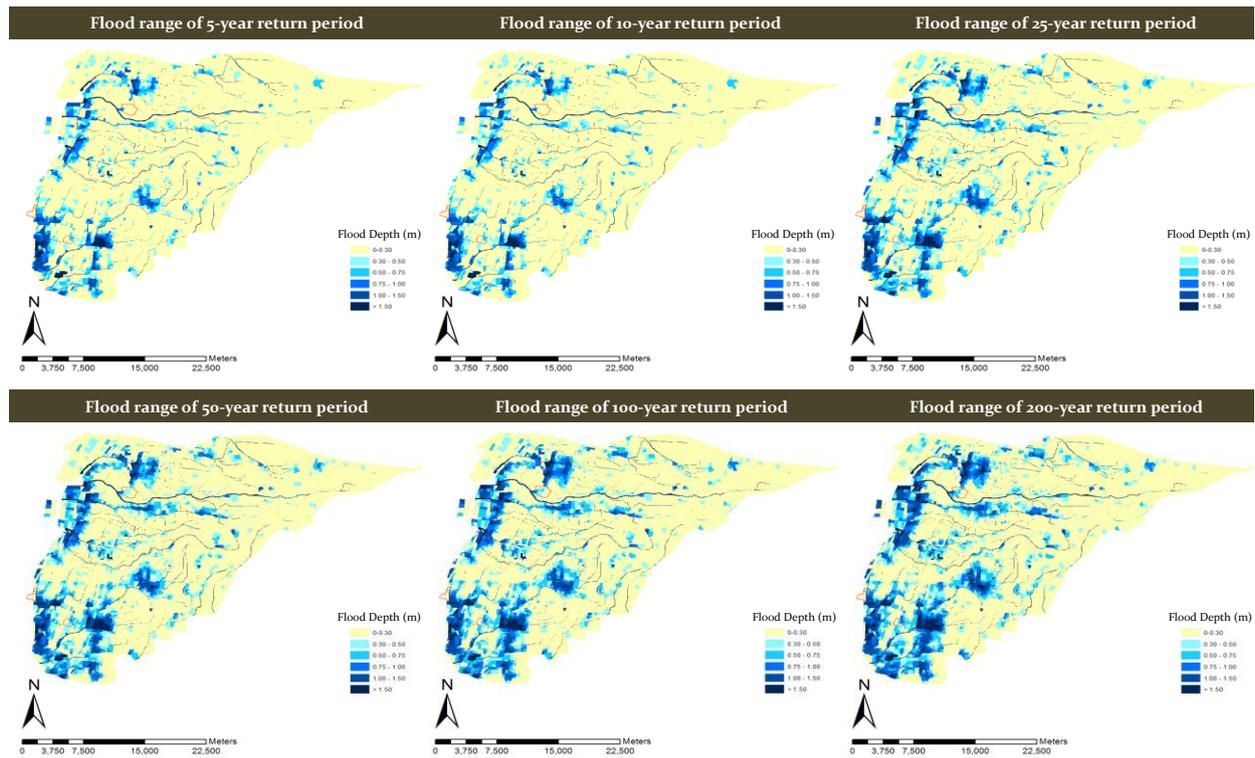

Figure 15: Flood range of various year return period under the 2nd scenario

Although areas along west coast have serious flood disasters under different scenarios, land use plan with water balance concepts indeed improve flood risks. Multipurpose reservoirs at fallow farmlands and wetlands are preliminary variables for now. We will then consider other potential land use types as flood detention purpose in later stages.

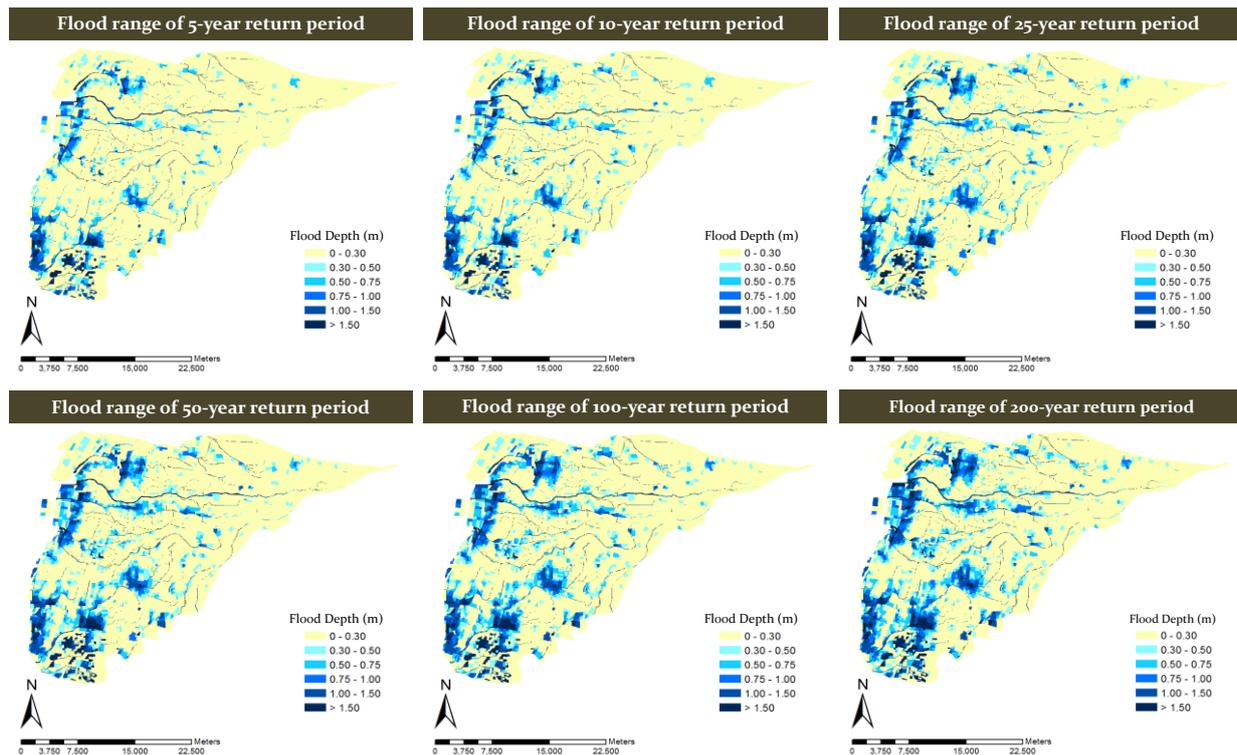

Figure 16: Flood range of various year return period under the 3rd scenario

4.2 Land use adjustment

In figure 17, we have separate buffer zones according to the elevations, including zone I, zone II and zone III. Zone I is the west of Provincial Highway 61 and elevation of 2m. The west boundaries of zone II are Provincial Highway 61 and elevation of 2m, and the east boundary of zone II is elevation of 3.8m. Zone III is the east of elevation of 3.8m.

Owing to various land use types in the study area, public properties are top priority for land adjustment strategy in this planning phase. Figure 18 indicates that the north and the south coast has relative higher flood risks, so public properties, fallow farmlands and wetlands have to become flood detentions. Other land use types such as residential, commercial and industrial have to integrate advanced construction techniques such as stilt houses and floating buildings.

Figure 19 indicates flood risks might happen in relative lower area especially in the south area in zone II. Lower land area have similar land use adjustment strategies to zone I by integrating advanced construction techniques. Other public properties have to be top priority for village move from zone I.

Figure 20 indicates zone III is relative low flood risk area comparing to zone I and zone II. However, public properties have to be top priority for flood retention in upstream region, and adequate flood water drainage system is necessary as well.

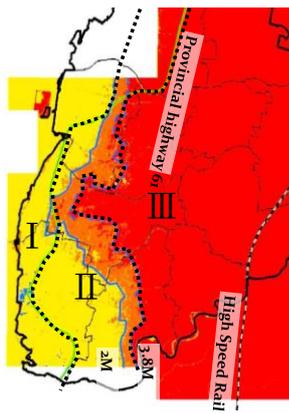

Figure 17: Buffer zones

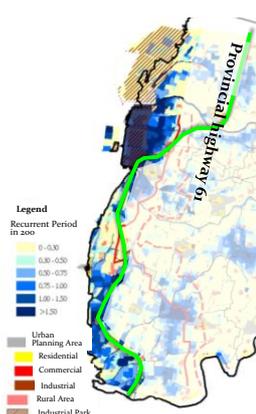

Figure 18: Zone I

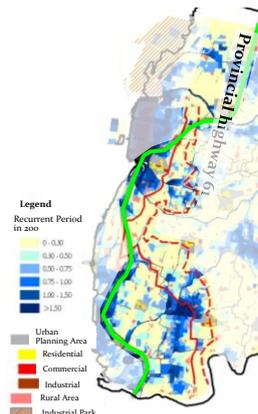

Figure 19: Zone II

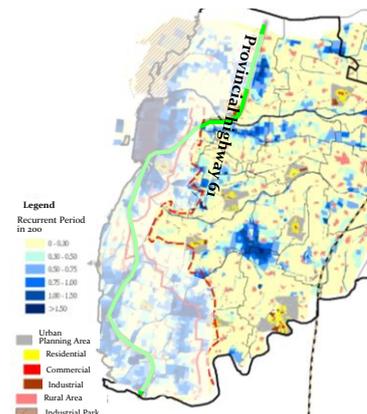

Figure 20: Zone III

5. Conclusion

Coupling with serious land subsidence and flood disasters, we attempt to base on water balance concept and scenario simulation techniques to clarify the urgency and timeliness of various policies for overall land use adaption in such water sensitive city like Yunlin in Taiwan. The integration of land use planning strategies under proper sequence and dynamic land subsidence monitoring system will elaborate flood adaptation and mitigation benefits. Our findings in this stage are as followings:

- A. Based on flood simulation results of applying physiographic inundation-drainage model, traditional flood prevention works are able to mitigate flood slightly under flood range of 5-, 10-, 25-year return periods.
- B. The integration of existing and planning traditional flood prevention works and other adaptive land use for detention are able to improve flood disasters conspicuously along the west coast for there are large amount wetlands.
- C. In the relative higher flood risks zone, public properties, fallow farmland and wetland are top priorities to become flood detentions. Land use adjustment strategies in relative lower area should integrate advanced construction techniques to mitigate property loss during flood disasters. Flood retention in upstream region and adequate flood water drainage system are necessary in the relative safer zone.

Whether Supply Side Housing Assistance Program Is Efficient In Helping Over Come Spatial Mismatch

Comparison Of Low Income Housing Tax Credit Program With Rental Housing

**Xu CHEN,
Tianjin Urban Planning and Design Institute, China
ID Number: 78**

Reviewer Comments:

- **Reviewer 39: A comparative study only and tenuously related to the track theme but potentially informative even if the author seems, so far, to be adding little that is original.**
- **NOTE ALSO unintended duplication of abstract's wording in the document as circulated.**
- **Reviewer 40: Comprehensive study on an assessment method of phenomena called 'spatial mismatch'. The paper itself requires some more structuring, it is difficult to read, there seem to be too many repetitions. The posed problem is very narrow, some background would be welcome. Another solution to the problem, possible to enhance by urban planning, would be introduction of some enterprises to the downtown, without relocation of excluded groups.**

1. Abstract

When low-income jobs move outside of the city and low-skill workers still stay in the center of the city, there is a spatial mismatch. The Spatial Mismatch Hypothesis is testing whether the low-skilled workers have access to low-income jobs as urbanization takes place. It has been tested for different dimensions for 40 years, and the U.S. government has used some policies to eliminate the separation of low-income jobs and housing. Although no housing policy was specifically aimed at eliminating the spatial mismatch, it is possible that the Low-Income Housing Tax Credit Program (LIHTC) has had some positive effect on the issue. The program gives credit to developers with the aim of providing affordable housing. This thesis is testing the effectiveness of the program in overcoming spatial mismatch, and comparing one supply side housing program - LIHTC program - with demand side housing program - rental housing. This paper aims to give suggestions and assessments on whether the LIHTC program is efficient than rental housing and whether it is worth working on with the goal of eliminating the spatial mismatch.

The hypothesis for this study is that the LIHTC program is more effective than rental housing in overcoming spatial mismatch, since the LIHTC program not only gives its recipients freedom to choose where to live and also makes it easier to approach low income jobs. The LIHTC is the only housing program with nearly 100 percent occupancy, and is also the second largest supply side housing program among all HUD housing programs.

2. Introduction

This thesis examines whether LIHTC is efficient in overcoming the spatial mismatch. It reviews the study of housing assistance programs and using the Index of Dissimilarity as a metric to determine how the programs work. This paper is not trying to prove the Spatial Mismatch Hypothesis, but to assess the housing assistance programs. It is comparing people in different areas who are assisted by LIHTC and those who live in rental housing to see how they access jobs, especially low income jobs. The thesis will also give a sense of how those people have been separated from low-income jobs. Although the Spatial Mismatch Hypothesis is mainly testing how African Americans are segregated from Caucasians, this work only tests how housing units and job needs are segregated.

The methodology I used for measuring the effectiveness of eliminating spatial mismatch is the Index of Dissimilarity, which is the measurement of two groups distributed across a geographic area. The study area is the New York Metropolitan area, since this area is well known as being challenged to provide housing for its large urban population. In the text part, I will give detailed information on how the study area is defined, how the data has been collected and how the calculations have been done.

Firstly, the article gives a review of the Spatial Mismatch Hypothesis. In the past, the Hypothesis has been tested in many studies and also by different models. Those empirical studies have tested different dimensions of the Spatial Mismatch Hypothesis (Ihlandfeldt and Sjoquist, 1998). Those findings and studies have proved the spatial mismatch hypothesis. Spatial mismatch itself is an economic and sociological phenomenon associated with the segregation between low income jobs and low skilled workers, so this work is testing the employment opportunities of

low skilled people and where they live.

Secondly, the article reviews housing programs that are implemented by United States Department of Housing and Urban Development. Among all the housing programs, the LIHTC program has been one of the most important programs providing affordable rental housing in the United States, because of its high occupancy among all housing programs since its inception (from HUD website). It was created by the Tax Reform Act of 1986 as an alternate method of funding housing for low- and moderate-income households, and has been in operation since 1987. But it has been argued that the program serves low-income households poorly. So this article tests the spatial relationship of recipients of the LIHTC program and low-income jobs and compare it with the spatial relationship of rental housing household and low-income jobs. The hypothesis here assumes that LIHTC spatially matches low-income jobs better than rental housing.

Thirdly, rental housing is the one of the major ways of providing affordable housing for low income workers and rent is an important variable when calculating the Consumer Price Index (CPI) since it includes rent of primary residence and owners' equivalent to rent in housing price. The generally accepted definition of affordability of housing is for a household to pay no more than 30 percent of its annual income on housing. So, families who pay more than 30 percent are considered cost-burdened, because they may have difficulty affording necessities, such as food, clothing, transportation and medical care. The article will examine 30%, 50% and 80% of Average Area Median Household Income (AMI) groups. In the rental housing part, the article compares the index of rental housing of each percentage group.

Finally, at the end of the article, a comparison of the three Indexes of Dissimilarity of rental housing and Index of Dissimilarity of the LIHTC program has been compiled in a table and a conclusion will be drawn on the effectiveness and efficiency in eliminating spatial mismatch of the LIHTC program as compared to those of the three rental housing percentage groups.

3. Literature Review & hypothesis

3.1. Spatial Mismatch Hypothesis

Spatial mismatch is the sociological, economic and political phenomenon associated an economic restructuring in which employment opportunities for low-income people are located far away from where they live. In the United States, this takes the form of high concentrations of poverty in central cities, with low-wage, low-skill employment opportunities concentrated in the suburbs.

John F. Kain first came up with the idea of the Spatial Mismatch Hypothesis (SMH) in 1968. The idea of SMH is that jobs are decentralized from the urban center, but urban workers, especially minorities, such as black and Latinos, are left in the centre of the city and they do not have easy access to employment. In his article 'Housing Segregation, African American Employment, and Metropolitan Decentralization', he investigated the relationship of housing market segregation and the distribution of non-white employment. He has three hypotheses, which have been proved by the method of home interviews and surveys in the Detroit and Chicago Areas. From his article, we learn that the experience of African Americans has been remarkably different

Whether Supply Side Housing Assistance Program is Efficient in Helping Overcome Spatial Mismatch49th ISOCARP Congress 2013

from that of other ethnic and racial groups in this respect. Stanley Lieberman has shown that African Americans are far more segregated than any other ethnic or racial group in American cities and that while segregation of immigrants and other groups has generally declined; the segregation of African Americans has increased over time.ⁱ In his article, at first, he gave the four most obvious reasons why housing market segregation is affecting the distribution of African American employment. (1) The distance factor, which will impose costs to African Americans. (2) Lacking of employment information from the job areas. (3) Possible discrimination in the job area against job seeking African Americans. (4) Possible self segregation by ghetto area people. And then he tests the hypothesis by using Chicago and Detroit as examples. He proved that the location of African Americans' jobs strongly affects the distribution of African American residences.ⁱⁱ He also examines the occupational groups of African Americans and their work and residence locations. He found that African American ghettos are typically located in the most central part of cities and expand only at their peripheries.ⁱⁱⁱ He came to the conclusion that housing market segregation clearly affects the distribution of African American employment.^{iv} His conclusion is supported by the data obtained from the Chicago and Detroit metropolitan areas. One year later, a paper "Housing Segregation, Negro Employment and Metropolitan Decentralization: An Alternative Perspective" by Joseph D. Mooney was published in the same journal. In his article, Mooney used a different model testing the same hypothesis. He examines the 25 largest standard metropolitan Statistical areas. He used a coefficient to measure the relationship between employment and population. He came to two major conclusions. Firstly, the locations where people live and the locations of job opportunities are closely connected. Secondly, the growing employment sectors in the central cities are largely for female employees.^v Almost thirty years later, in 1992, John F. Kain himself published a paper, "The Spatial Mismatch Hypothesis: Three Decades Later", which includes a comprehensive scholarly literature review for the spatial Mismatch Hypothesis, which deals with the effect of housing market discrimination on the employment of African Americans. In this paper he reviews the history of SMH and the arguments about his paper because of the problems that happened in ghetto areas, such as civil disorder. The government's reaction to the social disorder made this issue of spatial mismatch hypothesis widely recognized and it received extensive attention. There were several opponents and supporters during this three-decade period during which the hypothesis was hotly contested. The hypothesis was first rejected by two economists Ellwood and Leonard. Afterwards, Kain argued with them, because they rejected the spatial mismatch hypothesis on the ground of the different definition of coefficient variables in his 1974 paper, regarding the levels of racial segregation. Wilson's book, *The Truly Disadvantaged* (1987), helped to rekindle this dispute by attributing at least part of the employment problems of inner-city blacks to the suburbanization of industry and employment. (1991, p. 105). Kain analyzed the weakness of the opposition arguments about their models and coefficient of variables.

Most new employment opportunities do not occur in central cities, near all-African American neighborhoods. They are being created in suburbs and outlying areas—and this trend is likely to continue indefinitely. New office buildings have risen in the downtown of large cities, often near all-African American areas. But the outflow of manufacturing and retailing facilities normally offsets this addition significantly—and in many cases has caused a net loss of jobs in central cities.^{vi} After Kain's review, there were more than two dozen new studies on the spatial mismatch issue. Keith R. Ihlanfeldt and David L. Sjoquist gave a review of these studies.

There are also some other brilliant articles after the 30-year debate. In Michael A. Stoll's article, 'Within Cities and Suburbs: Racial Residential Concentration and the Spatial Distribution of

Whether Supply Side Housing Assistance Program is Efficient in Helping Overcome Spatial Mismatch

49th ISOCARP Congress 2013

Employment Opportunities across Sub-Metropolitan Areas', he indicates that less-educated people, public assistance recipients and poor minorities mostly reside in areas that are heavily populated by similar people, but the less-skilled and entry level jobs are in the suburb of metropolitan areas which are not easily accessed by public transit. This is Spatial Mismatch. He tested this hypothesis by examining Atlanta, Boston, Detroit, and Los Angeles, which represent the four different regional metropolitan types, since each has its own central city/ suburban dichotomy. His gave a great example of his data gathering and analysis method of testing the connection of jobs and people. The author recommended two possible results to increase central-city minority residents access to jobs. One is to give minorities more opportunity to live in suburban housing. The other is to subsidize commuters and commuting.

Another paper in this field is "The Mechanisms of Spatial Mismatch". This article is mainly about the factors that cause the spatial mismatch. The first part of the report shows how the jobs been suburbanized. The report argues that in most U.S. cities, the proportion of jobs located in the central cities decreased largely. For example, in 1980 the proportion of jobs located in the central cities was 57%, but in 2000, the proportion decreased to 47%. A number of factors caused this steady decrease: 1. Higher growth rate of jobs in suburbs than in the central city. 2. The rapid pace of suburbanization.

The second part of the report is about the disconnection of the minorities from jobs. The author, using statistics, strongly supports his assertion about blacks remaining in the city during suburbanization. Although the causes of the segregation are diverse, the author gives a direct explanation for the reasons: sheer racial discrimination and housing-market discrimination.

Besides the tests for the spatial mismatch the author made, he also gives 7 underlying mechanisms of spatial mismatch. They are (i) Workers may refuse a job that involves commutes that are too long because commuting to that job would be too costly in view of the proposed wage. (ii) Workers' job search efficiency may decrease with distance to jobs. In other words, for a given search effort, workers who live far away from jobs have fewer chances to find a job because, for instance, they get less information on distant job opportunities. (iii) Workers residing far away from jobs may not search intensively. For instance, when housing prices decrease with distance to jobs, distant workers may feel less pressured to search for a job in order to pay their rent. (iv) Workers may incur high search costs that cause them to restrict their spatial search horizon at the vicinity of their neighborhood. (v) Employers may discriminate against residentially segregated workers because of the stigma or prejudice associated with their residential location (redlining). In particular, suburban employers may consider that, on average, inner city residents have bad work habits or are more likely to be criminals (statistical discrimination). (vi) Employers may refuse to hire or prefer to pay lower wages to distant workers because commuting long distances makes them less productive (they are more tired or more likely to be absent). (vii) Suburban employers may think that their white local customers are unwilling to have contacts with minority workers. They thus discriminate against minority workers (customer discrimination) and in particular against those located in the central city. At the end of the article, the author also gave recommendations on different policy making.

To conclude, all the previous works give a detailed analysis of mechanisms by which spatial mismatch exists and why it exists but seldom mention the relationship with housing programs.

3.2. Housing assistance programs

Whether Supply Side Housing Assistance Program is Efficient in Helping Overcome Spatial Mismatch
 49th ISOCARP Congress 2013

Schwartz’s book gave an overall view on the housing programs. In his book, he introduced key concepts and institutes and examines the most important programs, and also includes empirical data concerning program evaluations, government documents, and studies carried out by the author and other scholars. The book worked well as an introductory level text. The first chapter is mainly about the US housing policy, including the current basic trends and problems, the housing finance system, and the role of the federal tax system in subsidizing homeowner and rental housing. The middle chapters focus on subsidy programs one by one. The closing chapters discuss issues and programs that do not necessarily involve subsidies, including homeownership, mixed-income housing, and governmental efforts to improve access to housing by reducing discriminatory barriers in the housing and mortgage markets. These chapters also offer reflections on future directions of U.S. housing policy.

“The federal government provides subsidies for low-income households in three basic ways: (1) supporting the construction and operation of specific housing development; (2) helping renters pay for privately owned housing; and (3) providing states and localities with funds to develop their programs.”^{vii} According to Schwartz’s book, the housing programs basically can be divided into two categories in the United States; one is supply side assistance, another is demand side assistance. The project-based or supply-side housing subsidies include federal level and local level. The federal government can either give money to state and local government for them to decide what forms of subsidy they want to use, or give money to developers to construct the public housing or operate privately owned housing instead.

From the supply side, public housing or government-subsidized housing programs have been built either by federal government or by nonprofit and private companies which are subsidized by government or by any forms of project based subsidies. In this category, job seekers have to live in the subsidized programs when they receive the subsidies, which greatly limits their approachability to low income jobs, since most of those who have been subsidized have no personal vehicle and have to use public transit to commute. Low-income housing is a typical example of this category. From the demand side, government issues vouchers or other tax deduction methods to help recipients of demand side housing programs with their financial burden or to enable low-income households to obtain housing that already exists in the private market.

Most Low-income households receive assistance through the following methods (Table 1). It can be seen that the Rental Voucher program, Public Housing and other Project-based subsidies are three main types of assistance that the federal government uses and have been assessed many times. The LIHTC program is one of the major methods for government to assist low-income workers that have not been much assessed.

Table 1: Overview of Federally subsidized Rental Housing

Program (year)	Total Units	Percentage of Total
Rental Vouchers	1803013	26%
Public Housing	1220937	18%
Other Project-based subsidies	1999545	29%

Whether Supply Side Housing Assistance Program is Efficient in Helping Overcome Spatial Mismatch
 49th ISOCARP Congress 2013

Deep Subsidy Programs	1709808	25%
Shallow Subsidy Programs	289737	4%
Low-income Housing tax Credits	908563	13%
Tax-Exempt Bond Financing	850000	12%
Home Funding	113553	2%
Total	6895611	100%

3.3. LIHTC program

The LIHTC program was created as an alternate method of funding housing for low- and moderate-income households. The LIHTC system, has been operated since 1987 and is very success in that it has generated many rental-housing units which are now occupied by low- and moderate-income households. However, many argue that the program is overly complex and poorly designed to serve the needs of low-income households (Stegman 1991). There are several significant articles about LIHTC, but none of them have analyzed the program in terms of eliminating spatial mismatch. Some of the related works evaluate how the program works. One of the most cited articles is ‘The LIHTC: an analysis of the first ten years’ by Jean L. Cummings and Denise DiPasquale. In this article, the author analyzes the cost of the projects, who they serve, where they are built and their financial viability by analyzing the 2544 LIHTC projects, which covered the entire history of the program. Before this article, there was very little detailed historical information on the characteristics and performance of the LIHTC. Although this article provides analysis very well about the program in 5 key areas: total development cost, source of financing, operating income and expenses, returns to equity and debt investors, and total subsidies provided, it has nothing to do with the elimination of spatial mismatch.

There are several inspiring articles by Professor Freeman related to LIHTC program. One of the articles mentioned that the percentage of African American in a neighborhood was a relatively strong predictor of the siting of LIHTC developments^{viii}. The article shows the relationship between concentrations of Latino and Asian residents and siting of assisted housing. At another article, ‘Comment on Kirk McClure’s “The Low-Income Housing Tax Credit Program Goes Mainstream and Moves to the Suburbs”’, he argues that LIHTC program is well suited to

Whether Supply Side Housing Assistance Program is Efficient in Helping Overcome Spatial Mismatch

49th ISOCARP Congress 2013

the peculiar circumstance of U.S. in terms of unambitious nature of its objectives, although some other argues that the program is fundamentally flawed. Another article 'Subsidized Housing and Neighborhood Racial Transition: An Empirical Investigation' By Professor Freeman indicates that there is no consistent relationship between assisted housing and racial transition in surrounding neighborhoods.

Another article, which examines how the LIHTC program works, is by Kirk McClure, of University of Kansas. His article "The Low-Income Housing Tax Credit as an Aid to Housing Finance: How Well Has It Worked?" was written when the program had been operating for 10 years. The article mainly deals with the program's financing problems, and controversy about whether the program mainly helps low-income households. In the first part of the article, the author gives a detailed review of how the program works, including the selection process and implementation process of projects. Then he gives the figures showing the program's performance, which show that the program has worked really well since its inception. The article also examines the construction types and market locations of LIHTC properties. The author finds that LIHTC projects are mostly located in areas with poor households, but little is known about the households besides their income. At the end the author comes to the conclusion that the program gives developers too much benefit and that this program and its tax credit are an inefficient subsidy system.

Some other inspiring research on LIHTC program include William S. Hettinger's "Low Income Housing Tax Credits: Strategies for Year 15" and most recently "Housing Choice Vouchers, the LIHTC, and the Federal Poverty Deconcentration Goal" by Anne R. Williamson of The University of Texas at San Antonio. Some of the research mentions the spatial character or analyzes the spatial distribution in certain areas, such as 'Spatial Analysis of the LIHTC Developments in Cuyahoga County' by David M. Brown of University of Cincinnati. Some are research on the market price or evaluations of whether builders get too much benefit. None of this research is about the spatial mismatch of jobs and units located.

3.4. Rental Housing

Rental housing is the major source of housing but there is not any specific research on the relationship of rental housing and low-income jobs. One of the most significant research on rental housing is "Rethinking rental housing" by John Gilderbloom, in which the author provides an attempt to justify state intervention in rental markets, and a more technocratic list of solutions to increases in rent during the 1970s. Although the book has nothing to do with the spatial mismatch of jobs, it is an exhaustive and penetrating study on rental housing policy and history. At the end of the book, the author proposes a variety of less obviously controversial fixes.

Among the variety of studies, there is basically no study on the spatial mismatch of LIHTC program and employment, and the spatial relationship of rental housing with employment. The most related studies are about how residence affects employment, such as Scott W. Allard and Sheldon Danziger's "How Residence and Race Affect the Employment of Welfare Recipients" published in September 2000.

4. Methodology

4.1. Data and Definition of Variables

Index of Dissimilarity is using to measure the relationship of housing units and low-income jobs in this article. There will be four Indexes of Dissimilarity for units of rental housing and low-income jobs. The first Index of Dissimilarity will show the relationship of units of LIHTC projects and low-income jobs; the second Index of Dissimilarity will show the relationship of units of rental housing and low-income jobs. The second category includes three different household income levels. The first group is the household which earns 30% of the Average Area Household Income (AMI), and the other two groups are households which earn 50% of AMI and 80% of AMI. The Index of Dissimilarity is one of the most common measures for assessing the separation of two groups.

The Index of Dissimilarity has been used to measure evenness largely. The Index is an indicator of just how much one group is spatially separated from another group. It has been frequently used by population geographers and demographers. One of the usages is in the book *Racism in Contemporary America* by Meyer Weinberg. The Index of Dissimilarity measures the evenness of housing units and low-income/ entry-level jobs in this thesis. The result will show these two groups' distribution across the census tracts within the New York metropolitan statistical area. I set up the formula by using spreadsheet software.

To access the efficiency of the LIHTC subsidy housing policy in eliminating spatial match is to measure the people's accessibility to jobs. In Spatial Mismatch Hypothesis, the mismatch is mainly the mismatch of low-income/ entry-level jobs and of workers. The measurement process in this thesis is calculating the Index of Dissimilarity of housing units provided by the LIHTC program and low-income/ entry-level jobs, since most people who live in subsidized housing programs are usually low-income workers. The variables include low-income/ entry-level jobs and housing units. The variable will be changed into low-income jobs and housing units. The measurements range from 0 to 1, where the higher the number, the more separated the two groups are. The formula is listed as follows:

Figure 1: The Index of Dissimilarity

$$\frac{1}{2} \sum_{i=1}^N \left| \frac{b_i}{B} - \frac{w_i}{W} \right|$$

For the Index of Dissimilarity of units by Low Income tax credit program and low-income/ entry-level jobs, where:

b_i = the units by LIHTC program of the i th area, e.g. census tract, in this study i is zip code level area

B = the total the units for the large geographic entity for which the Index of Dissimilarity is being

calculated.

w_i = the low-income/ entry-level jobs of the i th area

W = the total low-income/ entry-level jobs of the large geographic entity for which the Index of Dissimilarity is being calculated.

For the Index of Dissimilarity of residents lives in rental housing and low-income/ entry-level jobs (residents, who lives in rental housing, include rent account for 30% of 30%, 50%, 80% of AMI), where:

b_i = the residents lives in rental housing area of the i th area, e.g. census tract, in this study i is zip code level area

B = the total residents lives in rental housing for the large geographic entity for which the Index of Dissimilarity is being calculated.

w_i = the low-income/ entry-level jobs of the i th area

W = the total low-income/ entry-level jobs of the large geographic entity for which the Index of Dissimilarity is being calculated.

4.2. Study Area

The i areas are 347 zip code areas in the study area. Detailed zip code numbers can be found in the appendix. I chose the New York Metropolitan Area, also known as Metropolitan New York or Greater New York or Tri state Region, as my study area. It is the most populous metropolitan area in the United States and is also one of the most populous in the world. The metropolitan area is defined by the U.S. Office of Management and Budget. There are several definitions for New York Metropolitan area based on commuting pattern, which is the wider region consisting of New York Metropolitan area plus five adjacent metropolitan areas, or a smaller region based on the center of New York and its adjacent zone of influence. I chose the smaller region of New York Metropolitan area as my study area, which makes sense for low income housing assistance programs. The official definition of New York metropolitan statistical area is from the article from Executive Office of the President, Office of Management and Budget in Dec 2006. There are two Major Metropolitan areas for New York:

One is 35620: New York-Northern New Jersey-Long Island, NY-NJ-PA Metropolitan Statistical Area: including New York, NY; Newark, NJ; Edison, NJ; White Plains, NY; Union, NJ; Wayne, NJ.

The other one is 35644: New York-White Plains-Wayne, NY-NJ Metropolitan Division: including Bergen County, NJ; Hudson County, NJ; Passaic County, NJ; Bronx County, NY; Kings County, NY; New York County, NY; Putnam County, NY; Queens County, NY; Richmond County, NY; Rockland County, NY; Westchester County, NY.

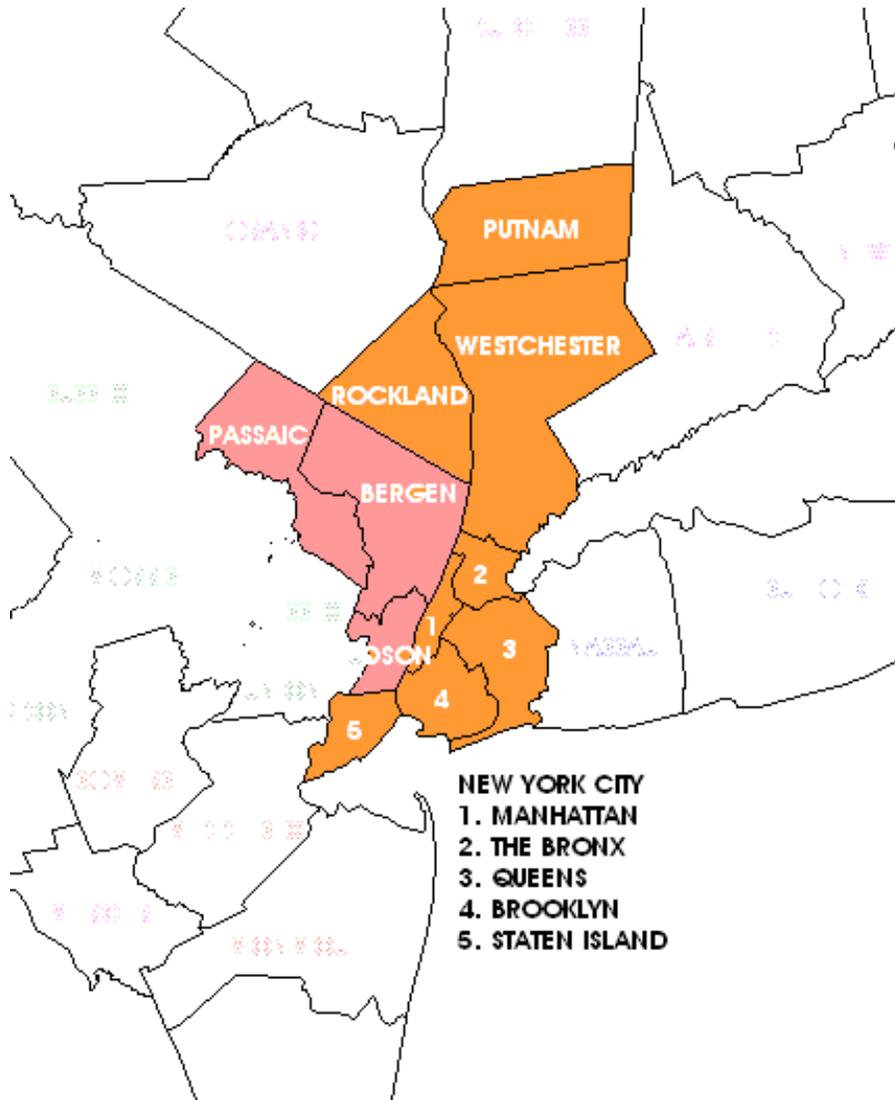

The first one is more focused on New Jersey. So I chose the second one to give a broader view of how the LIHTC works. Another reason for choosing 35644 area is as follows: I can get New Jersey employment data either for 35620 employment data by industry or for the whole state,

Whether Supply Side Housing Assistance Program is Efficient in Helping Overcome Spatial Mismatch

49th ISOCARP Congress 2013

but not in the form of zip code levels. After I consulted the staff in State of New Jersey Office of Labor Planning and Analysis, I found that they do not have zip code level employment data available, but only data at the municipal level.

So I chose the New York State part of the 35644 New York Metropolitan statistical area as my study area, which includes Bronx County, NY; Kings County, NY; New York County, NY; Putnam County, NY; Queens County, NY; Richmond County, NY; Rockland County, NY; Westchester County, NY, 8 Counties in total. The study area map follows (the orange area is the study area, the pink area is the three New Jersey counties within New York Metropolitan Statistical area):

4.3. Data Collection and Comparison

4.3.1 Employment data:

The zip code level employment data by zip code level in 2000, 2006, and 2008 for all these 8 counties were gathered from New York State Department of Labor Division of Research & Statistics via the help of James Brown, Principal Economist from New York State Department of Labor Division of Research and Statistics, and Elena Volovesky, from the same department. The zip code employment data of three New Jersey counties (Bergen County, Hudson County, Passaic County) are gathered from dataset online from Office of Labor Planning and Analysis State of New Jersey with the help of Mary Jane Carnevale, Cathy Mycoff and Chester Chinsky. Unfortunately, they do not have zip code level data available but only municipal level data. Because the zip code area does not correspond to the municipal area, the difference in units makes index calculation difficult. I tried to match each municipal areas with zip codes as follows: The NY metropolitan area 35644 contains three NJ counties, which are Bergen, Hudson and Passaic. These counties correspondence in zip code is hugely different. For Bergen County, there are 78 zip code areas containing 70 municipal areas. For Hudson County, there are 30 zip code areas containing 12 municipal areas. For Passaic County, there are 48 zip code areas containing 16 municipal areas, but the Municipal boundary is not exactly the same as the zip code boundary, and the New Jersey employment data is only available from 2003 to 2008, or before 1999. Because New Jersey employment data are not available for year 2000, but rental housing data are available for 2000 from census, municipalities are too big to really give a sense of the Mismatch.

I therefore dropped the three New Jersey counties from the New York Metropolitan area. The employment data I got is categorized by industries. There are 17 industries in total in each zip code area, including: agriculture & mining, Utilities, Construction, Manufacturing, Wholesale trade, Retail trade, Transportation & warehousing, Information, finance & insurance, Real estate & Retail & Leasing, Professional Scientific & Tech, Management of companies, Administrative & support, Educational Services, Social Assistance, Art & Entertainment & Recreation, Accommodation & Food service and Other services.

4.3.2 Low-income housing tax credit program data

The LIHTC Program data was gathered from HIHTC database online with the help of Michael Hollar, senior Economist from Policy Development and Research. I downloaded the whole dataset of the all LIHTC projects in U.S. since the program's inception and then selected the zip code areas within the study area. For the LIHTC Program, the most updated date they have available to the public is 2006, so I collected all the programs that were implemented after 1990, given that 30 year rule takes effect after 1990. When the LIHTC program began in 1987, properties receiving tax credits were required to stay eligible for 15 years. However, owners were able to opt out of the program after 15 years if they or the state housing agency were unable to find a buyer who is willing to maintain the affordability restrictions. The 30-year extended use agreement was instituted for properties placed in service in 1990 and later. So the data I collected is from 1990 and after since there is no data available on LIHTC program tenants, so I assume after 1990, the tenants are still in the apartments.

Whether Supply Side Housing Assistance Program is Efficient in Helping Overcome Spatial Mismatch

49th ISOCARP Congress 2013

There are 3 tax credit agencies in New York state: New York State Division of Housing and Community Renewal; New York State Housing Finance Agency; and City of New York, Dept. of Housing Preservation and Development. Usually the federal government will allocate the credit for affordable housing projects every year. The tax credits are allocated prior to construction or development of the projects. There is typically a 1-3 year period between when the credits are allocated and when the project is placed into service, so in this thesis, the data I selected is from 1990 to 2006, since the most updated data available is stops at 2006. For example, a project that was allocated credits in 2005 might not be ready for occupancy until 2007. So for the year 2006, there are only two projects being allocated credits, but much more being placed into service that year. The web query sorts the projects first by agency, then by year. When the LIHTC program began in 1987, properties receiving tax credits were required to stay eligible for 15 years. This eligibility time period has since been increased to 30 years in 1990. The LIHTC database contains a variable (NONPROG) that indicates whether a project is no longer monitored for compliance due to expired use agreement or some other reason. The 30-year extended use agreement was instituted for properties placed in service in 1990 and later. However, owners are able to opt of the program after 15 years if they or the state housing agency is unable to find a buyer who is willing to maintain the affordability restrictions. There is currently no comprehensive data on tenants living in LIHTC units. So I am using the data after 1990 assuming that people living in LIHTC units are not moving anywhere.

4.3.3 The rental housing data

The rental housing data is acquired from 2000 Decennial Census data portal for Census 2000 data at American Fact Finder website and with the help of Jane, EDS consultant from Columbia University. The most updated data for rental housing is from the year 2000. From the Summary File 3, I customized my table by choosing H62 Gross Rent of Specified renter-occupied housing units instead of choosing H54 Contract Rent of Specified renter-occupied housing units, because the definition of H54 contract rent is the monthly rent agreed to or contracted for, regardless of any furnishings, utilities, fees, meals, or services that may be included. For vacant units, it is the monthly rent asked for the rental unit at the time of enumeration. We need to exclude the vacant units from the total rental housing. So we choose H62 as variable. After selection of geographic type, the last choice is 5-digit zip code areas. The reason for choosing Summary File 3 is that it presents in-depth population and housing data collected on a sample basis. Summary Files 1 and 2 in Census 2000 do not have detailed housing information we need.

This variable has been divided into 24 subcategories, include Total, With cash rent total, With cash rent: less than \$ 100, With cash rent: \$100 to \$149, With cash rent: \$150 to \$199, With cash rent: \$200 to \$249, With cash rent: \$250 to \$299, With cash rent: \$300 to \$349, With cash rent: \$350 to \$399, With cash rent: \$400 to \$449, With cash rent: \$450 to \$499, With cash rent: \$500 to \$549, With cash rent: \$550 to \$599, With cash rent: \$600 to \$649, With cash rent: \$650 to \$699, With cash rent: \$700 to \$749, With cash rent: \$750 to \$799, With cash rent: \$800 to \$849, With cash rent: \$850 to \$899, With cash rent: \$900 to \$949, With cash rent: \$950 to \$999, With cash rent: \$1,000 to \$1,249, With cash rent: \$1,000 to \$1,249, With cash rent: \$1,250 to \$1,499, With cash rent: \$1,500 to \$1,999, With cash rent: \$2,000 or more, no cash rent. I did not count the no-cash rent. Part of the table is as follows:

Table 2: Rental housing data in study area by zip code level

5. Text

5.1 How does LIHTC work

The tax credits are determined by the development costs, and are used by the owner. However, because of Internal Revenue Service regulations and program restrictions, the owners of the property are usually not allowed to use all of the tax credits. Therefore, many LIHTC properties are owned by limited partnership groups, which are put together by syndicators. Under this situation, a lot of companies and private investors who participate within the LIHTC program aim at receiving credits against their federal tax liability in return when investing in housing projects. Tax Credits must be used for new construction, rehabilitation, or acquisition and rehabilitation, and projects must also meet the following requirements:

- At least 20 percent of the units are occupied by households whose income is less than 50

Whether Supply Side Housing Assistance Program is Efficient in Helping Overcome Spatial Mismatch

49th ISOCARP Congress 2013

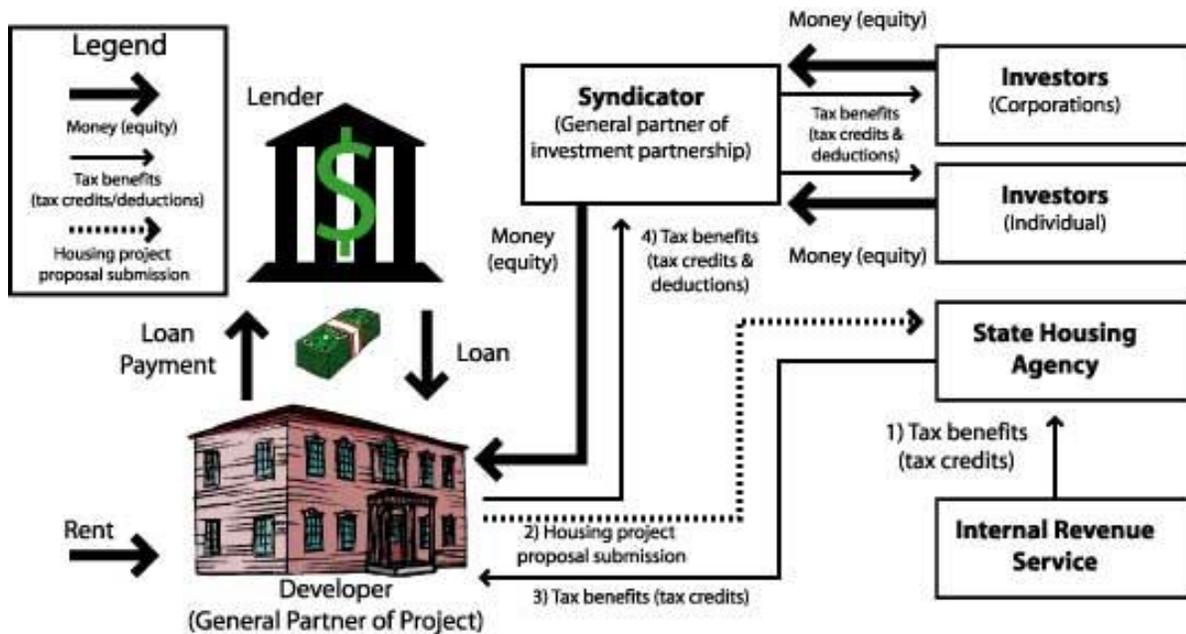

percent of the metropolitan area's median family income, or

- At least 40 percent of the units are occupied by households whose income is less than 60 percent of the metropolitan area's median family income ^{ix}
- When the LIHTC program began in 1987, properties receiving tax credits were required to stay eligible for 15 years. This eligibility time period has been increased to 30 years since 1990. _x

Most states determine the amount of tax credit an individual project receives based on its qualified basis. The qualified basis is determined by following standards. Firstly, the total cost of a project has been calculated. Secondly, the non-depreciable costs need to be deducted from the total project cost to determine the eligible basis, such as land, permanent financing costs, rent reserves and marketing costs, etc. Thirdly, as an option, the project developer may also voluntarily reduce the requested eligible basis in order to gain a competitive advantage. Finally, to determine the qualified basis, the eligible basis is multiplied by the applicable fraction, which is the smaller of the following criteria to arrive at the qualified basis: 1. The percentage of low-income units to total units. Or, 2. The percentage of square footage of the low-income units to the square footage of the total units.

The qualified basis is then multiplied by the federal tax credit rate, published monthly by the Internal Revenue Service, to determine the maximum allowable tax credit allocation. For projects that are new construction or rehabilitation, which are not financed with a federal subsidy, the rate is approximately 9%. For projects involving a federal subsidy (including projects financed more than 50% with tax exempt bonds), the rate is approximately 4%. The 9% and 4% rates are used to determine a project's initial tax credit reservation. A project's final (placed-in-service) tax credit allocation is based on actual project sources and uses of funds, the financing shortfall and the actual applicable federal rate.

Whether Supply Side Housing Assistance Program is Efficient in Helping Overcome Spatial Mismatch

Source: U.S. Department of Housing and Urban Development online

The chart illustrates the process of how the Low-income housing credit system works. The Internal Revenue Service issues the Tax Credits to the state housing agencies. The state housing agencies examine and investigate housing projects' proposal submissions and award the Tax Credits to the developer of the project. In the meantime, the developer could receive money from individual investors or institutional investors or other forms of lenders. In return for additional equity financing, the Tax Credits pass to the syndicator, who gets this equity financing from investors, to whom the syndicator passes the Tax Credits. So the investors get the tax credit advantage of investing in such affordable programs and tax credits can have a much larger impact than tax deductions. For example, Tax credits are subtracted directly from one's tax liability. Credits reduce tax liability dollar-for-dollar, but Tax deductions are subtracted from a taxpayer's total income to compute his or her tax base. Deductions reduce tax liability by the amount of the deduction times the tax rate. For example, for tax credit, a \$1,000 credit in a 15% tax bracket reduces tax liability by \$1,000. But for tax deduction, A \$1,000 deduction in 15% tax bracket reduces taxable income by \$1,000, thereby reducing tax liability by \$150.

5.2 Why testing the spatial mismatch on LIHTC and rental housing is important

LIHTC program is a very effective in housing subsidy used to finance the development of affordable housing and is one of the most important supply side housing assistance programs. According to U.S. Department of Housing and Urban Development staff, there were 4.9 million

Whether Supply Side Housing Assistance Program is Efficient in Helping Overcome Spatial Mismatch

49th ISOCARP Congress 2013

households living in HUD-subsidized housing in the United States in the year 2000, and the units of LIHTC program have high occupancy, and it is the second biggest supply side housing program among all HUD housing programs. The LIHTC program seems complicated, but many local housing and community development agencies are effectively using its tax credits to increase the supply of affordable housing in their communities.

LIHTC program is definitely a great method for promoting the construction of affordable housing projects, but how the program works in helping those low-income workers is unclear. Although it has high occupancy, we still cannot get a direct sense of how it serves the low-income worker. Whether the LIHTC spatially matches the need of all those low-income workers is the major question we would like to answer through a comparison to the rental-housing match with low-income jobs. We assume that LIHTC program spatially matches low-income jobs better than others since it has the highest occupancy.

To understand how the LIHTC works in eliminating spatial mismatch is important in assessing the supply side housing programs. As I mentioned in Spatial mismatch hypothesis, since the test of the relationship of housing units and low-income jobs has not been done yet, this thesis can be considered as a hope that my observations may lead to other studies.

5.3 Calculation

The calculation of Index of Dissimilarity of rental housing & low income jobs is as follows:

1. Figure out the median income of each county for the NYC metropolitan area in 2000. The data is in Table 3. To figure out the Area Median Income (AMI) in 2000, I got the area median income from HUD of those 8 counties.

Table 3: The area median family income in 2000 in study area

Bronx County	56200
Kings County	56200
New York County	56200
Putnam county	56200
Queens County	56200
Richmond County	56200
Westchester County	83100
Rockland County	82400

Source: U.S. Department of Housing and Urban Development

2. Based on that median income, calculate households with 80% of AMI, 50% of AMI and 30% of

Whether Supply Side Housing Assistance Program is Efficient in Helping Overcome Spatial Mismatch
 49th ISOCARP Congress 2013

AMI. Calculate 1/3 household income level to create the following table:

Table 4: Study Area average household income group

County	30% of Area Median Family income	50% of Area Median Family income	80% of Area Median Family income
Bronx County	16860	28100	44960
Kings County	16860	28100	44960
New York County	16860	28100	44960
Putnam county	16860	28100	44960
Queens County	16860	28100	44960
Richmond County	16860	28100	44960
Westchester County	24930	41500	66480
Rockland County	24720	41200	65920

- Figure out the amount of rent a household in each county would pay based on the percentage of AMI (80% of AMI, 50% of AMI, and 30% of AMI).

Table 5: Monthly rent of each income group

County	30% of 30% of AMI	30% of 50% of AMI	30% of 80% of AMI
Bronx County	421 (400)	702 (700)	1124 (1000)
Kings County	421 (400)	702 (700)	1124 (1000)
New York County	421 (400)	702 (700)	1124 (1000)
Putnam county	421 (400)	702 (700)	1124 (1000)
Queens County	421 (400)	702 (700)	1124 (1000)
Richmond County	421 (400)	702 (700)	1124 (1000)
Westchester County	623 (600)	1038 (1000)	1662 (1500)

Whether Supply Side Housing Assistance Program is Efficient in Helping Overcome Spatial Mismatch
 49th ISOCARP Congress 2013

Rockland County	618 (600)	1030 (1000)	1648 (1500)
-----------------	-----------	-------------	-------------

- Using the H62 variable in 2000 census zip code level rental housing data, determine how many units are rented for each of these 3 levels, in each zip code in the New York metropolitan area. Since the units are divided by rent range, I selected units according to number in the brackets in table 5.
- Then compile them with low-income jobs by zip code. The selection process for low-income jobs is as follows: total wage divided by total employment, and then calculate the half of the total average wage per person, which is 9952 USD. Those who earn below 9952 in each industry have been selected in each zip code area. Use the values obtained in #4 to calculate the dissimilarity index with the zip code level employment data.

5.4 Result Comparison

When calculating the index for LIHTC recipients and low-income jobs, the process is the same. So the Dissimilarity indexes of LIHTC & Low income job and rental housing & low-income jobs are as follows:

Table 6: Index of Dissimilarity of Housing Assistance programs and Low income jobs

Index of Dissimilarity variables	Index variable: Rental housing that is affordable to those with incomes that are 30% of AMI	Index variable: Rental housing that is affordable to those with incomes that are 50% of AMI	Index variable: Rental Housing that is affordable to those with incomes that are 80% of AMI	Index variable: all LIHTC projects
Index variable: low-income/ entry-level jobs	0.496	0.430	0.405	0.687

Study area: New York Metropolitan area: Bronx county, Kings County, New York County, Putnam County, Queens County, Richmond County, Westchester County, Rockland County

Typically the Index of Dissimilarity is between 0 to 1, with 0 meaning no segregation or spatial disparity, and 1 being complete segregation between the two groups with no spatial intermingling. In this result, we know from the table, that for those people who live in rental housing, 30% of household income is paid for the rental housing, the least segregation occurs between affordable rental housing and low-income jobs. The index is 0.496, which means 49.6% of the households who earn 30% of area median income would have to move in order for the rental housing and low-income job to be spatially integrated. Those who live in rental housing who earn 80% of area median income are segregated from low-income jobs at 0.430,

Whether Supply Side Housing Assistance Program is Efficient in Helping Overcome Spatial Mismatch

49th ISOCARP Congress 2013

which means 43% of low-income jobs need to be moved into those rental-housing areas to achieve a job housing integration. For households that earn 80% of area median income, 40.5% of the low-income jobs need to be moved into those rental-housing areas to achieve job housing integration. This group of people is segregated the least from jobs. The results of Index of Dissimilarity of the LIHTC program and low income jobs are the highest, with the number 0.687, which means that 68.7% of the LIHTC units would have to move into other areas in order for the LIHTC units and low-income jobs to be spatially integrated.

5.5 Explanation & Recommendation

The LIHTC program as a supply-side method works well to provide affordable housing. But the LIHTC program is not efficient enough in eliminating the spatial mismatch. One of the reasons is developers of LIHTC properties receive an additional 30% in tax credits if the property is located in a Qualified Census Tract (QCT). To be eligible for designation as a QCT, a census tract must have at least 50% of its households earning less than 60% of area median income or a poverty rate of at least 25%. Thus, developers have an incentive to locate in relatively poor areas, where there are presumably fewer jobs. The aim of the program is to increase affordable rental housing. However, unlike public housing, the goal is to have private developers build and manage the properties. Thus, developers receive tax credits in exchange for building low-income units and maintaining rent and income restrictions for at least 15 years. The 30% incentive is for developers to locate the property in areas where, probably, Congress feels affordable housing is under-supplied or needed. So, In this case, the LIHTC program works well in providing affordable housing, but needs to consider the work opportunities for people who live there before issuing the credits to developers. For example, gather information on low-income jobs and roughly calculate how many units might be needed for the area and then make a restriction on how many units should be built to minimize the overbuilt and supply-deficient.

Another reason that the LIHTC program does not efficiently eliminate spatial mismatch is the low-quality jobs are mostly offered by large representative firms, which need to choose the location by themselves. Their location decisions are affected by land rents as the dispersion forces firms to locate in suburbs and firm agglomeration forces them to locate in city center, so usually the dispersion force is stronger than the agglomeration force for the firms which have mostly entry-level jobs. Empirically, the entry-level jobs are mostly manual and service jobs. According to SMH, jobs are decreasing in the central city and there is mainly entry-level job growth rather than more skilled jobs in the suburbs, which cause the problem of spatial mismatch. The LIHTC projects are mostly located in poor neighborhoods, which are in cities. The low-skilled workers mostly are minorities who remained located in the city center where they lived before suburbanization. So to minimize the effect of dispersion force, the local government also needs to give different credits to developers according to the land values and related working opportunities.

Another reason for the inefficiency of LIHTC is rental housing gives tenants much more flexibility to live where they want to live, which gives them mobility in finding a job. The LIHTC program as a supply side housing program does not have the flexibility advantage of finding a job.

But at the end, more studies need to be done in this area. But at least two methods need to be

Whether Supply Side Housing Assistance Program is Efficient in Helping Overcome Spatial Mismatch

49th ISOCARP Congress 2013

taken into consideration both different tax credits for developer and different tax credits for area. To summarize: 1. The division for different tax credits for developers should be set. For example, in areas that have more low-income jobs, say set a portal of giving 30% additional tax credit for the projects built in the areas which have more low-income jobs or in the areas where 50 % of the household earning is lower than area average median income. 2. The government should allocate tax credits according to land value, which means to match the low-income jobs firms' need. Other methods could be taken into consideration is from the urban planning prespect is some incentive policice could be set as to encourage some enterprise to downtown. At last, I hope my observations could bring more good works in this field.

Planning for lively spaces: Adding value to old spaces

Elizelle Juaneé CILLIERS & Nicolene DE JONG

North West University, Unit for Environmental Sciences and Management, Urban and Regional Planning, Potchestroom, 2531, South Africa.

Peer review: 91

Abstract

The complexity of the spatial planning process has increased because the modern, highly-developed society is becoming increasingly dynamic with regard to social, sustainability and economic issues. The society wants its urban environment to be a reflection of its needs, demands and preferences. Planning for space implies planning for people, whose needs are constantly changing. Places are frequently valued for several intertwined reasons that can coexist and complement each other, but also compete and cause conflict. Identifying the reasons why the place is valued is essential in planning for the space.

Planners need to turn the conventional way of planning up-side down and introduce a more controversial planning process, focussing on the people and the life of the cities and public spaces, in order to enhance the value of spaces which already exists, and adhere to the needs of modern societies. Lively planning is introduced in this paper as the controversial planning process. Lively planning focuses on the inclusive public realm, creating versatile public spaces to celebrate the uniqueness of a place, encouraging alternative uses of the space and improve possibilities within the space. Lively planning transforms locations that people inhabit, into the places they live in. This paper will evaluate case studies where lively planning was introduced to transform the area and enhance the value of the space. Two specific case studies, namely Louvain-La-Neuve (Belgium) and Doornakkers (The Netherlands) will be discussed and evaluated to determine the added value brought along by the lively planning processes. The paper will conclude with initiatives to transform the current planning approaches in an attempt to add value to spaces that already exists.

1. Introduction to lively planning

Lively planning aims at creating lively spaces and public places for all citizens. Lively planning thus focuses on the social dimension of planning and the people that will inhabit the spaces. Soholt (2004:8) states that “Planners and architects ought to turn the conventional way of planning up-side down and introduce a more controversial planning process with the people and the life of the cities and public spaces in focus. Instead of starting with the buildings, we need to envision the future life of an area first. This way we can form nice spaces that are inviting for people and take in consideration people’s needs and behavioural patterns, and when the spaces are formed we can develop guidelines for planning of buildings.” This is the aim of the lively planning approach, substantiated by Hobart City Council (2011:1) whom regards a place as ‘lively’ when the focus is on the public grounds; being inclusive for all and open for a wide range of user groups.

Lively planning focuses on the inclusive public realm, creating versatile public spaces to celebrate the uniqueness of a place, encouraging alternative uses of the space and improve possibilities within the space. Lively planning transforms locations that people inhabit, into the places they live in. The challenge of the lively planning approach is to create spaces for people whose needs are constantly changing (Cilliers *et al.* (2012:13) and for society who is becoming more dynamic. The urban environment and public spaces should thus continuously address the needs of the community. This poses a further challenge as the changes in the urban environment are much slower as opposed to people’s needs (Barendse *et al.*, 2007:3), as illustrated in the following figure.

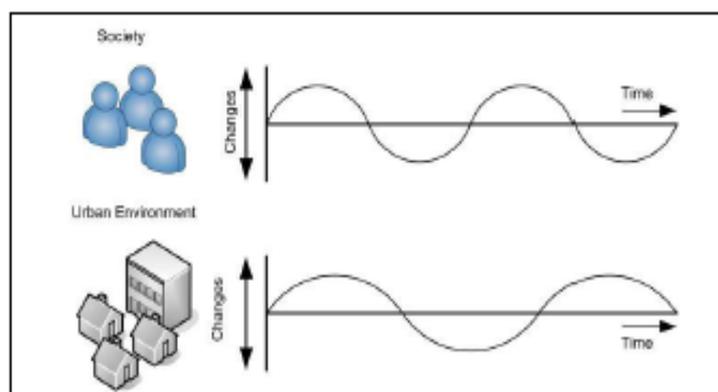

Figure 1: The change of society versus the urban environment

Source: Barendse *et al.* (2007:3)

The tension between the slow changing environment and the dynamic society can be minimized through comprehensive public participation processes (Soholt, 2004:8), where people’s needs and behavioral patterns are prioritized in order to plan for and create lively places, not only for present use, but future usage as well and thus adhere to sustainable planning initiatives. Another attempt to bridge the gap between the fast changing social needs and slow changing environment is by means of green-planning initiatives, using the natural environment to create places for social interaction and function.

When bringing lively-planning approaches and green-planning initiatives together, versatile public spaces can be created that celebrate the uniqueness of a place, while encouraging alternative uses of the space and improving possibilities for staying in the space (Hobart City Council, 2011:2). This integrated approach seeks to turn the conventional way of planning up-side down and introduce a more controversial planning process, focusing on the people-scale and actual users of the space.

Gehl (2004:31) supports the shift to site- and people-scale planning where the flow of natural life and movement trends are interpreted in order to create spaces that enhance these movements and functions and to, subsequently, create buildings and environments that will support these spaces. The execution of a lively planning approach is therefore made up of high density, integration, diversity, good public spaces and active ground floor facades (Gehl, 2004:37).

2. From spaces to places

Lively planning is based on the concept of place-making, aiming to transform spaces into places characterized by functions of activity and use. According to Harrison and Dourish (1996:67) space refers to the structural and geometrical qualities found in any physical environment whereas a place is a concept that also includes the dimensions of lived experience, interaction and the use of a space by its inhabitants. A place can be regarded as a space with function and meaning.

In this sense, a successful public space is a lively place that is secure and distinctive and contributes to the needs of the people who use it (Harrison and Dourish, 1996:67). Cowan *et al.* (2006:23) agrees that the process of successfully transforming a space to a place is based on the inputs of the people inhabiting the space, again stressing the importance of participatory planning processes as part of the place-making and lively planning approaches.

Cilliers *et al.* (2012:11) refers to successful places as a space enriched with the presence of numerous functions and activities regarding community life, where people inhabiting this place possesses a feeling of ownership and connectedness. The creation of place is therefore rooted in the process of integrating and delivering a variety of functions and activities within a mere space. The following figure illustrates certain measurements, intangibles and key attributes that should form part of the place-making process.

Figure 1: Place-making elements

Source: Adopted from Baltimore City Department of Planning (2010:90)

There are furthermore various factors that determine the success of a lively public space, captured in Table 1. These are broad principles that places should be measured against in order to determine their success in terms of the public sphere. These factors determine successful places that share a host of factors extending beyond mere physical dimensions, but incorporate the necessity of lived experience (Harrison & Dourish, 1996:67) and human connectedness (Cilliers *et al.*, 2012:9; Cowan *et al.*, 2006:24). The presence of these factors therefore ensures liveliness within a space, and the transformation of old spaces into lively places.

Factor	Description of successful public space
Identity	Historically, public spaces were the centre of communities; traditionally it helped shape the identity of entire cities by their image.
Attractions	Great public spaces have a variety of smaller “places” within it that appeal to various people. Functions create attractions.
Amenities	A public space should feature amenities that make it comfortable for people to use. A good amenity will help establish social interaction.
Flexibility	The use of a public space naturally changes during the day, week, and year and to respond to natural fluctuations. Flexibility needs to be built in at the outset.
Seasonal	Successful public spaces need more than one design, which can change with the seasons. Adaptive usage.
Access	A civic destination needs to be easy accessible, including crosswalks, lights timed for pedestrians, slow moving traffic and proper signage.
Visibility	The elements within space should be visible from a distance, and ground floor activity of buildings surrounding it should entice pedestrians to move.

Table 1: Factors of successful public places

Source: Adopted from Baltimore City Department of Planning (2010:170)

These aspects were all carefully studied and included in the conducting of the Baltimore Downtown Strategic Plan in which one of the goals was to improve existing public spaces and creating new open spaces to attract and retain businesses and residents in Downtown (Baltimore City Department of Planning, 2010:3) based on these abovementioned factors of successful public places (Table 1) and place-making elements (Figure 1).

The open space planning process included an assessment of open spaces within the study area and included stakeholder input in identifying five focus areas to study in more detail with a series of place-making workshops to evaluate and discuss potential physical improvements to each of these five areas. Within these processes and evaluations aspects like networks, sustainability, transportation and place-making was grounded as “guiding concepts” around which specific recommendations are based (Baltimore City Department of Planning, 2010:4).

Based on the simultaneous recognition and implementation of these guiding concepts and the abovementioned factors and elements, general recommendations were provided aimed at including these factors and elements in the current “deficient” open spaces in the West Side (Baltimore City Department of Planning, 2010:4).

The following table summarizes the approaches used to redevelop these open spaces along with the specific factors and/or elements that were included.

Recommendations	Description	Elements or factors included
Sustainable practices	Street tree plantings; utilizing signage and display panel; using of solar structures for water features and lighting.	<u>Flexibility; Seasonal planning; visibility.</u> Image – clean, “green”, attractive. Uses – indigenous, sustainable.
Transportation and Mode-Sharing	Accommodating bicyclists and considering short and long-term bike parking; converting non-arterial streets to two-way traffic flow to improve pedestrian environment and motor circulation.	<u>Access; Visibility.</u> Access and Linkages – connected, walkable; convenient, accessible.
Red Line and Metro Station Areas	Give function and presence to stations; capturing their unique identity; equal design consideration for pedestrians and accommodating pedestrian access by maintaining direct sight lines to stations.	<u>Access; Visibility; Identity.</u> Image – safe, clean, attractive, historic. Access and Linkages – connected; convenient.
Streetscape Enhancements	Utilize “shared space” to maintain vehicular traffic but emphasize pedestrian environment; creative ways to introduce shade, scale and color where street trees are not possible.	<u>Visibility; Attractions; Amenities; Identity.</u> Access and Linkages – pedestrian activity. Image – walkable, attractive.
Temporary Enhancements	Utilize pavement striping before investing in permanent solutions; utilize pots and planters able to be moved to different locations and “pop-up-cafes” where sidewalks are too narrow for outdoor dining.	<u>Amenities; Attractions; Flexibility; Visibility; Identity.</u> Sociability – diverse, street life, welcoming. Image – “green”, attractive.
Public Art	Develop solutions for blank walls (local artists); rotate art to keep space fresh and give people additional reasons to return.	<u>Seasonal planning; Identity; Attractions.</u> Image –attractive, charming; Uses – indigenous, real, special.
Availability of Refreshments	Consolidated and managed vending operations; recruit and locate restaurant uses to activate spaces.	<u>Amenities; Identity; Attractions.</u> Sociability – neighborly, diverse; Uses – local business ownership; property values. Image – Suitable, attractive.
Partnerships	Property owners, Downtown institutions, foundations and a residential base for stakeholders.	<u>Identity</u> Uses – property values, local business ownerships, rent levels; Sociability – neighborly, pride, friendly, stewardship.

Table 2: Baltimore open space plan – summary of recommendations

2.2 Creating a lively public place

As described previously, it is evident that lively places and public places are similar concepts, as both focus on the public realm and social functions. Both concepts need a people-focused approach (Cilliers *et al.*, 2012:16) and dimensions of lived experience, interaction and use by inhabitants (inhabitants in this context defined as 'public'). Both focus on public grounds, being inclusive for all people and open for a wide range of user groups.

Loudier and Dubois (2001:1) define a lively public place as a meeting place, a place for debate, controversy, discussion; a place that is accessible to all and that everyone is able to use. Lively planning seeks to plan for people, their needs and their constantly changing and evolving desires (Cilliers *et al.*, 2012:13).

Public places therefore need to constantly be regenerated (Loudier & Dubois, 2001:17), well and transparently managed (Philips, 2010:14) and well maintained (Baycan-Levent, 2007:11) in order to constantly adopt and comply with present human needs. Spaces should be versatile in order to ensure possibilities of change.

The following pilot studies illustrate the linkages between place-making approaches and green-planning approaches, where green-planning initiatives were used to transform a public space into a meaningful public place. The lively planning approach in creating public places in each of the case studies was discussed along with the lively attributes and public place-making factors. It seeks to identify initiatives used to transform the old spaces into vibrant, lively public places, by adding value to spaces which already exists.

3. Lively planning case studies

3.1 *Louvain-La-Neuve (Belgium)*

Place des Wallons in Louvain-la-Neuve, Wallonia, Belgium, is an urban space that has been built 40 years ago as a university city. Figure 3 illustrates the current open space, characterized as a neglected space with no function. As part of the LICl lively cities Interreg EU project, this public space in Louvain-La-Neuve in Belgium (Figure 1) was redeveloped to address this problem and add value to the space and enhance user function by introducing lively-planning approaches supported by green-planning initiatives, and transform the space into a destination where the public would choose to spend their time (illustrated by Figure 3).

An analysis was conducted within the space, comprising of movement within the space, actor-analysis, natural environment-analysis, as well as day-night functions. The analysis identified scattered routing within the area as the core issue to address in order to transform the old space into a lively public place. The lively-planning approach introduced recognizable entrances, guided walking routes, and more places to sit and socialize, as part of the transformation. These initiatives contributed to the sense-of-place of the area, the movement patterns and overall functional use and sustainability. Further green-planning initiatives were introduced to support the lively-planning concept, including city-trees, green roofs, green graffiti and public furniture (refer to Figure 3).

The city-tree initiative was based on the fact that trees are not fond of cities, but people love trees in the city as trees create a sense of place. In order for a tree to grow and be healthy it needs the same circumstances as it would have in its natural habitat. The city-tree initiative was introduced to help sustain the tree life within the case study area, based on implementing artificial habitats for city trees (such as tree boxes, permavoid boxes and tree sand (refer to Cilliers 2012 for details)).

The green-roof initiative included plants in the form of grasses, shrubs and even trees which was literally lifted up to the next level (Jansen and Ruifrok, 2012a: 17).

The green-graffiti initiative introduced moss graffiti (also called eco-graffiti or green graffiti) intended to replace spray paint, paint-markers or other such toxic chemicals and paints with a “moss-paint” that can grow on its own. The idea of making living, breathing graffiti has become a green-initiative and creative outlet for graffiti artists, especially since people became more eco-friendly and environmentally aware. It can also be considered another form of guerrilla gardening (Jansen and Ruifrok, 2012a: 18).

Figure 3: Re-development plan for Louvain-La-Neuve

Source: Adopted from Jansen and Ruifrok (2012b: 1).

The most contributory aspects included in this case study with regards to lively public place planning was the shaping of movement patterns within the space and introduction of green-initiatives which contributed to the creation of a sense of place within this area. These initiatives enhances place-making within a public space (i.e. transforming a 'space' into a 'place'), as it creates a quality environment in which social and environmental needs are simultaneously addressed (i.e. the focus on people-scale of planning in order to create PUBLIC lively places).

3.2 Doornakkers (The Netherlands)

Another redevelop project was located in Doornakkers, a residential neighbourhood in Eindhoven (The Netherlands), characterized by the "normal" problems and urban complexities of degeneration and neglectance of older urban areas, and shortage of qualitative social and public space. The other problem of this area was in terms of the lack of green spaces. The aim of the redevelopment project was to re-plan this area by means of lively-planning approaches supported by green-planning initiatives, to develop a qualitative green environment a network of green spaces, whilst providing adequate qualitative social public spaces and redeveloping the urban space of Doornakkers.

In an attempt to enhance the lively-planning approach and create lively public places within this area, green-planning initiatives were introduced. The aim was to create a "green-heart" within the area, combining social and environmental functions.

Various analyses was conducted, including professional analyses to determine environmental constrains and possibilities, stakeholder analyses to identify actual stakeholders and users of the area, risk analyses and SWOT-analyses to evaluate the places and their possibilities, strengths, weaknesses and threats, green analyses to quantify green values and identify gaps, and site analyses to determine micro and macro impacts. Two core green-initiatives were introduced to support the lively-planning approach, namely green walking routes, and green impulses.

The green walking routes initiative focussed on landmarks within the broader residential area, with the objective to design a space that will ensure residents to interact more with their direct environment. The social interaction and cultural significance where the main driving forces considered in the planning of the green walking routes, along with spin-offs such as recreation possibilities and a qualitative, usable environment. In terms of environmental quality, the expansion of current tree structures in the area where enhanced, along core corridors of movement (Boogaards, 2012:71). The current green networks (Figure 4a) was thus re-planned to be more integrative, connected by means of the green walking routes (Figure 4b).

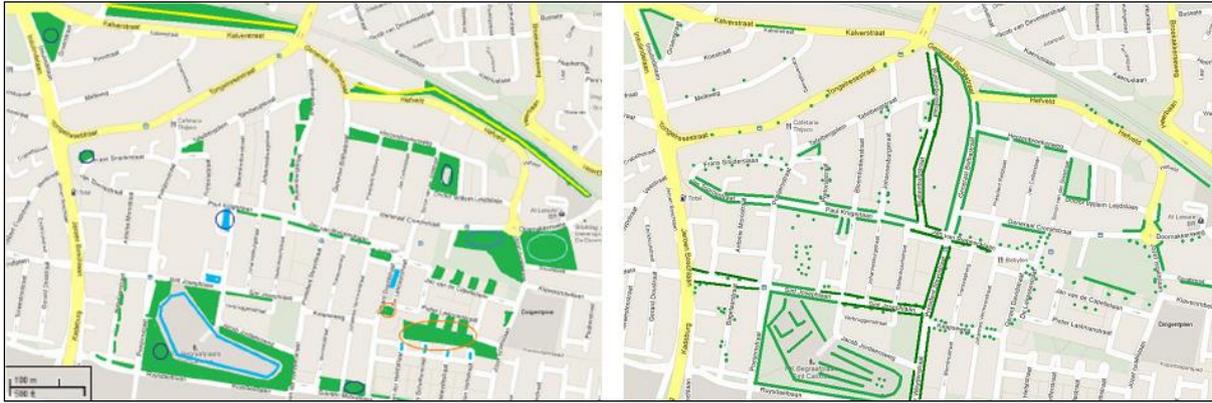

Figure 4: Current green network versus expansion of green structure along core corridors
Source: Boogaards (2012:70-71)

The green-impulse initiative was a creative approach to the planning of lively public green spaces, focussing on children-friendly spaces and the development thereof by means of a design-competition among residents. The green-impulse pilot raised awareness amongst residents (stated as a green heart beat), where social capital and public interest were enhanced as a result of an integrated green-planning initiative and holistic place-making approach. Concept designs were implemented in practice, transforming old spaces to lively public places.

The introduction of the green-planning initiatives as part of the place-making process in the public spaces in Doornakkers in the Netherlands, created a strong “green-identity”, while enhancing social functions in the area. The initiatives enhanced social awareness and green-planning among users of the space and community members, having a multi-dimensional impact.

4. Conclusion

Planning is a continuous process of anticipating and preparing for foreseeable future changes (Cilliers et al, 2011). Lively planning is a bottom-up planning approach, focused on the people-scale and aiming to transform old spaces into vibrant, lively places, constantly trying to address the social changes and needs. Green-planning initiatives assist the lively-planning approach by transforming old spaces by means of green networks that enhance the social and environmental function within an area.

The green-planning approaches described in this paper (such as city-trees, green roofs, green graffiti, green walking routes and green impulses) were specifically focused on the social and environmental benefits of a space. The case studies captured initiatives to transform the current planning approaches in an attempt to add value to spaces which already exists and address the gap between environmental planning and planning for the people (i.e. the changing society).

Lively planning approaches as captured in the case studies enhanced the identity of the place, focussed on the social dimension and social functions within the space and the natural environment (green-initiatives) that support the lively-planning approaches. These green-planning initiatives were found to enhance the value of the current spaces, acknowledging the dynamic and constantly changing social needs.

It was concluded that green-planning initiatives does not only enhance lively-planning approaches, but gives a space function. It creates a quality environment, addressing social and environmental needs simultaneously. There are various spin-offs for introducing green-spaces in our cities. Urban Planners, authorities and decision-makers should be the drivers of change in our cities, creating a sustainable, green environment for all residents. "To change life, we must first change space" (Lefebvre, 1991: 190).

From Garden City to City in a Garden (Case Study: Shiraz City as a "Permaculture" Model in Iran)

Sara FATTABI, Apadana Institute of Art and Architecture, Iran
Mojtaba BAZRKAR, MAF Hypermarkets, Iran

1. City Developing or Garden creating?

Human face many challenges related to the health and well being. Many of these challenges arise as the direct consequence of dense urban environments. Industry, automobiles, and impermeable concrete and asphalt surfaces combine to negatively impact upon the air and water quality, while climate change serves to exacerbate the urban heat island effect through global warming.

To help alleviate the environmental problems encountered with dense urban habitation and to encourage sustainable development, governments and non-profit agencies worldwide are working toward creating laws, establishing standards, and funding incentives to promote best practices in development. Rooftop gardens are an excellent example of incorporating passive, eco-friendly technology into new or existing development. Rooftop gardens help mitigate the negative impacts of cities on the environment by: conserving energy and water, improving air and water quality, assisting in storm water management, absorbing solar radiation, becoming a source of local food production, providing habitat restoration, and creating natural retreats.

Many cities have a lot of 'lost', green space that can help them to communicate with nature. Good weather that can help them breeze better. At least, better life through developing the city. As our population grows, we will have to make a greater effort to ensure that we continue to make space for greenery and our natural heritage. "...[W]hen basic necessities are no longer produced locally, people lose an important base for understanding how their everyday lives are connected with the environment and lose respect for the systems that sustain them" (Perkins, 1996,70).

2. Roof Gardening as one solution to Green

The Green Movement in the 60's has rejuvenated much interest in the promotion of roof greening as the answer to the host of problems related to rapid urbanization (Michael Wong), Rooftop gardening is only one example of urban agriculture, but has an important place within a comprehensive urban agriculture strategy, as it takes advantage of underutilized urban spaces. Nowadays the creation of green roofs and rooftop gardens are becoming increasingly popular in so many cities. These practices reduce the city's environmental footprint, increase sustainability of urban areas and improve quality of life. At the same time, the many benefits of local food production, particularly increased food security, are becoming more apparent.

The benefits of greening roofs are many. Green roofs use sustainable technologies and create jobs to produce roofing membranes, light weight growing mediums and filters (Kuhn, 1996). In addition, jobs are created in research, design, construction, landscaping, urban farming and consulting (RGRG, 2002).

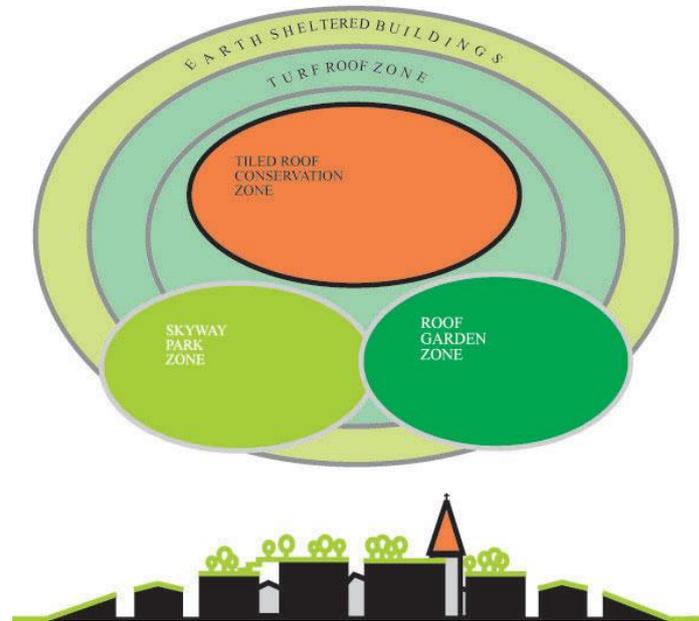

Figure 1: The diagram from a 1996 City as landscape essay on Eco-cities, suggests a citywide approach to the landscape treatment of roofs capes – and has a slight visual kinship with Michael Van Valkenburgh Associate’s design for the ASLA green roof.

2.1 Environmental Benefits of Roof Gardens

Exposure to green space reduces stress and increases a sense of wellness and belonging (Bremer et al, 2003, p. 55). “A ten percent increase in nearby green space was found to decrease a person’s health complaints in an amount equivalent to a five year reduction in that person’s age” (Sherer, 2006, p. 16). Food Production Reaches New Heights An important opportunity from greening rooftops is the potential for local food production. Rooftops provide accessible land tenure for urban farmers since the majority of other activities within the city do not compete for roof space (Meletist and Webster, 1999). By growing food on rooftops, citizens have an opportunity to contribute to the local economy, increase their own food security, grow fresh organic produce and decrease the time and transportation costs between themselves and their food (GRHC, 2002).

Conclusions Rooftops provide an alternative venue for producing food locally; reclamation of food citizenship. Corporate control, limited information to consumers, manipulation of consumers through supermarket hype and an emphasis on processed and convenience foods are all threats to food security. (Welsh and MacRae, 1998) Urban agriculture addresses economic, poverty, health and environmental issues and is a social movement that allows for people to make important choices about the food they eat (Guberman, 1998). Gardening is a favored pastime for many residents of Shiraz as a vehicle for relaxation, creative expression and beautification.

3. Roof gardening through “Permaculture”

Permaculture was developed in the early 1970's by Australian ecologists Bill Mollison and David Holmgren as a positive response to the energy crisis of the time and to ensuing environmental degradation and resource depletion. Permaculture was founded on the following assumptions: (Holmgren, 2002).

- 1) The environmental crisis is real and of a magnitude that will transform industrial society and threaten its existence,
- 2) Humans are subject to the same natural laws that govern the rest of the universe,

Figure 2: The diagram from a 1996 City as landscape essay on Eco-cities, suggests

Analysis of the roof top as an area for the development of permaculture design was chosen particularly as an investigation of how roof tops effectively become a building's fifth elevation. Roof tops often viewed from above in a city, with multilevel buildings, but rarely given the same amount of consideration as the other four conventional elevations. Roof tops in some cases are out of mind but not out of sight, becoming an unsightly and unlovely yet very dominant part of the city experience. The notion explored here is that these areas could become a very positive asset to a city if they were covered in vegetation. Perhaps there are more rooftop gardens in the 'Garden City' than most people know of, but even if they are out there, not enough is known by the general public about the possibilities above their heads.

“Permaculture” is derived from the words permanent, agriculture and culture. It comes from the principle that a stable, sustainable culture cannot exist without an integrated relationship with a system of sustainable agriculture (Holmgren, 2002, Whitefield 2004). From its conception, permaculture has had a strong emphasis on developing relationships between communities and agriculture for the purpose of creating a stable, secure, localized food system. Permaculture systems seek to amend the vulnerability and destructiveness of the modern industrial food system which is heavily dependent on massive amounts of fossil fuel inputs (e.g. petroleum based pesticides and herbicides, fertilizer production and transportation) (Gever, 1991, Holmgren 2002). Permaculture food systems make efficient use of energy, labor and material resources and maximize synergistic relationships and yield. Along with this food system focus and partly because of it, the other principles of permaculture developed to facilitate the creation of sustainable communities.

‘Permaculture’ is about

an attitude to the land and living, which seeks to work with nature and natural systems to achieve a balanced harmonious ecosystem, within which humans exist as part of a larger network of co-operating life.

The four ideas investigated are:

- A garden for the production of food for humans: Helping to introduce the idea of urban food production to the city
- A garden for people sensitive to allergies: An environment where all can enjoy the benefits of the garden
- A garden for the well being of the human mind: A kind of sanctuary from the stress of inner city living
- A garden for the preservation and the regeneration of habitat: For native plant, bird and animal species, encouraging a more diverse and stable ecosystem for the inner city (Maibritt Pedersen 1999 / 2002)

permaculture is not the landscape, or even the skills of organic gardening, sustainable farming, energy efficient building or eco-village development as such, but it can be used to design, establish, manage and improve these and all other efforts made by individuals, households and communities towards a sustainable future. Because the focus of this report is on roof top gardens as a method of inner city permaculture, the specific benefits of roof top gardening have been considered.

a. International Reputation of Cities

- A city employing systems of roof top permaculture would gain the international reputation of being an environmentally leading city, and tourism could increase, due to the novelty factor involved with the idea of roof top gardening. Such a city could also be an example to other cities and become a centre for learning, and research into the area of roof top permaculture in an inner city context.

b. Human well being

- The psychological effects of more garden and nature zones are certainly very positive and a huge benefit for the citizens of the city.

c. Increased Life of the Roofing Membrane

- A layer of soil moderates extreme temperature swings experienced on the roof between day and night, and therefore the expansion and contraction of the roof will be moderated, and the life span of the roof will be increased. In England it has been recorded that:

'The effect of temperature regulation Can reduce roof temperatures by 40' C in summer, and raise winter temperatures from -20' C to -5' C.

- Because the roofing is covered, it is protected from harmful UV rays and conventional everyday wear and tear. Exposed flat roofs may require renewal after as little as ten years. There are documented examples of roofs under roof top gardens being in near perfect condition after fifty years and longer.

d. Energy Cycling

- By putting food or plant scraps that came from the garden, back into the same garden, all of the energy that it took to grow the food or plants is kept within the area to assist with the growing of the next generation of plants. The introduction of roof top permaculture creates a use for some of the city's organic waste through composting, thus reducing landfill loads.

e. Economics

- Economically, ‘any amenity such as a roof garden could easily add up to twenty percent value to a domestic property...’ which would also be true perhaps of commercial property.

f. Location and Tenure

- The relative nearness of roof gardens is a major advantage. Individuals or businesses cultivating their roof space do not have to make trips to and from allotments or other gardens, which saves time and energy (both human and transport).

- One of the problems associated with urban agriculture is the lack of tenure. Temporary garden plots are often displaced by what is viewed as more productive use of the land (such as car parks, bypasses, apartments etc.) Many gardens are labour intensive to set up and people may be reluctant to invest time in an area of which continued availability is not assured. Roof top gardens are not likely to face this dilemma and therefore offer greater security of tenure. (Maibritt Pedersen 1999 / 2002)

Permaculture strategies focus on the opportunities rather than the obstacles. In the context of helping the transition from ignorant consumption to responsible production, permaculture builds on the persistence of both a culture of self-reliance, community values, and the retention of a range of skills, both conceptual and practical, despite the ravages of affluence. The identification of these invisible resources is as important in any permaculture project as the evaluation of biophysical and material resources. While sustainable “production” (of food and other resources) remains the prime objective of permaculture strategies, it can be argued that permaculture has been more effective at pioneering what has come to be called “sustainable consumption”. Rather than weak strategies to encourage green consumer purchasing, permaculture addresses the issues by reintegrating and contracting the production/consumption cycle around the focal point of the active individual nested within a household and a local community. Although permaculture is a conceptual framework for sustainable development that has its roots in ecological science and systems thinking, its grassroots spread within many different cultures and contexts show its potential to contribute to the evolution of a popular culture of sustainability, through adoption of very practical and empowering solutions.(Holmgren)

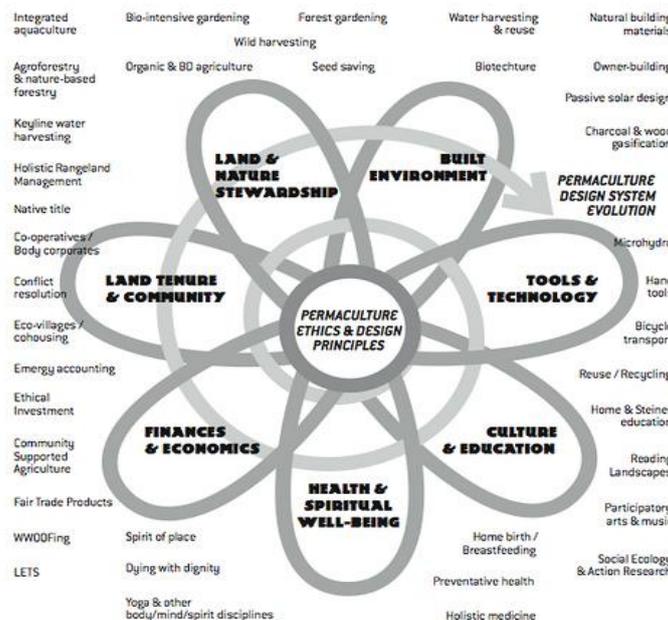

Figure 3: The Permaculture flower (Holmgren 2002)

3.1 Permaculture principles

The idea behind permaculture principles is that generalized principles can be derived from the study of both the natural world and pre-industrial sustainable societies, and that these will be universally applicable to fast-track the development of sustainable use of land and resources, whether that would be in a context of ecological and material abundance or one of deprivation. These principles can be divided into ethics and design principles.

Ethics act as constraints on survival instincts and the other personal and social constructs of self-interest that tend to drive human behavior in any society. They are culturally evolved mechanisms for more enlightened self-interest, a more inclusive view of who and what constitutes “us”, and a longer-term understanding of good and bad outcomes.

3.1.1 permaculture design principles

The scientific foundation for permaculture design principles lies generally within the modern science of ecology, and more particularly within the branch of ecology called ‘systems ecology’. Other intellectual disciplines, most particularly landscape geography and ethno biology, have contributed concepts that have been adapted to design principles. Fundamentally, permaculture design principles arise from a way of perceiving the world that is often described as ‘systems thinking’ and ‘design thinking’ (Holmgren)

Observe and interact: Beauty is in the eye of the beholder (i.e. systems thinking).

Catch and store energy: Make hay while the sun shines.

Obtain a yield: You can't work on an empty stomach.

Apply self-regulation and accept feedback: The sins of the fathers are visited on the children unto the seventh generation.

Use and value renewable resources and services: Let nature take its course.

Produce no waste: Waste not, want not.

Design from patterns to details: Can't see the wood for the trees.

Integrate rather than segregate: Many hands make light work.

Use small and slow solutions: The bigger they are, the harder they fall. Slow and steady wins the race.

Use and value diversity: Don't put all your eggs in one basket.

Use edges and value the marginal: Don't think you are on the right path just because it is well traveled.

Creatively use and respond to change: Vision is not seeing things as they are but as they will be. (Tomczak, 2007)

To apply these principles in the real world requires understanding them in the context of all the elements in the system that is being manipulated. These elements fall into the categories of, site components (e.g. water, earth, landscape, climate, organisms), energy components (e.g. technologies, structures, sources, connections), social components (e.g. legal aids, people, culture, trade and finance), and abstract components (e.g. timing, data, ethics) (Mollison 1988).

Both of these systems are very similar, even though the terms come from different disciplines; permaculture and home gardens respectively. Ecological gardening applies permaculture design to create sustainable home landscapes.

4. Permaculture Method Principle in Shiraz to become a Garden City

Iranian garden is the original output of Iranian life and mental interaction in their natural environment. On the other hand, Iranian garden is also the original output of Iranian life and mental interaction in their natural environment (Mansouri, 2005; Shahcheraghi, 2010). Especially in Shiraz that is known as Garden City.

Figure 4: Shiraz south west view, central zone: old gardens, and new construction

Shiraz is the sixth most populous city of Iran and the capital of Fars Province, with 1,455,073 inhabitants situated in southwestern Iran on the Roodkhaneye Khoshk (Dry River) seasonal river. It is found in the inland around 200 km from the Persian Gulf, at an elevation of 1,800 meters above sea level with a moderate climate and an active regional trade center for over a thousand years. Shiraz is the capital of Fars province, one of the most beautiful, historical cities in the world. Farsi (Persian or Parsi) the language of Ancient Fars (Pars), has become the official language of Iran (Persia). Different people have lived in the Fars province such as the Aryans, the Samis and the Turks, who worked together to form the Iranian culture. It is regarded as one of the oldest provinces of ancient Persia.

Shiraz is known as the city of poets, literature, wine and flowers. It is also considered by many Iranians to be the city of gardens, due to the many gardens and fruit trees that can be seen in the city. The economic base for Shiraz is commerce of products from the surrounding region, where grapes, citrus fruits, cotton and rice is produced. Of Shiraz own industries, cement, sugar, fertilizer, textile products, wood products, metalwork and rugs dominate.

Shiraz's climate has distinct seasons, and is overall classed as a semi-arid climate (Köppen BSh/BSk), though it is only a little short of a Mediterranean climate (Csa) summers are hot, with a July average high of 37.8 °C (100.0 °F). Winters are cool, with average low temperatures below freezing in December and January. Around 300 mm (12 in) of rain falls each year, almost entirely in the winter months, though in some cases as much as this has fallen in a single month (as in January 1965 and December 2004)[, whilst in the year from July 1965 to June 1966 as little as 82.9 millimeters (3.3 in) fell.

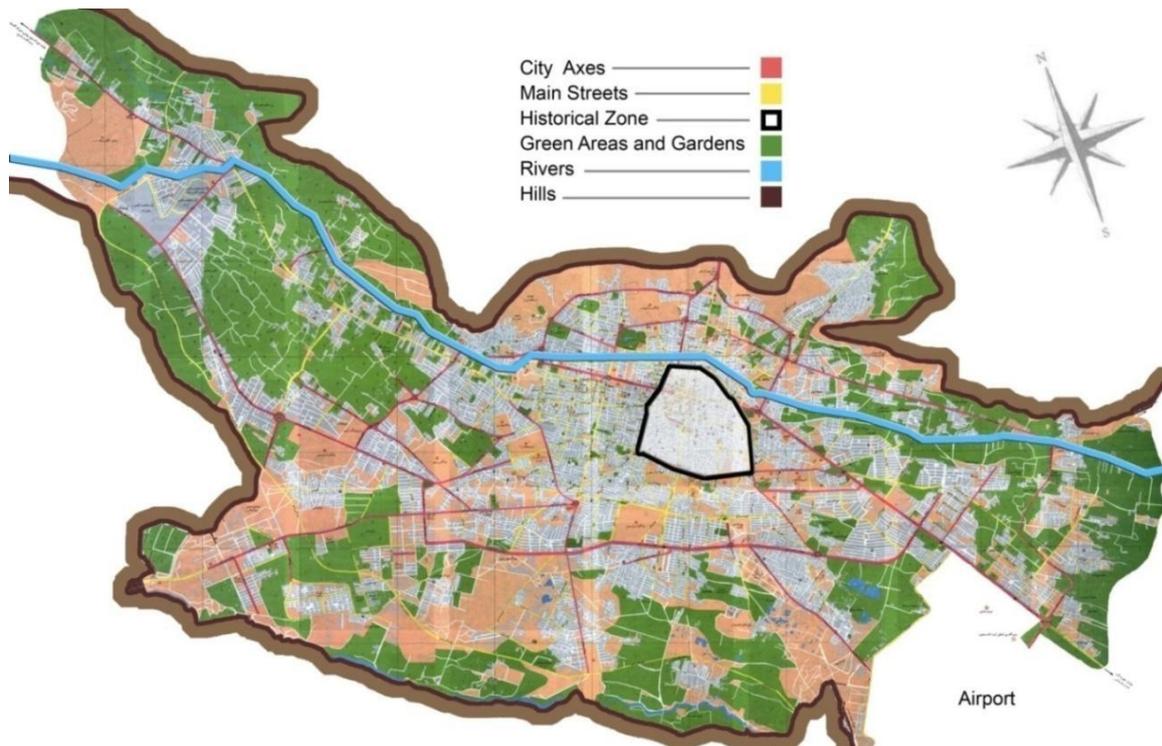

Figure 5: Shiraz Map

The wettest year has been 1955/1956 with as much as 857.2 millimeters (33.75 in), though since 1959 the highest has been around 590 millimeters (23.2 in) in each of 1995/1996 and 2004/2005. Shiraz contains a considerable number of gardens. Due to population growth in the city, many of these gardens may be lost to give way to new developments. Although some measures have been taken by the Municipality to preserve these gardens, many illegal developments still endanger them. As we can see because of its context and reputation of culture and long history, permaculture design can be done on it. Therefore we can renew and rebuild gardens through another way.

Figure 6: Shiraz north east view, near Dry River (Seasonal River)

Shiraz has some problems to serve daily transportation. This causes some urban projects to widen the streets in the central zone. In reality, the strategy has not been implemented in

many cases. Furthermore, the widespread patterns of physical growth have been acted So many gardens have been destroyed. In addition to opportunities for people to be connected to the identical built environment, Permaculture advantages can preserve human life from further damages. Roof gardening, greening open space, Pedestrian realm of the city is a great opportunity for citizens to reconnect to their history, environmental identity and cultural activities. It represents a different view of life to visitors which is safer, more beautiful and more convenient.

Figure 7: Green roof sample in Shiraz,

Environmental preservation, riverside and productive gardens Shiraz has over 400 hectares of fruit productive inner-city gardens inside its metropolitan area. Most of these gardens are located in North- West of the city in "Ghasr-Dasht" area. A few of these gardens have expensive buildings within them.

Lemon and orange trees are traditionally grown in private properties (e.g. Bagh-e- Eram) as well as public areas as. There are also local plantains trees grow up without any special care. The city river that is a seasonal waterway has a landscape which needs to be promoted as a linear recreational space for citizens. By some small changes in landscape design and safety promotion, it has potential to improve citizens' health.

There is a cultural event in each February (Bahman) when people plant trees one month before the spring, the so called "planting ceremony" (jashn-e-derakhtkari). Shiraz has fertilized soil and is one of agricultural centers of the country. It has numerous food production industries, as well as the potential to improve it further. It is suggested that the waste management system, food production and packaging industries must be taken into consideration in an integrated manner.

5. Conclusion

While the benefits of roof gardens are somewhat unquestionable from the environmental point of view, the cost effectiveness may need to be looked at in order for roof gardens to be widely adopted in our region. In conclusion those who do not garden may list time constraints, lack of access to land and lack of knowledge as reasons why they do not garden. Government at all levels must recognize the benefits of greening rooftops and

support initiatives to encourage this activity across the country. Developers, policy makers, architects, and the public require performance information on the technology, benefits, and costs involved. Even when a city recognizes the benefits of rooftop gardens, there is still the need to encourage the construction of green roofs by making them a financially viable option.

Iran has not yet caught on to the benefits of promoting green roofs and actions must be taken to encourage governments at all levels to support these initiatives. There are a number of local organizations in Shiraz that are working to promote the benefits of locally produced food and the potential for urban agriculture. Rooftop gardening is an integral part of this food production system and should be increased in Shiraz.

Development policy or palliative therapy? Investing in the quality of public spaces in the distance from large urban centersⁱ

Anna GOLEĐZINOWSKA, Department of Urban Design and Regional Planning
Faculty of Architecture, Gdansk University of Technology, Poland

Synopsis

The paper is concerned with two main issues: the phenomenon of an extensive network of medium-sized towns in Poland, and the development of strategies based on the quality of public spaces.

Poland has an extensive network of small and medium-sized towns. This second group - providing access to higher order services - influences the quality of life of a large part of the country's population. The aftermath of system change in 1989 was much more severe for smaller urban centers than for areas of metropolitan potential. The consequences of this transition shock are still evident.

Against this background, a priority for improving the quality of public spaces (this tendency has occurred around 2000 and intensified after the Polish accession to the EU in 2004), seems to be particularly worth verifying. Can the new quality of public space become an important development factor? Is the new image of the town an effective tool for mobilizing potentials or only relieves the symptoms of collapse?

The case studies were made for the four towns (Ustka, Pruszcz Gdanski, Tczew, Chojnice) in which improving the quality of public space was designed to achieve a different development goal. As the point of reference were used selected programs referring to the quality of public space implemented in areas of comparable settlement structure - Germany and Denmark.

The results show that under certain conditions the answer to the above questions can be positive. Furthermore, better results were achieved in those cases, in which the main investments in the public spaces have carried out without use of the EU funds.

1. The situation of small and medium-sized towns in the context of political changes in Poland

The Polish settlement network is characterized by high density of towns in the absence of global nodes and European engines (ESPON 2006). More than a dozen largest urban centers by far excel in contributing to the country's economic growth but it is in the space of small and medium-sized towns where a large part of the population resides. Thus, the smaller towns and connected rural areas significantly influence the direction of local development and, owing to their large number, they become an important component of regional growth.

Studies conducted in various parts of the country confirm that the small and medium-sized towns whose economies would be shaped in the past by a single employer or a single branch of industry suffered the effects of the transformations started in 1989 more severely than the larger multi-functional centers. It should be noted that in the period of socialism (particularly in the 60s and 70s), under the influence of the so-called "socialization of the economy", smaller urban centers were subjected to deep transformations of the traditional economic structures, socio-economic connections and forms of developing and using urban spaces (Heffner 2008).

Against the background of the common world trend of moving from the industrial to post-industrial identities, the case of Poland of the 90s was distinguished by the superimposition of the economic crisis on the administrative and organizational crisis: what was once a common state resource was divided into the state and municipal ownerships, which made it so much more difficult to formulate common strategies for the development of urban space.

A significant proportion of state-owned enterprises developed in or on the land of former nineteenth century factories – they were built on the then outskirts of towns, usually near the railway station. At the time of the collapse of industry in the late twentieth century, properties excluded from industrial production were already part of the downtown area. Liquidation of large enterprises was particularly difficult for local communities because such companies would often maintain also cultural and sport centers as well as educational units.

Post-military towns – bases of the Soviet Army (towards the end Army of the Russian Federation) or bases of national armies of the Warsaw Pact, closed down or adapted for civil use in the first half of the 90s – were urban structures characteristic for Central and Eastern Europe (Jarczewski & Kuryło 2009).

The spatial gaps described above needed filling for reasons related not only to urban planning but also to socio-economic factors – the post-industrial/post-military towns needed to acquire new functions that would provide property tax revenues to the towns and employment to the inhabitants. In the case of small and medium-sized the task turned out rather difficult inasmuch the centers were not significantly more attractive than the outskirts, so private capital was not interested in costly and procedurally difficult investment projects on brownfields areas.

Considering today's settlement processes, we are witnessing depopulation of urban spaces and the smallest towns with increasing population density of large and medium-sized towns and their immediate vicinityⁱⁱ (Ministry of Regional Development 2011). Regardless of the present migration, most of the Polish population remains outside major centers.

Sustainable development of the country's polycentric settlement network was to be supported by the territorial reform of 1999. Within the reform, self-governing voivodships (regions) and intermediate-level poviats (counties) were created in addition to the existing communes.

Thanks to these changes, foundations were to be laid for the "*conditions for the reconstruction of local ties and restoration of the role of small and medium-sized towns as active centers of community life with a view to modeling regional development*" (Kulesza 2000). The established network of provincial capitals was a compromise between scientific concepts and aspirations of local communities and as such its effectiveness is subject to criticism. Current research (Guzik 2011) has shown that due to the actual role they play for the surrounding area, some poviat capitals fail to serve their functions, while other areas lack a clear poviat center.

The group of poviat towns is very diverse in terms of population. In most voivodships the populations of the smallest poviat capitals oscillate around 10,000 while in the largest ones they do not exceed 100,000. In less urbanized voivodships, there are also poviat capitals just over 5,000 inhabitants. The largest group of poviat centers is made up of poviat centers within the range of 10,000-20,000 inhabitants.

2. A new role and quality of public space in the contemporary formal and legal environment

In new social and economic conditions, many medium-sized towns try to redefine their role and place in regional space structures, looking for new development impulses and opportunities to improve life conditions of local communities and strengthen their role of translocal or sub-regional centers of progress.

One of the elements of creating new development strategies is evaluating the potential in urban areas. After 45 years of centrally planned economy and sudden shift to local governing and free market economy, in the 90s living space for town citizens was degenerated not only in terms of technical and compositional aspects but also morally. Post-war reconstruction and development often came in the form of prefabricated large panels block of flats, which stood in opposition to the scale and structure of town centers (Gzell 1996). Devoid of proper restoration works, historically shaped areas were gradually appropriated by other functions, mostly by communication and trade. The notion of common good was disgraced by overuse in nomenclature and rhetoric of the then authorities.

According to Marszał & Kozłowski (2009), achievement of translocal functions of development centers is possible by means of actions aimed at three target groups:

- Improved competitiveness of the economic base and development of stable work places
- Improved quality of the municipal space (not only in the physical but also social dimension)
- Development of human capital in the area.

The increased role of the physical quality of urban space in the shaping of competitive image as in opposition to the scale of the center is indicated by Markowski (2006). In his opinion, in case of smaller towns, a key role is played by the physical attributes of their urban space and not such features as innovations or knowledge-based economy.

Medium-sized towns' investment policies seem to confirm the above statements concerning the quality of urban tissue. Engagement of efforts and means in reconstruction or construction of central squares and parks as well as other recreational areas are notable here.

The phenomenon of interest in the public space quality in medium-sized towns is quite surprising as it takes place in conditions of degradation of spatial development in legal and organizational realities.

Implementation of the regulations of the free market economy and decentralization of the administrative system was accompanied by, de facto, deconstruction of the spatial development system. The constitutional primacy of ownership rights results in poor protection of public interest in the act on spatial development and planning as well as related regulations (Jędraszko 2005). In effect, shared areas are taken possession of and settlement development is uncontrolled and characterized by low service quality and deurbanization of town centers.

The situation pertaining to the crisis management of town areas does not look any better. Despite works initiated in the 70s, Poland still lacks an act on revitalization. Local authorities form local revitalization programs on non-compulsory standards. The first wave of such documents took place in the mid-90s and was stimulated by the development of partnership relations with towns from Western parts of Europe and transfer of good practice on the spatial policy. The programs were executed from own means of towns in cooperation with housing cooperatives, and among the pioneers the majority was composed of medium-sized towns. The second wave of revitalization works was triggered around 2004 and was connected with requirements of the European Union pertaining to financing of complex revitalization enterprises. Those documents were often modified after 2007, in consequence of new EU programming and new guidelines. The fact confirms a lack of any (even informal one) national policy of towns' revitalization - the Polish model remains dependent on financing within the Cohesion Policy and the key decisions are reached on the European, regionalⁱⁱⁱ and local levels. Because of formal issues, the executed projects did not include public-private partnership. This option has been introduced gradually in new regions since 2009 (presently it is available in five regions) within projects executed with support of the JESSICA initiative^{iv}.

Passivity of central authorities come on top of poor urban development legislation when it comes to pilot programs or other forms of promoting good practices in spatial development.

In the light of the above, it is surprising that medium-sized towns, devoid of private capital and matter-of-content umbrella of the state, invest their own funds in upgrading the quality of public space. This policy is also present in regional and nationwide contests for the best public spatial development.

3. Case studies

Medium-sized towns constitute a very versatile collection. Better quality of public space may contribute to different strategic development aims which are illustrated by the selected case studies: post-industrial tourist area, new town center structures (increasing competitiveness of towns in relation to vast areas of suburbanization), sub-regional centers inflicted with deurbanization and a shaping sub-regional center.

The cases have been selected on the basis of a cross-sectional analysis was carried out for 22 medium-sized towns^v of socially and economically diverse Pomorskie Voivodeship (Golędzinowska 2013).

Name	Population ^{vi}		Change in the period 1995-2012		Status of poviat capital	Development goal related to quality of public spaces
	1995	2012	Units	Percentage		
Ustka	17213	16379	-834	-5,09%	-	Popular holiday resort
Pruszcz Gdański	21318	28621	7303	25,52%	+	Residential area with a distinct identity
Tczew	60615	60769	154	0,25%	+	Sustaining a competitive sub-regional centre
Chojnice	39872	40306	434	1,08%	+	Shaping a competitive sub-regional centre

Fig. 1. Profile of selected towns

3.1. Ustka

Ustka is a small coastal town affected by major development constraints. The fall of large enterprises engaged in the maritime industry (mainly boatbuilding, fishing and fish processing) resulted in problems of social, economic as well as spatial nature. The town boasts spa traditions reaching back to the 19th century but in the times of the so-called real-socialism, the quality of this function deteriorated considerably.

An important development factor is the proximity of Słupsk with a population of nearly 100,000. The residents of Ustka are thus provided with access to higher-end services. The residents of Słupsk, in turn, treat Ustka as their leisure center. The ongoing urbanization between Słupsk and Ustka (Rydz, Jażewicz 2005) and the concept adopted by the two towns' authorities to have a "bi-city" developed may cause that Ustka's space will increasingly serve the residents of Słupsk for recreation purposes and as an attractive place to live.

The town has its historical center, the district of Ustka Stara, formed on a plan of a regular orthogonal grid. Until recently the streets of Ustka were dominated by traffic. The town shows the highest population density and it suffers from high unemployment (Jażewicz 2007). Given the age of the urban development and limited financial means of the town's residents and

authorities, there is a serious renovation inadequacy in the area of Stara Ustka. Most of the historical district is situated in an intermediary spa zone – with the exception of the vicinity of the spa facilities in the eastern part of the town covered by a program of strict protection.

Ustka's port, the chief urban interior emerging on both sides of the river Słupia, is burdened with issues of a different nature. In effect of the above-mentioned collapse of maritime industries, vast areas of the ports turned into unused land. The smaller, eastern part of the port is adjacent to the historical center and it is more favorably situated in the intermediary spa zone. Thanks to its convenient accessibility and neighborhood of popular tourist destinations, the area quickly gained new functions. Conversely, the western part neighbors the extensively developed district of Ustka Rozwojowa (Eng. developing Ustka) and woodland – it is situated in the third, least rigorously protected spa zone. Weak transport connections with the eastern part of the town constitute a serious barrier to the zone's development.

In the 1990s, the local authorities ambitiously approached the subject of shaping the spatial development policy, despite its small scale. In 1995, a team of experts in environmental protection, economics, spatial development, transport and logistics engineering were commissioned to draw up *The Strategic Eco-Development Program for Ustka* (Gerstmann et. al.). In effect of their work, the team developed a comprehensive detailed document that indicated directions of changes consistent with the paradigm of sustainable development. According to the document, the priorities of the town's policy were, among others, development of the town's tourist functions, development of the port and improvement of the quality of the residential function. The program was adopted by the town council in 1996. However, due to strong restriction of a financial nature, few of those plans were actually implemented.

In 2001, the self-government of the newly created Pomorskie Voivodship incorporated the development of the Fish Auction into the operating program for the years 2001-2002. The role of the auction developed in the western part of the port was to rescue the fishing sector and, indirectly, also to strengthen the translocal role of Ustka. In view of the strong dependence on external factors such as the catch quota imposed by the European Commission, ever since its launch in 2004 the auction has been coping with financial problems and has had but a small impact on the environment (Czapliński 2012).

Along with Poland's accession of the European Union and accessibility of programs co-financing selected development projects, the town undertook to implement a number of modernization projects, narrowing a little the scope of the targets set out in *The Strategic Eco-Development Program*.

The Local Revitalization Program for Ustka Commune adopted in 2005 provided for the district of Ustka Stara. One of its priorities was to stop the decline of tourism (Bugajewska & Warsińska 2009).

The first phase in the implementation of the revitalization program concerned the former fishing settlement. The activities included, above all, modernization of traffic infrastructure, improvement of the quality of green areas and preservation of the typical half-timbered buildings. Most of the work concerning the arrangement of streets and parks was carried out with the use of funds from the Integrated Regional Operational Program 2004-2006. The reconstruction and conversion of the district's main traffic line into a promenade was supported with funds from the "Lithuania, Poland and Kaliningrad Region of Russian Federation Neighborhood Program". In order to preserve the region's landscape with its typical huts, activities were undertaken that were perceived as innovative but also controversial in the Polish conditions. Those efforts have been continued since 2004, funded exclusively from the commune's budget. Because of a very bad condition of the huts, in the majority of cases inventories are made and the huts are demolished and reconstructed. As part of the communal resources, the buildings are put up on sale in open tenders. This way

the commune obtains funds for new projects. The residents of the buildings are transferred to public housing projects in other parts of the town.

Given the selected (revised) goal - halting the decline in tourism – the town's investment policy aimed at improving aesthetics and comfort of using areas with a tourist potential turned out to be a successful form of intervention. Nevertheless, there are still challenges to be faced, like those connected with the development of the western port area and the seasonal changeability of the historical center under the process of gentrification.

Fig. 2. Reconstructed huts of Ustka Stara
Fig. 3. New waterfront at east side of former port area.

3.2. Pruszcz Gdański

Unlike the case described above, Pruszcz Gdański is on the path of fast development attributed chiefly to its excellent location in relation to the large harbor of Gdańsk and the transportation routes connecting the town with the center of the country – roads number 6 and 1, exits from A1 highway and the railway network. The competitiveness of the town is improved also by the presence of large areas available for development – including the post-military areas in the central part of the town.

Similarly, investments in public spaces turned out to an important element to the town's development strategy. However, this time it was all about averting a crisis situation.

One shortcoming of the functional-spatial structure of the town was lack of a historically formed public space focusing the life of the local community. There were some remains of a rural square along the present national road and a square in the center of a socialist realist project performing administrative functions but those spaces were used chiefly as passageways for cars and pedestrians and as such were devoid of human interactions that are typical for a properly functioning public space.

After the decentralization of the system of spatial planning that took place in the early 90s, thanks to the aforementioned spatial properties the town with the adjacent rural areas became a strong pole of suburbanization. Migration involved both residents and business entities. In view of the lack of space integrating the community, there was a risk of the town being perceived as a spatial extension to the new residential district void of a clear identity – Gdańsk Południe.

The *Development Strategy of Pruszcz Gdański Up Until 2010* placed strong emphasis on population growth – it envisaged a population of as many as 25,000 inhabiting the town in 2010, while the 2007 population already was 25,143 (Local Data Bank 2013). In order to make the town's residential offer more attractive in relation to the offers of other communes neighboring the agglomeration of Gdańsk, the document spoke also about the necessity to develop areas for leisure and integration, including the necessity to complete the work over a new center, for which first preparations had already been made.

In the post-military areas a system of crossing pedestrian routes and adjacent service-residential quarters were designed. The location of the land along the axis of a socialist

realist complex, national road no 1, the river Radunia, the town's Sport and Leisure Center and a park predestinated the area for this kind of spatial development. The town authorities decided to organize a competition for the architectural and urban concept. One of the partners in organizing the competition for the project was the Polish Association of Architects, which was to ensure a high quality of entries. This method of work made it possible to work out a very detailed spatial development plan, providing for the organization of public space. Public spaces named in the document were to be developed by the town, while the surrounding quarters were to be developed through private initiative.

First buildings were carried out on single plots of land, with a view to creating consistent quarters in the future. However, there was difficulty coordinating the particular activities of the investors and eventually the decision was made to put up whole quarters on sale (Pancewicz 2009). The development of the public space itself followed the development of the quarters. The basic phase was completed in 2007 and in 2012 the center and the town park were successfully connected within one axis. The projects were carried out without support from the EU, but the town used such funds when carrying out purely tourist or recreational projects such as the development of the theme park "Faktoria Rzymska" ("Roman trading post") and walking and bicycle routes within the so-called Amber Route.

Fig. 4-5. New town center in Pruszcz Gdański.

3.3. Tczew

As a result of the restructuring of the Polish State Railways (PKP), which was the largest employer in the region, at the beginning of the 90s the town found itself in a crisis situation. With many people self-employed in services and small-scale trade and with the location of a special economic zone, the problem of unemployment was significantly alleviated but the new business entities were chiefly located in the western and northern parts of the town, separated from the historical center by railway lines. Apart from the external factors contributing to the fall of the Old Town, we should mention also the major problem in the poor technical condition of public spaces and the surrounding historical buildings.

In the mid-90s, the local authorities undertook measures to increase the attractiveness of the center and to avert the ongoing deurbanization while changing the image of the town, from that of a railway town to that situated on the river Vistula. The aim of the first works (1995-1997) was to improve the technical condition and safety of squares and streets – in particular for pedestrians. In terms of the search for a function of the district that would make it attractive in relation to the retail and service centers located in other parts of the town, we should point to the town's efforts to develop cultural and recreational functions. In the years 1997-2002, the Tczew Cultural Center was modernized, and the years 2006-2007 brought the modernization of the Museum of the Vistula River and establishment of an institution vested with the role of representing the cultural heritage of the town and the surrounding area of Kociewie - in an attractive way, in accord with the modern requirements.

The cultural infrastructure was strengthened especially in the historical area of the Old Town. The open spaces around it were adapted for the recreation of residents and potential tourists. In 1999, the modernization of the Town Park established in 1998 started. In 2003,

work began to create a new public space that would serve as an extension of the public space in the center toward the river – the Vistula Boulevard.

The Local Revitalization Program adopted in 2004 provided for continuation of the policy of improving the attractiveness of the historical center. The current revitalization program is pursued within the Regional Operational Program of Pomorskie Voivodship for years 2007-2013, providing for upgrade of certain public spaces, location of business-support institutions as well as improving the quality of the residential resources.

The program hasn't been completed yet and it difficult now to assess its effects. The previous activity resulted in considerable growth of the Old Town, especially the boulevard as the place of the local community's recreation and integration. However, investors did not show any significantly larger interest in this area.

Fig. 6. Vistula Boulevard
Fig. 7. Museum of the Vistula River

3.4. Chojnice

The town of Chojnice is situated approximately 90 km from the closest large urban center. The extensive wood and metal industries after the privatization survived the economic transformation – a remarkable fact, bearing in mind that the town of Człuchów, situated just 14 km away, was indicated in the late 90s as Poland's unemployment pole.

The authorities of the town decided to take advantage of its relatively good economic situation and build its position as a service center of sub-regional significance – the new image of the town was to be an essential element of this strategy (Finster, 2009).

Within the works carried out in years 2001-2002, the aesthetics of the center's historical space was changed and revamped: the discordant architectural elements were either removed or modified and the functional layout was adjusted, limiting traffic and improving the comfort for pedestrians and cyclists. The most important and most spectacular part of the task was the reconstruction of the façade of a multi-family residential block occupying about 90 per cent of the southern frontage of the Old Market Square. Public spaces and the façades of public buildings were modernized with the use of municipal funds, while private owners were offered incentives in the form of free façade modernization designs and subsidies for renovation works.

The activities presented above are often referred to in the literature of the subject as "revitalization", but they were actually implemented without any revitalization plan in force. A relevant program was adopted as late as in 2004, within preparations for absorption of EU funds. Further projects related to the renovation of the most typical elements of the landscape were carried out mostly with subsidies from the EU cohesion fund – nevertheless, only one of them was carried out as a "comprehensive revitalization project" – the conversion of the former hospital into an educational center (media library and the seat of cultural and social societies) (2005-2007). Other projects were co-financed with funds provided to increase the attractiveness of tourism – for example, repair of the minor basilica or adaptation of a post-Jesuit complex for cultural purposes.

The rank of Chojnice's service functions located in the historical center may serve as evidence for the success of the town's image policy. What is more, after the modernization of the center the town attracts much more attention – in both research studies and in the mass media.

Fig. 8. The Old Market Square before renewal (source: Municipality of Chojnice).

Fig. 9. The Old Market Square current state.

4. Experience of western neighbors

In order to assess the purposefulness of the Polish towns' public space policies, it is worth referring to other areas of the European Union with similar settlement characteristics and climate conditions but different planning systems and development priorities – Denmark and Eastern Germany.

Following the German reunification in 1990, the town centers were affected by rapid depopulation. The reasons for this situation are found in a mass migration to the western part of the country and also, like in Poland, in migration of many families from downtown to suburban areas. To alleviate the crisis, the system of comprehensive renovation of degraded urban districts, started in Western Germany already in the 70s, was now to be applied also in the east of the country. The quality of public spaces is understood there as an evident feature of a well-run spatial policy.

The federal government and the governments of the constituent states have invested a lot of effort and huge sums of money in improving the quality of life in the eastern part of the country. In 1999, the federal government initiated *Soziale Stadt*, which was aimed at a comprehensive renovation of centers in eastern German towns. The program provided for improving infrastructure and boosting social and economic development. In 2001, *Stadtumbau Ost* was initiated, a program providing for scheduled demolitions of abandoned buildings and adaptation of land for social purposes (Bryx & Jadach-Sepiało 2009).

From the point of view of the town's competitiveness, it turned out to be a failure – the programs did not constrain the rapid shrinking of towns. In a small number of them, the process was stopped or restricted considerably – the development of new services and production played the key role here. However, the assessment of the phenomenon changes after we take into account the basis of the German state – the constitution that requires the residents are ensured decent living conditions regardless of where they live.

One important element of the German spatial policy is knowledge transfer and continuous improvement. The above mentioned programs are accompanied by extensive analyses and publications presenting their results. Periodical international construction fairs (*Internationale Bauausstellung*) support the introduction of innovations in spatial planning and the construction sector. In the context of strategies for transforming public spaces in medium-sized towns, the Building Exhibition Urban Redevelopment Saxony-Anhalt organized in 2010 is notable. The project covered 19 shrinking towns of this relatively sparsely populated state. The largest two towns each had about 230 thousand inhabitants, with the following towns in the 90-2.5 thousand range. In each town a different set topic was pursued, including renovation of a historical center of a unique cultural value, landscape adaptation of transformed areas or creation of a family-friendly town.

Denmark is a country of small and medium-sized towns in which the transformations of urban space are different in nature. The spatial planning system has been placed within the program of environmental protection in a broad sense of the term. Popularity of public spaces in this country comes from both the routine of active life (moving by bicycle, on foot) and from their architectural quality ensured by the local authorities, who understand the significance of this feature of urban space for the local communities^{vii}. The content and walkability of Danish towns is determined also by restrictive provisions of relevant national regulations.

Under the Danish planning act, the commune's strategy 'shall contain the municipal council's political objectives for the future work within reducing the negative effects of human activity on the environment and promoting sustainable urban development and urban regeneration.' Strategic planning at both local and regional levels must comply with the provisions of Local Agenda 21.

The act provides a number of tools protecting the traditional vitality of public spaces – e.g. by maintaining compact settlements (strict limitations of urban sprawl), locating trade in town centers, regulating the maximum size of retail space – in case of small towns this regulation is much more strict.

It also provides individual provisions for different regions - depending on the degree of risk of various phenomena. In case of the Greater Copenhagen area, the development of compact centers shaped in correlation with the public transport system (in particular the urban train) is strongly promoted. The Ministry of Environment, basing on a statistical method, conditions the possible location of workplaces on the availability of walking to the train station.

Like in eastern Germany, in 1996 the national authorities launched implementation of a program of comprehensive revitalization of degenerated urban districts called *Kvarterloeft*. The program has been financed mostly from central and municipal budgets. However, private stakeholders were also involved (Munk 2007).

Its main purpose was social inclusion, provision of decent housing and crime prevention but transformation of public space was a popular tool for the implementation of the program – e.g. Aalborg East, Vollsmose.

As in the case of the projects in Germany, an important part of *Kvarterloeft* was its constant evaluation and modification to fit the diagnosed needs but there was also an image element – in order to have inhabitants identify with the changes taking place around them (Tverskov 2007).

5. Conclusions and recommendations

An important element contributing to the success of the case studies describing medium-sized towns is their pioneering nature. This is especially true of Pruszcz Gdański and Chojnice, where the town authorities started modernization at the break of the 20th century without access to any external funds. We can attribute it to the social need for beauty in the urban space after years of the robust conditions of the centrally planned economy. The first activities were focused primarily on improving the competitiveness of the town against the background of the rural or amorphous suburban areas – as a place of residence, a tourist or service center. The matter of local community building seemed to be secondary. At present, however, it is necessary to re-evaluate such development strategies.

In the period of availability of the highest EU subsidies so far (2007-2013), many medium-sized towns were encouraged by the successes of their predecessors and the ease with which funds could be obtained and undertook activities aimed at improving the quality of public spaces. Among them, there were well thought-out projects as well as quite accidental ones – mindlessly copying solutions successfully completed in different conditions.

Considering the fact that the projects were carried out with little organizational and intellectual support from the central authorities, the experience of the Polish local centers in planning development by upgrading public spaces should be appraised favorably. Nevertheless, in the context of departing from EU subsidies replaced with repayable funds, the expected smaller access to funds after 2020 and economic issues that medium-sized towns still cope with, it seems necessary to draw up a support system at the national level.

The first general and overarching issue is to strengthen the role of the state in spatial planning. Recently, planning was moved from the competences of the Ministry of Infrastructure, criticized for inefficiency, to the competences of the Ministry of Regional Development, which now stimulates Poland's largest spatial transformations thanks to granted subsidies. In terms of the organization of the work, it seems a step in the right direction. However, thus far it has not resulted in any significant legislative changes.

In the context of the *Europe 2020* strategy, for which inclusive growth and settlement network issues are some of the chief concerns, it seems necessary to develop a legal framework that would trigger a comprehensive renovation of public spaces and surrounding housing resources. As in the case of the depicted Western experience, the state should be involved in this process financially and organizationally, breaking free from the dependence on EU funds granted subject to principles changing every seven years. The field where it is worth drawing on Western practices concerns the shaping of intellectual resources of programs aimed at upgrading urban spaces and image-improving efforts helping residents to better identify with the changes in progress.

ⁱ The paper is based on the outcomes of the research project “Transformation of public space in medium sized town in conditions of market economy in Poland” financed by the National Science Center on the basis of the decision number DEC-2011/01/N/HS4/05989.

ⁱⁱ In some cases the town is depopulating, however the considering the suburban communes, the area in total is growing.

ⁱⁱⁱ The voivodeships (regions) are the key stakeholders in implementation of the EU regional policy.

^{iv} Joint European Support for Sustainable Investment In City Areas.

^v For the purpose of this research, "medium-sized towns" are understood as those with populations between 10,000 and 100,000, in accordance with the term as it is defined in the National Spatial

Development Plan of 2005. This rather broad term includes also, with regard to their functions, also smaller towns that are the capitals of powiat districts.

^{vi} Based on the Local Data Bank; before 1995 a different statistical method was applied.

^{vii} A huge role in promoting awareness in this area has contributed the publication of Jan Gehl's "Life between buildings: Using Public Space" – first edition in issued in 1971.

Planning tool for the transformation to low density cities in more sustainable urban models

Jimena GOMEZ PIOVANO; Alejandro MESA, INCIHUSA CONICET CCT- Mendoza, Mendoza Argentina

1. Introduction

South America is one of the regions where the phenomenon of urbanization has a big proportion overcoming Europe and USA. This phenomenon increases in Argentina considering that 70% of the population lives in cities (ONU Habitat 2012). Most of the developments are concentrated in fertile and productive areas, while there are large desert areas without occupation or exploitation. Therefore the accelerated urbanization processes constitute a loss of agricultural production. There is a great need to preserve natural soil in the environment and is more complex in arid land where the expansion is limited to a certain area.

Salvador Rueda (1998) sustains that there are currently two antagonist models of urbanism, compact city and urban sprawl. Urban sprawl is the one that is dissipated in large areas, that has everything and much but with low population density, with functionally separate areas: university, industry, residence, commercial areas, and offices. (Rueda, 1998). These functional cores bind through a dense network of roads and private transport. Hence, urban sprawl is characterized by the increase in urbanized areas, consuming excessive amounts of energy and other natural resources such as soil.

The combination of the dispersion of activities that the diffuse city imposes, and the need of man to be in touch personally give as a results in a massive use of motorized means of locomotion, mostly private vehicles. This is due to the low population density makes that public transport becomes economically inefficient and unprofitable (Rueda, 1998; Mesa, 2005; Papparelli, 2009). Thus the urban sprawl model is considered unsustainable because the urban land track cover and horizontal mobility network is expands invading high-value land both ecological and agricultural (Rueda, 1998; Papparelli, 2009).

In contrast, compact cities, the highest population density promotes greater diversity of uses, that is to say, the coincidence in the same sector of the residence, services, economic activities and equipment. In this way provides the proper context for increased exchanges of information (Rueda, S. 1998; de Schiller, S. 2000). The confluence of activities on the ground floors meets the necessary urban services and facilities to the people, thus increasing the number of trips on foot or by bike and reducing the need to use motor transport (de Schiller, S. 2000). In turn, the highest population density favors public transport which produces fewer cars on the road, thus freeing up mobility pathways saturated today by private transit. The densification, in relation to infrastructure, resulting in lower energy consumption, as well as feasibility of implementing them (Burgess, 2000; Rueda, S. 1998; de Schiller, S. 2000).

The benefits resulting from the reduction in the rate of urban expansion, through the promotion of higher density settlements are particularly important where the urban growth rate is high, the cultivated land per capita and growth rates agricultural production are low (Mathey, 2000).

An example of this problem occurs in Metropolitan Area of Mendoza (MAM). The City is inserted into an oasis irrigated by the Mendoza River, forming a "green island" in a large space semidesert. The conglomerate urbanized area has increased by 129% between 1986 and 2011, while population growth was only 41%. In this process invade soil areas with high agricultural potential and the piedmont-extremely fragile ecosystem, while in the central areas the population decreases. This phenomenon is the result of internal migration, associated with the inhabitants of the central districts moves their place of residence to the periphery looking to improve their quality of life. Thus, it accelerates the process of territorial fragmentation, increasing demand for services and equipment, and unbridled competition for land use. Without considering the energy costs associated with new developments and isolated dwellings models that it promotes.

This is a very common trend in Latin America and corresponds begin planning the population growth in already developed areas. Consequently, this paper develops a simple simulation tool to visualize urban growth

2. Methodology

This paper consists of a description and application of a calculation methodology that allows to evaluate the different levels of sustainability indicators associated with land use of urban growth in low density cities (<80 inhabitants/hectare). **The** second step aims to verify theoretical application in a case. To this end, the different variables of urban growth for the MAM are studied.

The simulation tool designed develops a digital projection system in order to estimate levels of urban scale sustainability of cities. The instrument designed is structured as a strategy of continuous improvement (Deming PDCA Cycle), consists of four stages, which are called: know, estimate, test and act. For each one of the stages will establish the specific procedures that make up the tool.

2.1. Know

This first step aims to understand the characteristics of the study area: the historical, geographical, morphological and social place. In this study we obtained the data needed to perform the numerical estimation, which are described below:

- Population Data
 - Total Population Year A
 - Total Population Year B
 - Number of years between A-B
- Urban Data
 - Urban area (m²)
 - Surface mitigating public spacesⁱ (m²)
 - Total floor area (m²)
 - Urban parcels surface (m²)
 - Area of undeveloped urban parcels (m²)
 - Surface circulation (m²)
 - Relationship between the built footprint and the surface of building land (F.O.S.)
 - Relationship between the floor area and the area of land (F.O.T.)

Where A= prior to the current period with data and B= current year

2.2. Estimate

In this second stage is performed the simulation for growth. For this, it is necessary to set the time period under study, it is denominated "year C", subsequently it projected population growth in the study area, based on population data recorded in the previous point.

- Estimation of population growth ⁽ⁱⁱ⁾

$$\text{Population C} = \left\{ \left[\left(\frac{\text{Population B}_{-1}}{\text{Population A}} \right) \cdot \text{Year A- C} \right] + 1 \right\} \cdot \text{Population A}$$

- Public spaces stipulated

$$\text{New public spaces} = (\text{Population C} - \text{Population B}) \cdot \left(\frac{\text{Mitigating public spaces}}{\text{Population B}} \right)$$

- New area built

$$\text{New area built} = (\text{Population C} - \text{Population B}) \cdot \left(\frac{\text{Area built}}{\text{Population B}} \right)$$

- Area of new urban parcels

$$\text{Area of new urban parcels} = \frac{\text{New area built}}{\left(\frac{\text{Area built}}{\text{Area urban parcels}} \right)}$$

- Area of new urban parcels without building

$$\text{Area of new urban parcels without building} = \text{Area of new urban parcels} \cdot \left(\frac{\text{Area of urban parcels without building}}{\text{Area of urban parcels}} \right)$$

- Area of new circulations

$$\text{New circulations area} =$$

$$\frac{\text{Circulation Area} \cdot (\text{New parcels area} + \text{Area of new urban parcels without building} + \text{New public space area})}{(\text{Parcels areas} + \text{Public space area})}$$

2.3. Test

In this instance, assesses sustainability levels of the estimated simulations during the time period studied. To this end, we compare the simulation results obtained in relation to the ideal values established by Salvador Rueda (s/f) as optimal, of the following urban indicators:

- Density Housing

$$\frac{\text{Estimated number of inhabitants}}{\text{Total urban area}} \rightarrow \text{Desirable value 220-350 inhabitant / ha}$$

- Absolute Compactness (Ca):

$$\frac{(\text{Area built} + \text{New area built}) \cdot 3}{\text{Total built-up area}} \rightarrow \text{Desirable value 5}$$

- Corrected Compactness (Cc):

$$\frac{(\text{Area built} + \text{New area built}) * 3}{\text{Public space area} + \text{New public space}} \rightarrow \text{Desirable value 10 a 50 m}$$

- Public space mitigating (EPA):

$$\frac{(\text{Public space area} + \text{New public space})}{\text{Estimated number of inhabitants}} \rightarrow \text{Desirable value } 10\text{m}^2/\text{inhabitant}$$

2.4. Act

At this stage the results are evaluated in the previous point. If the values found far from the reference values shall be proposed generating growth options and the cycle begins again.

3. Development

3.1. CASE A: Estimation of growth of the Metropolitan Area of Mendoza in a period of 30 years according to current growth parameters.

3.1.1. Know

The AMM consists of six political-administrative regions City of Mendoza, Godoy Cruz, Guaymallén, Las Heras, Luján y Maipú. The urban area that comprise have approximately 18,000 ha, inserted into the oasis watered by the Rio Mendoza of 158,000 ha. Historically, the formation of the AMM was developed as an extension of the urban area of the City of Mendoza to the neighboring departments. In a first stage, the growth was around the foundation area, but from an earthquake happened in 1861 built a new town on land adjoining. The continued growth of the urban area was including small urban centers, independent in its formation, as the departmental centers. This development process that began in the late nineteenth century and is maintained to the present, resulting in extensive low density urban area, which invades the neighboring agricultural areas of high ecological value, and piedmont areas (at west), extremely fragile ecosystem (Figure 1).

Figure 1: Growth of MAM. Mosaics built on cadastral base

In recent years, the AMM has increased the urban area with an annual rate of 4.5%. Between 1983 and 2011 the area grew by 129%. For example, from 2003 to 2011, the urban spot went from having an area of 14,026 ha to 17,732 ha. However, this model of rapid increase of the urbanized area contrasts with the population increase which has a slower pace (Figure 2).

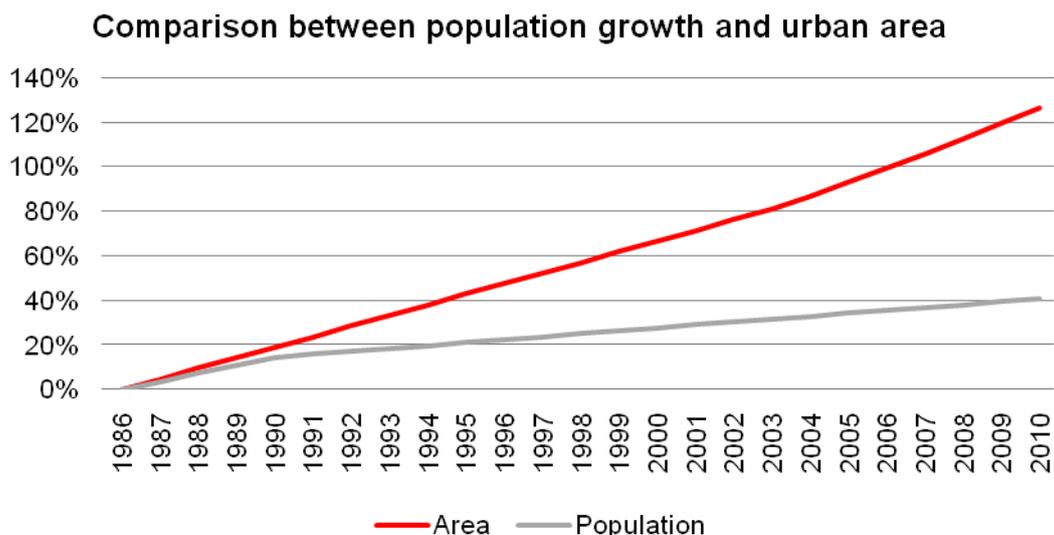

Figure 2: Comparison between population growth and urban area

On the one hand, this is because new projects are of lower density than the consolidated areas. While on the other hand there is an intra-urban migration process where the families living in the center leave their former homes and move their residences to new areas on the periphery. Thus, when comparing the 1991 census data and 2001 in 46% of consolidated urban areas there were declines in the number of inhabitants, while in the periphery increased the population (Figure 3).

Today the MMA is the fourth largest city in Argentina with a population of 1,086,633 inhabitants and an urban area of about 18,000 ha. It is formed by 60% of urban parcels, 36% of circulations and 4% of public recreational spaces (squares, parks and pedestrian) (Figure 3). The relationship built between the tread surface and ground (FOS) of MMA is 0.37, with variations depending on the department. The one with greatest levels is the City department who reaches a 0.5, while the lower value 0.17 corresponds to Lujan. The relationship between the floor area and the area of land (FOT) on average is 0.66, taking the most range in City department and lowest in Maipú department (Figure 2).

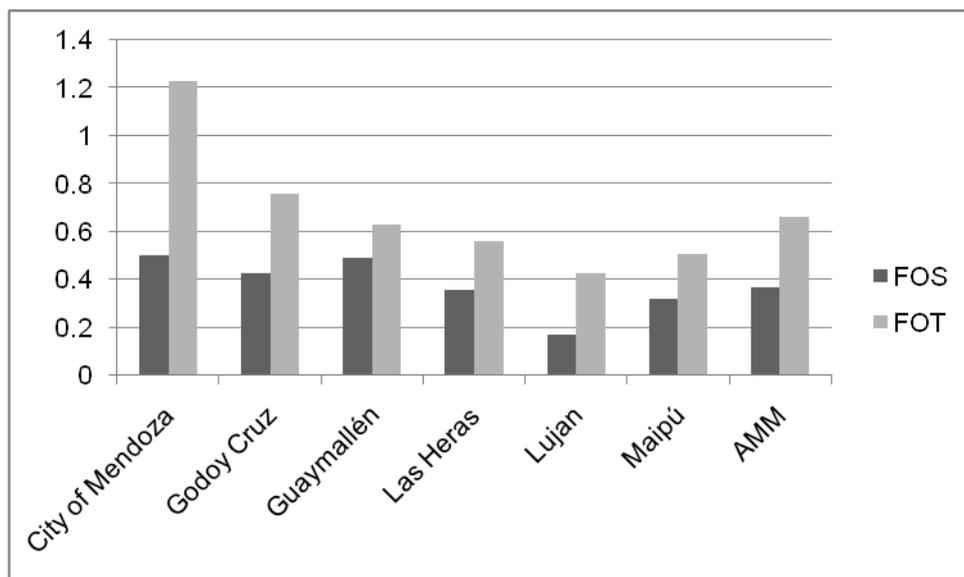

Figure 3: Urban indicators FOS FOT by department

On the other hand, within the consolidated urban area are available 30,608,775 m² of parcels unoccupied, representing 24% of the area devoted to such use (Figure 4). The relationship between floor area and number of inhabitants is 39.35m²/hab.

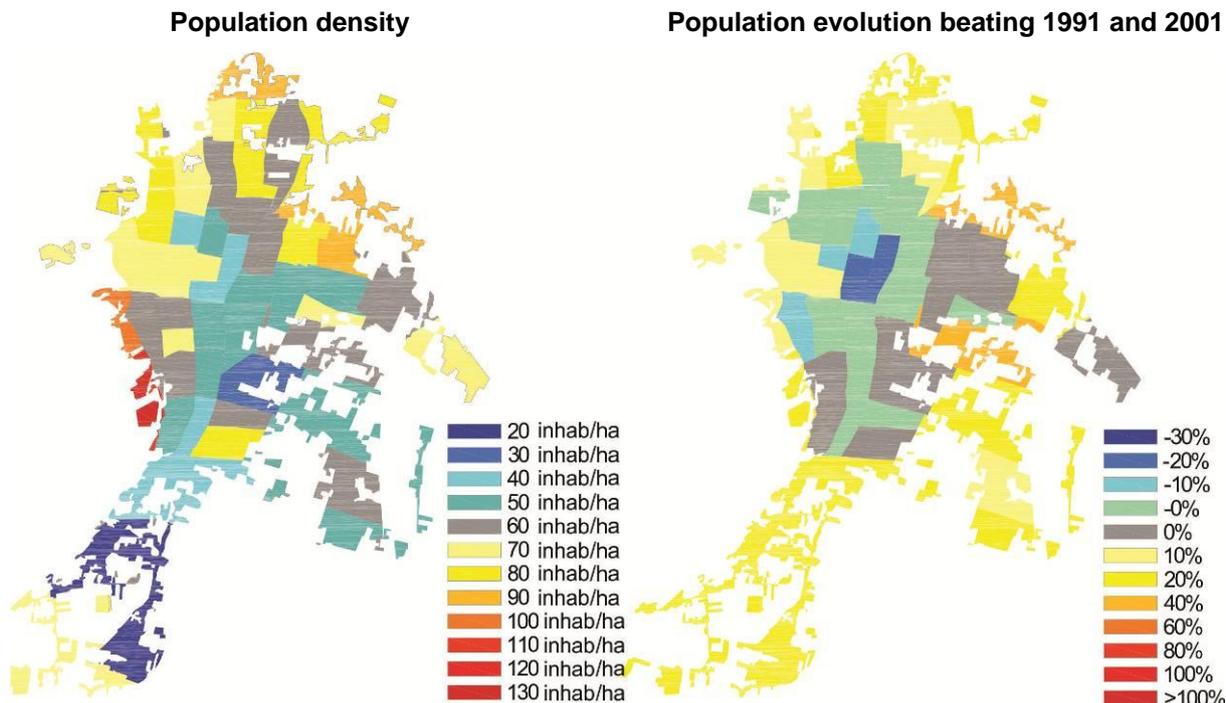

Figure 4: Population density and Population evolution

The AMM has 8,097,088 m² of public spaces attenuating, which correspond to 7.45 m²/inhab. The distribution of the same in the territory is uneven: in the district of City lies the most (50.15m²/inhab.), While the Department of Las Heras is the one that has fewer (0.62 m²/inhab.) (Figure 5).

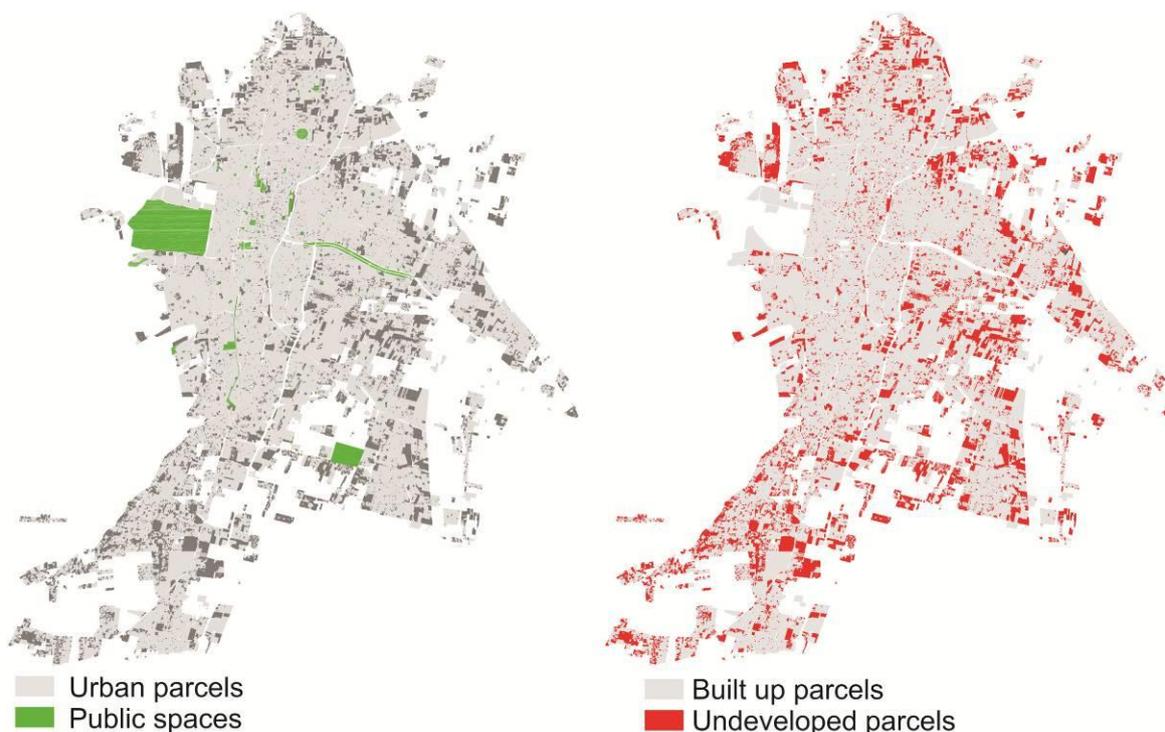

Figure 5: Composition of the urbanized surface of the Metropolitan Area of Mendoza.

3.2. Estimate:

The growth simulation raised here covers the period of 30 years, 2,013ⁱⁱⁱ and 2,043^{iv}. Following the current growth trend, by the year 2043 the number of inhabitants of the AMM would amount to 1,407,567 inhabitants, which would mean an increase of 320 934 people (28%), accompanied by an expansion of the urban area of 7,318 ha, composed as follows:

Siguiendo las tendencia actuales de crecimiento, para el año 2.043 la cantidad de habitantes del AMM ascendería a 1.407.567 habitantes, lo que significaría un aumento de 320.934 personas (28%), acompañado por una expansión de la mancha urbana de 7.318 ha, compuesta de la siguiente manera:

- New public spaces: 2,391,455.15 m²
- New built-up areas: 12,630,639.77 m²
- New surface plots: 37,259,064.31 m²
- New areas of undeveloped parcels: 9,040,226.87 m²
- New surface circulation: 26,851,075.91 m²

3.2.1. Test:

In this third stage, we will evaluate the levels of sustainability of the urban to 2,043.

- Density Residential: 49 inhab. / Ha →desirable value 220-350 inhabitant / ha
- Compactness Absolute (Ca) 0.59 →desirable value 5 m
- Corrected Compactness (Cc): 15.84 →desirable value 10-50 m
- Public space mitigation (EPA) = 7.37 → desirable value 10 m²/habitante

3.2.2. Act

The values of sustainability indicators, evaluated in the previous section, not found within the optimum parameters, so that there is proposed a new growth strategy. This new project aims to meet the demand of building area, on the current consolidated structure, completing the current undeveloped parcels.

3.3. CASE B: Estimation of growth of the Metropolitan Area of Mendoza in a period of 30 years without increasing urbanization surface.

3.3.1. Know:

As in the previous simulation, at this stage is performed a growth forecast for a time period 30, which will compare the results of the two proposals. Consequently, population growth would be identical to the previous inhabitants 320,934.40, but contrary to the previous model this will not increase the urbanized area.

3.3.2. Stimate:

Posed simulation corresponds to the period between 2,013 and 2,043. According to the statistical estimation of the urban population would 1,407,567.40 inhabitants. This population increase would not be accompanied by the expansion of the urban area, but for the use of parcels without buildings, the available surface is 30,608,775 m². It involves the construction of:

- New public spaces: 2,391,455.15 m²
- New built-up areas: 12,630,639.77 m²

Here we see that the current urban area can host for 30 years the growth population following the current urban construction rates and including mitigating public spaces, all of this using only 80% of vacant land. For this reason, we conclude that the developed area of the AMM can be maintained without increases for more than 30 years.

3.3.3. Test:

As in the previous case, in this stage are evaluated sustainable levels of new urban structure.

- Density Residential: 67 inhab. / Ha → desirable value 220-350 inhabitant / ha
- Compactness Absolute (Ca): 0.80 → desirable value 5 m
- Corrected Compactness (Cc): 15.84 = → desirable value 10-50 m
- Public space mitigation (EPA) = 7.37 → desirable value 10 m²/habitante

3.3.4. Act:

The values of urban indicators of this proposal have better performance than the previous simulation, but are far from the desired parameters. For this reason, we propose a new strategy for growth. This new project proposes, as above, limit growth to the current area. It also proposes to work with the population level necessary for stocking density is within the ideal values involving sustainable development. This new calculation implies the renewal of the building industry.

3.4. CASE C: Estimated population growth necessary to reach desirable urban density values posed by Rueda.

3.4.1. Know

To carry out this simulation proceeded to calculate the necessary population to urban sprawl current density reached 220 inhabitants / ha. The calculation indicates that this requires 4,596,853 people. Following the statistical estimations this level of population would be reached in 360 years.

3.4.2. Estimate

Referred simulation corresponds to the period between 2,013 and 2,373. According to the statistical estimation of population growth will be 3.51022 million people, reaching the 4,596,853 inhabitants. It involves the construction of:

- New public spaces: 26,156,540.65 m²
- New built-up areas: 138,147,622.54 m²

The parcels surface unbuilt, today, is 30,608,775 m², that to leading to the 85% of them would be destined to public spaces. While newly built surfaces correspond to the renewal of current buildings.

3.4.3. Test:

As in the previous case, at this stage assess sustainability levels the urban sprawl of 2043.

- Density Residential: 220 inhab. / Ha → desirable value 220-350 inhabitant / ha
- Compactness Absolute (Ca): 2.61 → desirable value 5 m
- Corrected Compactness (Cc): 15.84 = → desirable value 10-50 m
- Mitigation Public Space (EPA) = 7.37 → desirable value 10 m²/habitante

3.4.4. Act

Two of urban indicators evaluated in this proposal are within parameters of sustainability, while the amount of public space is slightly smaller than that established. Consequently, future simulations should increase public spaces surfaces.

This is a theoretical exercise, since we do not know what can happen in 360 years.

4. Conclusion

The work done, on the one hand, presents a simple simulation tool for the visualization of the evolution patterns associated with urban growth of cities, and also assess the levels of sustainability of land use. Studies denote that for the urban area reached sustainable levels established for other regions, it should quadruple its population.

On the other hand, analyzes the current characteristics of AMM and its future projection, showing that the current low density urban model is far from the standards of sustainable development. Therefore, urban planning must develop strategies that reverse sprawl.

In short, the introduction of simulation tools in urban planning allows to evaluate the current models, and redirect unsustainable growth processes in more sustainable models.

Old neighborhoods showcasing new urbanism principles to promote walking for transport

Paula Grant MPIA CPP, Senior Lecturer (Urban and Regional Planning), University of Southern Queensland

Abstract

The built environment shapes our transport choices and has a significant impact on the environmental, economic and social wellness of communities. Compact land use patterns, as opposed to urban sprawl, can improve public health by providing the environment to make walking a feasible mode of transport. Toowoomba's traditional inner city suburbs have the built form characteristics of compactness, connectivity, density, lot layout and mix of uses to be walkable. Using existing literature, geographic information systems, data, survey results and a walkability scoring tool, this paper will show that although being walkable and exhibiting New Urbanism characteristics very few people walk to work in Toowoomba's urban centre for a variety of reasons. This paper will argue that personal value propositions and attitudes are as influential for walking for transport as physical urban environments.

Keywords

Walkability, new urbanism, public health, built environment, psycho-social barriers

1 Background

New Urbanism advocates claim that this urban design theory can reduce both travel distance and time, increase the use of public transport and reduce dependence on the private vehicle (Cozens and Hillier, 2008). Much of the literature debates the benefits of a grid pattern over a cul-de-sac neighborhood layout (And and Ahn, 2003). Many contend that very few newly built New Urbanism environments have been critically or systematically evaluated to prove or disprove the claims of improved walkability and that they suffer generally from methodological problems. (Randall and Baetz, 2001). Much of the debate is driven by an aversion to what is perceived as a one size fits all codified stance by new urbanism based on a grid pattern as opposed to a cul-de-sac pattern or any acknowledgement that there is no one kind of planning that will promote walkability (Cozens and Hillier, 2008).

Given that very few actual levels of pedestrian activity were studied in the literature to ascertain if urban design factors such as grid or cul-de-sac connectivity necessarily result in increased levels of walking, I have looked to an existing older neighborhood that I contend displays the characteristics of a connected and walkable design to determine if levels of walking to work attain a high percentage of mode share. In valuing what already exists and putting aside the new urbanism debate surrounding grid layouts, the real message for planners may be to look beyond the natural environment attributes and focus on the psycho-social correlates of walkability as policy makers.

New Urbanists, following the congress of New Urbanism in 1998, generally subscribe to a set of core principles and code provisions including:

- compact, walkable neighborhoods with clearly defined edges;
- a clearly defined centre with public space, public buildings , a transit stop, and retail businesses;

- an interconnected street network, forming coherent blocks and lined with building fronts rather than parking lots;
- a diverse mix of activities and housing options;
- civic spaces in prominent places; and
- open spaces in convenient locations throughout neighborhoods (Lund, 2003).

2 Purpose

The purpose of this paper is to establish that the inner city areas of East Toowoomba are highly walkable and then to identify what share walking has of available modes of journeys to work. The paper will explore a multi-disciplinary approach to increasing the mode share of walking for journeys to work by identifying the various correlates of walkability identified in existing literature and placing new emphasis on the psycho-social correlates of various modes. The fundamental question this paper asks is if old, existing neighborhoods that are displaying all of the characteristics espoused by new urbanists are not experiencing higher levels of people walking to work what are the correlates that as planners and policy makers we can identify, understand and influence? The paper will discuss an existing theory of the correlates of walkability proposed by Saelens et al (2003) and then contribute to that theory by developing it further by attributing equal importance to other psycho-social correlates for walking for transport. In order to understand why people are not walking in highly walkable environments the paper will also suggest a number of paradigm shifts required for transport policy planners that take into account the psycho-social factors that influence travel behaviours.

3 Method

This paper is a desk top study based on existing literature, geographic information systems, census, survey results and a walkability scoring tool.

There exists a large volume of literature about walkability from a variety of disciplines and some literature that provides a cross-disciplinary approach. Systematic reviews (Giles-Corti et al., 2013, Cervero and Kockelman, 1997, Duncan et al., 2010, Frank et al., 2003) have concluded that built environment attributes, especially land use patterns, are consistently related to physical activity in general and to walking for transport in particular. Different factors impacting on walking for transport, including proximity, connectivity, land use mix and infrastructure have been identified (Duncan et al., 2010, Frank et al., 2006a, Frank et al., 2006b). Reviews of the public health and preventative medicine literature indicate that access to recreation settings and the aesthetics of activity settings are related to walking. Reviews of the transport and urban planning literature indicate that ease of pedestrian access to nearby destinations is related to walking (Saelens et al., 2003).

The census and the Toowoomba household travel survey conducted by the Department of Transport and Main Roads in 2012 are the primary data sources for the paper. The survey collected comprehensive travel behavior information from a sample of 2000 households in private dwellings. The data contains both quantitative and qualitative responses. Survey results are representative of personal travel by Toowoomba residents on a typical school term weekday. Results are based on sample data benchmarked to the 2011 census data results about number of private dwellings and estimated resident population living in dwellings by age and gender (ABS, 2012).

The walkability audit tool used for the paper is Walk Score. Walk score is a freely available product that was founded by a private company in 2007. The stated mission of the company is to promote walkable neighborhoods with the idea that this is one of the simplest and best solutions for the environment, our health and our economy. According to the walk score webpage, the walk score algorithm awards points based on the distance to the closest amenity in each category. If the closest amenity in a category is within 400 metres it assigns the maximum number of points. The number of points declines as the distance approaches 1.6 km—no points are awarded for amenities further than 1.6 kilometres. Each category is weighted equally and the points are summed and normalized to yield a score from 0–100. The number of nearby amenities is the leading predictor of whether people walk. Relevant amenities include "businesses, parks, theaters, schools and other common destinations (Score, 2013). Walk score does not take into account pedestrian infrastructure, road type, weather nor criminal activity statistics. Carr, Dunsiger and Marcus (2010) have validated the use of walk score as a reliable measure of access to walkable amenities and identify that it is a convenient and inexpensive option for research into the correlated between walkability and physical activity.

4 Results

4.1 Walkable neighborhoods – Toowoomba inner city suburbs

Using the walk score tool the area of Toowoomba Central (3 464 people), East Toowoomba (7 154 people) and South Toowoomba (6 826 people) score 82, 68 and 62 respectively. These three areas represent the older, traditional and first settled areas of Toowoomba. Toowoomba as a city (96,567 people) has an overall walk score of only 46, illustrating that ironically the older neighborhoods of Toowoomba are exhibiting more walkable urban design characteristics than the new. The most walkable cities in Queensland according to walk score are Brisbane, Gold Coast and Toowoomba. The least walkable cities are Bargara, Hervey Bay and Warwick (Score, 2013).

Figure 1 shows the score as a colour ranging from green for a hundred to red for a zero walk score.

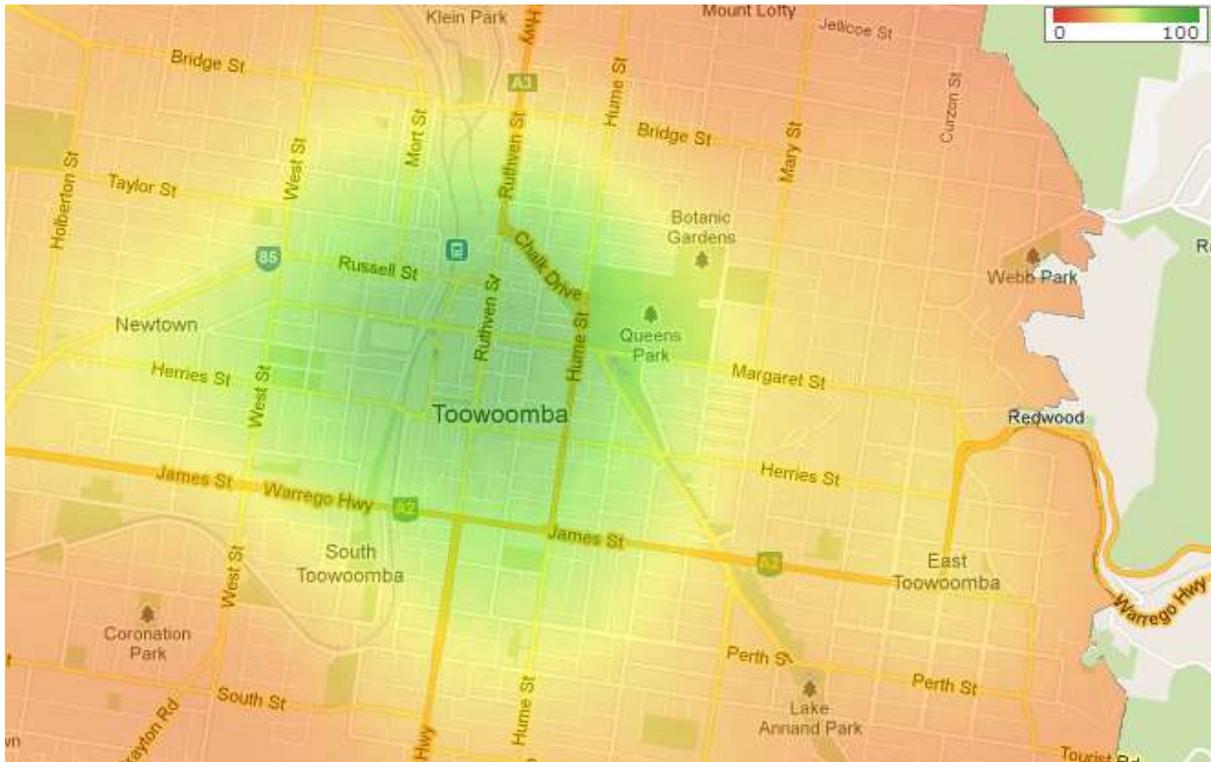

Figure 1: Toowoomba City, South Toowoomba and East Toowoomba walk score retrieved from http://www.walkscore.com/AU-QLD/Toowoomba/Toowoomba_City 7 May 2013

Further analysis of the inner city suburbs by evaluating how they perform against the new urbanism design principles contained in the Next Generation Planning Handbook also reveal a high correlation between these traditional, older suburbs and new urbanism criteria (Queensland, 2011)

New Urbanism Principle

compact, walkable neighbourhoods with clearly defined edges

Evaluation by Next Generation Planning Handbook

Compact urban form

Edges formed by East and West Creek, James Street and the Great Dividing Range

a clearly defined centre with public space, public buildings, a transit stop, and retail businesses

Toowoomba city centre clearly defined with civic buildings, transit stops and retail

Grid street network with rear lanes in Caledonian Estate

a diverse mix of activities and housing options

Diversity of housing and land use mix

civic spaces in prominent places

Queens Park and East Creek Mothers Memorial

open spaces in convenient locations throughout neighbourhoods

Queens park, East and West Creeks

Figure 2: New urbanism evaluation of Toowoomba (Queensland, 2011)

4.2 Who is walking to work in these highly walkable neighborhoods?

Only five percent of the population walks to work in Toowoomba's inner city neighborhoods and an overwhelming 95% rely on a private vehicle for their journey to work. Toowoomba does have a high proportion of medium distance trips (two – five kilometres) in comparison to other regional centres in Queensland due to its compact built form. Approximately 17% of all commuter journeys to work are short, less than two kilometres and end relatively close to home. Of all journeys to work fifty-eight percent are less than five kilometres (QTMR, 2012).

Analysis undertaken for Setting the Transport Scene in the Darling Downs indicates that around 36% of residents live within one and a half kilometres of a commercial activity centre and/or major employment hubs.

Toowoomba urban area consists mainly of a grid street layout making connectivity and permeability high for walking. The pathways within creek networks do provide linear networks in a park setting for walking within the urban area. One in three commuters travel less than four kilometres to work in the Toowoomba urban area. These figures would indicate that at least some of these journeys could possibly be converted to walking if we started to understand and address the reasons for private vehicle use more comprehensively and started to compete in that space for mode share.

The estimated average time spent travelling in a return trip by car Toowoomba residents each day is fifty-two minutes. For those walking trips recorded in the 2012 Toowoomba household travel survey the average distance recorded was one kilometre and the duration was fifteen minutes (QTMR, 2012).

In 2012 Toowoomba Regional Council area had 536 kilometres of existing pathways. 149 kilometers of these have been constructed over the last ten years, with 85% of all pathways located in the Toowoomba urban area.

A Toowoomba regional transport user analysis survey on attitudes towards travel modes conducted in 2010 found that four percent of all respondents said walking was not available in their local area and fifty percent did not consider walking as an option for journeys to work. Of the fifty percent, barriers or reasons for not walking included 45% said too far, 25% not comfortable, 23% said not fit enough and 16% no paths. Respondents were given thirteen possible associations with various transport modes including environmentally friendly, cheap, value for money, enjoyable, flexible, comfortable, easy, popular unreliable, stressful, unappealing and quick and were asked to nominate five of those in no particular order for each mode of transport.

Respondents cited the following top five associations with walking:

Top associations with walking	Association	% of respondents who nominated this particular association
1	Environmentally friendly	82%
2	Cheap	76%
3	Value for money	58%
4	Enjoyable	50%
5	Flexible	45%

Figure 3: Top five associations with walking

While most of the respondents identified very positively with the idea of walking and showed a clear understanding of the environmental and financial benefits of it, fewer viewed enjoyment, flexibility and value for money as positive associations. These lower scoring positive associations for enjoyment of walking are linked to the barriers identified for walking being the “journey is too far, walking is not comfortable, I am not fit enough and no paths have been provided”. The lowest scoring positive association relates to flexibility and can be linked to the value attached to the freedom and choice associated with the private car. The value placed on these positive association with the car are key to identifying as planners and policy makers what else needs to be done to promote healthy places and compete with perceptions and psycho social correlates of physical activity.

Respondents cited the following top five associations with the private vehicle:

Top associations with the private vehicle	Association	% of respondents who nominated this particular association
---	-------------	--

1	Comfortable	89%
2	Flexible	80%
3	Easy	78%
4	Popular	77%
5	Quick	76%

Figure 4: Top five associations with the private vehicle

The barriers identified by respondents to using a private vehicle include “congestion, impact on the environment, I don’t have a license and parking is too expensive”. These barriers are also critical clues for policy makers who have the political will to compete with the car and reclaim streets for people. Trends indicate that congestion will get worse not better and that the flexibility offered by the car will also decrease correspondingly with people spending longer and longer in the car due to congestion. All of the top associations cited by respondents for private vehicles are placed under serious threat if congestion increases including quickness and ultimately popularity.

5 Discussion

Planners have and do traditionally follow a number of key design principles that they believe by their application will promote walkability and create a healthy community. The principles include active transport, aesthetics, connectivity, environments for all people, mixed density, mixed land use, parks and open space, safety and surveillance, social inclusion and supporting infrastructure (ALGA et al., 2009). Extensive research exists to suggest that physical activity including walking is influenced by environmental variables and neighborhood context (Lund, 2003; Ross, 2000) (Saelens et al., 2003). Land use mix, density, connectivity and streetscape design are well documented built environment factors that can influence active transport to a degree in preference to private vehicle use.

The physical environment barriers to walking have traditionally been related to gaps in pedestrian infrastructure including partial or non-existent walking paths, poor quality walking surfaces, non-existent or inappropriate crossing treatments, speeding traffic, high speed traffic and high volume heavy vehicle traffic. The evidence demonstrates that there is an inherent contradiction in traditional responses to walkability and that even when the built environment is conducive in terms of compactness, proximity, connectivity, density, lot layouts and use mix there are other factors that are barriers to walking for transport in Toowoomba. Personal, social and perceptual barriers include people’s attitude to walking and these attitudes may be influenced by climate, topography, convenience, comfort, doubt about ability to walk, safety and status and are what we need to know more about in walkable environments where people are not walking.

The theory developed by Saelens, Sallis and Frank considers neighborhood environment factors, individual factors and walking and cycling purpose. The model, “*proposes next possible steps in the evaluation of environmental and psycho-social variables involved with physical activity and their interaction. For instance it is possible that the collective psycho-social factors of social support, self-efficacy and positive beliefs about physical activity are more closely related to the behavior in the presence of a more walkable physical environment.*” (B.Saelens, Sallis & Frank, 2003)

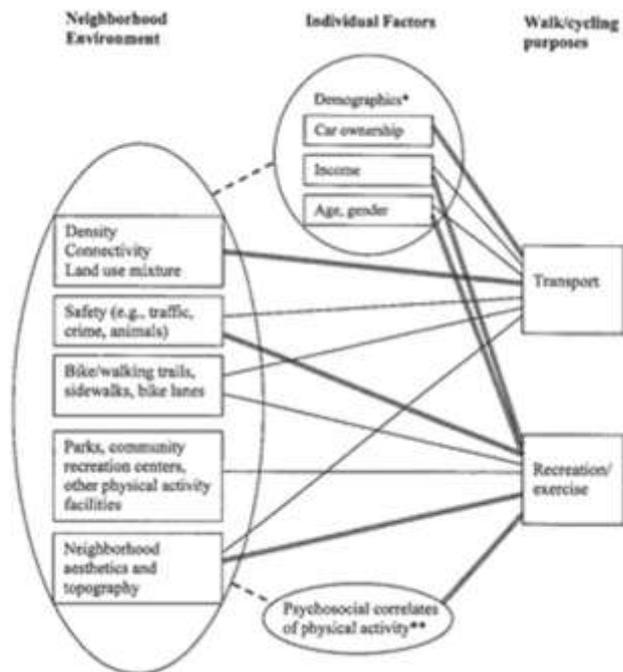

Figure 5: Saelens, Sallis and Frank Model (Saelens et al., 2003)

The model also attributes differing levels of importance to various environmental and individual factors depending on the purpose of the walking. The model attributes most important correlates for walking for transport to density, connectivity, land use mix and car ownership. The model does not attribute any importance to the psychosocial correlates for walking for transport. It does however show a dashed line between the psycho-social and neighborhood environment as a mediated relationship.

From the evidence presented not enough is understood about why people don't walk to and from work when the journey is walkable. As planners and policy makers we can influence, facilitate and provide the environment both physically and socially to overcome some real and perceived barriers to walking and contribute to the health and well-being of communities. The role of the planner can impact on the design and redevelopment of spaces and advocate for a greater priority on pedestrian infrastructure to influence changes in behaviour to create healthier places. The evidence in this paper suggests that it is not enough to create an environment for walking without understanding what motivates people to prefer the private vehicle when all of these design principles are in place. The less researched influences that this paper attributes equal significance are personal value positions, and attitudes to walking. These psychosocial attributes include variables such as self-efficacy, value attached to private vehicle, perceived benefits, perceived barriers, social support and a lack of enjoyment of physical activity (Saelens et al., 2003).

There is a lot of mixed thinking in the data collected to suggest that while people think walking to work is a good thing there a number of reasons that they won't or don't do it. In addition to the built environment incentives already understood, planners and policy decision makers need to have a much better understanding of the actual value people place on the perceived freedom and choice a private vehicle gives in order to propose a viable alternative that competes with this deeply held attachment (Litman, 2006).

Figure 6 proposes the psycho-social considerations of walking for transport that should be weighted as importantly as the environment and individual factors by urban planners working within multi-disciplinary teams of public health, transport, urban design and infrastructure providers

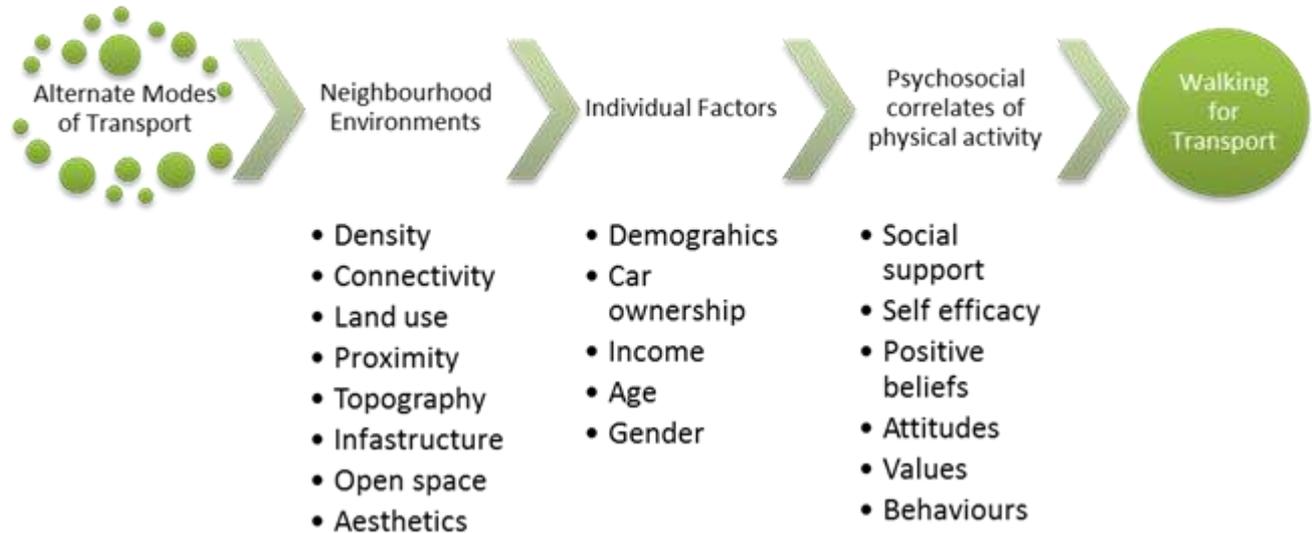

Figure 6: Correlates for walking for transport

Education won't necessarily change behavior as noted by Newhouse (1990) however planning frameworks and governance models can provide incentives and disincentives for vehicle use and walking. Making it harder for people to take cars to work and making it easier for people to choose to walk is within the sphere of influence for planning. Critically Newhouse identifies attitude as one of the most important influences on behavior, amongst others including locus of control, sense of responsibility and knowledge. In this case attitude can be defined as an enduring positive or negative feeling about private vehicles and walking. Beliefs based on information also come into play as either factual or personal opinion about different modes of transport. (Newhouse, 1990, De Vos et al., 2012, Elias and Shiftan, 2012)

According to Litman (2006) motor vehicle travel has started to peak in most developed countries because of demographic and economic trends of aging population, rising fuel prices, travel speeds, increased urbanisation, improved travel options, increased health and environmental concerns and changes in consumer preferences. For many their own car is not just a way to get around it is a symbol of success and freedom. For these reasons people buy more expensive cars, drive more and avoid using alternatives. McGucking and Lynott (2010) provide evidence using travel data and consumer surveys that there are significant attitudinal differences between older and younger generations. Hymas (2011) believes those born after 1980 aspire more to the urban lifestyles and are more interested in electronic devices than cars. The stigma once associated with walking, cycling or catching a bus has lessened as urban living becomes more popular.

Changing demands will require new transport policy and planning responses. A paradigm shift is required to move from the old paradigm of motor vehicle dominance to a new paradigm of multi-modal travel.

	Old paradigm	New paradigm
Transport	Mobility	Accessibility
Transport planning goals	Travel speed	Accessibility
Transport measurement	Levels of service, road type, traffic speed, congestion delay	Level of service, multi-modal, time and money required to access services
Transport affordability	Minimise vehicle costs (fuel, parking)	Minimise total transport cost, Supports affordable modes and affordable accessible housing
Analysis	Quantitative e.g. speed	Qualitative e.g. convenience and comfort
Modes	Car	Walking, cycling, public transport
Solutions	Roadway expansion	Transport demand management
Land Use	Sprawl	Smart growth
Funding	Dedicated funds for roads and parking facilities	Least cost planning allocates funds to the most cost effective and beneficial option

Figure 7 : Paradigm shift for multi-modal travel (Litman, 2006)

This shift in thinking will require all of the elements shown in figure 6 to be considered equally and from the various perspectives of urban planners, designers, engineers and public health specialists.

6 Conclusions

The value placed on older, traditional neighbourhoods in close proximity to high quality urban spaces with a mix of residential, commercial and retail uses is widely recognized. New urbanism is in part about getting back to the village or the older design ideas about land use mix, permeable lot layouts and housing diversity on which the community and market places significant value. This paper has identified that despite displaying new urbanism characteristics and being walkable fewer people than expected living in these areas in Toowoomba's inner suburbs are walking for transport. Further research is required to identify attitudinal and behavioral reasons why people are not walking for transport in these highly walkable environments. Linking these results to transport, public health and urban planning policies and programmes to increase mode share is as important as reviewing the neighbourhood's physical elements or individual demographic profiles.

Brisbane's urbanism: looking for an identity. What can we learn from Inala.

Kelly GREENOP* The University of Queensland, Australia
Dr. Sébastien DARCHEN, The University of Queensland, Australia
Author ID:

Abstract

This paper draws on the Inala case study to develop guidelines to incorporate place identity considerations in contemporary Brisbane's urbanism. We critically analyse the emergence of the New World City marketing strategy and the New City Centre Master Plan associated to it. Our conclusion is that a balance between economic objectives (positioning Brisbane as key player in the Asia-Pacific) and the development of an authentic identity (through public involvement) still needs to be achieved. We provide recommendations at the end of the paper.

Introduction

Urban planning in Queensland is known as having been shaped by a pro-development culture. This translates strongly in the design of Brisbane's public spaces which we argue still suffer from an 'identity crisis' despite recent initiatives (e.g., Brisbane City Council's City Centre Master Plan, 2012; New City Plan, 2013) that are clear attempts to foster public consultation on how to generate a sense of place and to confer a more urban identity to the Brisbane CBD. This appears as a key element for the development of an enhanced identity for Brisbane that would also contribute to its status as a 'New World City'. In this paper we argue that instead of developing or (re)developing urban areas according to the latest commercial trend some guidance should be provided to preserve the identity of Brisbane and also to create a sense of belonging based on the history of specific places. Our point is that planning professionals should create "places" (or support the recognition and enhancement of existing places) and not simply "spaces". Based on the lessons learned from the case of Inala we propose guidelines to inform the planning practice and to create a sense of place in the broader Brisbane context. We argue that this will lead to a more authentic version of place, in line with place theorists. Ultimately the paper concludes on directions to develop a Brisbane urbanism in the context of an emerging city, inclusive of its past but also looking towards the future as a 'new world city'.

From a theoretical point of view, the paper is based on the concepts of place and sense of place. Places are composed of three interrelated components that give meanings to place: the physical setting, activity and meaning. For example Relph (1976) referring to Lynch (1960) associates the identity of a place with the ability to evoke human senses through qualities that make it distinctive from other places. We also draw on Augé's (1995) work examining the plethora of 'non-places' that he argues characterise many modern cities, and the antithesis of this, the creation of authentic place.

We use the case study of the Brisbane suburb of Inala, located in the suburban outer southwest and characterised by public housing and a proportionately large population of migrant and Indigenous communities, to examine place-making in Brisbane. We utilise ethnography to examine residents' attachment to and identification with place, as well as the

Greenop & Darchen, Brisbane's Urbanism: looking for an identity, 49th ISOCARP Congress 2013 demographic, socio-economic and other quantitative aspects of place that characterise Inala. We combine these factors with an examination of the urban planning of the suburb and changes to this over time, to discuss how an authentic, resilient and sustainable place requires a combination of community, government and individuals to develop and maintain this authenticity.

Based on this case, we present recommendations to achieve a balance between positioning Brisbane as key player in the Asia-Pacific and creating a sense of place. Creating a sense of place has been developed incrementally over time, and often involving initiatives driven from within the Inala community itself, rather than through a broad strategic process, but we examine how planning and other bureaucratic regimes have affected place-making in this location.

One of the strategies that we wish to put forward is the importance of acknowledging the history of a place and the cultures of its people when developing place-making strategies. First we define place-making strategies as applied by planning professionals and then we develop an alternative approach - based on the case of Inala - to enhance the symbolic value of urban spaces.

As Brisbane and South East Queensland works to plan for its increasing population, and the development of existing places to increase their cohesiveness and social capital (e.g., Logan and developing areas such as Springfield) issues of community identity, sustainability and inclusiveness become increasingly important for planners and policy makers. We argue that a community-centred, identity-focussed approach is an important consideration in this developing debate.

Theory: towards a distinction between place and non-place

There is a large corpus of works in urban planning focusing on the urban form and sense of place. Our aim here is not to present an exhaustive list of works but to explain how the dichotomy of place/non-place is informing our analysis of both Inala and recent initiatives to improve city and regenerate Brisbane's City Centre. While place theory is extensive, within Australia there are few examples of the examination of places based on these theories, resulting in what we argue is a disconnected approach to place-making by urban designers, planners and the state. We seek to inform the ways in which city places can be successfully made, remade and maintained through a more thorough understanding of what constitutes authentic place, informed by both the literature and the short case studies that we undertake.

Kevin Lynch (1960) has identified criteria to evaluate the performance of urban environments: 1. Vitality; 2. Sense; 3. Fit; 4. Access; 5. Control; 6. Efficiency and justice. Kevin Lynch (1960, p. 6) defines "the identity of place simply as that it provides its individuality and distinction from other places and serves as a basis for its recognition as a separable entity."

Place theorists recognise that places are not only comprised of their physical and experiential qualities in the present, but of their associations with people, events and histories. The classic geographic definition of place by Agnew states that place is comprised of location, locale and sense of place (Agnew 1987, 28); locale is defined as the setting which allows for social interactions to occur, and sense of place as the emotional

Greenop & Darchen, Brisbane's Urbanism: looking for an identity, 49th ISOCARP Congress 2013 associations bound up with place. Similarly, geographer David Harvey, stresses that not only the physical, but the social is important in place; places are socially constructed and made meaningful through social processes (Harvey 1993, p. 5). To this we want to stress the importance of the recognition of locale and sense of place in the creation or regeneration of places, and discuss how these aspects of place are challenged by planning that considers perhaps too fully the physical aspects of place rather than the entirety of place.

To demonstrate that this holistic approach to place is not new, but nevertheless essential, we draw here on the work of Gehl (2010) and, much earlier, Jacobs (1961) and consider their planning proposals in the context of place. Current place-making strategies can be considered as a reaction to the consequences of modernist planning and the modernist movement in architecture, which many critics claimed created standardised places that lacked character and history. While we do not agree that all modernism falls into this category, the criticism of character-less places and what is lacking is important to consider. Jan Gehl's (2010) idea of "life between buildings" and his broader approach of the "human dimension" that according to him has been an overlooked aspect of urban planning, are obvious reaction to the diminishing urban street life, here Gehl (2010) refers to Jane Jacobs' *The Death and Life of Great American Cities* (1961). Jacobs (1961) - cited by Gehl (2010, p. 3) - pointed out that the increase of car traffic and the urban planning ideology of modernism that separates the uses of the city into separate zones would put an end to city life. Gehl (2010, p. 6) sees "the human dimension" as a necessary new planning dimension: "urban planners and architects must reinforce pedestrianism as an integrated city policy to develop lively, safe, sustainable and healthy cities." Gehl (2010, p. 6) insists on: "strengthening the social function of city space as a meeting place that contributes toward the aim of social sustainability and an open and democratic society." Both Gehl and Jacobs before him argue for a recognition of place-creating that accounts for the various aspects of place, the physical, social and emotional.

We can also cite Jane Jacobs and her idea of "vitality of neighborhoods" that has been reused lately in the Creative City approach to urban planning (See Darchen, 2013). Jane Jacobs insisted that specific components should be part of a neighborhood: diversity of social groups, public spaces, etc.

French anthropologist Marc Augé further criticises both modernist and post-modernist place making, dubbing many locations in the era of supermodernity as "non-places". According to Augé (1995) these non-places: "designate...two complementary but distinct realities: spaces formed in relation to certain ends (transport, transit, commerce, leisure) and the relations that individuals have with these spaces" in opposition to "anthropological places" that create the social. Non-places are places of transience like international airports; motels and highways, they are generic places that according to Augé (1995, p. 94): "create solitary contractuality".

Augé (1995) explains that the distinction between places and non-places derives from the opposition between Place and Space. According to Augé: "the term 'space' is more abstract in itself than the term 'place' whose usage refers to an event (which has taken place), a myth (said to have taken place) or a history (high places)" (1995, p. 82).

In this paper we use the distinction between places and non-places that we find more explicit. When applied to planning we believe that Global urbanism replicating similar urban projects from one place to another contributes to the development of non-places. On that point Haila (2006, p. 285) refers to the operation of global actors to create an international image for the city. She refers to Zukin (1992): "the wordly superstars, including developers, architects and private-sector financial institutions" design the landscape in all global cities"; thus contributing to the development of "non-places".

Situating 'place identity' within social sustainability

Within place theory, the concept of place identity is particularly useful when analysing the ways in which places are used and in what regard they are held by their community. We also use the more recently developed concept of social sustainability to examine places, and situate place identity within this concept in order to link place theory and place-making.

Place identity is a difficult concept to define, but geographers, planners and architects all stress the importance of the links between people and place, and the ways in which places can contribute to the identity of users, and determine their identity in terms of the activities, associations and histories developed in place. Place identity is sometimes discussed as a component or synonym of 'sense of place' and we draw on both place identity and sense of place here to get to the heart of what matters about place, for people.

Relph describes how the "physical appearance, activities and meanings are the raw materials of the identity of places." (1976, p. 48) In the emerging literature on social sustainability, a 'sense of place' is one component that contributes to socially sustainable communities. According to Dempsey et al. (2011), indicators for socially sustainable communities are as follows:

- Interactions with other residents and social networks;
- Participation on collective community activities;
- Pride or sense of place;
- Residential stability (low turnover of residents);
- Security (lack of crime and disorder).

Furthermore, Davenport and Anderson (2005) explain that places "play a vital role in developing and maintaining self and group identity of the people; place identity is also defined as "the way in which a place informs the identity of a person or people." (Proshansky et al., 1995). The notion of place identity or sense of place is also closely linked to the concept of place attachment. Shamsudin and Ujang (2008, p. 400) define "place attachment" as a form of bonding between the person and a setting, while Hildago and Hernandez stress the desire to stay close to a place as being key to attachment (2001, p. 274).

In previous work we made the point that place identity could be threatened by regeneration initiatives with the example of the Fortitude Valley renewal plan (Darchen and Ladouceur, 2013). Historically, social sustainability has not been a strong component of urban planning in Queensland and certainly not a strong focus of previous renewal initiatives (Darchen and Ladouceur, 2013). However, regeneration plans are now increasingly recognising the

Greenop & Darchen, Brisbane's Urbanism: looking for an identity, 49th ISOCARP Congress 2013 impacts of regeneration initiatives on local communities, social sustainability is starting to be a key component of planning and urban transport initiatives (e.g., Gold Coast rapid transit corridor Master Plan includes a strong component on social sustainability issues) (Interview 1).

In this paper we are making the point that place-making strategies should go further than renovating places to attract new residents and new business activities. Place-making strategies should recognise the history of places to foster a sense of belonging and place identity. In that regard, Newman and Jennings (2008, p. 146) propose strategies to foster a sense of place:

- Protecting important existing elements of their natural and cultural heritage;
- Designing to make historical and current social and ecological processes more visible;
- Using cultural practices and the arts to nurture and deepen a sense of place;
- Discovering city "songlines".

We argue that the creation of an authentic places should be the key goal of urban strategies and improvements. The theories of place making that encompass identity, history, sustainability and community are all indicated as essential to such an authenticity. We now discuss the importance of the increasingly recognised role of Australian Aboriginal communities and their place histories and sense of place in the post colonial Australian city.

Authentic places: starting with Aboriginal place

The importance of place to Australian Aboriginal and Torres Strait Islander communities is well known and urban Aboriginal populations are no different. Place, in the specific concept of *country* that embodies a person's links to history, spirituality, family and identity is central to many Aboriginal and Torres Strait Islander people's lives into the contemporary era (see for example Sutton, 1995, 2003). While anthropologists have explained *country* in various ways, from the architectural perspective architect and academic Kevin O'Brien explains *country*:

"Country is an aboriginal Idea. It is an Idea that binds groupings of aboriginal people to the place of their ancestors, past, current and future. It understands that every moment of the land, sea and sky, its particle, its prospects and its prompts, enables life." (O'Brien 2012)

For many Aboriginal people their historical forced exclusion from *country* and places of importance does not necessarily reduce their connection or commitment to places that are now the sites of cities such as Brisbane. Native title claims over urban areas such as Perth (Bennell v Western Australia [2006] FCA 1243) (National Native Title Tribunal 2006) and Brisbane are testament to Aboriginal people's commitment to connect with and be acknowledged as ongoing owners of their *country* (National Native Title Tribunal 2013, 2013a).

Clashes between forces of gentrification within urban areas, and both the attachments and the difficulties that Aboriginal people face within cities are not easy to resolve. The differing goals of different stakeholder groups, often based on the variation in sense of place or place identity, can result in resistance to place changes, and loss of an existing place identity can occur when urban development does not include principles of social sustainability. Shaw's examination of Redfern, an important location for urban Aboriginal people in Sydney, and

Greenop & Darchen, Brisbane's Urbanism: looking for an identity, 49th ISOCARP Congress 2013 the recent gentrification of the suburb, in *Cities of Whiteness* (2007) shines an important light on the need for authenticity and realistic goals in place-making activities. For Aboriginal people within urban areas of Australia, especially capital cities, there is a danger of a second wave of 'colonisation' of place occurring which once more excludes, marginalises or ignores the needs of urban Aboriginal and Torres Strait Islander peoples, when socially sustainable processes are not considered. While the fields of anthropology, cultural studies and history have considered their colonial legacy, the disciplines of architecture and planning have barely acknowledged their roles in the exclusion, isolation, segregation and oppression of Aboriginal and Torres Strait Islander peoples in Australia.

Recognition of Aboriginal prior ownership of and special places within cities has occurred at various levels from the production of guidebooks, such as *The Melbourne Dreaming: a guide to the Aboriginal Places of Melbourne* (Eidelson 1997) and *Aboriginal Sydney* (Hinkson and Harris 2001, 2010), but no such guide or comprehensive account of Brisbane's existing or historical Aboriginal places exists.

Historian Peter Read (2000) argues that for many non-Aboriginal people, and especially Anglo-Australians, there is a need to come to terms with the underlying and continuing importance of Aboriginal history and origins within our cities. His account of finding 'belonging' within his favourite Sydney childhood places, through deep engagement with Aboriginal traditional owners, establishes acknowledgement of traditional custodianship of city places as his preferred way of connecting to place authentically, but also demands connection with traditional owners in ways that could become onerous rather than engaging.

O'Brien's ongoing *Finding Country* (2006-current) project challenged designers to imagine the city half emptied of its population and what could be revealed in such a removal, such as the underlying *country* of Aboriginal owners and their continuing connections. Brit Andresen and Mara Francis' running up entry for the Australian CAPITheticAL competition (2013) which posited a model for a renewed Australian capital city based on their *Sedimentary City* concept which recognises multiple layers of history, including the 'First City' being the Indigenous history and use of an area (Andresen and Francis, 2013). O'Brien, and Andresen and Francis' imagined or potential futures attempt to determine a more authentic vision for place that, returning to place theory, encompass not only physical but social and cultural aspects of place .

These approaches, we argue, contribute to an authentic (if hypothetical) approach to urban placemaking that acknowledges both the traditional ownership of cities by their Aboriginal custodians, and the urban forms that embody memories an existing places identities for Aboriginal, Torres Strait Islanders and more recent arrivals.

We argue that a sense of place identity cannot be created from top-down processes but must include elements of history, an understanding of place meaning and the layers of meaning that exist for places, including different ethnic and cultural groups, as well as for different ages or users.

Research question and methods

Greenop & Darchen, Brisbane's Urbanism: looking for an identity, 49th ISOCARP Congress 2013

Following our literature review our research question is as follows: "How can we achieve a balance between creating an authentic sense of place through planning strategies and positioning Brisbane as a key player in the Asia-Pacific region". We discuss in the conclusion if these objective are compatible or mutually exclusive. We consider the case study of Inala as an example of the development overtime of an authentic sense of place, we thus explore this case study to provide recommendations for the orientation of Brisbane's urbanism. To inform the current situation of both the orientation of Brisbane's urbanism and the influence of the New World City marketing campaign we performed semi-directed interviews with key informants (see list at the end of the paper).

The Inala research was conducted during an extended period of fieldwork for Greenop's PhD research (2013). Both formal research interviews and and informal participant observation was conducted between 2007 and 2012. Research began with 'initial interviews' which were unpaid and short, to determine the suitability and interest of the participant to undertake an 'in-depth interview' which was paid and of a longer duration. These were sometimes recorded, but at the request of participants, not always. Approximately 40 in-depth interviews were conducted with sometimes more than one participant per interview. From this initial research an increasing amount of participant observation was undertaken with participants who were willing to engage in the research on a long-term and highly involved manner. This is in line with ethnographic methods common in anthropology (Spradley 1979). Fieldwork notes, videos, photographs and reflection allowed for the development of the thick description of ethnography and this was tested through seeking contrary views from within the community.

Limitations on this method have been widely discussed (e.g., Stewart 1998), but nevertheless it allows for greater insights into the how and why of place relationships than less subjective methods such as surveys. This method allows us to explore people's direct experiences of place, and their developing sense of place over time. It answers the call by place theorists such as Lewicka (2011) for further detail not just on what places and people-place relationships are, but how they are formed and what effect the physical environment may have upon these relationships.

Brisbane's identity: the emerging city?

Brisbane still suffers an identity crisis compared to the dominant metropolises that are Melbourne and Sydney. Brisbane has a reputation within Australia as lacking an urban tradition, the identity of Brisbane is still very much one of a suburban, low density city (Fulton, 2011), with even locals at times referring to it as still a 'big country town' dominated by a suburban identity. The conception of Brisbane as 'backward' and suburban, in need of an urban identity seems to still drive the response in urban strategies today. The trend is to reverse this suburban identity into an urban identity, Urban Renewal Brisbane (URB) in the document *The making of a New World City, 1991-2012* states that planning and renewal initiatives are closely linked to the objective of promoting Brisbane as the 'New World City'. In this process of transforming the identity of Brisbane from a suburban 'big country town' into a metropolis, the work of (URB) is presented as being central (Brisbane City Council, 2013). This process of identity change is best embodied in the 2007 City Centre Master Plan (CCMP) with key innovations being promoted: 1. Revitalisation of laneways and small places; 2. Development of an architectural language inspired by sustainable subtropical

Greenop & Darchen, Brisbane's Urbanism: looking for an identity, 49th ISOCARP Congress 2013 design; 3. development of distinct commercial precincts and knowledge clusters in the CBD; 4. Deliver catalytic demonstration projects (BCC, 2013).

The message of URB in the document "The making of a new world city, 1991-2012" is clear: planning incentives starting in the 1990s with the Building Better Cities program are closely related to the objective of building an urban identity for Brisbane that is also international: *"Brisbane is the 'Gen Y' of international cities: youthful, progressive and confident, home to Australia's premier live music scene, the nation's largest gallery of Modern Art and one of the most important centres for digital games design outside the USA. Brisbane is the nation's gateway to the Asia-Pacific markets and 'knowledge now accounts for much of the city's exports."* (BCC, 2013, p. 8-9).

This focus on the new, rather than any aspects of Brisbane's history, we argue may be caused by the crisis of identity surrounding the image of Queensland under the Joh Bjelke-Petersen era, during which political freedom, cultural diversity, Aboriginal rights and many other aspects of social progress were oppressed. We argue that the dating of the beginning of Brisbane as a new world city from 1991 is no coincidence in terms of the socio-political history of Queensland. The corrupt Bjelke-Petersen government was ousted in 1987 and the Fitzgerald Inquiry into political and police corruption was conducted from 1987-1989, clearing the way for an era of political renewal in Queensland. In 1988 the World Expo was held in Brisbane bringing a new focus on the importance of engagement with domestic and global ideas, the arts, tourism and creativity. 1991 marked the beginning of the Labour Lord Mayorship of Jim Soorley, who oversaw planning changes such as the focus on Brisbane's river as a place of entertainment and recreation rather than industry, and saw the city open to new ideas such as outdoor dining, and densification and the movements to social justice initiatives such as the city taking a role in assistance for homeless people. In parallel, the reforming State governments of the National Party Premiers Mike Ahern and Russell Cooper saw the relaxation of laws on rights to protest and an end to the voting gerrymander. Federal recognition of Aboriginal rights to land through Native Title were also being established (following the *Mabo no 2 v State of Queensland* decision in the High Court in 1992) (High Court of Australia 1992). In short this was an era of unprecedented political, social and urban renewal in Queensland, and the new world city idea reflects this ongoing process of modernisation in the state.

There is strong push currently to develop a more forward-thinking identity for Brisbane (Interview Brisbane Marketing, June 7th 2013). This process started in November 2007 and was an 18 month long process, 36 000 interviews were conducted with business but also community groups (should have the stakeholders involved); the idea behind the redefinition of Brisbane's identity as new world city resolves around the acronym LEADS (Lifestyle obsessed, Environmentally friendly, Asia Pacific gateway, Digitally connected, Socially inclusive). Furthermore, we were able to learn more about the slogan: "Australia's New World City" (see figure below).

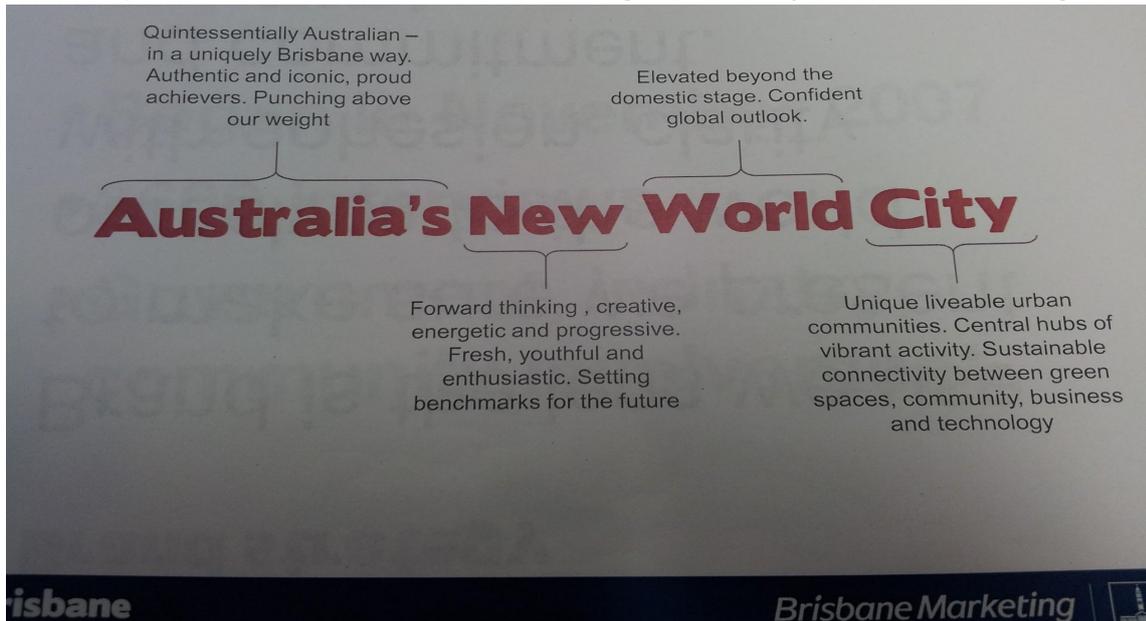

Figure 1. Brisbane's New World City Marketing Strategy

Source: Brisbane Marketing

“Australia’s” refers to the following: *Quintessentially Australian - In a uniquely Brisbane way. Authentic and Iconic, proud achievers. Punching above our weight.* “New” refers to: *Forward thinking, creative, energetic and progressive. Fresh, youthful and enthusiastic;* ‘World’ refers to: *Elevated beyond domestic stage. Confident. Global outlook;* ‘City’ refers to: *Unique liveable urban communities. Central hubs of vibrant activity. Sustainable connectivity...*

According to our interviewee, the evolution of Brisbane’s identity has a starting point with World Expo “Leisure in the era of technology” of 1988 which is considered as a cultural turning point in Brisbane’s history. The marketing campaign started in November 2007 and was an 18 months process; it included participation from different institutions, the industry and community involvement through a total of 36 000 interviews (Brisbane marketing); the campaign was then outsourced to private consultants. According to our interviewee, the marketing strategy is constantly evolving but the brand message is based on the following points:

- An emerging global city;
- Innovating on what’s important from the past to set the tone for our future;
- Ranked the second best city in Asia for foreign investment;
- Named a ‘Gamma World City’ (gaining sense of confidence and desire to look to the future);
- Recognised for being friendly, tolerant, clean, green, sustainable, vibrant, youthful, energetic and creative.

The branding of Brisbane is very much orientated towards the positioning of Brisbane as a major economic player in Asia-Pacific (e.g., attraction of Chinese students to study in Brisbane). Brisbane is constantly working on the positioning of Brisbane on the international scale and as a major player (e.g., host of the next G20). Our interviewee recognised that the emphasis was not on celebrating the past even though the branding of Brisbane as a major tourist and cultural destination is part of the strategy (Interview 2). But the past is not very present in the development of Brisbane’s new identity as a “World city”. The communication

Greenop & Darchen, Brisbane's Urbanism: looking for an identity, 49th ISOCARP Congress 2013

branch of Brisbane City Council (BCC) recognises that the "New World City" strategy is very much a Brisbane Marketing product although the strategy also reflects strongly the views of the Lord Mayor (Interview 3). According to our interviewee there are two component to the "New World City" concept: 1. Brisbane is a place where it is easy to do business; 2. Brisbane is place where people like to live. The second component translates into planning strategies in the New City Master Plan: the aim is to create 'urban hubs' where people can live, work and play (Interview 3). Community consultation has been a priority in the New City Master Plan, innovative methods (use of social media, creation of a social hub via internet) have been implemented to foster public consultation (Interview 3). For example Brisbane Urban Renewal organised the Ideas Fiesta Festival to encourage community input on the New City Centre Master Plan (Interview 3). The New City Masterplan includes key priorities: "Making it easier to do business in Brisbane"; "Protecting Brisbane's past and guiding future architecture", etc. (Brisbane City Council, 2013). However, through our interviews the building of a more urban identity is mainly based on making Brisbane a nice place to live and a place where it's easy to do business in the making of Brisbane's identity, the recognition of the past is rather limited and not viewed as a strong asset in building the New World City identity (our interviews).

The approach to Brisbane's identity in the new world city concept is very much driven by an idea of newness and a reinvention, or rebranding of Brisbane's identity, rather than an approach that includes its historical and cultural traditions. Brisbane's Indigenous heritage, which includes one of the largest Aboriginal and Torres Strait Islander populations in Australia, is not a key aspect of the creation of the New World City image, despite the cultural capital embedded in Australia's broader image of being home to the "world's most ancient living culture" (Tourism Australia 2013). We argue here that the future development of the new world city concept for Brisbane, that begins to include historical and social aspects of the city's history will encourage the development of a more complete and authentic place identity for Queensland. This, we argue, will result in a strategy that more successfully connects with Brisbane's residents and their place experiences, place identity and sense of place, which are key elements of socially sustainable planning practices (Dempsey et al., 2011).

We examine the slower and more community centred place identity and sense of place within the Brisbane suburb of Inala, created through both community-led and council funded projects that combine a sense of place with a desire to maintain or remake places according to the aspirations of local residents. We use this example of a suburb in Brisbane's outer south-west to discuss the development of a sense of place over decades, that is now being seen increasingly as multicultural, authentic and desirable. We argue that the Brisbane as an 'emerging city' should combine a strong role in the Asia-Pacific from an economic point of view but also be a place where local residents (from different cultural backgrounds) can have an input in the evolution of the city. This is why we find the case study of Inala as aspirational.

Inala: authentic place-making over decades

Greenop's study of Inala's Aboriginal community and their diverse and culturally based placed attachment formed part of her ethnographic study with members of the Aboriginal community within Inala (Greenop, 2013). What we argue that such attachment, sense of

Greenop & Darchen, Brisbane's Urbanism: looking for an identity, 49th ISOCARP Congress 2013
place and authenticity of place is achieved in Inala through the work of both locals and the state in creating places that operate to enhance community while acknowledging history.

Inala was developed as a housing commission suburb from the 1950s and soon became home to post World War II European migrants, Aboriginal and Torres Strait Islander families and non-Indigenous populations, all drawn in on the basis of housing need. Further changes in the demographics have included a large Vietnamese population and other more recent migrants including Polynesian and African families. While the compulsion to move into Inala was and often still is based on state housing, the stability of residence of many families indicates an ongoing place attachment, and the formation of supportive communities that allow residents to maintain their cultural values.

Local initiatives, such as community pre-schools, cultural groups and sporting teams, and support for these projects by the state and commercial interests, such as the Stylin'UP Indigenous Youth Festival supported by Brisbane City Council provide a deepening sense of place in Inala, based on these activities and the history that gathers around their continuation over time. The Stylin'UP motto: "Pride in self, pride in community, pride in culture" (Stylin'Up 2013) emphasises the place-based links developed through such programs which operate as a community driven, state-supported development of sense of place. Other enterprises in Inala, such as businesses that provide culturally specific foods, clothing and goods from Vietnam and the Pacific Islands, highlight the commercial opportunities that are being developed through such residential communities that maintain their stability over time.

While Inala has been in past decade the subject of the derision typically meted out to state housing suburbs, in more recent times the authenticity of cultures and the maintenance of tradition has been seen as valuable cultural capital that those in the more 'ordinary' nearby suburbs seek to acquire. While the exoticisation of place and formation of notions of the other for cultural consumption are far from the aim of place-making, the desire to see the patina of history and local forms of living based on a resident population are played out in these more recent recognitions of Inala's suburban places:

"Stepping through the back door...[of Inala Civic Centre] I found another world. A square surrounded by Asian grocers, eateries, fish shops and butchers, while in the centre men gathered to chat and play mahjong" (Brisbane News 2011, 11). Some comments from the neighbouring suburb of Forest Lake, a 'lifestyle community' created by developer Delfin in the 1990s and set on the shores of a large artificial lake, have raised concerns over the difference between Inala and Forest Lake stating that "[Inala] has wonderful community groups...Local community leader Rob Scott said Inala had greater community co-operation than Forest Lake. 'The design of Forest Lake has taken away from people's sense of ownership of the area because (developer) Delfin has done everything,' Mr Scott said. 'Now that Delfin has pulled out, the people of Forest Lake have to take up the slack and encourage community interaction'... 'Because Inala is a low socio-economic community, the people interact because they need to get council and State Government support for local initiatives and projects for the betterment of their area.'" (South-West News, 2008).

In short this description outlines the sense of place of Inala as superior to Forest Lake, based on the involvement of community groups in decisions and planning within the community. While not alleviating the socioeconomic disadvantage that Inala faces, this

Greenop & Darchen, Brisbane's Urbanism: looking for an identity, 49th ISOCARP Congress 2013 approach seems to be envied by at least some neighbours in Forest Lake who sense the danger of becoming a non-place where the developer 'has done everything'. Further components of social sustainability are part of Inala's original planning including walkable local shops, schools, churches and playgrounds which formed important neighbourhoods hubs within the broader community. The street pattern of grids and a hierarchy of roads that is highly navigable and suitable for bus-based public transport is in contrast to the culs-de-sac approach of more modern suburbs, in which privacy and car-based transport are emphasised, but many argue leads to isolation and disconnected communities (Lucy and Phillips 2006).

Within Inala many developments that have contributed to the high levels of social capital within the community began as community projects that then attracted state support. The Inala Indigenous preschool Wandarrah is an example, valued by many members of the indigenous community in Inala, that demonstrates that community development in terms of education, publically accessible facilities and community controlled organisations contribute to sense of place, just as much as more obvious urban facilities such as open spaces, cafes and entertainment precincts.

The place identity of some of Inala's residents attests to the historical and continuing development of its sense of place. One resident stated that despite moving to Inala only to access public housing, "Inala is home now, for life" (Greenop, 2013 p.144). This place attachment leads to stability in place, created in part by the support of a culturally specific community, and aligns with the components of social sustainability outlined by Dempsey et al. (2011).

Here are the key points from the Inala case study that we find relevant to inform the planning practice in Brisbane:

- Place identity is related to the valuing of urban amenity for people of all ages, including social, educational, sporting and cultural facilities
- Place identity builds up over time (over decades) based on activities and experiences that occur in place
- High levels of social capital and place identity are interconnected
- Strong place identity leads to socially sustainable communities (low turnover of residents enables investment in local activities, fosters the development of a sense of place and contributes to consolidation of social networks and sense of belonging)

Conclusion

The current version of the new world city for Brisbane offers a version of place that is developing, and requires further components of history and community interaction to fulfill its potential in creating an authentic, and meaningful place for both marketing purposes that aligns with residents' understandings of and aspirations for place. The occupation of the city as derived from the LEADS themes indicates a city based on being exceptional, rather than facilitating a life for its citizens. The imagery of the new world city also indicates spaces of entertainment, consumption, socialization and celebration, urban hubs where we can "live work and play" but to what extent does it reflect people's aspirations and needs to refer to Gehl's (2010) concept of "Planning for people". The everyday activities of work, school, caring for families (of all ages), shopping and interacting with people in ordinary ways are not yet put forward as making part of the city's future, despite their being the bulk of one's

Greenop & Darchen, Brisbane's Urbanism: looking for an identity, 49th ISOCARP Congress 2013 experiences and critical to most people's quality of life. Acknowledging the Indigenous, migrant and political context of places within the city, will connect with both an authentic version of Brisbane as understood by its residents, and also encourage their contribution to further development of places through community engagement with planning processes. In other words the New World City and its associated Brisbane's urbanism might work in an oversimplified reality where the complexity of Australian contemporary society is eluded. Key issues that needs to be addressed are : recognition of increasing migrant population in Brisbane; recognition of aboriginal past in developing a sense of place. An encouraging sign is the willingness to foster public consultation but it is not likely to be sufficient to resolve the tensions around the recognition of Brisbane's darkest history, this would require more political commitment. At the moment, resolving this issue appears as secondary compared to positioning Brisbane on the Asia-Pacific map from an economic perspective. To answer our research question, creating authentic places and consolidate Brisbane's economic competitiveness are not incompatible but currently the second objectives is achieved at the expense of the first objective.

Recommendations

Based on the case studies and literature discussed above, we make a number of recommendations to the ongoing work of the Brisbane New World City marketing campaign and the planning strategies associated to it.

1. Consultations with community regarding the urban planning and place-making within Brisbane should be ongoing and genuinely seek to implement community needs and goals. Community based, 'bottom-up' approaches are required to properly engage communities with place at the neighborhood scale and should be included alongside 'top-down', strategic policies concerning the city as whole.
2. The approach should acknowledge and take account of the process of creating place identity, which develops over time. People's experiences of place, events and ongoing relationship with a place will affect their place identity or sense of place, hence not only physical strategies but social, economic and cultural considerations need to be incorporated into urban plans.
3. Evaluation of the place-making effects of the strategies should be conducted over time to 'check in' with communities and stakeholder groups ranging from resident to businesses which are affected by changes made to particular areas. This will feed into experiences of place that can reinforce place identity, and ensure that place authenticity can be developed and carried by local communities.
4. Strategies should allow for the development of place authenticity through room to localise and tailor planning approaches to specific place-based needs and goals. The creation of places that genuinely reflect the diversity and specifics of Brisbane's cultural communities, including an acknowledgement of their histories, will strengthen the New World City aims of Brisbane being a unique and vibrant cultural location.

The understanding of Beijing Cultural Spaces

Zongpei GU, China academy of urban planning and design, China

“The enduring competitive advantages in a global economy lie increasingly in local things.”¹

With the progress of globalization, urban culture becomes increasingly important. Beijing has a long history and rich cultural resources. But the space vectors of her cultural resources are being invaded in the process of urban growth. In the end of 2011, the municipal government decided to “turn Beijing into a city of prestigious cultural center of national demonstration and promotion and international significance.”² Building such a “Culture-enriched Beijing” pose an urgent quest to reexamine and analyze the current status of the city’s urban cultural space against the background of the new era.

1. Identification of Beijing’s Current Urban Cultural Space

“A nation’s cultural renaissance starts with a summary of its legacy.”³

Beijing’s long history and rich cultural resources laid a solid foundation for her cultural construction. An empirical study of the current status of her urban cultural space is the basis and prerequisite for further analysis. This article will discuss the current status of Beijing’s urban cultural space from her historical cultural space and contemporary-modern urban cultural space in a time sequence.

1.1 Historical Cultural Space

Before the establishment of People’s Republic of China, Beijing’s historical cultural resources can be divided into ancient time (before the opium war in 1840) and modern time(1980 – 1949).

1.1.1 Ancient Time

Beijing’s history as a city can be traced back to more than 3,000 years ago. Many of the surviving ancient cultural resources have high historic and artistic value. Because of their large quantity, this article selects national key cultural relics protection units for discussion, and classifies Beijing’s existing ancient cultural space resources into three types: religious culture, ancient city culture, and the royal culture.

Beijing’s existing historic cultural relics from before the Yuan Dynasty are mainly of religious culture in the forms of temples, pagodas, pedestals, and scripture tablets, etc. The cultural relics from the Ming and the Qing dynasties are more abundant, including considerable amount of relics of old city culture and royal culture, as well as those of religious culture. During the Ming and the Qing dynasties, the city of Beijing was extended on the foundation of the capital of the Yuan, which involved reconstructions of the enclosures, the imperial city and palace, and the royal altar. The result was a “masterpiece of city planning”⁴ in ancient China, and unique cultural and spiritual legacies for today. Apart from the national key cultural relics protection units, today’s traditional alleys and historic blocks are also important components of the old city culture.

1.1.2 Modern Time

From 1840 to 1949, China was first invaded by the western powers, and then plunged into decades of civil war after the establishment of the government of Republic China. During this period, city constructions stagnated, but cultural types became more abundant. Their influence on Beijing's present-day civilization is no longer limited to physical space. Certain folk custom and living styles continue to this day. So the studies of this period should not be limited to the national key cultural relics protection units.

The disintegration of the feudal system led to the decline of the royal culture. After the period of the Republic China, the royal properties were turned into museums and public parks such as the Palace Museum, Zhongshan Park, and Xiannongtan Temple, etc. Some cloisters have carried on the temple fair culture till today. The cultural resources survived the period of Republic China include office buildings, former residences of celebrities, traditional brand shops, and theaters, etc. They mainly concentrate within the Second Ring Road. War memorials are distributed mainly in the center and the west of the city, around the Fragrance Hills, and in Lugou Bridge district to the southwest of the city.

1.1.3 Spatial Characteristics of Historical Cultural Spaces

Through spatial integration of ancient and modern cultural resources, we can see that before the founding of the state, Beijing's historic cultural resources concentrated mainly at the former city location in the Ming and the Qing dynasties, located inside today's Second Ring Road and in the northwest part of the city. There were three types of architectures: royal property, religious buildings, and those of the republic of China. Their spatial sequence symbolized the feudal hierarchy and strict rituals in that historical period. Their ideological origin reflected the essence of traditional culture. (Figure 1)

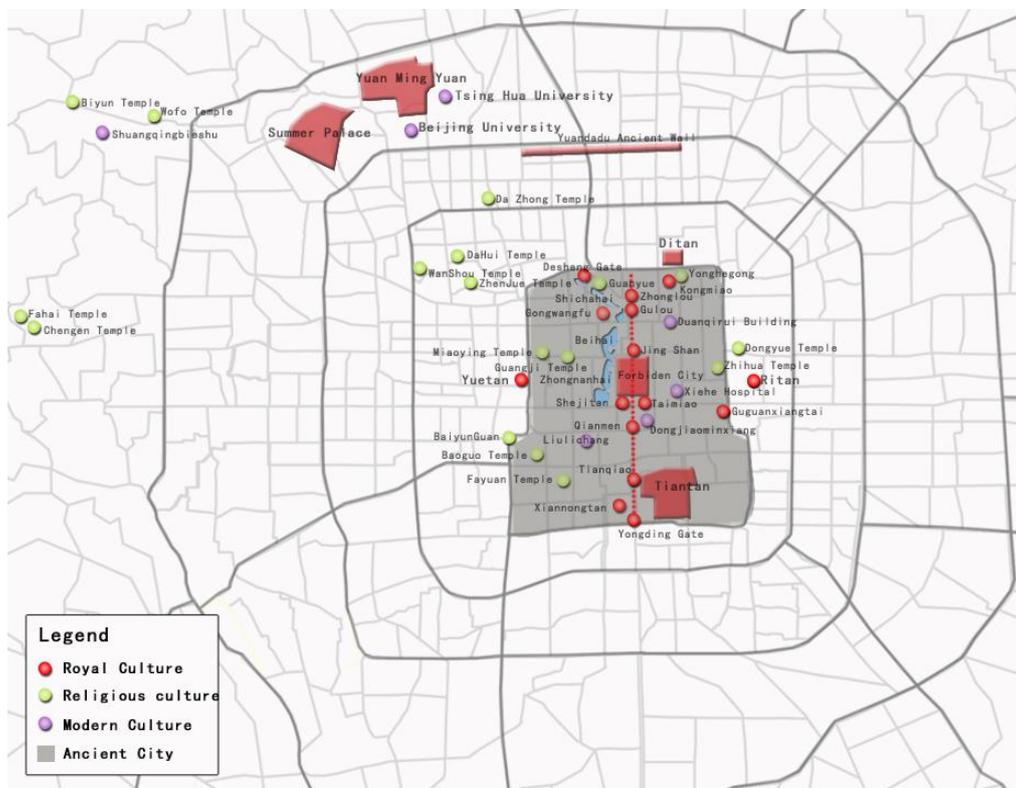

Figure 1 The Distribution of Beijing's historical cultural resources (self-made)

1.2 Contemporary and Present-Day Urban Cultural Space

1.2.1 Contemporary Time

In the early days of the People's Republic of China, Beijing's urban construction followed the policy of "turning consumer cities into producer cities", and focused on the development of industries, especially heavy industries⁵. Cultural development lagged behind. During the first Five-Year Plan period, Beijing went through large-scale urban development. Space designs for streets were explored and different styles of space models were developed. Before the outbreak of the Cultural Revolution, Beijing's overall urban spatial structure was readjusted with urban construction. The ramparts began to be removed. The Changan Avenue was transformed. During the 1950s and 1960s, a group of large public buildings were erected at key sites in the city. They included some cultural facilities of far-reaching significance such as the Top Ten construction, the Capital Theater, the National Art Gallery, and the Museum of Natural History. These cultural facilities mainly concentrated in the inner city areas along the Changan Avenue. At the same time, in the north of the city, the district of culture and education, represented by eight colleges, began to take shape.

Following China's reform and opening-up, Beijing saw another surge in urban construction. A group of important cultural facilities like the National Library and the China International Exhibition Center were built up. Until 1990s, the government had emphasized public interest and basic cultural needs in cultural facilities construction. At that time, the government was the primary investor and constructor in the field of culture⁶. By the end of 1980s, the opening and successful operation of Grand View Garden and Tianqiaole Tea Garden symbolized the beginning of autonomous development in Beijing's culture industry⁷. After the reform and opening-up, the cultural facilities tended to spread out from the old city toward later developed urban areas, and the differences between the northern and the southern districts started to appear.

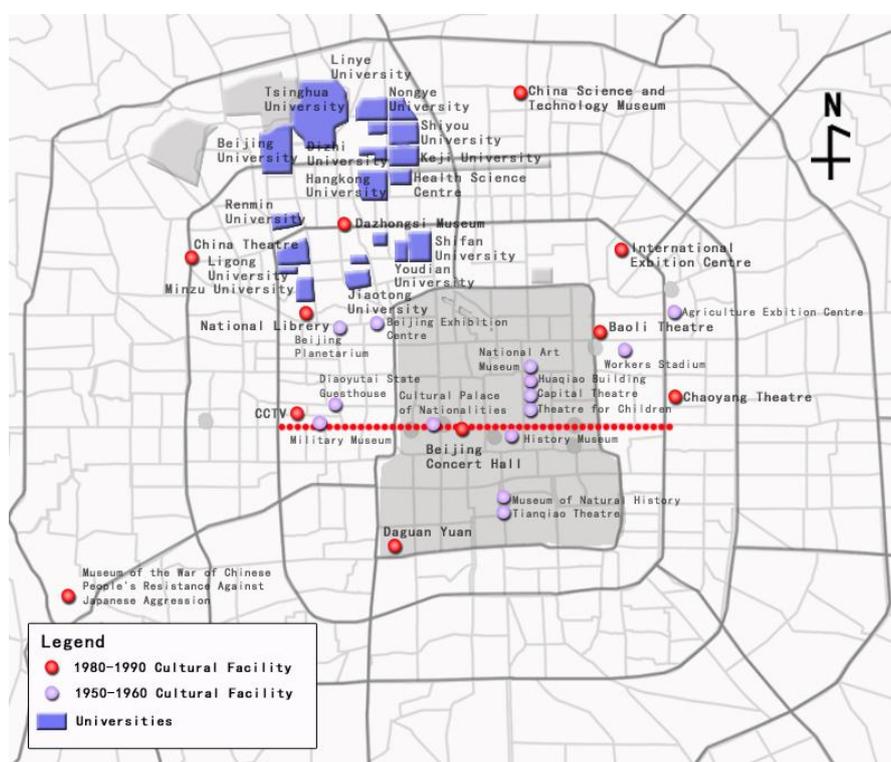

Figure 2 The Distribution of Beijing's urban cultural space after the founding of the state – early 1990s (self-made)

1.2.2 Present-Day Time

With the progress of reform and opening-up and urban development, Beijing's industry-oriented developmental pattern faces many problems. Industry structure adjustment is imperative. Besides, the comprehensive function of culture, especially its potential in economy, becomes increasingly clear. The government begins to reexamine the construction in the field of culture. Cultural facilities such as China Central Television and China Millennium Monument etc. have been built in this period. In their space layout, some large facilities (such as exhibition centers and gymnasiums, etc.) are located further north with the city's development and big events (such as the Asian Games). Meanwhile, cultural streets of special features begin to emerge. The launch of the Olympic project in 2003 upgraded the overall level of Beijing's urban construction. The Olympics Park has become a new urban cultural center.

In 2005, the government decided to vigorously develop cultural creative industry. Centers of cultural creative industry began to pop up around the city. Some old factory buildings have been transformed into such centers, represented by the "798 Art District", a gradually formed autonomous center since 2001. Other centers latterly rising to importance include CBD International Media Cultural Creative Industry Park in Chaoyang District and Digital Entertainment Industry Park in Shijingshan District, etc. in 2009, the State Department gave permission to construct the first National Autonomous Innovation Demonstration District in Zhongguancun. (Figure 3)

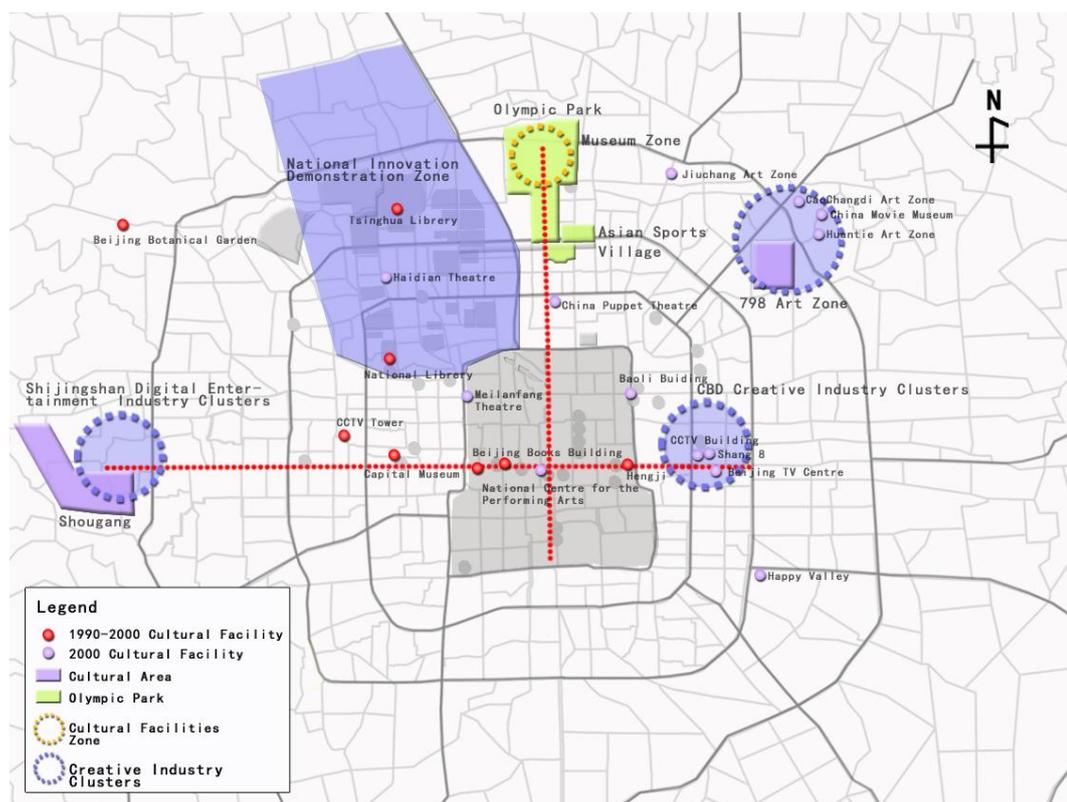

Figure 3 The Distribution of Beijing's urban cultural space after 1990 (self-made)

1.2.3 Contemporary and Present-Day Urban Cultural Spaces Characteristics

On the whole, after the founding of the state, Beijing's urban cultural resources noticeably concentrated in the north part of the city. Apart from the "horizontal line" along the Changan Avenue (from Shijingshan to CBD) and the "vertical line" that extends the historic city axis (to

the Olympics Park), Zhongguancun and the Science and Educational Film District in the northwest, as well as the “798 Art District” in the northeast, are also main urban cultural spaces. Comparing the overall space structure with the traditional society, Beijing is facing different developmental scenarios in modernization construction. On the one hand, industrialization has freed productivity, followed by large-scale urban reconstruction and unavoidable destruction of historic culture; one the other hand, as an important part of urban economy and urban feature development, cultural creative industry has greatly helped recent urban industry upgrade and urban space development.

1.3 Summary of Current Beijing Urban Cultural Space

By the time period, Beijing’s urban cultural resources can be divided into four categories. They are ancient time, modern time, contemporary time, and present-day time. By the characteristics of their content, they can be further divided into twelve sub-categories. They are religious culture, old city culture, royal culture, culture of Republic of China, folk culture, revolutionary culture, industry heritage culture, modern characteristic culture, populace leisure culture, culture and arts, Olympic culture, and culture and education. And they have different space vectors (Table 1).

Table 1 Summary of Current Beijing Urban Cultural Space

Time	Cultural Resources Types	Existing Artifacts	Locations
Ancient Time	Religious Culture	Religious sites Temples	The old city area The northwest part of city
	Ancient City Culture	Rampart ruins, Traditional allies And blocks	The old city area
	Royal Culture	Imperial Gardens Imperial tombs	The old city area The northwest part of city
Modern Time	Culture of Republic of China	Office buildings, former residences of celebrities, traditional brand shops	The old city area
	Folk Culture	Theaters Temple fair	The south part of old city
	Revolutionary Culture	Memorial places	The old city area The northwest part of city Lugou Bridge
Contemporary Time	Industrial Heritage Culture	Factory buildings Industrial areas	Chaoyang District Shijingshan District
	Modern Characteristic Culture	The Top Ten Construction of the 1950s Characteristic Streets	Changan Avenue Sanlihe Dongsi
Present-day Time	Populace Leisure Culture	Shopping streets Food streets Bar streets Leisure parks	Not concentrated. More in north and east than in south and west
	Contemporary culture And Arts	Art galleries Art academies Art districts	In centers
		Theaters, museums	Traditional theaters concentrate in Dashanlan

		district, Qianmen
Olympic Culture	Olympic stadiums, gyms, parks	Concentrate around Olympic park
Cultural Education	Universities	Haidian District

Cultural resources of different types from different time periods reflect different aspects of Beijing's urban cultural ideology. In general, historical cultural resources from the ancient and modern times are the most typical and representative urban cultural space of Beijing. They are also the unique characteristics of Beijing as a world-renowned ancient capital city. This kind of cultural resources should not only be kept in books and stories. They should be combined into today's city life. The artifacts can be properly utilized as long as strict protection measures are in place. The urban cultural resources artifacts after the modern civilization have more varieties. Many of them are still in use today, and they have certain effect on today's urban life. This kind of space should be valued in urban construction. The construction of cultural space will help realize urban cultural renaissance.

2. Analysis of Beijing's Current urban cultural space

*"World-famous cities are able to affect their nations' history because they can always represent their nations and their cultures, and pass on most of them down to their future generations."*⁸

Based on the study of the development and distribution of Beijing's urban cultural space during ancient, modern, contemporary, and present-day periods, this article will analyze Beijing's current urban cultural space in two areas: advantages and achievement, and problems and insufficiency.

2.1 Advantages and Achievement

2.1.1 Advantages in Resources

A glorious long history and splendid urban culture give Beijing very rich cultural resources. Combining the information from the lists of Cultural Relics Protection Units, Conservation Districts of Historic Sites, Historical and Cultural Cities, relics and protected residences in census registrations, as well as other sources of classification of historical and present-day cultural resources, Beijing's urban cultural resources can be summarize into three levels: sites, areas, and districts (Table 2). "Sites" are the cultural resources in the forms of single construction or historic relic, including historic cultural heritages, Cultural Relics Protection Units of all administrative levels, and outstanding historic constructions from modern and contemporary time periods. Contemporary and present-day urban cultural resources are cultural facilities of various types managed by all administrative levels. "Areas" are mainly historic culture conservation districts, underground cultural relics burial grounds, and cultural creative industry centers. "Districts" are whole old cities.

Table 2 classification and Current Situation of Beijing's Urban Cultural Resources

Levels	Categories	Artifacts
Sites	World Cultural Heritage	6 World Cultural Heritage: the Palace Museum, the Great Wall, Zhoukoudian Peking Man site, the Temple of Heave, the Summer Palace, the Ming Tombs
	Cultural Relics Protection Units of all	98 key national protected cultural relics, 357 municipal-level protected cultural relics

	administrative levels	
	Cultural facilities of various types managed by all administrative levels	89 commercial performance venues, 25 public libraries, 1 mass art hall, 317 cultural stations
	Others	Cultural relics in census registrations, protected residences, outstanding historic constructions from modern and contemporary time periods
Areas	Conservation districts of historic culture	There are 43 in total, 33 of them are inside the old city, and 10 are outside. The first group, 25 (declared in 1990) include South chizi Street, South Luogu Lane, etc. The second group, 15 (designated by “Beijing Historical and Cultural City Conservation Planning” in 2002) 5 of them are inside the old city, and 5 are outside. The third group, 3 (added in 2004) Xintaicang, Dongsinan, Nannaoshikou. Most construction control areas of conservation districts were also expanded.
	Underground cultural relics	36 underground cultural relics burial grounds,
	Cultural creative industry centers	30 Cultural industry centers
Districts	Historic cultural cities	Include the whole old city and historic cultural resources

2.1.2 Industrial and Personnel Advantages

As the nation’s political and cultural center, Beijing has good foundation for cultural creative industry and human resource advantage. There are 89 universities, 281 scientific research institutes, and nearly 700,000 research personnel⁹. Nationwide, Beijing has 42% of publishing houses, 35% of newspapers and periodicals, 60% of film and audiovisual industries, and 54.5% of TV show episodes production¹⁰. From 2001 to 2010, the added value of cultural industry in Beijing continued to growth, from ¥250,000,000 in 2001 to ¥2,070,000,000 in 2010, increased by more than seven times in 10 years. (Figure 4)

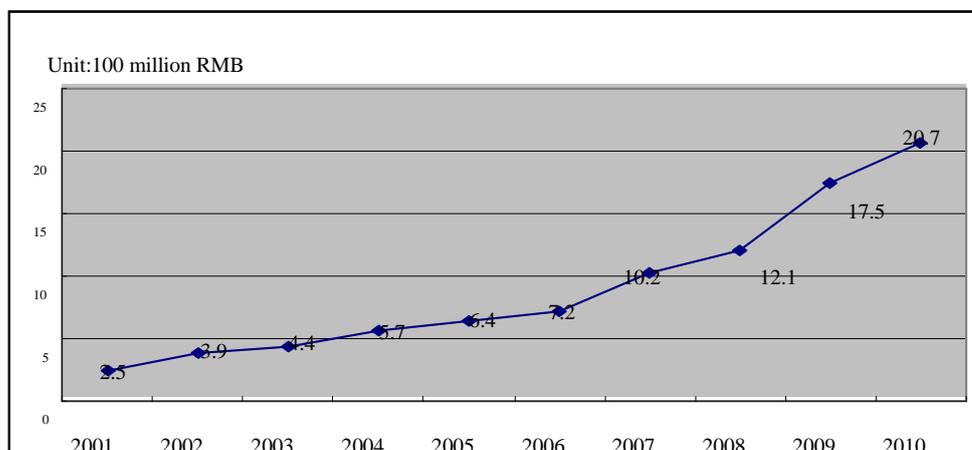

Figure 4 The added value of Beijing's cultural Industry 2001 -2010

Figure courtesy: <http://www.bjwh.gov.cn/>

Table 3 compares the development of cultural creative industry among Beijing, Shanghai and Shenzhen in 2010. Compared with Shanghai and Shenzhen, Beijing's added value of cultural industry and its percentage in regional GDP are the highest. According to the data from the National Bureau of Statistics, Beijing's total number and types of cultural creative industries, total transaction volume of cultural artifacts and artwork, total episodes of TV show production, total film production and office boxes all ranked first in the country. The employment in creative industry in Beijing is well above that of other interior provinces and cities. In many cultural creative industries such as professional and technical services, software, and press and publication, etc, Beijing has clear advantages over other regions, as shown in Figure 5.

Table 3 Comparison of cultural creative industry growth among Beijing, Shanghai, and Shenzhen

Economic indicator	Beijing	Shanghai	Shenzhen
Regional GDP (100 million yuan)	14113.6	17166.0	9581.5
Regional added value of the tertiary industry (100 million yuan)	10600.8	9833.5	5051.7
The percentage of the tertiary industry in regional GDP (%)	75.1	57.3	52.7
The added value of cultural creative industry (100 million yuan)	1697.7	973.6	637.23
The percentage of the added value of cultural creative industry in regional GDP (%)	12.0	5.7	6.7
The percentage of the added value of cultural industry in the tertiary industry (%)	16.0	9.9	12.6
The percentage of the added value of cultural industry over the previous year (%)	13.8	10.5	22.9

2.1.3 Current Policy Advantages

In 2008, Beijing successfully hosted Olympic Games. The development of "Culture-enriched Olympics" and "Culture-enriched Beijing" achieved remarkable results. More and more efforts were put in conservation of historic cultural heritages¹¹. The average annual increase of the added value of cultural creative industry reached 20.3% and became a new highlight in economic social development. In the planning outline of "The twelfth 5-year plan", "Culture-enriched Beijing" is number one in development strategy. Currently, "Culture-enriched

Beijing” is the core content of Beijing’s urban development. In the chapter “The Charm of Cultural Highlight” of “The Twelfth Five-Year Plan Outline for Beijing National Economic and Social Development”, the author advocates “turn Beijing into a center of cultural innovation, operation, trade and experience with international influence”, and proposed “to integrate and upgrade 30 municipal-level cultural creative industry centers,to improve their cohesion and enhance their exemplary role, and to form a pattern supported by multi element and characteristic development.” The “Construction Plan for The Development of Culture-enriched Beijing during the Twelfth Five-Year Plan” released in August 2011 put forward an action plan for Beijing’s urban development from 2011 to 2015.

In December 2011, in order to carry out “CPC Central Committee’s Decision on Some Major Issues in Deepening the Reform of Cultural System to Promote Vigorous Development and Prosperity of Socialist Culture”, the municipal government issued “Beijing’s Proposal to Speed Up the Construction of a Capital City of Advanced Socialist Culture with Chinese Characteristics”, and articulated the development goal as “turning the capital city into a prestigious cultural center of national demonstration and promotion and international significance”, specified in eight aspects including “developed cultural creative industry”, “highlighted charm of urban culture”, and “enhanced cultural international influence”.

Clearly, culture is the most important strategy in Beijing’s current urban development. Beijing enjoys policy advantages in urban culture development and cultural space construction.

2.2 Problems and Insufficiency

2.2.1 Cultural Space Protection

Although the history and culture consecration system is increasingly improved, Beijing is still losing her cultural features. On the one hand, as the capital city of China, Beijing’s central areas are clustered with many municipal agencies of administration, culture, economy, traffic, sports, tour, etc. Most are in the old city area, causing damage to historic and cultural resources during decades of construction after the founding of the state, and putting tremendous pressure on conservation of old Beijing’s low-level and small-scale style. On the other hand, for many reasons such as historical, economic and traffic development, Beijing’s overall old city protection was not effectively implemented. Many historic and cultural resources are still being invaded (Figure 6). Some historic cultural space already in the list for protection are still being destroyed or “dismantled for maintenance”. (Figure 7)

Figure 6 FuWang Royal palace, the main building is now occupied by the Institute of History of Natural Science

Corresponding to the occupation and demolition of cultural space, there is a reconstruction fever for fake antiques and false relics. The transform of Qianmen Street is a typical example. While genuine relics were pulled down, fake ones were built up based only on photos before maintenance standards were issued. The products were some sight spots for tourism development in the name of consecration. The spirit of Beijing was lost in the process.

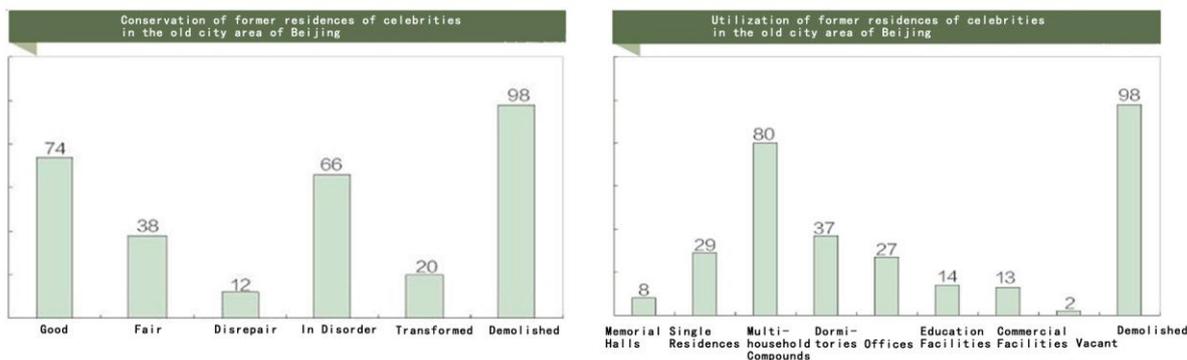

Figure 7 conservation and utilization of former residences of celebrities in the old city area of Beijing
Figure courtesy: the report of conservation and utilization of former residences of celebrities in the old city area of Beijing(2005)

“Genuine Relics” and “Fake Antiques”

Sixty years ago, Beijing’s gate towers and ramparts were torn down to reduce traffic jams.” Lin Huiyin predicted, “Today you are dismantle real antiques. One day you will regret and want to rebuild. But then you can only build fake antiques.”

Today, the fake antiques have become a common trend. Yongdin gate tower and former residences of celebrities have been rebuilt. Three turrets along Beijing’s center axis will be rebuilt in 2012 to restore the old city appearance. In September 2011, Premier Wen Jiabao warned. “Since the founding of the state, We should have learned a good lesson: dismantled the genuine and you build the fake. Great quantity of real heritage has been destroyed, and then lots of money is spent to build fake stuff.”

----“Southern Weekend”, 2/9/2012

2.2.2 Cultural Space Identification

While it is regretful to have genuine relics demolished, let’s not forget that historic landmark buildings are only a part of Beijing’s cultural space. Identification of cultural space should not limit to” former residences of celebrities” and “tangible cultural heritage”, or the 33 Conservation districts of historic culture. Apart from sites and districts of relics, ruins and conservations, there are great number of residential buildings inside Beijing’s old city area. They play a very important role in keeping the city’s historic style and overall urban characteristics. Apart from conventional “historic culture” and “industrial heritage”, there are other types of urban space with special cultural value as well, waiting to be recognized and explored. Take the example of Baiwanzhuang Subdistrict. It was known as “the No. 1 residential district of the new capital” in the 1950s. But its cultural value is known only to a few experts (Figure 8). In 2011, Baiwanzhuang Subdistrict was declared as dilapidate and faced demolition.

Baiwanzhuang Subdistrict

The subdistrict, designed by master architect Zhang Kaiji, is a combination of Chinese and Russian Styles. The construction started in 1953 in the then west suburb of Beijing and completed in 1956. With buildings of red brick walls and sloping roofs, large green areas and playgrounds, quiet surroundings and even distance for sunlight, It became a model for residential area construction for decades.

2.2.3 Application of Cultural Space

Since 1980, “reconstruction of old and dilapidated buildings” has played a big role in the destruction of Beijing’s old city and cultural space is. In practice, most areas in the old city are overcrowded and the housing conditions are worrisome. It cannot fully reflect Beijing’s true features and living conditions, nor can it really be a stimulus or economic resource in urban development. The grimmest issue facing Beijing’s urban cultural space development is how to effectively utilize various cultural resources, including historic cultural resources, and adapt their rich connotation and ideology to current urban life.

While a great part of cultural space is not fully utilized, some other part is overused. Take South Luogu Lane for example, after “Jiaodaokou Street Community Development plan (2006-2020)” and “South Luogu Lane Protection and Development Plan (2006-2020)” were drawn in 2006, the focus of the plans shifted to promoting and guiding industrial development in South Luogu Lane area. A developmental pattern was introduced to use cultural creative industry to finance commerce. Since then, South Luogu Lane has gradually become one of the best-known characteristic historical streets. While the volume of its visitors continues to increase, the commercial form in South Luogu Lane has gradually transformed from a popular market of creative products to a shopping area of specialty stores and expensive galleries and bars. This kind of “cultural space” has become the nickname of consumption and fashion. The ideology of cultural space is replaced by the “cultural symbol” of the new age.

3. Conclusion

Besides history and literature, Current urban culture should also have spaces as its vectors. Spaces that embody Beijing’s urban culture can be acknowledged as Beijing’s urban cultural spaces. They collectively reflect Beijing’s history, society and characteristics. These spaces should be protected and properly utilized in the process of urban development.

As a city of rich cultural resources, Beijing is facing a double challenge of cultural space protection and construction. With analysis of Beijing’s current urban cultural space, this article concludes that the construction of urban cultural space should start from the reality of current urban lives, and base on appropriate protection, recognition and utilization, and

create opportunities for cultural innovation with cultural resources. As to the goal of protecting Beijing's historic cultural resources, emphasis should be placed on a shift from protection to exploration for their inner value, and proper ways of their renewal and reuse. For thousands of years, historic heritage and rich culture from different ages made up Beijing's cultural resources with great potential for conservation and development. Integration and utilization of these resources will promote the formation and development of Beijing's cultural areas and realize the development goal of "Culture-enriched Beijing".

Renewal Agenda in Istanbul: Urbanisation vs. Urbicide

Zeynep GUNAY, Istanbul Technical University, Turkey

1. Introduction

Urban renewal is among the priorities of urban agenda in Istanbul considering the large amount of squatter areas, disaster-vulnerable existing building stock, and historic building stock due to half a century long uncontrolled rapid urbanisation. Eventhough urban renewal is not a new phenomenon in Turkey, 1999 Marmara Earthquakes have played a major role in the rising awareness on the importance of quality of building stock rather than the quantity, as a way to resolve the urbanisation perception by focusing on what already exists and by legitimising urban renewal. On one hand, new laws and regulations have followed the earthquakes to determine the legal and institutional framework of urban renewal. On the other hand, the private sector has valorised this process through the large-scale property-led renewal schemes in the transformation of squatter areas, historic inner-city neighbourhoods, waterfronts, industrial areas, public spaces and natural protection zones into the giant construction zones of economic rant and land speculation. Infact, the paper claims that the large-scale property-led renewal schemes, which have been employed as an evolving model in resolving the urbanisation problem, are turned into the instruments of “urbicide” in Istanbul as a political “evolving” model of urban destruction. The same process has resulted in the declining of participatory, transparent and sustainable approaches of urban planning. The concerns arising out of this change of emphasis encompass conflicts between comprehensive planning and project-based fragmented interventions, process and action, common interests and private interests, authenticity / diversity and standardization, users and owners. Within this scope, by constructing an urban renewal framework through the exploration of Law on the Protection and the Revitalisation of Deteriorated Historical and Cultural Immovable Assets (2005) and Law on the Transformation of Areas under Disaster Risk (2012), the paper intends to discuss the evolving and declining urbanisation patterns in Istanbul by relating them with up-to-date political, economic, technological and socio-economic inferences. Considerable emphasis is placed on the use of examples to illustrate and critically analyze meanings, inputs, outputs and impacts. The paper concludes by addressing in what ways the planning as a profession can manage these evolving and declining models in resolving contradictions stemming from the dichotomy of urbanisation and urbicide in Istanbul.

2. Rationale for Urban Renewal

Urban renewal is not a new phenomenon in Istanbul, but it is still among the priorities of urban agenda as an action to cope with the haphazard urbanization patterns and large amounts of squatters due to the uncontrolled rapid urbanization since the 1950s, large amounts of disaster-vulnerable existing building stock due to lack of administrative control over construction and building construction technology, and large amounts of historic building stock in need of careful conservation, rehabilitation and continuous maintenance. As outlined in Gunay et al (forthcoming), the building stock in Istanbul is quite young with a percentage of 66 built after 1980; but the building condition analysis based on the last building count of Turkey in 2000 (TUIK, 2000, p. 454) shows that most of the buildings constructed before the 2000s should either be demolished or consolidated. While nearly 60% of the total building stock can be termed unauthorized, the challenges on the urban landscape are coupled with

the deterioration of physical fabric due to aging or poor maintenance; mismatch between contemporary needs and existing functions; changing perceptions and value judgements on the image of buildings or settlements. The overcrowding and gradual shift in the profile of the inhabitants caused by rural-to-urban migration are also effective in urban deprivation. In addition to the quality of building stock and profile of inhabitants, there is an immense market pressure for transformation in the most economically and culturally valuable zones including the waterfronts, old industrial areas, historic neighbourhoods, public spaces and natural protection zones. Inefficient urban management together with the official obsolescence in providing strategic, flexible, responsive and participatory planning instruments, methodologies and organization forms prevents central and local governments to deal effectively with the problems. These rationales make apparent that there is an urgent need for comprehensive and integrated vision and action to resolve the problems associated with fuzzy urbanisation in Istanbul.

3. Responding to the Rationale: Evolution of Renewal Agenda

Regarding these rationales, urban renewal has always been among the priorities of urban agenda in Turkey. A detailed conceptualisation for the evolution of urban renewal in Turkey with reference to mainstream politics can be found in Gunay et al. (forthcoming) and Ataov and Osmay (2007). Before the 1950s, urban renewal was an intervention on its own record rather than a governmental initiative mainly because of fires. After the 1950s, urban renewal was a strategy for the clearance of deprived areas for the opening of new transportation arteries or recovering the silhouette effect of major monuments; and a strategy that helped the transformation of urban landscape by apartment blocks under the name of “modernity project”. Coming to the 1960s, it was conducted via demolition-based activities in squatter areas, which were once encouraged because of their self-help housing character for the shortage of public funds to accommodate the new inhabitants. The globalization and liberalization project of the 1980s again resulted in the increasing focus on new constructions rather than investments in the existing building stock especially through the enactment of Mass Housing Law in 1984 (Law No. 2985, 18344/02.03.1984).

In the 2000s, urban renewal has become the base of urbanisation politics and planning agenda via a growing tendency on neoliberal urbanisation politics based on project-based interventions and public-private partnerships. According to Bartu-Candan and Kulluoglu (2008, p.9), neoliberalism have also paved the way for the social and spatial segregation of the emerging groups of poverty and wealth in urban spaces, or the emergence of the so-called spaces of decay, distressed areas, and privileged spaces. While the institutional and legal regulations had followed the renewal practices before the 2000s (Ataov and Osmay, 2007); one of the most important attempt in this period was the employment of urban renewal – together with large-scale property-led renewal schemes- in the legal and institutional base. According to Tekeli (2011), one of the differences between the former periods and the 2000s is the fact that urban renewal is started to be conducted by the powerful stakeholders, namely the government itself comparative to the unpowerful actors of the former periods such as contractors or squatter dwellers. 1999 Marmara Earthquakes have played a major role in the rising awareness on the importance of quality of building stock rather than the quantity, as a way to resolve the urbanisation perception by focusing on what already exists. However it has also given political “legitimacy” to urban renewal interventions. While there has been a rise of focus on more participatory and inclusive approaches in planning and renewal through the empowerment of local governments as a result of Local Agenda 21 of the UN Habitat Conference held in Istanbul in 1996, the period starting from the election of the Justice and Development Party in 2002 has provided a return to more centralised even over-centralised institutional forms and planning practices.

Between 2002 and 2012 major attempts were being made to prepare the legal format for the employment of neoliberal urban politics including the alteration of Mass Housing Law (Law no. 5162) in 2004; the authorization of Mass Housing Authority (TOKI) to realize, prepare and alter all kinds and scales of development plans in areas determined as the mass housing settlement regions; and enactment of Municipality Law (Law no. 5393) in 2005) to give the municipalities the right of determining renewal process in their own. Considering the empowerment of greater municipalities with respect to centralised governance structures, the share of Greater Municipalities in State and local municipality tax budget has risen respectively from 2.50% to 4.4% and from 5% to 6% in 2008 – while there seen a decrease from 2.85% to 1.40% in local municipality tax shares in municipalities and from %30 to %20 in greater municipalities. On the other hand, the budget of Greater Municipality of Istanbul has risen to €3.5 billion in 2013, while €720 million was allocated to Ministry of Culture and Tourism (1.9%). In 2011, the Ministry of Environment and Urbanism was opened replacing the Ministry of Public Works and Settlements. Erdogan Bayraktar, the former head of TOKI, was ironically promoted as the Minister.

Regarding the evolution of urban renewal policies and practices, it can be stated that each period had used a different package of planning tools in the utilisation of urban renewal; however all of them have focused on market conditions and spontaneous solutions of community (Ataov and Osmay, 2007). Despite different conceptualizations that are being used interchangeably with revitalization, regeneration or transformation, urban renewal has always been associated with physical interventions and destructions; and it has covered the radical transformation interventions that demolishes the old for reconstruction (Tekeli, 2011). On the other hand, the socio-economic aspects of renewal interventions have always been ignored.

4. Large-Scale Area-Based Urban Renewal Framework: The Solution?

There are two fundamental laws defining the legal base of large-scale property-led renewal schemes in Turkey: “Law on the Protection and the Revitalisation of Deteriorated Historical and Cultural Immovable Assets” (Law No.5366, 05.07.2005) and “Law on the Transformation of Areas under Disaster Risk” (Law No.6306, 31.05.2012).

4.1 Law on the Protection and the Revitalisation of Deteriorated Historical and Cultural Immovable Assets

This law propounds renewal sites in order to consolidate the urban structure for earthquake risk mitigation, and regenerate especially the deprived neighbourhoods of historic city centres through the utilisation of mixed-uses. Renewal zone decision is taken by Municipal Assemblies in the settlements having municipalities, and by General Assembly of Provinces in the settlements outside governed by Special Administration of Provinces outside municipal boundaries. The Board of Ministers approve the renewal zone decision. The scale of intervention starts from 5000 square metres. Key implementation instrument is urgent expropriation to overcome postpone; although it can only be utilised in national security/defence issues according to the Expropriation Law (Law no. 2942). There are different implementation and financing authorities and actors; however the projects are generally managed by a public-oriented implementation model. The responsibilities in planning and conservation are shared between Greater Municipalities and local municipalities at local level, and Supreme Board for the Protection of Cultural and Natural Assets under the Ministry of Culture and Tourism at national level. The Law also propounds the establishment of “Boards of Renewal” authorised to approve the renewal projects. This regularisation bypasses “Boards of Protection” which were responsible in the control of conservation status of historic neighbourhoods since the enactment of the Law on the Protection of Cultural and Natural Assets in 1983 (Law no. 2863). TOKI is contradictorily the

most powerful institution in the implementation of the law along with the corporations of municipalities such as KIPTAS - housing agency, KUDEB - Control Bureau for the Conservation of Cultural Assets, and other relevant private sector architecture and construction firms. The owners of historic buildings, which are not demolished, are obliged to carry out their own conservation projects under the assistance of KUDEB, otherwise they are given housing in one of the mass housing areas constructed by TOKI at the periphery of the city. In the latter case, the financial model is based on monthly instalments of long-term credits. It is also possible to transfer funds from the Fund for the Protection of Immovable Cultural Assets to the municipality budgets. However, the implementation and financial models ignores tenants.

4.2 Law on the Transformation of Areas under Disaster Risk

Having issued by the slogan of “making slums history”, this Law covers the areas which could not be covered through the previously mentioned law. By focusing on demolition and reconstruction through the authority of Ministry of Environment and Urbanism, the Law is far from solving the quality problem in housing provision, but rather raises serious debates on environmental and social consequences including the transformation of conservation sites, agriculture and forest areas into reserved housing zones for construction, the demolition of even steady housing stock and the displacement of inhabitants (Gunay et al. forthcoming). It brings forward a definition for risk areas to be transformed as “buildings within or outside risk areas that have completed their economic life, or which are scientifically and technically proven to be at risk of demolition or high damage”. By bringing all authorities that are responsible for planning, development and control under one institution, the Ministry of Environment and Urbanism. Through this newly attained responsibility, the Ministry is authorized to expropriate the immovable or exchange them with others; to transfer immovable property rights and zoning rights to other areas; to divide and to allocate shares forming the immovables; and to establish rights; which means “everything”. The minimum size of transformation areas is 50.000 square metres. According to Law, majority decision of share holders (2/3) is enough for the application for renewal, disregarding the decision of all. A licensed institution by the Ministry is authorised to conduct research to detect whether or not their building is at risk. The licensing of the institutions through the Ministry creates a threat over independency that the majority of the licensed institutions are also the construction firms who will be responsible for the renewal projects. The Law calls for temporary housing or workplace and rent benefits for shareholders, however it is not certain when and where these housing and workplaces will be given. Seen from the current practices that it is a high possibility that these places will be at the periphery of cities. It also launches the renewal fund which will be generated from administrative fines collected under the Environment Law, income from the properties sold under the Forestry Law, and a certain amount of the annual net profit of the Provincial Bank. There is interest rate support to banks, rental support, demolition credit, ministerial construction credit and credit for detection. The regulations also provides opportunities for the transfer of development rights. One of the most important threats through the law is the definition of reserve zones for new settlement, which are not clearly defined and can be and possibly will be applied to natural protection zones and forests.

5. What Does Renewal Meant for the Opportunity Spaces of Istanbul?

5.1 “Making invasion history”

The Law No. 5366 has introduced a major challenge for the **historic landscapes** of Istanbul. 11 historic zones in Istanbul’s Beyoglu, Fatih (in Historic Peninsula), Eyup, Zeytinburnu and Tuzla districts were declared as “renewal sites” between 2006 and 2010. These include 6 historic neighbourhoods in Beyoglu conservation site (such as Tarlabasi, Cezayir Çıkmazi, Tophane, Galata Tower, Municipality Building and environs); and 47 historic neighbourhoods

in the Historic Peninsula (such as Ayvansaray, Sulukule, Suleymaniye, Yenikapı-Yali, Sultanahmet, Kucuk Ayasofya, Grand Bazaar and environs) mostly with urgent expropriation decisions. The buffer zone for the Land Walls World Heritage Site is included in Zeytinburnu renewal area. There is a variety of interventions that are designed both to renovate and upgrade existing older housing and to build new housing through the complete demolition of obsolescent properties. The projects have been based on the theory that the conservation of cultural heritage through the elimination of “invasion” would increase the sense of belonging where different social groups live together; the prevention of decay through the eviction of social elements who do not invest in the maintenance of these; the protection of cultural dynamics and increase social integration with the rest of the city; and the establishment of a participatory process through public meetings (see Gunay, 2011). Regarding the Law No. 5366, the large-scale renewal projects have provided serious discussions on the sustainability of historic environment. Regarding their world heritage sites status, they are threatened to be included in the World Heritage List in Danger due to the lack of effective conservation or overuse of renewal policies and practices (UNESCO/WHC, 2010). Moreover, the projects are criticised as projects of “gentrification” and recommended that a balance must be found between conservation, social needs and identity of the community (UNESCO/WHC, 2008). For instance in Suleymaniye, KIPTAS has bought 101 buildings, most of which were demolished to perform restoration project by 2011. Sulukule and Ayvansaray were nearly totally demolished under the name of protecting the historical identity and improving the building stock which are not safe for earthquake by 2012 (Gunay, 2011). Tarlabasi project consisted of the renewal of 278 buildings, 76% of which were registered (for more information, see Kuyucu and Unsal, 2010). As a results of the renewal projects in historic neighbourhoods, which are described as “source of shame or dirt bag”, nearly 50% of properties has changed ownerships after the destruction decisions and urgent expropriations. Only in Sulukule this meant the replacement of 5000 families (see Gunay, 2012a).

5.2 “Making slums history”

Squatter areas, on the other hand, have always been one of the most important priorities of renewal framework in Turkey since the 1960s. Once they were encouraged as a way of self-help housing in a country of limited financial resources at the edge of industrialisation; after the 2000s, they started to be identified as “invaders” as they provided a boundary for the utilisation of opportunity spaces of Istanbul. One of the first renewal interventions were conducted in Ayazma, a squatter neighbourhood found in the 1980s. The neighbourhood was totally demolished in 2009 because of its increasing land values through the construction of important highways, industrial areas and Olympic Stadium. While the owners were offered dwellings in TOKI’s Bezirganbahçe Mass Housing Area at the periphery, the land emptied from low-income residents and squatters were filled with high-rise upper-income gated sites (see Bartu-Candan and Kolluoglu, 2008). Finally regularised urban renewal based on the Law on the Transformation of Areas under Disaster Risk has started in October 2012 through a live screening in the media. Based on the slogan of “making slums history”, the Prime Minister Recep Tayyip Erdogan pushed the button of bomb to start the demolition of 6.5 million building in Turkey (40% of building stock). 35 cities were selected primarily defining the largest renewal project in Turkish history. Only in Istanbul this means the demolition of approximately 1 million buildings. The neighbourhoods of Sumer, Esenler, Maltepe, Bayrampasa, Fikirtepe, and Derbent are among the first project areas to be chosen for renewal with respect to their strategic locations. The private sector has valorised this process of transforming squatter areas and inner-city neighbourhoods into the urban spaces of economic rant and land speculation under the name of “resource development and revenue-sharing projects” (see Gunay, 2012b). While these projects are being encouraged in order to raise financial resources in order to be used in housing projects for lower and middle income groups, the practices show that a considerable portion of the newly constructed buildings by TOKI are sold in the market to upper-income groups. For instance in Derbent neighbourhood, which is along the main financial axis of Istanbul with a

view of Bosphorus strait, the dwellings of gated sites are being sold for a minimum of €435.000. While the project proposes a population of 10.000 replacing the actual population of 7000, only 1000 buildings will be reserved for shareholders. On the other hand, the inhabitants of the 800 squatters will be given housing in the reserved zones for construction at the periphery.

6. Dichotomy of Urbanisation and Urbicide in the Renewal Agenda of Istanbul

The large-scale property-led renewal schemes, which have been employed as an evolving model in resolving the urbanisation problem, are turned into the instruments of “urbicide” in Istanbul as a political “evolving” model of urban destruction.

The current so-called planning practices offer an economic-oriented approach, which results in the interruption of planning process via the prominence of concepts such as “revitalisation”, “transformation”, “renewal” projects. Planning’s intervening and controlling role in entrepreneurial practices undergoes a change via neoliberal policies, thus, private sector-oriented partial projects replace comprehensive planning approaches. Within this process, planners and architects, who are the actors of the planning become agencies led by the private sector. In addition, the basic fundamental of the profession, which is the “public interest”, is replaced by an understanding of “corporate income”. Public authority and public resources are being used not to provide affordable and high-quality urban environments to the lower-income groups, but to open up profitable investment areas either for the state or for certain private developers.

While planning, as a participatory, transparent and sustainable approach, is a declining model of practice in Turkey, there is an emergence of uncontrolled power in the governance of the built environment bypassing planning. Over-centralised structure of urban renewal interventions prevents the dynamics of local governance and limits transparency of process through the elimination of independent control mechanisms through the empowerment of new actors. Ministry of Environment and Urbanism and TOKI have been authorised as real-estate agents, and has turned it into a “dangerously powerful institution directly at the service of the executive branch of the government” (Kuyucu and Unsal, 2010).

Urban renewal interventions, associated with physical interventions and destructions, focus on market conditions and spontaneous solutions of community, while the socio-economic aspects are being ignored. Urban renewal projects lead to the separation of community according to their socio-economic classes, ethnic backgrounds and cultural choices. Urban renewal interventions transforms inner-city into opportunity spaces resulting in the exclusion and eviction of the low-income local community, while destroying the collective memories. They also result in the displacing and replacing of new forms of poverty (Bartu-Candan and Kulluoglu, 2008). The Advisory Group on Forced Evictions (AGFE, 2009) estimates that the number of people that are under the threat of involuntary eviction is approximately one million, most of whom are currently the residents of historic neighbourhoods. In addition, the focus on physical renewal provides serious environmental consequences to the transformation of conservation sites, agriculture and forest areas into reserved zones for new settlement construction.

These remarks show that urban renewal practices in Turkey was proved to be a state-driven destruction and real-estate marketing strategy, rather than being a strategy to respond to historic preservation, disaster risk or urban deprivation. Apart from the mentioned legal frameworks, there are even new schemes being drafted by the government to regularise the process of urban renewal, through a more centralised structure to prevent the participation and to limit the control mechanisms of local municipalities, independent boards of

professions, non-governmental organisations and the community. Renewal projects is not limited only to historic landscapes and squatter areas; the waterfronts, old industrial areas and even public spaces are subject to large-scale urban renewal projects as the new opportunity spaces of Istanbul. Istanbul, as a city of water, has been facing the most challenging threats of its waterfronts through the projects such as Haydarpaşaport, Galataport and Halic port. The public spaces including the Gezi Park that has become subject to the most powerful community action starting from May 2013, has been projected to be replaced by a mall complex together with others as Camlica Hill. While the mega projects such as 3rd Bridge, Canal Istanbul and Olympic Village are threatening the natural protection zones of the city, there seen no hesitation to destroy Yenikapi archaeological excavations of 8000 year-old history in order to construct transfer hubs.

Thus, there is an urgent need for change of emphasis in the governmental perception and political culture to employ holistic urban renewal framework through empowering sustainable, participatory, transparent and strategic planning approaches; raising consciousness into the role of community, community organisations and local governance; encouraging reinvestment and improvement rather than demolition; and most importantly preserving and respecting the country's cultural and environmental inheritance. Within the scope of this emerging agenda, there is still a role for planning and planners in managing these evolving and declining models of practice. One of the most important factors is that the "rational" planning approach has no validity anymore; the planning has to be responsive to strategic, flexible, responsive and participatory approaches as an intermediary between all stakeholders including the public and private sector as well as the community. Planning system should be open to change, if it wants to manage change. The planning profession may and should not have the power to change the ongoing political inferences on cities itself, however it may be a powerful instrument to construct the democratic management framework for cities and communities by creating the conditions of coordination, cooperation and negotiation. Because as Newman and Thornley (2002, pp. 23) puts forward the planning lies at the interface of market and politics in the neoliberal era. This is a shift from being the agents of development control towards being the agents of strategic-thinking.

South West Victoria 2012 – 2050 Are the Settlements Sustainable?

J. M. Herron, D. Jones, J. Rollo, Deakin University, Williamstown, Australia

Over the past few decades coastal cities around the world have grown at an incredible rate. With this growth have come major challenges relating to land use planning, social relationships, economic development, bio diversity and the ecological footprint.

The following paper selects three regional coastal towns (Warrnambool, Portland and Port Fairy) situated in the Australian state of Victoria, and addresses the issues of: increasing population and population density; open space requirements; residential density issues; public transport coverage; employment and employment density; a shifting economic climate; environment and climate change; water quality issues and building energy consumption with subsequent CO₂ emissions.

Through a series of simulations the nine issues for each of the three cities will be examined from 2012 through to 2030.

The goal is to highlight the current and simulated future impacts of the selected issues and propose solutions that could mitigate those impacts.

1 Introduction to the Study Area

The study area for this research is represented by the cities of Warrnambool, Port Fairy and Portland and surrounding area in South West Victoria. Warrnambool is approximately 300 kilometres west of Melbourne; Port Fairy is 25 Kilometres from Warrnambool while Portland is located 100 kilometres west of Warrnambool.

Warrnambool was first incorporated as a municipality in 1855 and is the largest settlement in South West Victoria with a population of 32,000. Warrnambool is the administrative, educational and commercial centre for South West Victoria.

Port Fairy can be traced back to 1810. Port Fairy is the largest settlement in Moyne Shire with a population of 2,800. Port Fairy, is the administrative and commercial centre for Moyne Shire. The bulk of the commercial activity is focused on municipal government and tourism activities.

Portland is the oldest European settlement in Victoria with the first settlers appearing between 1815 and 1820 and is the major residential and commercial centre for Glenelg Shire with an approximate population of 10,000. Warrnambool, Port Fairy and Portland with their locations respective to the rest of Victoria are shown in Figure 1.

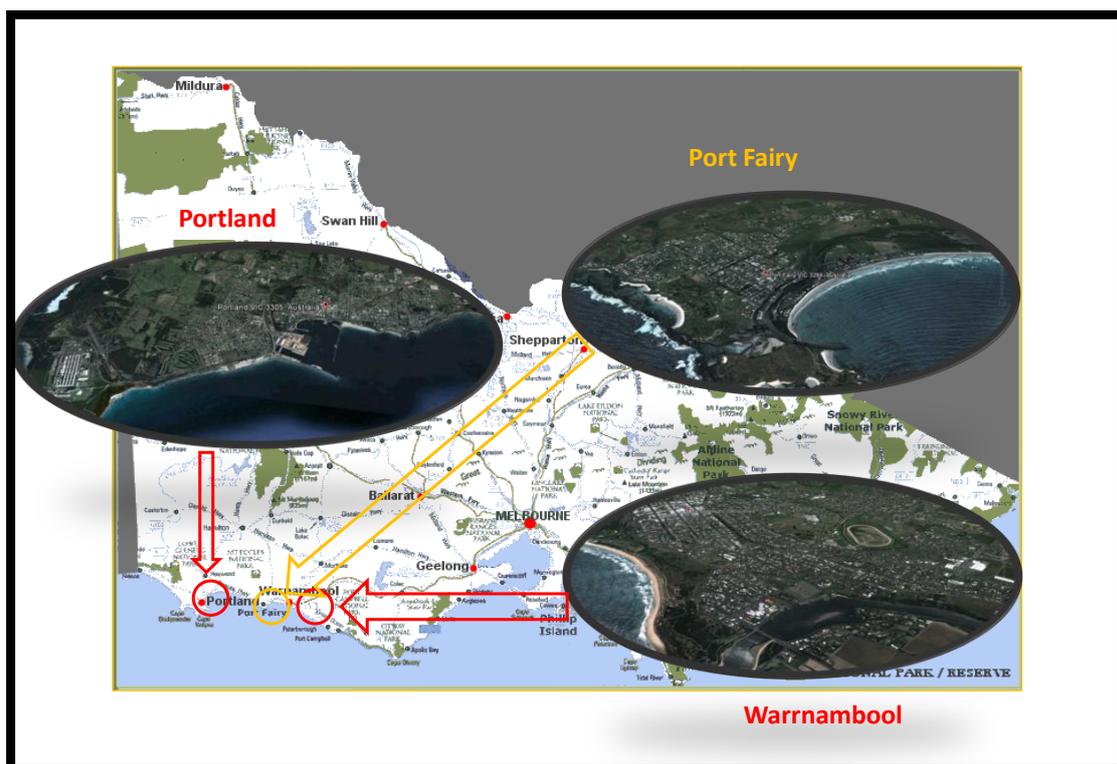

Figure 1 Greater Study Area Including the Cities of Warrnambool, Portland and Port Fairy

Source:(Goggle 2013; Herron Murray 2013)

Throughout their entire existence Warrnambool, Portland and Port Fairy have been major ports for South West Victoria and South Australia. The port facilities for the three cities are an integral part of each city and provide a direct input into whether or not each of the three

cities can continue as a sustainable settlement. Warrnambool, Portland and Port Fairy in the last two years have outlined plans to redevelop either their respective port facilities or Central Business District (CBD) area. This paper will examine the current urban design frameworks for Warrnambool, Portland and Port Fairy and through the use of scenarios assess the sustainability of each settlement.

“Urban Design is the art of making places for people. It includes the way places work and matters such as community safety, as well as how they look. It concerns the connections between people and places, movement and urban form, nature and the built fabric, and the processes for ensuring successful villages, towns and cities” (Strzelecka 2010)

Urban Design has eight objectives:

1. Character - A place with its own identity
2. Continuity and enclosure – A place where public and private spaces are clearly distinguished
3. Quality of the public realm – A place with attractive and successful outdoor area
4. Ease of movement – A place that is easy to get to and move through
5. Legibility - A place that has a clear image and is easy to understand
6. Adaptability – A place that can change easily
7. Diversity - A place with variety and choice
8. Sustainability- A place that meets the needs of today without comprising the future

The structural components of an Urban Design Framework are shown in Figure 2. This type of framework was used to influence and direct the current and future design characteristics and features of Warrnambool, Portland and Port Fairy.

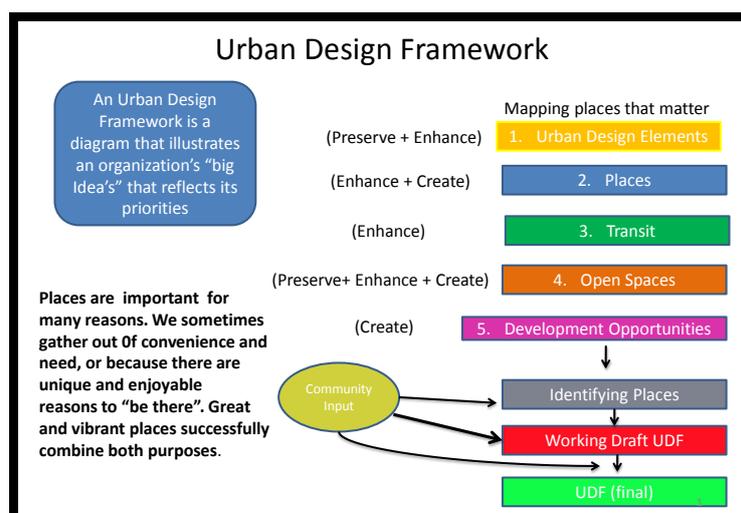

Figure 2 Urban Design Framework

Source:(Herron 2012)

1.1 Warrnambool

Warrnambool urban design framework focuses on five themes:

- i. City spaces and landscape
- ii. Pedestrians and accessibility
- iii. Cars and parking
- iv. Land use and activities
- v. Built form and heritage

The themes have a series of objectives including:

1. Ensuring that the Warrnambool City Centre continues to be the primary retail and services centre
2. Encouraging a diversity of new investments in the City Centre, encompassing retail, commercial, entertainment, recreation, community, cultural and residential services and facilities;
3. Supporting the development of medium density residential development within walking distance of the City Centre;

Source:(City of Warrnambool 2011)

The urban design framework drew attention to the lack of land that could be used for development and to water and energy conservation measures that improve Warrnambool's sustainability.

1.2 Port Fairy

The town of Port Fairy has been transformed over the last decade or so from a local service centre and fishing port with a tourist and recreation profile to an iconic high profile tourist and resident destination.

That transformation has partly been driven by some forces internal to the town but it has largely been imposed by external trends and factors which have impacted on many coastal communities.

There is an emerging concern about aspects of the town's future. These concerns range across an agenda comprising social economic and environmental elements.

1. the scale and form of much recent development
2. the capacity of the town to retain its character and identity in a growing urban area
3. the impact of existing and projected developments on the built heritage and the natural features associated with the coast, the Moyne River and the Belfast Lough
4. the provision of housing that can meet different household needs and provide affordable options

5. the lack of long term, permanent work in the town and the capacity of the town to retain and attract young people and new entrants into the workforce
6. the implications of an increasingly aged population and the implications of such a demographic structure for services and facilities
7. a growing questioning as to whether development for developments' sake is necessarily compatible with Port Fairy as a town and community
8. a growing concern that the scale of recent development and the level of likely future development may be detrimental to the qualities that are valued by long term residents and those who have been attracted to shift to and visit Port Fairy

Source:(Moynes Shire 2012)

The Port Fairy Urban Design Framework drew attention to the flooding issue and to the scale of development that was occurring in Port Fairy.

1.3 Portland

The City of Portland has recently completed an urban design framework for the Port of Portland area along with the Central Business District (CBD). The framework commented on the lack of available land for development in the CBD area and greater Portland area and the potential long term weakness and uncertainty in the Portland economy.

1.4 Frameworks Inner Workings

Each of the three design frameworks had a set of pre-determined parameters for Character; Continuity and enclosure; Quality of the public realm; Ease of movement; Legibility; Adaptability; Diversity and Sustainability. The parameters were generated through a series of ongoing public consultations and resident surveys.

The Portland design framework was influenced by the Portland Land Use model. This model which had its origins as a theoretical model was modified to become a practical applied planning tool. The Portland model was comprised of four sub models (Soils, Settlement, Population and Climate Change) along with a series of legal and physical constraints to reflect the current planning landscape and legal framework. The Portland Land Use Model includes a series of components including: an External Factor Evaluation matrix; Internal Factor Evaluation matrix; Scenarios and a Quantitative Strategic planning matrix.

An External Factor Evaluation Matrix is a strategic management tool often used to assess current conditions. It is a good tool used to visualize and prioritize the opportunities and threats that an organization is facing and is composed of five steps. The steps include (1) listing the factors; (2) assigning weights; (3) rating the factors; (4) multiplying the weights by ratings; and (5) Summing the weights by the ratings.

The Internal factor evaluation (IFE) matrix is a strategic tool used for evaluating strengths and weaknesses in organizations. The IFE matrix together with the EFE matrix is a strategy formulation tool and is created in three steps: Identifying the Key internal factors; Assigning Weights; and Rating:

Scenarios in land use planning have traditionally focused on: Population growth by a specific percentage each year; Expansion of various type of land zonings; the development of

The amount of land dedicated to open space (i.e. parkland (municipal and state parks, gardens and reserves and sporting reserves) for the combined three settlements and surrounding rural areas entire is 63987.5 Ha or 1.42 Ha per individual. This figure is misleading as the study area has 61,820 of state forest and park. Once this amount is removed from the total only 2168 Ha of open space has been allocated for the combined three cities and surrounding rural area with Warrnambool having 1572.54 Ha (i.e. 0.04 Ha per resident) Portland having 229.78 Ha (i.e. 0.0229 Ha per resident) and Port Fairy 363.86 Ha (i.e.0.129 Ha per resident).

2.5 Public Transport

Each of the three settlements has a viable municipal mass transit system comprised of private bus operations, Vline train service to Melbourne and scheduled airline services to Melbourne.

2.6 Current Water Resources

Ground water is the major source of water in South West Victoria. Groundwater is defined as “water that it is found under the ground. It is stored in and can flow through discrete layers know as aquifers.” (Glenelg Hopkins Catchment Management Authority 2003)

Ground water is extracted from the aquifers through the use of a bore hole. Eleven hundred and eighty nine (1189) are situated in the three settlements and surrounding country side.

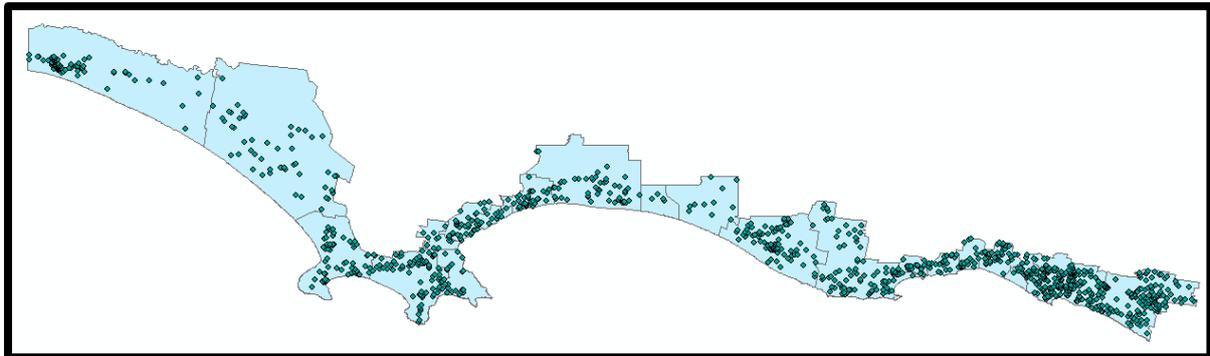

Figure 4 Ground Water and Borehole location for the three Cities and surrounding rural areas

Source:(Victorian Department of Primary Industry 2010)

The ground water is used in a variety of applications such as domestic & stock water supply; domestic water; ground water recharge; industrial and commercial water applications; irrigation and waste disposal.

2.7 Climate Change

The impacts of Climate Change on the three settlements and surrounding rural area include; increased evaporation rates, increased bush fire risk, more frequent and severe droughts; a projected decline in Victorian farm production; sea level rise of 0.8m by 2100 and more intense storms threatening coastal infrastructure.

2.8 Current Employment

The employment patterns from 1947 through 2010 shows persons in employment grew from 6,322 to 19,823 an increase of 13501 or 213.56%. The industries in the study area that have a local or national competitive advantage are: Manufacturing; Retail; Transport; Electricity Gas Water & Waste Services; Information, Media & Telecommunications; Accommodation; Public Administration and Agriculture

3 Future Scenarios for the Study Area and Settlements

A series of scenarios were developed to test the how sustainable the three settlements were. The scenarios involved:

1. Forecasting future population growth and its impact on land and water supply, urban and open space density the resulting increase or decrease in CO₂ emissions generated by human activity and forecasting the changing economic and employment environment.\

3.1 Scenario 1

Population increases

The state government has development population forecast for the period 2011 through to 2031 (i.e. 2011, 2016, 2021, 2026 and 2031).

Table 1 Forecast Population Increases for Warrnambool, Portland and Port Fairy

Town	Era	Forecast population Increase	Year	Total Population	Increase
Warrnambool	2011-2016	8.17%	2016	36,988	2795
	2016-2021	6.56%	2021	39,416	2428
	2021-2026	5.90%	2026	41,740	2324
	2026-2031	5.26%	2031	43,934	2194
Portland	2011-2016	3.12%	2016	11,891	2795
	2016-2021	3.76%	2021	12338	360
	2021-2026	3.47%	2026	12766	447
	2026-2031	3.16%	2031	13169	428
Port Fairy	2011-2016	6.08%	2016	2,970	696
	2016-2021	5.36%	2021	3,129	651
	2021-2026	4.82%	2026	3,280	617
	2026-2031	4.18%	2031	3,417	561

Source; (Victorian Department of Planning and Community Development 2012)

3.2 Landuse and future Land Requirements

Portland, Port Fairy and Warrnambool each have a land budget which contains a 10 year supply of vacant land for future residential, commercial or industrial expansion. Table 3 indicates the number current of vacant lots per city; the number of lots needed to house the expected increased population by era and the number of additional lots that will be required by 2031.

Table 2 Land Budget for expected housing growth

Location	Era	Expected Households	Lots Required for increased population	Surplus or Deficit of lots	Number of new lots required or created
Warrnambool	2011-2016	14,664	1285	Deficit	847
	2016-2021	15,904	1240	Deficit	2087
	2021-2026	17,063	1159	Deficit	3246
	2026-2031	18,158	1090	Deficit	4336
Portland	2011-2016	4486	166	Surplus	456
	2016-2021	4659	173	Surplus	283
	2021-2026	4819.	160	Surplus	123
	2026-2031	4970.	151	Deficit	28
Port Fairy	2011-2016	2052	122	Surplus	127
	2016-2021	2178.	126	Surplus	2
	2021-2026	2295.	118	Deficit	116
	2026-2031	2401.	106	Deficit	222

Source:(Herron Murray 2013)

3.3 Warrnambool Sustainability

As shown in Table 3 Warrnambool has a chronic residential land shortage needing a predicted 4,400 lots to meet the expected population increase by 2031. To resolve this issue Warrnambool has several options at its disposal:

1. Developing more residential land by rezoning the last agricultural land in the city;
2. Decreasing lot size and increasing urban density; and
3. Working with the surrounding municipality to co develop new residential areas adjoining Warrnambool and Port Fairy

Warrnambool is not sustainable in its current form. Residential density will increase from 913 individuals per square kilometre to 1253.82 in 2031 while open space density will decrease from 0.04 Ha per individual to 0.0346 Ha per individual. The density issue will need to take into consideration that the fastest growing segments in the Warrnambool population are the 45+ and 65+ age groups.

Warrnambool consumed 475 ML of its total water allotment of 750ML in 2010 (i.e. 62%). The current water consumption per dwelling is 166 kilolitres per dwelling per year, using this figure and extrapolating it forward to 2031 water consumption would go up to 3,014,228 Kiloliters or 3014.228 ML over four times the entire current water allotment. This factor again brings into consideration whether or not Warrnambool is sustainable.

There is a solution - Warrnambool currently has 4674 ML of recycled water at its disposal and to date has used not one drop of this resource, Warrnambool uses only 8.70% of its total water resources.

The Warrnambool Public Transport and bus system has the ability to expand to carry additional passenger and additional routes.

The Victorian State government believes the current and future economic growth of Warrnambool will “*focus on key industries where new investment is anticipated including dairying, energy and tourism with significant opportunities for further value-adding in major industries.*” (Victorian Department of Planning and Community Development 2013)

“By 2031 the largest sectors in the economy are projected to be healthcare, agriculture, manufacturing and construction. Other high growth sectors will include retail trade, financial, professional and scientific services and accommodation. This highlights a shift from primary production to a more service-based economy and will require workforce changes and services to support skills development and productivity improvements. Employment in manufacturing is expected to decline between 2011 and 2031, with healthcare, retail trade, accommodation and food being the largest employers by 2031.”(Victorian Department of Planning and Community Development 2013)

Limiting this scenario is managing competing demands for agricultural land, particularly in the corridor from Warrnambool to Portland, including limiting urban encroachment into highly productive agricultural areas. The reduction of agricultural land for housing will impact on future agricultural production and overall economic returns.

With the indicated expansion of Warrnambool population CO2 emissions have been forecast to double by 2050. This factor will be compounded by the effects of Climate Change on the Warrnambool coastline and landscape. Warrnambool has developed an environmental strategy that focuses on coastal management, waterways and wetlands, pest plants and animals, flora and fauna protection, parks, reserves and public open space development, community awareness and involvement, water and energy efficiency, recycling and accountability. The question is will this program be sufficient to ensure that Warrnambool will still be sustainable and liveable as it is today?

3.4 Port Fairy Sustainability

As indicated in Table 3 Port Fairy starts out with a residential land surplus and by 2031 has a chronic residential land shortage needing a predicted 222 lots to meet the expected population increase by 2031. To resolve this issue Port Fairy has two options at its disposal:

1. Developing more residential land by rezoning agricultural land that surrounds the city; and
2. Decreasing lot size and increasing urban density

To make Port Fairy sustainable in its current form residential density will increase from 344 individuals per square kilometre to 420.29 in 2031 while open space density will decrease from 0.129 Ha per individual to 0.106 Ha per individual. This density increase will need to take into consideration that the fastest growing segments in the Port Fairy population are the 45+ and 65+ age groups.

Port Fairy consumed 702 ML of its total water allotment of 1026 ML in 2010 (i.e. 68.4%). This figure takes into consideration the large agricultural component of water usage by the Port Fairy dairying industry which is one of the largest in Victoria.

The current water consumption per dwelling is 136 kilolitres per dwelling per year, using this figure and extrapolating it forward to 2031; water consumption would go up to 326,536 Kiloliters or 325.536 ML. This figure then needs to be added to agricultural water usage component (i.e. currently 425 ML per annum) to get a total water usage figure of approximately 750 M/L per annum. This amount of water is currently under the yearly water allotment of 1026 per annum. In addition Port Fairy has an additional 999 M/L of recycled water at its disposal giving the community a total volume of 2025 ML at its disposal. Port Fairy will not face a water shortage for the foreseeable future

The Port Fairy Public Transport and bus system has the ability to expand to carry additional passenger and additional routes.

As stated earlier the Victorian Government believes the current and future economic growth will focus on certain industries. In Port Fairy's case those industries are tourism, agricultural and retail based activities.

The reduction of prime agricultural land to support the increased housing demands of Port Fairy and Warrnambool will need to be managed to minimize the damage residential expansion will have on agricultural production.

Port Fairy is large producer of CO₂ emissions as a result of its large dairy industry. The increase in population by 2031 will further add to this total. Port Fairy has just introduced an environmental strategy which focuses on three issues: water conservation; soil quality and conservation and green house gas emissions.

Port Fairy is also subject to severe coastal flooding and erosion as the result of climate change. This issue is the number one long term factor threatening Port Fairy's sustainability. Port Fairy currently is sustainable but the long term prospects could be another matter.

3.5 Portland Sustainability

As shown in Table 3 Portland starts out with a residential land surplus and by 2031 has a residential land shortage needing a predicted 28 lots to meet the expected population increase by 2031. To resolve this issue Portland has several options at its disposal

1. Developing more residential land by rezoning agricultural land that surrounds the city
2. Decreasing lot size and
3. Increasing urban density

Portland is not facing the residential land issue that face both Warrnambool and Port Fairy.

Portland consumed 1797 ML of its total water allotment of 6222 ML in 2010 (i.e. 28.8%). This figure takes into consideration the large agricultural and industrial component of water usage by the Portland agricultural sector and the Portland Aluminium Smelter which is one of the largest in the world.

The current water consumption per dwelling is 158 kilolitres per dwelling per year, using this figure and extrapolating it forward to 2031 water consumption would go up to 785,260 Kiloliters or 785.260 ML. This amount of water is currently under the yearly water allotment of 6222ML per annum. In addition Portland has an additional 1235 M/L of recycled water at its disposal giving the community a total volume of 7457 ML at its disposal.

The Portland Public Transport and bus system has the ability to expand to carry additional passenger and additional routes.

As stated earlier the Victorian Government believes the current and future economic growth will focus on certain industries - in Portland's case those industries are industrial, transportation, tourism, agricultural and retail based activities.

Two key economic drivers for the Portland area are the Portland Smelter and the scheduled plantation forestry harvest. The Portland Smelter represents 700 jobs and 15% of the entire export GDP for the State of Victoria. The smelter has electricity contracts with the Victoria government until 2025 while the sustainable forestry plantation harvest was severely impacted by the Japanese earthquakes and corresponding nuclear events that occurred in 2010-2011. The entire forestry harvest was destined for the Japanese pulp and paper industry over a 20 year period. This industry is wholly based in the area affected by the tsunami and subsequent nuclear power-plant disaster, and has no immediate short or medium term date for the recommencement of pulp and paper production. The harvesting of the forest crop will not commence until the Japanese pulp and paper industry recommences the production of pulp and paper.

Portland is large producer of CO2 emissions which are the result of the Portland Smelter which consumes 25% of all electricity generated in Victoria all which is generated through the burning of brown coal.

Portland is also subject to severe coastal flooding and erosion as the result of climate change. This issue will be a long term factor that threatens Portland's sustainability.

4 Lessons learned and Further Applications

The use of the design framework has been expanded in Portland and Port Fairy. In Port Fairy the 2012-2013 flooding study conducted by the University of New South Wales outlined the impacts of flooding throughout the Port Fairy area. This information will in turn be used to broaden the parameters of the design framework to acknowledge the threat and impact of flooding in the Port Fairy region.

In Portland, the urban design framework is being adopted and used to frame the redevelopment of the Portland Waterfront. In the proposal the Portland waterfront would be transformed into a waterfront precinct.

Warrnambool has used its design framework for the partial redevelopment of its CBD, further commercial development to the western and eastern sections of Warrnambool will be guided by the design framework.

5 Summary

The continued sustainability of the three cities hinges on factors which are controlled by the cities themselves. In Warrnambool's case higher density limits and the use recycled water will ensure a sustainable future.

For Port Fairy the major issue is flooding and coastal erosion both of which can be mitigated through coastal management.

Portland faces issues of economic sustainability and is the most vulnerable of the three settlements. Portland must foster and develop other industries beside the smelter and the economic exploitation of natural resources for its future prosperity.

The urban design frameworks have identified specific concerns for each of the settlements. As stated earlier *Urban Design is the art of making places for people...People and their actions will make a place sustainable or not. (Marshall 2001)*

Adaptive strategies of urban disaster recovery planning

Mark KAMMERBAUER, Technical University Munich, Germany

1. Introduction

When disaster impacts cities, planners are required to address two central aims: on the one hand, cities need to recover after disaster, and on the other, urban development that existed before disaster is supposed to continue afterwards. For both aims, forms of planning exist: recovery planning and urban planning. How similar and how different are they? How do they complement or contradict each other in the case of urban disaster? What role do existing conditions as well as the scale of disaster play, and how can planning adapt to these situations? Is it possible to plan for the rebuilding of existing structures and necessary improvements at the same time?

To address this subject matter, this contribution deals with contradictions between recovery planning and urban masterplanning in the case of the urban mega-disaster in New Orleans in the US after Hurricane Katrina. While recovery planning is intended to enable a 'return to normal', urban master land use planning is aimed at an alteration or transformation of a given situation. In the case of New Orleans after Hurricane Katrina in 2005 the Citywide Recovery Plan had to adapt to the aftermath of disaster, while the new Masterplan advocates growth and improvement. Here, the conjunction of particular spatial, institutional and social aspects of the city and the scale of disaster seems critical.

In the following, socio-spatial perspectives as theoretical basis for this contribution will be outlined in connection to urban planning and disaster recovery planning. A methodological discussion will describe the employed case study approach. For this contribution, data were selected from the author's empirical long-term case study based on mixed-method quantitative and qualitative research in New Orleans. A quantitative questionnaire survey conducted in 2007 with an impacted population in a particularly hard-hit area of the city, the Lower Ninth Ward, serves to indicate vulnerabilities related to societal and spatial aspects and the capacity to recover and rebuild. Qualitative interviews were conducted in 2009 with key individuals in federal and local institutions and planning authorities involved in the recovery process. Their integrated observation permits identifying weak links between spatial, social, and institutional aspects.

The conclusion will correlate these aspects and indicate processes of adaptation in recovery planning amidst contradictory planning aims and problems of repopulation and rebuilding in the city. Questions of density of impacted neighborhoods emerge against the background of existing urban shrinkage processes. The case study area demonstrates massive population loss and low rebuilding rates, related to vulnerabilities, stratification, and lacking capacity to rebuild. Recovery plans and related institutions in New Orleans adapted to these circumstances through the definition of Policy Areas and the Lot Next Door program, while the new Masterplan permitted potentially unsustainable development in low-density neighborhoods.

Knowledge-based planning recommendations may enable a balance between existing conditions and necessary adaptation and improvement to support quick, yet also sustainable recovery in the case of urban mega-disasters. The approach is applicable to cases of urban disaster in the USA and adaptable to other (global) cases of coastal and peri-coastal metropolises subject to (hydro-meteorological) risk by taking the particular spatial, institutional, and social context into account.

2. Socio-spatial approaches to planning

Socio-spatial perspectives in urban studies and disaster research provide a theoretical basis for research on planning in the context of both cities and disaster and their relation to social and demographic aspects. These perspectives state that "spatial or environmental and locational considerations are always part and parcel of everyday social relationships" (Gottdiener and Hutchison 2006:xv). This is based on a political economy approach towards the production of space by associating economic development "with important factors in the social and political change of metropolitan space" (Gottdiener and Hutchison 2006:86). These relate to particular social and demographic aspects, including "social class, race, gender, ethnicity, age, family status, and religion (Gottdiener and Hutchison 2006:1) and refer to spatial aspects such as "the clustering of homes according to family income" (ibid.). Research topics include policy and programs, questions on growth, and possible improvement of living conditions in urbanized environments (Gottdiener and Hutchison 2006:xvi). These refer to "the activity of planning, which seeks to obtain the best living and working arrangements in developing cities" (Gottdiener and Hutchison 2006:314).

Planning can be described as an activity that has the capacity "to predict the consequences of its actions" (Campbell and Fainstein 2003:2) and to adapt "to changes in the city and region, which in turn are transformed by planning and politics" (Campbell and Fainstein 2003:4). Its aim is "to alter the existing course of events" (Campbell and Fainstein 2003:6) by addressing "social, economic, and environmental challenges" (Campbell and Fainstein 2003:8). The fact is pointed out that planning is context-specific, as "problems and conditions of planning are not everywhere the same" (Friedmann 2003:76). In addition, there exists a field of tension between existing conditions and structures and intended or envisioned changes within them or impacting them: "the new will be resisted, not because it is new, but because it threatens to displace something that already exists" (Friedmann 2003:78).

Contemporary urban planning includes "participatory, broad-based strategies for managing urban change" (Kaiser and Godshalk 1995:367) and comprehensive plans that may include information on "amount, pace, location, and costs of growth as policy choices" (Kaiser and Godshalk 1995:374). In this regard, a master plan for contemporary land use planning can serve as a framework "for community consensus on future growth" (Kaiser and Godshalk 1995:366) in relation to "effective implementation under turbulent conditions" (Kaiser and Godshalk 1995:367). Plans also serve to apply for grants from the federal government, e.g. for urban renewal purposes (Kaiser and Godshalk 1995:370).

2.1 - Planning for disaster recovery

A brief review of relevant concepts serves to discuss planning for disaster recovery. Disasters can be defined as consensus crises as opposed to conflict crises (Tierney 2006a). US legislative definitions of natural disaster include "hurricane, tornado, storm, high water, wind-driven water, tidal wave, tsunami, earthquake, volcanic eruption, landslide, mudslide, snowstorm, or drought" (Stallings 2005:240-241). Government authorities are required to respond when a disaster occurs and causes a "breakdown of public order and safety" (Dombrowsky 1998:20). The "trigger determines the measure" (ibid.) of institutional intervention. At the same time, socio-spatial perspectives in disaster research point out that the way societies alter their environment can contribute to disaster (Hoffman, Oliver-Smith 2002).

Emergency management includes the skills required to deal with harmful occasions such as disasters and is considered a public service (McEntire 2006:169). Within the disaster cycle (cf. Smith and Birkland 2012), it can be structured into phases, including planning and preparedness, mitigation, response, and recovery. In the US, the Robert

T. Stafford Disaster Relief and Emergency Assistance Act (Stafford Act) serves as legislative basis for emergency management. It defines how the Federal Emergency Management Agency (FEMA) and other institutions operate during and after disaster (Witham et al. 2007:13-14).¹ Governmental assistance is supposed to enable the “reconstruction and rehabilitation of devastated areas” (42 U.S.C. 5121-5207 2007:1), and the Stafford Act calls for communities to return to “normal pattern[s] of life as soon as possible” (42 U.S.C. 5121- 5207 2007:48). For this purpose, recovery funding is provided through supplemental appropriations approved by US Congress.

Research on the recovery of cities after disaster points out that “the time needed for reconstruction reflects not only the amount of damage and the available recovery resources, but also predisaster trends” (Haas, Kates, Bowden 1977:xxvi). Urban disaster is considered an interruption of existing urban development processes, including growth. Existing conditions are seen to inform the progress of recovery after disaster: “stable, stagnant or declining cities recover slowly and may even have their decline accelerated” (Haas, Kates, Bowden 1977:19). Recovery is considered complete when the evacuated population has returned, debris has been removed, and infrastructure and services have been restored.

Recovery can be structured into periods including restoration, replacement reconstruction, and betterment reconstruction, each requiring successively longer amounts of time in relation to the scale of disaster. The latter may be oriented towards future urban development (Haas, Kates, Bowden 1977:3). Overly ambitious plans may cause delays within the recovery process, and enabling a transition between the two reconstruction periods is recommended. Planning can also lead to inequalities in the context of “official priorities to provide disproportionate assistance to certain kinds of people and certain kinds of places” (Vale and Campanella 2005:353). Thus, rebuilding is correlated to “value-laden questions about equity [and] the needs of low-income residents” (Vale and Campanella 2005:13).

2.2 - Social aspects: stratification and vulnerability

When researching urban disaster recovery, city and disaster can be identified as a dual context. Within the respective discourses on cities and disasters, socio-spatial research perspectives point out the relevance of social aspects and inequalities. In cities, the concept of stratification indicates social disparities that immanently refer to spatial aspects. In disasters, the concept of vulnerability points out how social and demographic aspects impact the capacity of populations to respond to disaster. In the case of urban disaster, both concepts can be correlated. Stratification describes how individuals are distributed asymmetrically “across social categories that are characterized by differential access to scarce resources” (Massey 2007:1-2). These social categories can be defined according to specific characteristics including “gender, age, and kinship” (Massey 2007:2). Inequality serves to measure degrees of stratification and is reinforced when social and spatial aspects overlap, as in the case of spatial segregation (Massey 2007:19). In US cities these problems are historically related to “the problems of racial inequality” (Wilson 1987:20).

Vulnerability indicates why populations are impacted by disaster to differing degrees in relation to root causes of historic or societal origin. Vulnerability and natural hazards combined are seen to produce disaster based on “a chain of root causes embedded in ideological, social, and economic systems (...) and specific sets of unsafe conditions” (Hoffman and Oliver-Smith 2002:28). Social characteristics of “class, race, ethnicity, gender, or age” (ibid.) serve as indicators in relation to “specific political, economic, and social variables” (ibid.). Vulnerability is considered “a condition that already exists before a hazard triggers disaster [and] is part of people’s everyday life” (cf. Wisner et al. 2004). In addition, certain locations can be identified that contribute to

vulnerabilities, such as “high-density population concentrations in flood plains” (Quarantelli and Perry 2005:343). Access to resources comprises a significant indicator that refers to inequalities that existed before the impact of disaster and are related to “a livelihood in normal, pre-disaster times” (Wisner et al. 2004:94). After disaster, progress in recovery is based on access to resources, including funding, loans, and insurance monies (Tierney 2006b).

3. Case Study Methodology

This contribution features data from the author's empirical case study research in New Orleans and a particularly hard-hit area of the city, the Lower Ninth Ward in 2007 and 2009. A case study methodology was selected to research the interrelation of planning and social aspects of urban recovery after disaster. Case studies may draw from “multiple sources of evidence” (Yin 2009:18) and are useful when cases are unique or offer “a phenomenon previously inaccessible to social science inquiry” (Yin 2009:48). Communities are possible research units for case studies (Yin 2009:12) and can be related to the concept of neighborhood in urban space, as “neighborhood is often the place where people find community” (Williams 1985:34). Researching communities can “provide evidence of specific links to sociospatial organizations in the area” (Gottdiener and Hutchison 2006:195-196). Neighborhoods in return can be differentiated according to social characteristics of “wealth, race, and gender [and] differences in individual lifestyles” (Gottdiener and Hutchison 2006:141).

This paper proposes a research unit in the city based on its progress in recovery, i.e. where recovery is below the city average in terms of physical rebuilding, repopulation, and the impact of post-disaster planning. It focuses on an area that is confronted with weak recovery within a context of preexisting socio-spatial conditions and corresponding recovery programs. Central factors for the selection of an appropriate research unit include the degree of destruction of the built environment, the degree of repopulation, urban vulnerabilities in recovery, and their relation to recovery planning and master planning in the city. These are outlined here and followed by a description of the employed methods, which include document research and archival review, a quantitative questionnaire survey, and qualitative semi-structured, open-ended interviews.

3.1 - Selection of research unit: Lower Ninth Ward

After Hurricane Katrina impacted the Gulf Coast of the US in August 2005, congressional emergency supplemental appropriations provided funding for recovery, while the impacted states were responsible for action plans (Czerwinski 2007:2,9-12). Funding was increased also due to Hurricane Rita, which struck in September 2005. The immense degree of housing damage in combination with uninsured losses or insufficient funding based on insurance payouts, private resources, and loans comprised key issues in the recovery of individual homeowners.

Based on the action plan submitted by the state of Louisiana, the state's central rebuilding effort titled the Road Home program² faced numerous problems, including a difficult and slow application process, budget deficits, and legal and regulatory conflicts causing changes while the program was running. The most significant change was the inclusion of a buyout option, which enabled applicants to sell their properties and homes to the state instead of rebuilding them. This essentially counteracted the program's original aim. In 2009 approximately 45,000 Road Home program closings took place in New Orleans, of which 40,000 decided to rebuild (GNOCDC 2009:13). According to 2010 estimates, “approximately 4,500 properties (...) were sold to the state via the Road Home program” (Plyer 2010:3) and were acquired by the New

Orleans Redevelopment Authority (NORA). By June 2009 the Road Home program had produced 4,600 buyout properties that were unevenly distributed across planning districts. The Lower Ninth Ward or Planning District 8 comprised 776 buyout properties at that time - not the highest quantity, yet the highest rate among city planning districts.

After peaking in 1960 at 33,000 population numbers in the Lower Ninth Ward had declined to 19,500 before Katrina. It was hit hard particularly by floods caused by collapsing flood walls along the Industrial Canal, which intersects the urban fabric. The Lower Ninth Ward is comprised of two identifiable neighborhoods (Holy Cross and Lower 9 neighborhoods, the latter sometimes also called Lower Nine or Lower Ninth Ward neighborhood) and includes Jackson Barracks, a historic military facility now serving the Louisiana National Guard situated along the border to St. Bernard Parish. Existing social aspects in the Lower Ninth Ward include a majority African American population, high poverty rates, an above-city average percentage of homeowners, and high levels of disabled and elderly citizens. Dense social networks existed, related to patterns of generational housing and long-term residency (cf. GNOCDC 2009; H3 Studio Project Team 2007; The ACORN Housing/University Partnership 2007). For these reasons, the Lower Ninth Ward was selected as research unit.

3.2 - Quantitative and qualitative mixed methods

The case study employs mixed methods, including document research, a quantitative questionnaire survey, and qualitative semi-structured interviews with key individuals. The empirical research took place in 2007 and 2009 in New Orleans, Houston, and Washington, D.C. The quantitative questionnaire survey was conducted in 2007 and served to research vulnerabilities of a population sample group that lived in the Lower Ninth Ward before Katrina. The major share of the sample group had returned to New Orleans after Katrina, while some had not yet been able to return at that time and lived in Houston, a major destination for Katrina evacuees. The questionnaire was designed to enable comparison with the US Census (GNOCDC 2000; GNOCDC 2003a; GNOCDC 2003b) and a larger survey conducted among New Orleans evacuees in Houston (Wilson and Stein 2006). The author surveyed respondents at three occasions: in New Orleans in the Lower Ninth Ward at a Holy Cross Neighborhood Organization meeting and in St. Maurice Church, and in Houston at the Lakeside Estate Housing Complex. 75 completed questionnaires were collected and calculated as 100 percent. The questions aim at evacuation and return, housing conditions, and support in recovery.

In 2009 the author held qualitative semi-structured interviews with key individuals in federal, state, and local institutions involved in the recovery process. The interviews served to critically address how legal frameworks, programs, and plans informed the recovery process. For this purpose, a set of topical question modules was developed forming a pool of questions that could be targeted to specific interviewees. Confidentiality was guaranteed and interviews recorded digitally. Verbatim transcripts were then created and submitted to the interviewees for edits, corrections, and approval.

4. Results

In addition to selecting data from the quantitative questionnaire and the qualitative interviews for this section, the following documents were reviewed: the 'Citywide Strategic Recovery and Rebuilding Plan' (City of New Orleans n.d.), the 'Master Cooperative Endeavor Agreement Between the City of New Orleans and the New Orleans Redevelopment Authority' (City of New Orleans and New Orleans Redevelopment Authority 2008), the New

Orleans Redevelopment Authority's 'Community Improvement Planning Areas'. (NORA n.d.), and the 'New Orleans Master Plan and Comprehensive Zoning Ordinance' (City of New Orleans et al. 2009). Initial recovery planning proposals in New Orleans after Katrina included the 'Action Plan to Rebuild New Orleans' of the Bring New Orleans Back Commission (BNOB) and the 'New Orleans Neighborhoods Rebuilding Plan' presented by the City Council. Eventually, the 'Unified New Orleans Plan' (UNOP) was developed as a collaborative effort and outlined the aims of the 'Citywide Strategic Recovery and Redevelopment Plan' ('Citywide Plan'). It focuses on reconstruction after disaster and is defined as a type of plan different than a master land use plan. The Citywide Plan was created by a 'Citywide Team' that included "local urban planning practitioners and university professors" (City of New Orleans n.d.:13) who collaborated with District Planners from "nationally recognized architectural firms" (ibid.) within a participatory planning process that resulted in the creation of district and neighborhood plans.

The Citywide Plan describes the priorities of reconstruction in the city in relation to funding within a recovery timeframe spanning 5 to 10 years. It serves to guide the recovery process "in a rational way that creates stability and paves the way for future growth and prosperity" (City of New Orleans n.d.:9). The aim is to achieve a "quality of life in New Orleans [that] is back to – or better than – what it was before Katrina" (City of New Orleans n.d.:10). However, the UNOP also acknowledges that "it cannot be assumed that everyone will want to, or be able to, return to the City" (City of New Orleans n.d.:9). This is also related to lacking "financial or manpower assets to fix everything at once" (City of New Orleans n.d.:10), and leads to a prioritization of recovery efforts according to Policy Areas:

"Policy Area A – Less flood risk and/or higher repopulation rates

"Policy Area B – Moderate flood risk and/or moderate repopulation rates

"Policy Area C – Highest flood risk and slowest repopulation rates" (City of New Orleans n.d.:65).³

The New Orleans Redevelopment Authority (NORA) was originally responsible for neighborhood development and clearance of slums as Community Improvement Agency. Based on a Master Cooperative Endeavor Agreement NORA became the city's contractor in the recovery effort in 2008. NORA already had the competence to acquire blighted properties before Katrina (NORA n.d.). To deal with both blight and the vacancies created by Road Home buyout properties, NORA developed the 'Lot Next Door Incentive Program Management' (Lot Next Door program). It offers homeowners the opportunity to purchase adjacent properties in this context from NORA (City of New Orleans and New Orleans Redevelopment Authority 2008:12). As result, homeowners can both increase the size (and value) of their properties, yet also contribute to an increase of neighborhood repopulation percentages.

In the course of the planning processes and citizen participation taking place after Katrina, the new district and neighborhood plans were integrated within a new master plan aimed at a twenty-year timeframe. In 2007, the City Charter was amended, thus providing the basis for the City Planning Commission to create the 2030 Masterplan and Comprehensive Zoning Ordinance in relation to "the city's capital improvement plan [and] a neighborhood participation system for land use decision making" (City of New Orleans et al. 2009:3.12). How and where do the aims of these planning documents become contradictory, where did adaptation occur, and how are these issues related to social aspects in the research unit? The following interview excerpts offer insight into these questions.

4.1 - Qualitative interviews

A staff member of the United States House of Representatives Committee on Homeland Security (WDC-RDH-2009.05.22) responsible for emergency management

issues discussed the impact of federal legislation on post-Katrina recovery. Using the CDBG program to provide funding for recovery is considered appropriate, since it comprises “a useful (...) preexisting tool that is able to be funded very quickly” (ibid.). As result, legislation “didn’t have to be an authorization of a new program to send money to the state” (ibid.). CDBG may pose problems, yet also benefits: “states can use it for whatever they want” (ibid.), while it offers the opportunity to propose plans “to the federal government from the ground up” (ibid.), since “nobody understands the issues on the ground like the locals do” (ibid.).

The Director of Real Estate Strategy of the New Orleans Redevelopment Authority (NO-OS-2009.06.12) offered a detailed view on interactions between recovery funding, programs, and plans. The fact that the state of Louisiana received the CDBG funding for recovery is not considered beneficial for rebuilding the city: “the rules of a traditional program like CDBG do not fit disaster recovery” (NO-OS-2009.06.12), because “you need somebody willing to take legitimate and reasonable interpretation” (ibid.). However, “because you have a state that is in charge of stewarding this money, they have no incentive ultimately to take an aggressive interpretation (...) because that ensures they will never have to repay a dime of this money” (ibid.). As a result, this procedure is seen to be “responsible for an incredible number of problems with the recovery” (ibid.). Most prominently, the Road Home program became “a fundamentally unfair program to New Orleans, yet sort of inevitable if you are letting decisions being driven by the state” (ibid.), due to its “disproportionate share of the rental-type programs” (ibid.). This emerges as a problem in a city that has a large rental population: “the state is something like a 75 percent homeownership state, but New Orleans is at 40 percent” (ibid.).

In this regard, the decision to include the buyout “didn’t do anything to promote collective action” (NO-OS- 2009.06.12) and resulted in “no effective procedures to guarantee rebuilding” (ibid.). This was viewed as “a massive failing. Because now you could take that money and walk away” (ibid.). Orienting Road Home grants on pre-disaster property values contributed to this situation: “If you lost a 50,000 dollar house, it will still cost you 150,000 dollars to rebuild” (ibid.). As result, Road Home applicants may be confronted with funding gaps and choose the buyout option: “if you only give someone 50,000 dollars for their house they lost that was in a poor neighborhood, it didn’t make sense for them to go with the rehab program, and they might have sold you the property” (ibid.).

The difficult application procedures of the Road Home program were intended “to make sure that people weren’t improperly applying for it” (NO-OS-2009.06.12), yet impacted the recovery of the city: “if it took you 3 years to get money to rebuild your house, and you have just spent three years living somewhere else, (...) re-uprooting your life to come back is not necessarily what is going to happen. So that delay in getting the money out had tremendous consequences that far exceeded anything you would have lost by using a more simple or straightforward calculation methodology” (ibid.). As a result, the Road Home program contributed to low, incomplete, and uneven repopulation.

The Citywide Plan was required to adapt to this by formulating different recovery policies and Policy Areas. This is also due to the fact that a recovery plan didn't exist when Katrina struck, preventing timely coordination with the Road Home program: “what you would have wanted would have been for this Road Home Program to match your recovery plan” (NO-OS-2009.06.12). The Policy Areas are differentiated according to degree of destruction and repopulation. The most successful belong to Policy Area A, comprising the historic parts of the city that received little damage. Policy Area B includes “all those neighborhoods that were safe prior to Katrina and are right now in the states of 45-50 percent occupancy” (ibid.). Here, recovery is confronted with “high

levels of vacancy and (...) drastically depressed real estate prices” (ibid.). However, the repopulation of the third type is the decisive aspect: “until it gets from that sort of incredibly vulnerable 50-80 percent unoccupied level, it is a neighborhood that is a lot more likely of going down than it is of going up” (ibid.). The most difficult neighborhoods belong to Policy Area C: “urban areas in tremendous states of decay” (ibid.) defined by “[h]istoric poverty combined with massive storm damage, population loss, economic loss” (ibid.). Planning here needs to be “relatively narrowly targeted. You pick a few blocks, a few zones” (ibid.). The notion is that otherwise “you will quickly dilute whatever is feasible, whatever energy those areas have” (ibid.).

The new Masterplan and Comprehensive Zoning Ordinance is viewed critically due to its emphasis on growth. However, New Orleans was a shrinking city before Katrina and struggled with slow repopulation in particular areas during the recovery phase: “basically the Masterplan is projecting very high levels of growth for the city, which runs contrary to the last 45 years, and ignores the facts that in a tremendous number of our neighborhoods we’re facing an incredibly difficult challenge right now, in that they’re 50 percent occupied” (NO-OS-2009.06.12). This resulted in the presence of “far more urban spaces than people who want to live in them” (ibid.). Yet, the Masterplan is seen to contradict this situation: “it allows multifamily development outside the downtown” (ibid.). Instead, “for reasons of de-densification for integration and everything else, a single family plotting of people is a much more resilient pattern” (ibid.).

Lacking coordination between state and local programs and plans led to a situation where the recovery plan needed to adapt to the actual situation and depart from the return to normal paradigm. The conclusion is made that “planning and recovery confronts very difficult challenges in how to handle and control shrinkage” (NO-OS-06.12.2009) due to repopulation rates and urban densities. As for recovery, the most important thing is getting money into people’s hands quickly” (ibid.).⁴ However, shrinkage was not adequately acknowledged by the Masterplan. This caused problems particularly in hard-hit neighborhoods with existing social disparities belonging to Policy Area C with existing conditions such as low incomes and low property values. These resulted in recovery funding gaps that contributed to deciding for the buyout option. The following data illustrate related social aspects identified within the author's empirical research.

4.2 Quantitative questionnaire survey

The following selection of questions from the author's quantitative questionnaire survey in 2007 deal with reasons for returning to New Orleans, circumstances of homeownership, damages to homes, support from institutions, and access to resources.

Question 15. Describe your residence (before and after Katrina). Before Katrina, 71 respondents lived in a house. This changed significantly after Katrina: 19 individuals lived in a house, 15 in an apartment or condominium, 15 in a mobile home or trailer, 8 noted 'other', and 18 did not respond. A significant number of participants had not returned to the housing conditions they had lived in before the disaster.

Question 17. Did/Do you own or rent your residence? (before and after Katrina) 60 respondents noted they had been homeowners before Katrina, while 11 had been renters and 4 didn't answer this question. After Katrina, 41 individuals remained homeowners. The number of renters rose to 19, and 15 provided no answer. The majority of participants were homeowners before and after the disaster, yet figures declined significantly.

Question 18. Was your home damaged? 42 individuals answered that their homes were 'strongly damaged'. The homes of 28 respondents were 'completely destroyed'. The Holy Cross subgroup, with its lower number of completely destroyed homes, reflects to the fact that the Holy Cross neighborhood, located along the natural levee of the Mississippi, also incurred less damage than the adjacent Lower 9 neighborhood.

Question 24. Are you back in your old home? 14 participants noted they had returned to their pre-disaster homes. 47 individuals hadn't been able to move back at that time. 14 provided no answer. Despite having returned to the city, a large majority was still either dependent on interim housing, which indicates that these citizens had not yet completed their individual rebuilding efforts, or had moved on to alternative housing solutions in the city.

Question 28. What makes help difficult? This question features examples that made receiving assistance difficult either 'very much', 'somewhat', or 'not much'. In each case, respondents noted that receiving help was 'very' difficult: in the case of insurance paperwork (26 individuals), in terms of FEMA paperwork (21 individuals), and regarding building permits (14 individuals). The fourth example is medical attention, an aspect relevant to researching vulnerabilities (here, 19 noted 'very much' in terms of difficulty in receiving help).

Question 26. Are there other reasons that make returning difficult? The answers here show that 'no money' is the most significant reason that makes return difficult (32 answers). Traumatic experiences are summed up in 'bad memories' (22 answers), followed by absence of family and friends (17 answers) and lack of security (17 answers). While access to monetary resources appears most important, social capital (or absence thereof) also emerges as an important factor.

While these questions already indicate the problems citizens face in recovery, the comparison with the Houston subgroup offers insight into why people cannot return. It can be compared with a larger study among Katrina evacuees from New Orleans who had arrived in Houston (Wilson and Stein 2006), which concludes that the evacuees who remained in Houston were unlikely to return mostly "because very few of these respondents owned their homes in New Orleans" (Wilson and Stein 2006:7). In comparison, the author's survey also features a majority of individuals that noted their ethnicity as African American. Incomes were below \$25,000 (7 respondents noted a household income of less than \$15,000 after Katrina), and the majority were renters. Differences include the fact that the author's survey indicated a higher average age of participants (42.5 years) and a higher degree of female respondents. In sum, lacking access to resources can be correlated predominantly to existing demographic aspects of income and ethnicity. In the context of disaster, they can be interpreted as vulnerabilities that existed before the disaster; in the context of the city, they can be identified as aspects of stratification; and in recovery, they translate into access to resources:

- most respondents are homeowners who had been able to return;
- most housing was either strongly damaged or completely destroyed;
- difficulties emerge in applying for support in recovery;
- the degree of renters increased;
- long-term evacuees are mostly renters with low income;
- returning individuals require alternative housing during recovery.

Figure 2: Lower Ninth Ward, typical shotgun house (the author 2009)

Figure 3: Lower Ninth Ward, multi-family development (the author 2009)

Figure 4: Lower Ninth Ward, small rental property (the author 2009)

5. Conclusion

The following contradictions between recovery planning and masterplanning that emerged in the aftermath of the Katrina disaster in New Orleans can be identified: the Citywide Plan addresses shrinkage, while the Masterplan advocates growth. The context that both refer to is based on existing conditions and the scale of disaster, resulting in uneven recovery in the city, where some areas are more and others are less successful in their repopulation and rebuilding efforts. The Road Home program for individual homeowner recovery contributed to this situation by offering the buyout option, exacerbating low rebuilding rates in hard-hit neighborhoods. Planning and institutions in recovery in the city were required to adapt to this situation in terms of recovery policies and programs, thus proposing perspectives of urban development that contradicted the aspirations of the new Masterplan. These forms of adaptation include the Citywide Plan's Policy Areas and NORA's Lot Next Door program.

Due to uneven repopulation and rebuilding, the Citywide Plan formulated three different policy areas. Policy Area C denotes parts of the city that experience below-average repopulation and rebuilding, thus necessitating targeted recovery initiatives. This departure from the return to normal paradigm of recovery planning is related to the existing conditions in these areas. They inform the progress of recovery after the disaster, and the existing spatial and social aspects can be interpreted as vulnerabilities in disaster and inequalities of stratification. The selected research unit, the Lower Ninth Ward, exemplifies these conditions with a pre-storm majority African-American population with below-average incomes and homeowners with low property values. In addition to this, the Road Home program's buyout option enabled residents with funding gaps and limited access to resources to sell their properties to the state and leave. The situation is most pronounced in the Lower 9 neighborhood, partially below sea level and subject to increased risk, compared to the historic Holy Cross neighborhood, situated along the natural levee of the Mississippi.

Blighted properties and Road Home buyout properties are made available to residents via NORA's Lot Next Door program, a form of adaptation in recovery planning aimed at fostering infill development. In Policy Area C this becomes extremely difficult, due to low repopulation rates. However, this situation is further complicated by the aspirational aims for urban growth formulated in the new Masterplan. It supports large multi-family development throughout the city. Thus, its aims become doubly contradictory: they defy historic shrinkage before Katrina and low repopulation rates in hard-hit areas of the city after the disaster. These observations indicate the weak link between institutional aspects of recovery and related social and spatial aspects. However, the entire rebuilding process is not yet complete, and despite weak recovery in the Lower Ninth Ward, nonprofit organizations purchase Lot Next Door properties from NORA to further rebuilding efforts.

For recovery to be effective, institutional support and funding must be quick. Recovery planning and masterplanning, while comprising two different forms of (urban) planning, require coordination of planning goals in relation to existing conditions. Therefore, the author proposes the following planning recommendations: planning before disaster is beneficial, as it enables coordination between recovery programs and plans. State-led recovery funding and programs must take into account that cities comprise particular ratios of homeowners and rental populations: strategies need to be adjusted accordingly. To assist both homeowners and renters in low-density neighborhoods, the author suggests targeted and early support for Small Rental Properties, particularly where infill development appears more sustainable than large multi-family development. Rebuilding what existed before the storm ('reconstruction') and improving this situation ('betterment') need to be balanced carefully to avoid contradictions between shrinkage and growth.

While the empirical data refers to an American example, the theoretical basis, the methodological approach, and the sociological and community-oriented methods enable application to other contexts and similar (potential) cases. Due to global urbanization

processes and the potential dangers of (anthropogenic) climate change and sea level rise, plenty of coastal and peri-coastal metropolises come to mind in this regard. The existing conditions of the city - social aspects that are continually informed by spatial aspects - appear as significant factors that influence recovery planning. In the case of urban disasters, to value what exists in the city becomes a matter of survival during recovery after disaster.

Endnotes

- 1 In this context, planning is supposed to take place before disaster and may complement other planning activities oriented towards urban development while also stating "land acquisition needs during recovery" (McEntire 2006:173). Planning may also contribute to mitigation, defined as "efforts to prevent disasters or minimize impact through hazard and vulnerability assessments, improved construction practices, and better land-use decisions" (McEntire 2006:172). Mitigation may include structural (built) measures and non-structural measures, such as legislature, zoning, or building codes.
- 2 After receiving massive housing damage due to Hurricanes Katrina and Rita, the state of Louisiana created a coordinating institution, the Louisiana Recovery Authority (LRA). Use of funds as intended by the LRA was subject to approval by the state legislature. The LRA developed the Road Home program, which was introduced in 2006 with the intention to "encourage homeowners to (...) begin rebuilding" (Czerwinski 2007:7) and "re-establish their lives in Louisiana" (Road Home n.d.:n.p.). The program's primary focus were owner occupants, who could apply for grants based on property values "before the storms and the amount of damage that was not covered by insurance or other forms of assistance" (Czerwinski 2007:7). The Road Home program was continually altered and comprised four different options for homeowner recovery assistance defined as repair, rebuild, relocate, or sell. Preconditions included that applicants were owner-occupants of "a single or double unit structure" (Road Home n.d.:n.p.) as "main residence at the time of the hurricane" (ibid.) and that FEMA had categorized these structures as either 'destroyed' or with 'major' or 'severe' damage. Applicants could receive a maximum grant sum of \$150,000. Other forms of support, e.g. insurance monies, were deducted from the total amount. The Road Home program included a component for the owners of rental properties, including "large developers and small property owners" (ibid.). These were implemented only after delays.
- 3 To address recovery problems of hard-hit areas of the city, the Citywide Plan was supplemented by the Citywide Recovery Implementation Strategy (Recovery Strategy), created by the Office of Recovery Development and Administration (ORDA) and adopted by the City Council in 2007. The Recovery Strategy defined Target Recovery Areas in 17 neighborhoods "in need of urban transformation as the result of pre-Katrina deterioration as well as damage incurred both during the 2005 Hurricane Season" (City of New Orleans and New Orleans Redevelopment Authority 2008:1-2).
- 4 Differences between planning for recovery and for 'normal' urban development are pointed out. For instance, independent planning commissions exist so "that politicians aren't able to dictate (...) waivers and variances" (NO-OS-2009.06.12). The precondition for this is "insulat[ing] as many of these boards and commissions from the political process" (ibid.). During disaster recovery, however, "that is all upside-down" (ibid.).

Space and Narratives: Interdisciplinary Approaches to Reading Socio-Spatial Interplays in Rapidly Urbanizing Environments¹

KRISHNAMURTHY, Sukanya, Ph.D., Canada

Abstract

The city is represented not just by its physical fabric, but also by collective representations of various characteristics that contribute to its making- memory, identity, forgetting, transformations, history etc. Understanding diverse representations and systems that exists in cities is critical both in planning and theorizing how urban spaces can be analyzed and studied. To approach various facets of socio-spatial interplays, this paper advocates the combining of structural theorists such as Choay, Lefebvre and Rossi to create an empirical matrix that bridges physical and social attributes of urban environments. The empirical matrix aims to study various phenomena such as evolution and identity of various spaces, memory associated space, place-making, attachment to name a few.

Bangalore, like any of the many large urban centers (or mega regions) is living under the umbrella of economic and cultural changes that has now become synonymous with modern India. When the developed matrix was applied to the city of Bangalore, India it enabled the identification of sites that were meaningful locations that people made, inhabited, visited and participated inherently linked to the production of memory, identity and attachment. This paper highlights new approaches to identifying spaces of importance in rapidly urbanizing environments that are beneficial to long term urban renewal plans and, identifying and protecting spaces of local importance.

One of the primary aims of this paper is to highlight the importance of creative research methodologies particularly in dynamic urban environments, the matrix encouraged the study to deal with observable patterns, various historicity's, political, economic and social productions. The interdisciplinary approach of combining various theories, empirical data and qualitative methodology brought out nuances in an urban environment that is currently striving to find a balance between globalized and local expression of urban space.

1. Introduction

Bangalore (India) like many urban centers around the world is under constant threat of transformation- political, social, cultural and architectural. Living through various transformations over the last two hundred years, the city has had to both imagine itself and re-imagine itself many times over. Under this context of constant flux, first subject to the British rule (late nineteenth to mid twentieth century) followed by liberalization of the markets (late twentieth century) and the IT boom (last twenty five years), historical process within the city have left many an indicator on the urban form. Within the Indian subcontinent, Bangalore is an example where the changes that the city has faced in terms of urban transformation can be traced with relative ease mainly due to the presence of the past in various distinct and distinguishable layers. These sites or markers from regimes of yesteryears play dichotomous roles as of sites of memory and sites of urban transition.

Discerning how various regimes that the city experienced and its many forms affected the production of heterogeneous urban space, this paper explores open ended narratives on the role of architecture, identity and place-making. Investigating a landscape of chequered

¹ Sections of this paper are part of a Ph.D. dissertation titled 'Reading Architecture/Remembering/Forgetting Interplay: Development of a Framework to Study Urban and Object Level Cases' by the author. The thesis was defended in November 2012 at Faculty of Architecture, Bauhaus Universität, Weimar. Email: krishnamurthy.sukanya@gmail.com

architectural history to trace and analyze how rapidly urbanizing environments accommodate for spaces of everyday importance in globalizing climates, this paper develops a strategy of study that bridges the physical and social parameters of urban form. The analysis is approached through the structural, semiotic and representative nature of urban form (or architecture).

Urban environments can be considered as inherently complex, dynamic and transformative in nature (Eco, Lynch, Rossi, Lefebvre, Halbwachs, Harvey, Boyer et.al.); to accommodate for these characteristics the paper formulates a qualitative matrix that balances these various attributes. Though a number of theories have been put forward to connect diverse narratives and physical form, in this paper the works of Aldo Rossi, Henri Lefebvre and Françoise Choay were seminal in informing the matrix construction. Each of the above stated theoreticians developed various parameters through which dynamic urban spaces can be studied, while highlighting the need to understand space as more than a physical construct.

The first section focuses on the primary aim of the paper, to develop a methodology that connects and expands on the various roles that urban environments play. In building the said matrix and using various interdisciplinary qualitative methodologies, the paper contributes to finding a way to traverse and connect myriad socio-spatial narratives, expanded in the latter half of the paper. Applied to the urban environment of Bangalore, the study encouraged the identification of sites of local importance from various strata's of urban development, existence of local heritage sites and commemorative acts that (re) connected space and inhabitants were brought forward.

This paper highlights that in reading narratives in space, urban form moves from its purely physical semblance to the realm of the symbolic and commemorative, connected to identity production and attachment or place making. In order to study urban environments that are complex and inherently transformative, the paper illustrates the heightened need for innovative interdisciplinary methodologies that can accommodate variances and be shaped depending on context of study. The study concludes that urban form when read and observed as a mnemonic and commemorative platform, acts as a marker and material witness contributing to notions of representation, individual and social identity; thereby not just expanding upon traditional definitions of urban environments, but also highlighting the role that local sites (or architecture) play in globalizing climates.

2. Constructing the theoretical framework and matrix

Based on the technique developed by Françoise Choay (1969) in *Urbanism and Semiology* with the aim to bridge the empirical analysis of architecture with certain rhythms in the city that are spatial in their orientation, this section develops a theoretical framework that can be adapted and used as an analytical guide in various urban environments. By expanding upon Choay's work on differentiating architectural analysis into various layers to include the theories of Rossi, Lefebvre, Halbwachs and Connerton, the framework moves to encompass elements needed to observe various narratives that lend itself to spatial expressions.

Choay's work can be interpreted as a strategy to connect the analysis of urban form with narratives in the city that are spatial in their rhythm. Through her work one understands that spatial rhythms in a city can be read through: (1) architectural systems or spatial organizations, (2) auxiliary systems in usage (symbolism, rituals etc.) and (3) syntagms; patterns and elements that are defined in relation to each other – and in relation to the whole structure. Parallels can be drawn between her work and Aldo Rossi's presentation of reading a city and patterns. In *Architecture of the City*, Rossi advocates using evolution of space as a toolkit to study patterns and developments of architectural space or systems. For Rossi studying the evolution of a spatial system helps in identifying sites of permanence or urban artifacts in the city that provide a framework for understanding the forces that shaped form. Rossi (1984, p.21-22) states 'the theory of urban artifacts, stems from the identification of the city itself as an artifact and from its

division into individual buildings and dwelling areas'. He also introduces the concept of 'primary elements' that expands on the role that certain elements exhibit heightened sense of meanings given their roles in urban landscapes (Rossi 1984, p.22). This concept is seminal in identifying spaces of importance in a given environment.

Though Rossi is emphatic upon the production of architecture and its relation to society, he does not expand on how these sites are socially produced or represented. Through the readings of Henri Lefèbvre, the production of social space and socio-spatial practices with respect to architecture can be expanded upon. In *The Production of Space*, Lefèbvre (1991, p.18) stresses that architectural space is not space itself, but only a way of look at space, which is a space of social practices. Lefèbvre (1996) describes the city and its urban life as a dynamic dialectic process of possibilities and encounters. Complimentary to Rossi, he describes the development of society and the city as dialectics between different kinds of human interactions and practices acted out in space. Lefebvre (1991, p.38) proposes a spatial triad that he labels as 'the three moments of social space' (the perceived-conceived-lived) to distinguish various characteristics of spatial production to aide the argumentation between actual space and mental space.

Between Choay's and Rossi's urban form production and patterns, and Lefèbvre's social space, approaching the question of studying urban space gets a framework that is rooted in both architecture and social practices. By combining theories that are structural in root urban environments can be studied and analyzed as morphological systems that are related inherently to social production and practices.

Constructing the empirical matrix

In the act of threading various theories together the aim is to build a matrix that bridges commonalities that exists between the various theoreticians. Through the brief theoretical introduction above, it can be concluded that the city can be studied and represented not just by its physical fabric and form, but also by collective representations of various characteristics that contribute to its making- like history, identity, transformations, memory etc. Understanding of forms and morphological systems arises from the study through the observation of various actions, social practices that both produce and transform the spaces and the forms it contains.

The aim of the framework is to help identify sites wherein spatial narratives can be experienced and observed in a dynamic urban environment. Building on Choay's initial strategy, to accommodate Rossi, Lefebvre, Halbwachs and Connerton, the following process of development can be diagrammatically represented:

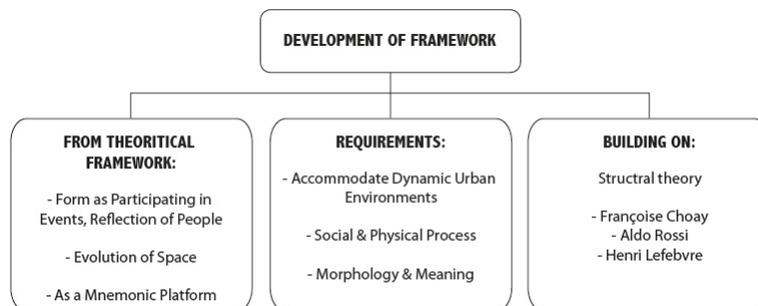

Fig 1. Process of framework development

The process of developing the framework contained three distinct steps as highlighted in Fig. 1 and was based on the works of the theorists briefly outlined in the previous section. To accommodate the dynamic and transformative nature of urban environments, it was necessary that the developed matrix had the potential to address simultaneously the social and physical

production of space and behaviors. Following through on rigorous questioning and critique of the motives behind the creation of such frameworks in various discussions, the resultant empirical matrix expanded as a network diagram (Fig. 2) was used to discern possible sites on socio-spatial interplay within an urban environment.

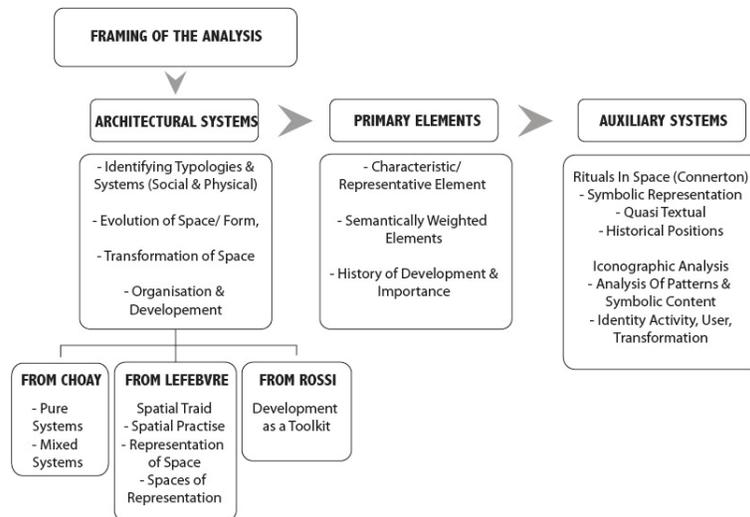

Fig 2. Empirical matrix derived and developed from various theories

The matrix expands on first establishing predominant architectural systems that exist in the selected urban environment. This helps in identifying evolution of space and recognizing the patterns or strata's of development (from the theories of Choay, Rossi and Lefebvre), before progressing towards positioning sites of importance and primary elements. The matrix also takes into account auxiliary systems of communications such as iconography and rituals that provides a holistic picture of various narratives that can be observed. Each of the three distinct steps though identified independently as process to undertake when applied to an urban environment go almost in parallel. It is important to note that each step offers observations and evaluations that lead to identifying diverse narratives in urban space and described in detail through the empirical study of Bangalore, India.

3. Application of the empirical matrix: Bangalore, India

For a city that can trace it's living and built history² to mid sixteenth century, the urban landscapes went through various stages of development from that of a small village hamlet to a cantonment of the British times and is featured on the list of fastest growing cities of the world.³

These belts of development through the last centuries have had distinct observable characteristics in lieu with various period's of economics and social practices the city experienced. Using this as a keystone for commencement for the empirical work on the city, this

² Though traces of various regimes (from fourth century AD onwards) can be discerned within the genealogy of the city this was considered out of the scope of this work. The reference year for the birth of an urban settlement described in the next sections is early sixteenth century. Refer Hasan 1970, Nair 2005, Mathur and Cunha 2006 for more details.

³ According to the international independent think tank City Mayors Foundation cities in the India, China, Africa and South America's are among the top 100 featured cities as the fastest growing cities in the world. City Mayors Statistics, 'The world's fastest growing cities and urban areas from 2006 to 2020', http://www.citymayors.com/statistics/urban_growth1.html [21 July 2012].

section describes the climate that produced various forms, behaviors and attachments. Elaborating on the development of the urban landscape both in terms of form and the processes through which certain elements of architecture developed in conjunction with prevalent practices of the given period, leading to zones with distinct characteristics where various forms of socio-spatial interplay can be recorded.

A diachronic approach to the investigation gave access to study areas and the contrasts between various stages of development i.e. studying not just the system of development but also how the production of meaning and function developed. The biggest challenge with the urban study was the problem of scale and selecting of the various methods for collecting and collating available data and forming an analysis of the same. The identifying of a specific zone helped with narrowing down the process through which certain elements are ascribed with meaning leading to attachment and narratives in urban space. This line of investigating encouraged the study of various layers within the urban space and helped trace sites of importance in parallel.

The following sections expand on the implementation of developed matrix that lead to the identification of the history of forms and settlement patterns within the city (that lead to its amalgamated identity and structure) and the discerning of various primary elements.

3.1. Step 1: Identifying Architectural Systems

Tracing predominant architectural systems, regimes and patterns of development is the first step in the developed framework. As with other cities in the Indian sub continent, Bangalore's history of urbanization can be characterized into four main economic, political and architectural paradigms: Kingdoms, Colonization, Post-Colonization and Globalized Spaces. During each of the four periods, a specific typology of urban space can be identified along with development of important or primary spaces within each of these development zones. Based on Chakravorty's (2000) classification of periods of paradigms in Calcutta, a similar paradigm can be drawn for Bangalore.

Time Period	Political Regime	Economic Climate	Planning
Pre 1537	Various Kingdoms	Trade, business	Organic
1537-1790	Kingdom	Regional trading, shop keeping, regional production	Organic
1790-1937	Colonialism	International market distribution, exploitation, segregation	Colonial
1947-1991	Post-Colonial Democracy	State lead import, substitution industrialization	Start of modernist planning
1991-present	Post-Colonial Democracy	Liberalisation of markets	Global developments

Table 1: Various planning paradigms in the city of Bangalore and the division of the four zones. Based on Chakravorty (2000) and Stallmeyer (2006).

The organic city, which is one of the models of pre-colonial south Indian planning between the sixteenth and eighteenth century, contained a fort (*kote*), settlement/ market area (*pete or pettah*) and large artificially constructed body of water or tank (*kere*). The growth of the city is attributed to its geographical location in the South Indian peninsula, its relatively central position meant that the city was in the crossroads of routes going north-south and east. The

agglomeration of various settlements around the ample tanks in the region, growth of local markets and growing population were the markings of a region facing potential growth.

Bangalore attracted the attention of the British in late eighteenth century, who saw the geographical location and climate as favorable conditions to establish a cantonment (or Civil

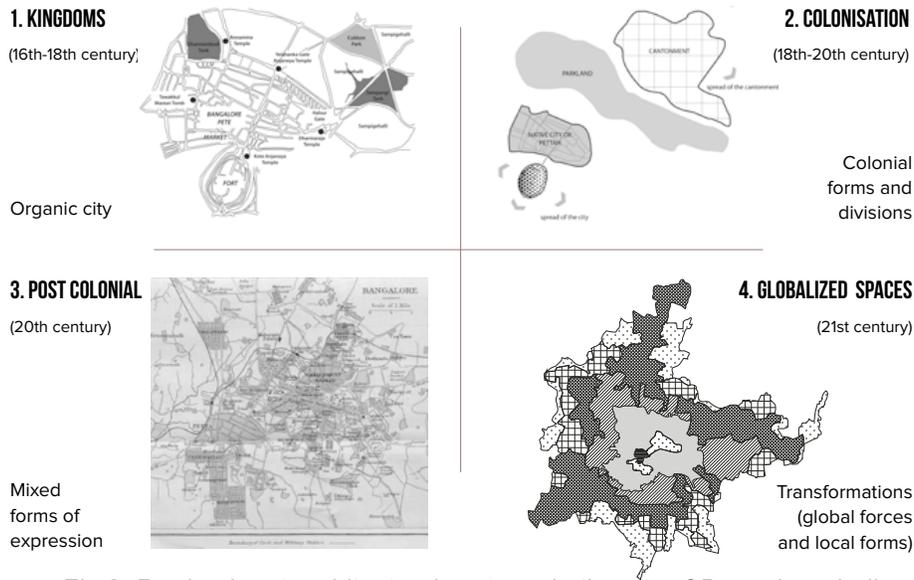

Fig 3. Predominant architectural systems in the city of Bangalore, India

and Military Station) in the city. As with other colonial cities, the period of colonization saw division of urban form between the colonizers and the natives. The introduction of new planning methods such blocks, squares and grids differentiated the organic city from the colonial one. The contemporary city still retains the swathe of parkland that once divided the two cities as a remnant from colonial times. Following the fall of the British in the mid twentieth century, post-colonial Bangalore faced with the uphill task of combining two cities to create a unified identity. Urban form remained divided well into the seventies and eighties

Lastly, the global spaces within the city are responses to new pressures that the city faces. Bangalore, as hypothesized in the *Informational City* by Manuel Castell (1991) can be defined as a space/ site of global production and consumption practices. The liberalization of the Indian economy and growth of the information technology industry and the effects on urban space has been the topic of many an academic debate. The culminating effects of a small town grown into a metropolis of nearly nine million inhabitants is situated within the confines of small town dreams and contrasted by the need to compete with other cities on a global front.

By studying these processes individually what came to the forefront was the complexity of the situation within the city and the type of methodological direction that could facilitate the understanding of socio-spatial narratives within the city through various architectural systems. By going through the process of identifying systems and regimes, the process yielded a direction towards identifying zones of importance.

Through the first step of the matrix, four broad architectural systems in the city were identified where each of the systems developed under the influence of various regimes differing in planning, economics, political and social norms. Within each regime, patterns and structures in the city developed in almost disjunction with existing forms and independent of planning strategies that existed at the given time, these varied approaches to planning contributed to the resultant form in the city today.

Given that the four architectural systems spread over an urban area of more than seven hundred square kilometers with nearly nine million in population it was necessary to identify a

zone that could behave as a background to study specific socio-spatial narratives, i.e. create an empirical boundary of study. To fulfill this requirement from the four systems, the organic city or the oldest section of the city that remained a fixed point of historic reference was selected as a zone wherein to explore the concepts of socio-spatial narration. This selection was based on a mix of morphological and iconographical characteristics, existence of various urban rituals, and myriad spaces of transformation in a singular zone. An important factor that contributed to its identification was the repeated emphasis that the organic city was given in various discourses during the time of case study visits.

3.2. Step 2: Identifying Primary Elements

The system developed by Aldo Rossi (1984, p.22) provides an approach for studying relations between 'semantically weighted elements'⁴ and other urban elements within the development of the urban fabric. A primary element is a space of local importance and represents a definitive phase in the development of a layer in a given or selected zone. These elements are not necessarily historical in nature, but elements or spaces that play either major or minor roles of importance within a certain regional or local contexts. They go beyond a level of physical importance and can be read as a concept developed through the relationships that these elements have within their surroundings.

Founded in sixteenth century the area of the Pettah and the Fort has remained the historic core of the city for the last five hundred years. Studying this form and the practices within this space speaks of the connections to the past and the coming of different waves of transformation. Though the area has changed demographically, spatially it retains the forms from yesteryears, the narrow roads, divisions based on professions, narrow houses with mixed business and living quarters remains the characteristic of the space (see Fig. 4).

Identifying primary elements within the organic city was done through a number of qualitative steps starting with observation and focus groups (5-7 people), before moving on to targeted interviews, videographies and go-alongs. Focus groups provided a broad base of ideas to work on ranging from historical sites in the old city or Pettah to traditional spaces of occupation that were fast disappearing. Through a series of interviews and discussions, archival material analysis and various focus groups⁵ possible locations of primary elements were collected. Within the old city the following quantifiers were identified⁶:

- 1) Historic Sites: Fort, Pettah and Tanks
- 2) Religious institutions
- 3) Markets and squares
- 4) Traditional living quarters and occupations

One of the first exercises conducted was the mapping of main pettah zone, showcasing its inherent organic shape, highlighting spaces or zones that were extinct but retained attachments to both the inhabitants of the space and general public, and lastly identifying where primary elements were positioned. Fig. 4 highlights primary elements identified in the pettah that are explored in detail through the following sections. Predominantly the mapping of primary

⁴ Françoise Choay introduces the concept of 'semantically weighted elements', to show the relationship between minor elements and those elements related to the concept of power. The relationship between these various elements helps both the reading of the urban space and an indication of how the urban setting evolved.

⁵ The focus was to get a cross section of people who were both familiar and unfamiliar with the area. To get diverse unbiased opinions focus groups were held in various places in the city (including the Pettah). Focus group 1: Inhabitants of the Pettah and general public; Focus group 2: Planners, researchers, architects and university students; Focus group 3: General public and school students.

⁶ Through the exercise a number of sites were identified (more than a hundred locations) and what is highlighted here are the sites that were common or repeated in various conversations.

elements were along the main roads that divided the pettah into various sections, highlighting importance of visual interaction of everyday spaces and degree of local importance.

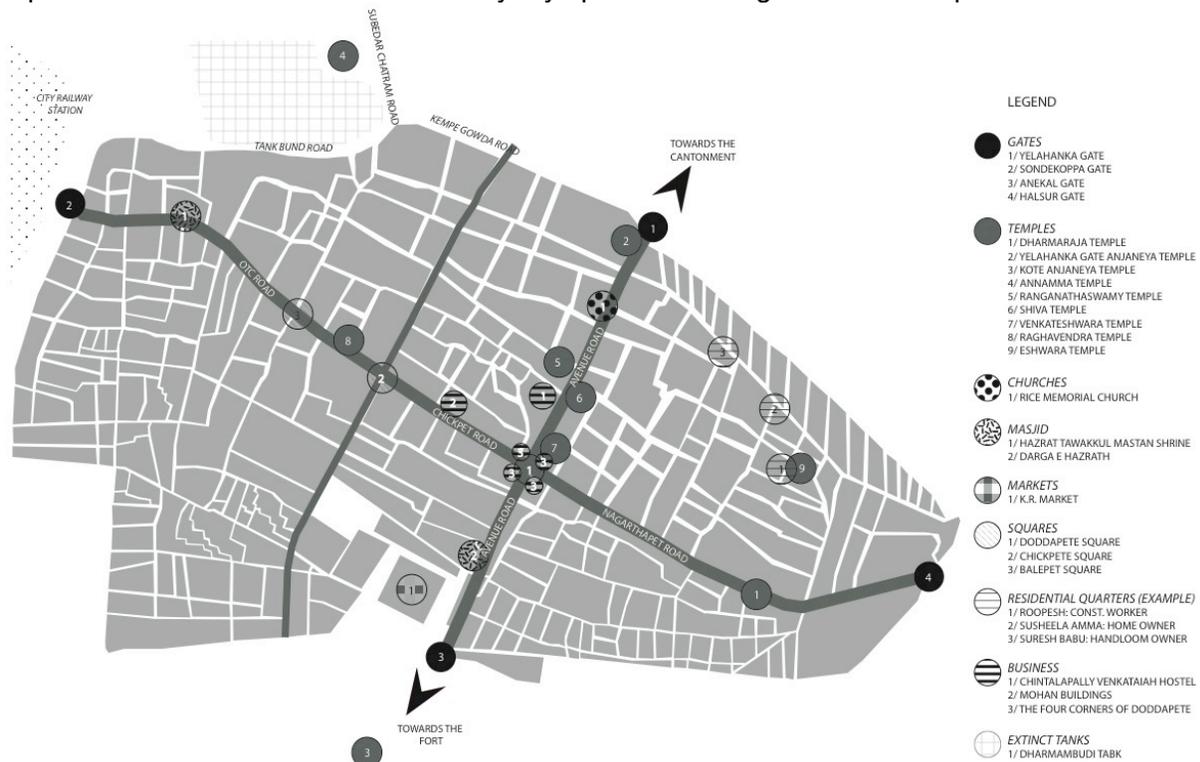

Fig 4. Primary elements identified in the organic city or pettah. The map also highlights the organic growth of the city with narrow roads in the city of Bangalore, India

Historic Sites: Fort, Pettah and Tanks

Though none of the former grandeur remains, a partial remnant of the sixteenth century fort draws to it a constant stream of visitors. This site is slowly regaining emphasis within the city's landscape through interventions from city based NGO's, tourist and conservation groups. The 're-appearance' of the Fort within the urban landscape of the city lays emphasis on the making of new mental images with the inhabitants, an aspect that has so far been neglected.

We studied this in school when I was much-much younger, responds Anand when asked about his visit to the fort wall and the markets. It didn't even occur to me that this historic site still exists in the city until a friend of mine visited this place a few months back. Today we have come as a big group to be tourists in the city we live in (and laughs).⁷

In relation to the disappearing fort, the Pettah area plays a more significant role in tracing narratives within urban space. Through the presence of certain social characteristics and urban form retention, the Pettah forms a zone charged with various stories and behaviors. The area was once a predominantly market and residential areas has slowly transformed into what is now referred to as 'the city'. By using Kevin Lynch (1992, p. 2) and his theories on mental images '... one particular visual quality: the apparent clarity of legibility of the cityscape. By this we mean the ease with which its parts can be recognized and can be organized into a coherent pattern',

⁷ Interview with tourists on site, Anand Balasubramaniam, Software Engineer. May 2011

this zone can be analyzed as one that has retained recognizable patterns. The marked divisions in space based on business or function drives the notion of legibility here, as years of settlement based on certain patterns are recognizable and is also communicated through behaviors in the space.

For the Pettah, an area that acts as an artifact to the city (through its presence of a historical core, function and form) constitutes to 'containing' the historical and collective memory of the city provided a necessary link to the past of the city as Eisenman (1992, p.10) expands 'For Rossi, the city is a theatre of human events. This theatre is no longer just a representation: it is a reality. It absorbs events and feelings and every new event contains within it a memory of the past and a potential memory for the future'. The entire Pettah area exists as a zone that contains history, memory and place attachment that has grown through various stages and centuries, it is important to see the zone in its entirety before studying the elements that contribute to its characteristics. In a city of constant transformation it serves to bring the past into the present, providing a past that can still be experienced (Eisenman 1992).

Similarly the role of tanks (small bodies of water) cannot be overlooked, given that the pettah evolved due to its close proximity to two tanks north and south of its boundaries. Though extinct (land-filled), the functions that revolved around these tanks continue, economic and religious continue.

Religious institutions

Religious institutions within the South Asian context play the role of the community's focal point in terms of not just centers of worship but also the institution around which communal and in the past educational activities took place. Though the relevance of these institutions are fast changing in a landscape of modernization and technology, within the Pettah area some institutions continue to hold on to strong traditions and attachments to form and associated practices.

The existence of various religious institutions⁸ within a small area speaks of not just the diversity of religions but stands testimony to the various regimes and demographical shifts whose introduction brought in new forms of religious practices within the pettah. Apart from the economic division that can be easily perceived from the urban form, the existence of various social groups in terms of religious affiliations can also be discerned. The common urban space that these various intuitions act upon and occupy, attests to various faiths, rituals and myths.

Markets and squares

Historically the Pettah area developed as a mix between residential quarters and entrepreneurial spaces. In the last centuries, though the demography has undergone various shifts, the mixed character has remained constant. Markets within the Pettah areas, both permanent and temporary have always played a role as an important node for exchange of goods, and continue to attract residents of the pettah and the city.⁹

The city's oldest square is at the junction of the two main roads in the Pettah (see Fig. 4), and is also the site where the founder of the city decided the urban boundary in sixteenth century. Though there is no evidence of this event on site, city lore and myth have strong references to the role that this site played in establishing the kings' regime (Hassan 1970 p.14)

⁸ Within the Pettah area there are Hindu Temples, Churches and Mosques, each with a distinct patronage populace.

⁹ For more details on interviews, maps and data on markets please refer Krishnamurthy 2012.

Traditional living quarters and occupations

As the urban environment is home to a myriad number of communities (weavers, oil extractors, textile manufactures etc.), form reflected function and individual community's identity. Divided by profession and communities, the urban environment was identified by occupation that lent itself to the naming of a particular zone.

Over the last decades this identification through communal identity has been disappearing, divisions within the family and escalating land value has dictated and forced new forms of residential quarters in the Pettah (apartment style living). The pettah though has small pockets of traditional living quarters (see Fig 4), When the case study of this area was carried out in 2011, the distinction between residential spaces and business activities were hard to discern given the rate of transformation.

3.3 Step 3: Auxiliary systems: Rituals in space

Karaga

The Karaga and Bangalore city are conjoined by a complex web of relationships, associations and themes. It is the ultimate grand spectacle, a ritual and social performance that converts the urban landscape and its inhabitants from being just a backdrop, to dynamic, living participants. In its subtext lie the dominant themes of dualities/transformation that co-exist on various meta-physical and spatial levels.

Aliyeh Rizvi, City Blogger¹⁰

The Karaga festivals, is one of the oldest festivals celebrated in the city, though driven by the community of Tigala's, it now brings together thousands of people from the city for a week long celebration. In the act of all these people agglomerating in one place, sites in the Pettah that are generally lost in everyday are reignited.¹¹

Karaga is an annual religious performance/ritual that takes place through the lanes and at specific sites within the Pettah. Connerton (1989: 44) defines the word 'ritual' as rule governed activity of a symbolic character, which draws the attention of its participants to objects of thought and feeling which they hold to be of special significance. He continues that rituals 'are formalized acts, and tend to be stylized, stereotyped and repetitive... they are not performed under inner momentary compulsion but are deliberately observed to denote feelings'. The event of the Karaga is a historic ritual that continues to play out yearly and is attended by a large segment of the population of the old city and from other parts of the city as well.

The Karaga is described here due to its relevance and attachment to urban form, sustaining group memory and the process through which it is conveyed. Studied as a commemorative event, one that supports the conveying the traditions of the past to the present. The Karaga is a performance dedicated to the goddess Draupadi and is a festival celebrated by the community of the Tigalas. The Tigala community were a group of horticulturalists (gardeners) who settled near tanks across the city and developed the tradition of this performance that continues till today.

The locus of the performance is the Dharmaraja Temple in the city (marked as No. 1 in the Fig. 5) that traditionally belonged to the group of the Tigalas. The event is spread over eleven-day duration (during the months of March-April) with the last day of the festival culminating with the carrying of the sacred pot through the streets of the Pettah. The movement

¹⁰ "The Bangalore Karaga – The Sons of Draupadi". <https://aturquoisecloud.wordpress.com/2011/04/25/the-bangalore-karaga-sons-of-draupadi/> (accessed November 15, 2011).

¹¹ Interview with Karaga participant, April 2011.

of the Karaga through the Pettah reconnects various parts of the area and its religious institutions and also visits what was once the fort area (as one of the temples visited by the Karaga lies outside the boundaries of the Pettah area) and a symbolic visit to the extinct tank of the area.

The route map is depicted in Fig. 5 highlights the sites of the Karaga in relation to other spaces in the Pettah area. The movement of the Karaga from one site to another marks what was once the boundary of the Pettah or City area. Slicing through various historical and religious periods, the Karaga marks a commemorative mnemonic to the past. With the Karaga visiting the four corners of the Pettah area and the shrine that marks the coming of a large Muslim population (during the time of Haider Ali and Tippu Sultan), underlines these periods and also highlights the axes that run through the Pettah area.

The movement and agglomeration of over twenty thousand to fifty thousand people within this space marks the performance as a powerful mnemonic for the city, its form and urban memory. In the process of this performance the participating population brings out spaces that have been long forgotten and rekindling of connection between body, memory and architecture takes place. Within the Pettah area, the working of architecture as a platform to experience various socio-spatial narratives is evident through the attachment to form. The rate of transformation¹² of the Pettah area, though fast, has left untouched certain spaces and behaviors that remain iconic of the space. The historic sites, the organic form of the Pettah and commemorative rituals in space reflect sites of the everyday where complex relations and interconnections between place, people and matter can be experienced. Echoing Arendt (1958: 96), who argues that the reality and reliability of the human world rests primarily on the fact that we are surrounded by things more permanent than the activity by which they were produced.

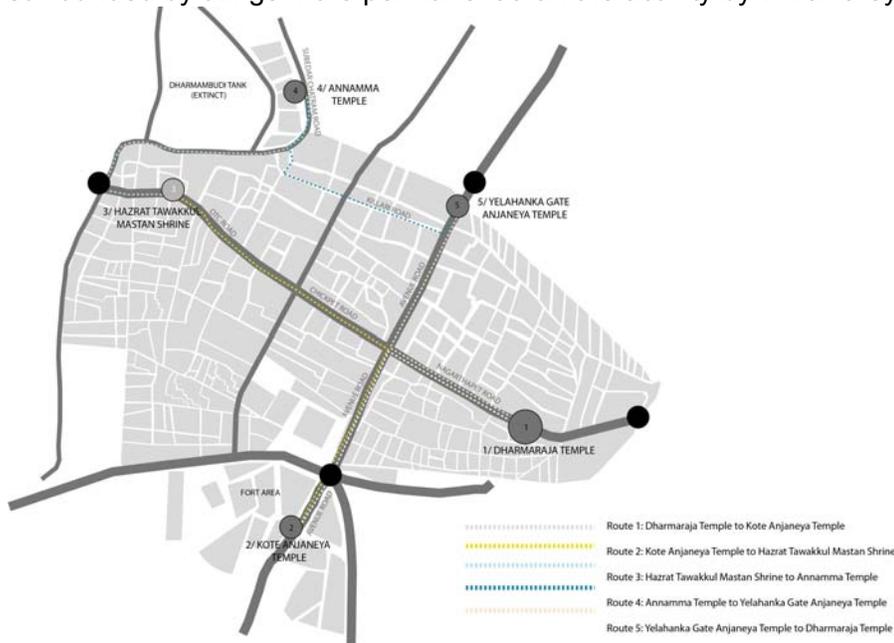

Fig. 5: Tracing the root of Karaga festival through the pettah. The exercise was carried out as a go along coupled with videography and extensive photography.

¹² There are plans for expanding roads, changing layouts to accommodate parking structures, etc. which raised objections throughout the city. Writes Chandrashekar Balachandran, Cultural Geographer and Founder of Dharani Trust in the city 'Change is inevitable, but history should not be lost. The cultural plurality and diversity can be seen in these areas. The Rice Memorial Church, Moinuddinn Darga and many ancient Hindu temples should remain untouched... if we lose our historical landscape, we lose the reminders of collected memory.'

The characteristics of the Pettah area are buried deep within the historic and commemorative mnemonics of space that aid the making of urban memory with the zone (and also contributing to the memory of the city in general). Continuing along the lines of Rossi's (1994) 'permanence's' within the city, the Pettah area contains 'this relationship between the locus and the citizenry then becomes the city's predominant image, both of architecture and of landscape, and as certain artifacts become part of its memory, new ones emerge'.

4. Conclusions

Various facets contribute to the representative nature of urban environments; history, collective memory, social behaviors and attachments, that go beyond the scope of its purely physical presence. Through the study of forms and morphological systems, observation of various actions and social practices, this paper expands on the need for innovative ways to study spatial narratives in constantly transforming environments.

The constructed empirical framework initiated the identification of potential sites of importance and narratives by studying the city as an evolution of various architectural forms and systems, where each system instituted certain morphological markers and characteristics contributing to the making of a particular site of importance or primary element. Architectural systems, forms and elements were studied as potential sites where in to discern and experience various socio-spatial narratives. By identifying elements and practices in the urban environment, the created framework encouraged the observation of narratives in space in a collective and individual, and institutional level.

The study drew out observations on social practices and lifestyles, place identity and attachment, rituals etc. providing insight into the constantly metamorphosing nature of ascribing symbolic value to a site. Primary elements were sites of important local narratives that were evolutionary rather than fixed and identified based on role, morphological characteristics and function rather than historic relevance alone. The active participation and shaping of urban environments through various social processes and influences, reflects the urgent need to study urban environments through frameworks that are interdisciplinary and qualitative.

The observations also demonstrate the role that everyday spaces play in globalizing environments. In a climate of rapid growth and constant change, spaces that accentuate identity, place-making and social representation need to be further analyzed, protected and studied.

New Funding Options for Urban Renewal

Joe LANGLEY, SKM, Australia

1 Introduction

Australia is unquestionably a great place to live. The OECD Better Life Index ranked Australia near the top in 13 of 14 quality of life indices in its 2012 report (Organization of Economic Co-operation and Development 2012). In terms of overall life satisfaction, Australian's rated themselves 7th highest among 36 OECD countries, equal with New Zealand and ahead of Ireland, United Kingdom and the United States. For good reason, Australia has earned its reputation as "the Lucky Country".

Despite these favorable OECD rankings, Australia is experiencing growing pains that are seriously threatening its enviable quality of life. Due to its geography and settlement patterns, Australia's six widely dispersed mainland capital cities hug its coastal fringe and have absorbed a large portion of internal and external migration. Over the last decade, for example, Australia's two largest cities, Sydney and Melbourne, have attracted nearly 40 per cent of the country's population growth, yet housing production has not kept up with this pace (Major Cities Unit, p.16). Rising construction costs, aging infrastructure, protracted government regulatory processes and a cultural preference for low density living have conspired to drive up housing costs and push new housing production to the urban edges. "Since 1996, house prices in Australia have increased faster and for the longest period since 1880" and outright home ownership has dropped from 60 percent to 46% (Major Cities Unit, p.4). These trends have resulted in a seemingly endless cycle of urban sprawl, increasing worker commuting times and unsustainable demand for all forms of urban infrastructure.

State governments have belatedly responded by shifting their focus to urban renewal and public transport to address housing affordability and road congestion issues. In 2013, the New South Wales (NSW) state government created UrbanGrowth NSW from Landcom, the traditional greenfield land development agency. UrbanGrowth's new mandate is to unblock obstacles to housing within the existing metropolitan footprint by consolidating fragmented brownfield sites close to city centres. After years of resistance, Transport for New South Wales (TfNSW), the state's transport agency, is working with Sydney City Council to extend the Sydney light rail network opened in 1997 from 7.2km to 12.8km. A planned 13km extension will link southeastern suburbs, sports venues and the University of New South Wales with the CBD (Parsons Brinckeroff Australia Pty Ltd 2013). Similar schemes combining urban renewal and new light rail networks are in planning or implementation stages throughout Australia, including:

- East Perth urban redevelopment in Western Australia (WA) (East Perth Redevelopment Agency, 20008)
- Perth light rail network
- Gold Coast light rail project in Queensland
- Melbourne's grade separated junctions project in Victoria
- Newcastle urban renewal and light rail plan in NSW
- Sunshine Coast Council's light rail project in Queensland

While progress is being made by these and other initiatives, the cost and pace of retrofitting Australia's urban centres is far outstripped by the demands for housing and public transport. Urban renewal and public transport are inextricably linked, and the common obstacle confronting these schemes is funding. Infrastructure Australia's (IA) 2013 infrastructure

priority list includes 79 proposals with an estimated cost of over \$80 billion, representing the most productive investments needed to maintain Australia's competitive position in the global economy. Australia's competitiveness and the quality of life of its citizens will decline if these and other critical infrastructure investments are not made (Infrastructure Finance Working Group, 2012). Despite spending more than \$22 billion in transport infrastructure engineering and construction in 2009-10, IA projects that Australia has an infrastructure funding deficit of approximately \$300 billion (Infrastructure Australia 2012, p.6). There is simply not enough funding under current Commonwealth and state government arrangements to fill this funding gap.

A proven means of filling the gap in urban renewal and public transport funding can be found in greater involvement by the private sector and in reforms in the way funding is sourced. The Australia Bureau of Infrastructure, Transport and Regional Economics (BITRE) states that the Australian Government's investment in highways, interstate rail networks and urban public transport systems delivers a return of \$2.65 for every \$1 invested (Infrastructure Finance Working Group, p.1). This being the case, the Commonwealth Government and peak industry associations, including Infrastructure Partnerships Australia (IPA), the Property Council of Australia (PCA) and Consult Australia, have advocated the use of value capture funding methods to contribute to Australia's funding shortfall. Although used extensively in the North America for over 40 years and recently introduced to the UK, value capture methods are not well understood in Australia and have been studiously rejected by some state treasuries.

This paper examines the potential use of value capture to contribute to Australia's urban renewal and public transport funding shortfall. Obstacles and opportunities to this funding method are examined based upon recent pilot studies, government and private sector reports, and urban renewal and public transport projects proposed or under construction throughout the country. Successful value capture programs in North America are presented to illustrate how such programs could be implemented given Australian governance and legislative frameworks. Recommendations are made concerning how value capture methods should be considered and implemented in this country.

2 What is Value Capture?

2.1 Background

Value capture funding methods arose in California in the 1960s as a means of kick-starting urban renewal programs in economically depressed urban areas. Early state legislation required local government to classify these areas as "blighted" urban renewal districts as a precondition putting a value capture program in place. Specific projects and programs were then planned within the blighted district to attract new investment, housing and jobs. These programs were called Tax Increment Financing programs (TIF) because they were funded by the increase (increment) in local property tax revenue resulting from the renewal district improvement programs.

In the US, TIF programs allow local councils and development authorities to sequester increases in property tax revenues above a base year generated within the urban renewal district for a set period of time, usually 20 to 25 years. The sequestered funds are combined with traditional local, state and federal government funds, such as local public works budgets, development levies and state government grants, to fill funding gaps for predetermined urban renewal programs and projects. Complementary private sector housing and commercial developments are identified and actively promoted as part of the scheme. In most cases, TIF funding fills the gap between what the public sector can afford and what the private sector will invest, thereby serving as the catalyst for economic development. TIF

revenues underwrite bonds or loans which ensure stakeholders that key public elements of urban renewal programs will be put in place, demonstrating the public sector's commitment to the program and attracting complementary private sector investment.

TIF programs have evolved considerably over the past 50 years and now exist under state enabling legislation in 49 of the 50 US states and the District of Columbia (Council of Development Finance Agencies, p. 1). It is the most widely used local government program for financing economic development in the US (Briffault 2010). TIF programs are also legislated in Canada and Puerto Rico. In 2012, the UK government introduced TIF legislation which allows local authorities to borrow against future growth in business rates to fund infrastructure, attract private sector investment and create jobs. The UK Government initially earmarked £150 million for TIF projects from 2013-14. A program focusing on four key development sites in Newcastle and Gateshead Councils using the TIF scheme is expected to initiate "a £92 million investment programme, creating 2,000 permanent jobs within five years, and 13,000 within 25 years"(Sanford 2013).

2.2 Definition

There are a number of funding models in use in Australia and internationally to contribute to urban infrastructure and transport planning, and each has advantages and disadvantages that must be tailored to local circumstances and objectives. A Canadian study on smart growth identified 15 different funding methods currently used in North America (Tomalty 2007). Over-use or misapplication of any of these methods can have unintended consequences and have actually discouraged complementary private sector investment. Over-reliance on upfront development levies in NSW is widely acknowledged as having stalled economic growth, diminished housing affordability and reduced employment in the mid to late 2000s (Allen Consulting Group 2003)(O'Flynn 2011). These findings forced the NSW government to reduce upfront developer levies by \$64,000 per lot (NSW Department of Premier and Cabinet 2008). Clearly, understanding how various funding models work is critical in implementing effective urban renewal programs.

In Australia and New Zealand, the value capture funding model is not well understood and has taken on a variety of meanings, not all of which are consistent or appropriate. This can result in less effective program design, delayed implementation or premature rejection of value capture as a potential funding method for urban renewal and transport projects. For example, a report for the New Zealand Transport Agency incorrectly defines value capture mechanisms as user charges applied to recover general funds, and concludes that only *perceived* benefits would be recovered from its use (Kemp et al. 2012). Lessons learned from the Gold Coast light rail project in Queensland include the need to clearly articulate what value capture is to key stakeholders and to develop a robust and early stakeholder consensus based upon non-transport "city building" objectives (Gold Coast Rapid Transit 2012). The funding shortfall is too great to limit viable options due to poor design and a lack of understanding. It is therefore important to clearly define what value capture methods are and how they are best implemented, or risk limiting their effectiveness or missing the opportunity to use them altogether.

For the purposes of this paper, value capture refers to funding methods that are closely tied to increases in public tax revenues from private property. The method relies on establishing a revenue benchmark prior to program commencement that can be monitored against specific planned investments in transport infrastructure and urban renewal. Revenues above the benchmark are then sequestered into dedicated accounts and used to repay bonds or loans which fund projects and programs, while revenues below the baseline continue to flow to taxing authorities. Examples of potential value capture revenue streams include;

- Improved property values resulting from infrastructure investments, land rezoning, and density controls

- Increases in property transfer taxes, local government rates, business rates, land taxes and related local government charges
- Sale of additional development rights over and above those permitted under existing zoning, also called sale of “bonus floorspace”
- Sale of under-utilised government land beside public transport corridors and stations
- Sale of air rights over public land and transport corridors and stations.

2.3 How is value created and captured?

Numerous studies demonstrate that well-planned urban renewal programs which integrate land use and transport infrastructure produce significant increases in land values. A 2006 study of 89 TIF districts spread across 67 municipalities in the Chicago metropolitan area found that mean annualised property values in TIF districts increased by 35% between 1983 and 1993, compared with a 6% increase in overall municipal property values (Byrne, P 2006). Industrial and CBD districts experienced the highest median increases, growing by 32% and 26%, respectively. These increases are caused by improved access to jobs and housing, more efficient and productive uses of land and infrastructure, and the ability of employers and employees to specialise to produce high value services and products.

Value capture programs provide an equitable means of reinvesting a portion of the benefits created by urban renewal and transport infrastructure programs. The chart in Figure 1 provides an illustration of the TIF conceptual funding model, which is the basis of value capture. The key features of the model are:

- Focuses on generating funds from *incremental* revenues above a predetermined baseline, as opposed to imposing additional upfront costs on development
- Establishes a clear nexus between public infrastructure investment and the captured revenue sources
- Captured revenue streams are dedicated to repayment of specific public infrastructure projects and programs for a set timeframe, typically 20 to 25 years
- Full revenue stream is returned to original taxing authorities at the end of the repayment period
- Captured revenue streams provide a long term source of revenue to underwrite loans and / or bonds which fund initial infrastructure and urban renewal investments

2.4 Common Uses of Value Capture Funds

Uses of TIF funds in the US vary from state to state depending upon enabling legislation. The most common uses of funds are:

- Studies, surveys and plans of existing land uses and infrastructure assets
- Professional services, such as architectural, engineering, legal, property marketing and financial planning
- Property acquisition and site consolidation
- Demolition and site preparation
- Rehabilitation and renovation of existing buildings
- Construction of new or improvements to existing infrastructure
- Affordable housing programs for new or displaced residents.

- Enhanced security services, job training program and day care services to promote employment opportunities for low income residents
- Relocation costs for businesses or residents affected by redevelopment

While not all of these uses would be appropriate in the Australian context, they demonstrate the flexibility of value capture programs in addressing local needs in the US system.

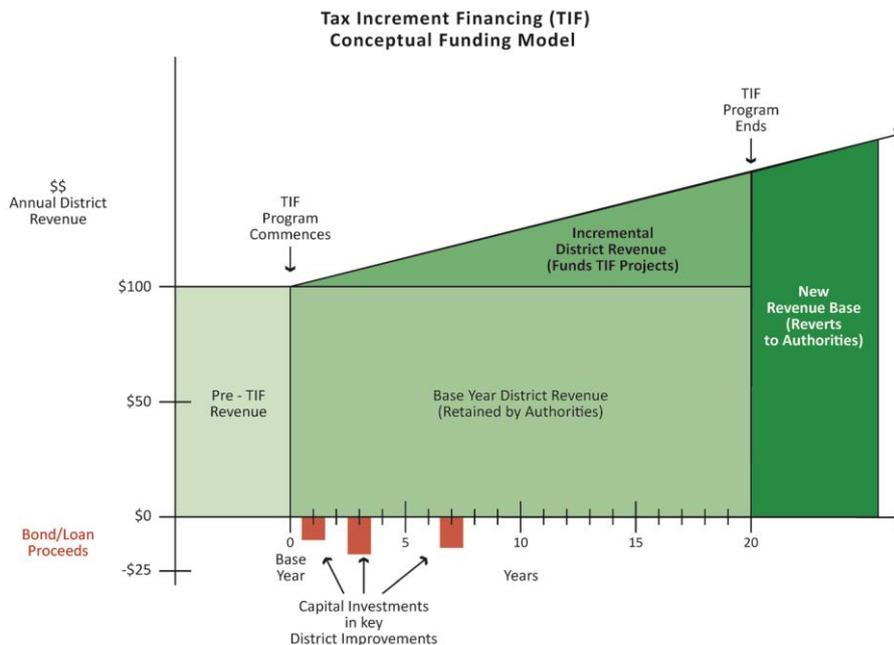

Figure 1: Tax Increment Funding Model

3 10 Key Success Factors

Experience with public – private partnership programs in Australia and internationally demonstrates that a number of important factors are essential in successful value capture programs. Ten key factors are outlined below as a prelude to identifying the opportunities and obstacles to the use of value capture methods in Australia.

3.1 Develop a comprehensive, long term plan

Value capture programs typically rely on the successful implementation of a number of mutually supportive and coordinated public and private investments to lift economic activity over a sustained period. As was found in the Gold Coast light rail example, city building must be a key driver that extends a project's objectives "beyond its transport function" to embrace high quality, higher density, mixed uses (Gold Coast Rapid Transit 2012). The absence of a comprehensive, long term strategy at the start of stakeholder consultation was later recognized a weakness in the Gold Coast light rail network by its proponents, resulting in missed opportunities for fully leveraging the benefits of the network. These strategies also need to extend 20 or more years into the future so that the benefits of a fully mature program, which tend to occur at its back end, can be captured to underwrite financing.

3.2 *Embrace genuine and robust stakeholder consultation.*

Stakeholder consultation has evolved into an established and essential component of public transport and urban planning programs at the national, state and local levels in Australia. The NSW government recognizes this by mandating four levels of stakeholder consultation in new draft planning legislation, with separate and independent consultation required at the strategic, regional, sub-regional and local levels (NSW Government 2013). The Urban Land Institute recommends that such programs consider a full spectrum of participation, as developed by the International Association for Public Participation. This will ensure that differing needs of community interests groups for different levels of information will be addressed and regulatory delays can be avoided (Corrigan 2005).

3.3 *Carefully select the improvement district*

Successful value capture districts in North America vary from small downtown improvement districts in rural communities covering several city blocks to large industrial precincts covering hundreds of hectares, such as the 345 ha Pilsen industrial TIF district in Chicago (Trkla, et al 1998). In setting the boundaries of an improvement district, consideration needs to be given to the nature and cost of physical improvements needed to create value uplift, catalytic projects that are likely to kick-start development activity, and the attitudes of business and residential property owners to the proposed activities. Assuming financial objectives can be met, it may be better not to include staunch opponents in the scheme in order to keep the program moving forward smoothly. Once the program's success is evident, attitudes may change and boundaries can be extended.

3.4 *Create a shared vision*

A shared vision involving all stakeholders requires building early consensus among residents, property owners, community groups, hospitals, educational institution, employers and businesses, even those opposed to the scheme. A widely scoped stakeholder consultation program involving all stakeholders and the media will assist in getting the message out and building alliances (Corrigan 2005). It is far better to have robust debate and informed opponents than an information vacuum and misinformation about the program.

3.5 *Establish a clear and balanced governance framework*

Value capture programs rely on establishing and maintaining good will among a wide range of public and private interest groups. Government agencies and commercial interests invest hard capital to create value, but as a form of public – private partnership operating within a democratically elected system of government, the success of these programs often relies heavily on the non – financial contributions and support from other interests, such as neighborhood associations, educational institutions, local health and social service agencies and various other special interest groups. This often requires a widely supported and collaborative process, and mechanisms to provide appropriate involvement from all groups, such as the use of task forces, facilitators and intermediaries (Corrigan 2005).

3.6 *Understand the risks and rewards for all stakeholders*

The high profile failures of several large public – private transport projects in Australia, including the Cross City Tunnel (\$700 million) and Lane Cove Tunnel (\$1.1 billion) in Sydney and the Clem7 (\$3.2 billion) and Airport Link (\$4.8 billion) in Brisbane, highlight the need for all parties to understand the risks and rewards of public – private projects. Although unsustainable toll revenues in each instance were a major factor, community opposition, pressure on proponents to inflate traffic volumes and unpopular road closures and diversions by transport agencies also contributed to these failures. Such failures cost private sector investors lost billions of dollars, but the general public also loses because future opportunities to involve much needed private sector investments will be more costly and

harder to secure. Understanding and valuing the risks and rewards of all stakeholders is therefore critical in public – private projects.

3.7 Use incentives to attract private investment and better design

Local government planning and development controls are increasingly turning to incentives rather than prescriptive standards to achieve better development outcomes and reduce costs. For example, the NSW Government is following the lead of Queensland and Victoria in moving to merit assessment processes supported by development guidelines in urban renewal areas to enable greater innovation in design, reduce approvals timeframes and lower costs (NSW Government 2013). Incentives such as reduced car parking requirements near public transit stations can significantly improve housing affordability and encourage public transport ridership. Specifically- tailored precinct zoning and development controls, such as planned unit developments (PUD) and transferable development rights (TDR), are often required to achieve higher density residential and commercial development while maintaining public open space standards. These and other incentives should be explored and encouraged.

3.8 Secure consistent and coordinated leadership

Studies of high speed railway stations in Europe and Asia found that a major factor in successful station precinct development programs is the presence of strong and consistent local leadership (AECOM 2013). Persistent local leadership by Mayor Clover Moore was a major factor in overcoming NSW government resistance to the Sydney light rail extension currently being delivered. While political leadership is important, sustained leadership that transcends administrative and political change and maintains a consistent vision for the project is essential given the long term nature of urban renewal and public transport investments.

3.9 Secure the ability to influence outcomes

A major obstacle in urban renewal programs is land fragmentation. In Australia, local and state government agencies have the power of compulsory acquisition, but this tool is used sparingly due to limitations in the ability of the agency to repackage and resell the land for other than narrowly defined public uses. In NSW for example, the compensation payable is based upon the market value of the property, disregarding increases in value caused by the carrying out or the proposal to carry out a public purpose (Land Acquisition (Just Terms Compensation) Act 1991). Lack of clear authority by Parramatta City Council under NSW law to acquire private land for redevelopment resulted in a four year delay of Civic Place, a major urban renewal project. Planning controls and compulsory acquisition powers need to provide urban renewal authorities with the ability to undertake widespread urban renewal programs where necessary or desirable in the broader public interest. The ability to repackage and sell land varies by jurisdiction, so it is important to obtain current and accurate legal advice on any limitations that may exist on land acquired through compulsory acquisition.

3.10 Build trust as a core value

Trust is an overriding value in public – private partnerships. Building and maintaining trust can be established through small efforts that evolve into larger efforts but require continual effort and commitment to be maintained. Other factors already discussed, including genuine stakeholder consultation and clear and balanced governance, are mutually supportive of this value (Corrigan 2005).

4 Obstacles and Opportunities for Value Capture in Australia

Value capture methods have been a subject of some discussion but little concrete action in Australia for many years. Given the overwhelming level of its success in other countries and

the significant need for new sources of funds to maintain economic prosperity and productivity, why hasn't value capture been implemented in Australia?

This section examines the major obstacles to its acceptance and identifies some of the benefits to its implementation in Australia. Since there are no existing programs to evaluate and little critical research on this subject in this country, these observations are drawn from the personal experiences of the author based upon 30 years in property development and urban planning consultancy in Australia, New Zealand and the United States.

4.1 *Institutional Resistance to Hypothecation*

Obstacles. Perhaps the biggest obstacle to value capture in Australia is institutional resistance by Commonwealth and state treasury officials. Public treasury officials don't like the idea of hypothecating future revenue streams for any purpose. Discussions with current and former treasury representatives generally produces a list of potential drawbacks, some of which are valid but others which are due to a misunderstanding of the method or an apparent professional bias against this approach. These views persist in government after years of effort by professional associations, academics (McIntosh 2011) and knowledgeable practitioners urging government treasuries to give serious and objective consideration to this funding model.

Opportunities. The weight of government opinion has recently shifted as government bodies such as IA and the Department of Infrastructure and Transport's Major Cities Unit have tallied up the national backlog of infrastructure investment, highlighted housing affordability and production problems, and forecast a decline in national productivity. Initiatives are either underway or recommended for Commonwealth and state treasuries to examine how value capture funding can help solve these problems. Examples include:

- The Commonwealth Government's study into high speed rail concluded that value capture programs could generate significant revenue and productivity gains if coordinated with a comprehensive urban renewal program around Sydney's Central Station (AECOM 2013).
- The Victorian Department of Treasury and Finance engaged technical advisors in April 2013 to provide advice on a value capture initiative to fund a reconfiguration of grade-level train crossings in commercial centres in Melbourne.
- IA has rated the \$4.4 billion Brisbane Cross River Rail project "ready to proceed" in its June 2013 national infrastructure report subject to an independent review of its land value capture proposal (Infrastructure Australia 2013).
- In May 2013, the NSW Parliament's Standing Committee on Transport and Infrastructure instructed the NSW Treasury to "examine ways to implement value capture mechanisms for transit oriented development precincts, in order to generate funding for future infrastructure projects" (Legislative Assembly Standing Committee on Transport and Infrastructure 2013).
- The Western Australian Department of Transport is studying the use of value capture funding methods to support implementation of its MAX light rail network.

These new initiatives are very promising. However, they do not have an overarching national perspective or coordination that would allow the sharing of research and findings into this method.

4.2 *Value versus Cost of Renewal*

Obstacles. A fundamental characteristic of this funding model is its focus on the *value* created by a public sector investment as opposed to the *cost* of the investment.

Many public and private sector practitioners in planning, finance, property and economic development assume that development levies, betterment taxes and other imposts are value

capture methods if they are applied to properties or areas experiencing value uplift. While such levies should be considered and if appropriate applied to an urban renewal or transport precinct, they rarely if ever are applied in a manner that reflects differences in the value uplift from one property to another.

The Gold Coast light rail funding model, for example, applies a flat rate to all properties equally within a defined transport district. This is certainly a valid method for generating funding, but a property owner next door to a light rail station under this system is charged at the same rate as a property owner some distance from the station. Windfall profits can be made in these cases by property owners or speculators. In effect, property owners farther away from the station subsidise the property value increase of those closer to the station.

Opportunities. Under a value capture method, revenue streams are primarily captured from incremental growth in public revenue streams that are directly attributable to the investment, such as a light rail station or public domain improvements. Examples of revenue streams which would increase as a result of these investments include:

- Recurring revenue, such as state and local taxes, stamp duty and development levies
- Non-recurring revenue, such as the sale of government assets (surplus land) or development rights (air rights, bonus zoning).

In setting up a value capture funding scheme, the sponsoring agency, such as an urban renewal authority, works with all stakeholders and taxing authorities to decide what projects or programs will be funded under the model, what revenue streams will be captured, to what extent and for how long. An agreement is reached to sequester those public revenue streams into special purpose funds to pay for specific projects and programs. These characteristics provide a degree of consultation, transparency and long term commitment that is not widely practiced in public sector spending.

4.3 *Gross Benefits versus Net Benefits*

Obstacles. Some observers object to value capture on the grounds that growth within a value capture precinct will draw commercial activity, jobs and housing from other areas. They argue that these schemes don't create value within a wider region, they simply move economic activity from one neighborhood, precinct or municipality to another.

Opportunities. This is a frequent criticism of TIF programs in the US, where few states have state – wide land use planning and local governments compete fiercely at times for commercial and residential development to increase their tax bases. This objection is valid in the US, but it fails to acknowledge a number of pressing problems in Australia's capital cities, including housing production shortfalls, the need for more efficient land use patterns and declining economic productivity.

Housing production in NSW in particular has been chronically weak for many years and housing affordability has declined significantly as a result. A 2009 study reported that the underlying demand for new dwellings in the State was around 50,000 per year, but new housing was 31,500 in 2007/08; 24,600 in 2008/09; and 31,000 in 2009/10 (BIS Shrapnel 2008, p.16). This represents a shortfall of nearly 20,000 new dwellings per year. An increasing proportion of families are unable to afford to purchase a home, in spite of government efforts to reduce costs through stamp duty relief and other concessions. Australia needs more and cheaper houses everywhere.

Well-planned urban renewal provides more efficient and productive uses for urban land. The NSW Government created UrbanGrowth in 2013 and has focused its role on unlocking stalled housing production on low density, fragmented brownfield sites. UrbanGrowth will do this by working across government agencies to consolidate land in urban activation precincts for higher density development served by improved public transport. By providing a new source of funds for UrbanGrowth, value capture programs will contribute to improved land use efficiencies, a frequently stated national and state planning objective.

In its *2013 State of Australian Cities* report, the Commonwealth Government's Major Cities Unit identified a decline in national productivity from previous years as a key issue. Industrial sectors experiencing increasing productivity are "located in city centres and rely on increasing job densities to drive productivity" (Major Cities Unit 2012). This finding highlights the need for greater density and improved public transport to maintain Australia's global competitiveness. Value capture programs are designed to address the need for higher density, transit – oriented development to improve national productivity.

4.4 Council Financial Capacity

Obstacles. The financial capacity of local government in Australia is frequently cited as a reason for the declining quality of urban centres. Councils, it is claimed, are hampered by high operating deficits, restrictions on borrowings and infrastructure backlogs.

Opportunities. Limitations on local councils' management and financial capacities are real but solvable problems. A 2013 report by the NSW Treasury Corporation (TCorp) found only 54% of local councils in the State achieved a financial sustainability outlook of moderate or better, and that 46% were weak, very weak or distressed (NSW Treasury Corporation 2013). Solutions to these shortcomings include improved management training and skills, better long range planning, and more productive use of financial assets. For example, some councils have low or no debt and strong cash flow, but large infrastructure backlogs. The report recommends that local government make more effective use of borrowing and debt management to improve financial performance. Urban renewal programs undertaken in accordance with this research paper are well aligned with TCorp's recommendations and would provide the economic development underpinnings for improved financial health of many councils.

4.5 Use of Debt

Obstacles. Government agencies at all levels are justifiably resistant to assuming unsustainable debt and are well advised to be prudent financial managers. The requirements to maintain AAA credit ratings and limit consolidated state government financial obligations are common arguments against value capture programs.

Opportunities. The most effective urban renewal programs use value capture to bridge the gap in the timing between investments in public infrastructure and the flow of tax revenue resulting from those investments. They supplement, but do not replace, existing funding sources, such as Commonwealth and state grants, development levies and rates revenue. Large early lead-in public infrastructure investments, such as transport interchanges, public domain improvements, land consolidation and urban drainage systems are common uses of these funds. These investments, if properly planned and implemented with other public and private sector investments, create long term social, economic and financial benefits for government that increase public revenues (GFOA Executive Board 2008). They also provide a clear commitment and needed catalyst to investment for the private sector, and serve to de-risk public and private financial underwriting.

Financing for key program elements could be arranged through short term treasury guarantees until revenue sources stabilise, or through infrastructure bonds issued and administered through state financing bodies, such as TCorp. Bonds with varying maturities and risk levels can be matched with appropriate program elements and investor needs. Once revenues from program elements are stabilised, the bonds can be retired and funds recycled for other projects and programs. Strong bond underwriting standards administered by TCorp and ASIC would provide the financial rigor needed to attract institutional and retail investors, allowing small superannuation funds to tap into a new investment vehicle (PricewaterhouseCoopers 2008).

5 Denver Union Station Redevelopment Case Study

The Denver Union Station redevelopment project (DUS) is a \$500 million public – private partnership formed to create a modern multi-modal transport hub and urban renewal precinct in Denver, Colorado in the United States. The project was approved Denver voters in 2004, and will be completed in 2014 (Denver Union Station Project Authority 2008). The project's major transport elements are:

- An eight track commuter rail station connecting Denver international airport, the national passenger line (Amtrak), and the cities of Boulder and Golden.
- A three track light rail station connecting to the southeast, southwest and west lines
- 22 bay regional bus facility
- Free CBD shuttle bus

The public infrastructure components are being developed by a dedicated, special purpose public transport and renewal authority, which will hand over the transport elements to existing transport agencies upon their completion and will be dissolved. Two private sector property development consortiums will develop five parcels within the 20 ha improvement district. The development will contain 125,400 square metres (1.35 million square feet) of retail, residential, hotel and commercial office uses with heights up to 61 metres (200 feet). A 685 space parking garage is also provided in the master plan (Denver Union Station Project Authority 2008, p.35).

A key feature of the redevelopment is the renovation and reuse of Denver's historic Union Station constructed in the late 19th century. The station will be the focal point of an extensive public domain connecting the precinct to nearby sports stadia, the "LoDo" entertainment precinct, central business district and the Platte River open space network.

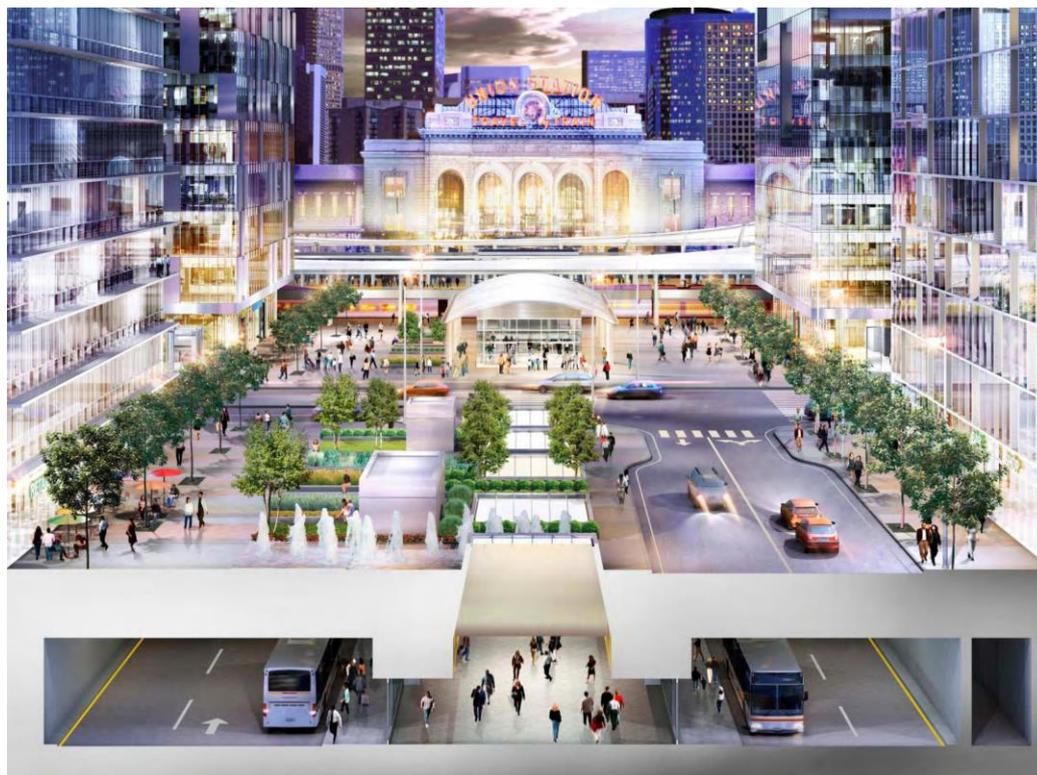

Funding for the transport elements is provided by a combination of federal and state government grants, loans and local tax increment financing. Sources of funding and repayment are shown in the Table 1 below.

Funding	\$M	Repayment	Terms
Federal & State Grants	\$109.30	Loan Repayment	\$165M - \$12M/pa, 15yrs, 5.65%
Property sales	\$37.40	TIF revenue	\$135M for 30 yrs.
<u>Federal Loans</u>	<u>\$300</u>	Loan guarantee City of Denver	Up to \$8M/pa to cover shortfalls TIF revenue
Total	\$446.7M		

Table 1: Denver Union Station Redevelopment Funding and Repayment

Sources: Denver Union Station Project Authority

A key enabling source for funding DUS is the US Transport Infrastructure Finance and Innovation Act (TIFIA) program. This program provides up to \$10 in credit assistance for each dollar of Federal funds for state and local transport infrastructure investments. TIFIA allows projects using TIF and other innovative funding sources to secure favorable financing rates in the private market during early "ramp-up" periods for new projects (Department of Transportation 2012). DUS embodies the 10 Key Success Factors described in Section 3, and provides a working model for urban renewal and transport infrastructure projects.

6 Conclusions and Recommendations

Value capture methods have provided an equitable, transparent and prudent means of supplementing traditional sources of government and private sector funding for urban renewal and transport infrastructure in the North America for over 40 years. Studies in Australia by government agencies (AECOM 2013), industry associations (PricewaterhouseCoopers 2008) and academic institutions (McIntosh 2011) support the introduction of this funding model. There are few legislative or regulatory barriers that would prevent value capture methods from being implemented now on a limited scale at the state and local levels. There are significant public benefits, commercial opportunities and national productivity gains that would arise from more systematic structural and legislative reforms in support of value capture methods at federal, state and local levels.

On the basis of the research undertaken for this paper, it is recommended that:

1. The Commonwealth Government should take a stronger leadership role in the development of Australian cities, such as through the establishment of an urban infrastructure fund and the strengthening of the Major Cities Unit (Urban Coalition 2013).
2. There is a pressing need for the Commonwealth to coordinate the various initiatives underway and planned on value capture research, funding and financing, procurement and implementation. This should include the development of national guidelines and standards, and co-funding pilot studies of planned urban renewal and public transport programs in the states.
3. Commonwealth and state treasuries and other relevant agencies should act on market innovations and reforms which support value capture and other initiatives to reduce Australia's infrastructure backlog, such as those proposed by IA in its 2013 *National Infrastructure Plan*.

4. State treasuries should take a proactive role in supporting financial and regulatory innovations and reforms which are being pursued by their sister agencies in the areas of urban planning, urban renewal and public transport.
5. State and local agencies should investigate how value capture methods can be applied as part of metropolitan land use planning, transport planning and urban renewal programs.

Valuing service and retail structures in core areas of cities

Sławomir Ledwoń, PhD, Architect, Gdansk University of Technology, Poland

1. Introduction

Contemporary, rapid changes in cities create the need to evaluate and protect its existing structure. Many elements are analysed and evaluated. Built structure, urban and architectural heritage, historical landmarks, scarcity of environmental assets are all very precious. But what is also natural to the centre itself are its functional features. One of them is retailing. Over time services have been exposed to many pressures. New shopping centres built outside cities aided sprawl, and this sprawl created demand to build new centres. Apart from that more of the public space and social activity has moved to virtual space – communication over distance sometimes seems easier than in close proximity. In this case “traditional” urban activity is also an asset of the city core. What stimulates that are vibrant high streets. Over time retail formats are also changing. Competition from virtual space is competitive to traditional brick and mortar outlets, these also adapt and change to face new demands. All these create new circumstances to plan new retail and service networks and look differently at their role in cities.

The article describes the methodology for identifying, surveying and evaluating existing city centre’s service and retail structure – using a specially designed Android phone application developed by the author. By recording information about spatial location of services that is combined with basic information about their types a database is created. This method also introduces an innovative smartphone application that aids surveying, which is also described in the article. Based on this data an assessment of the core structure can be made that illustrates the spatial distribution of different outlets.

2. Statistical retailing data

In Poland, the main institution responsible for collecting statistical data is Central Statistical Office (Główny Urząd Statystyczny – GUS). It is a governmental organisation that is surveying, analysing and publishing various data. Most of this data is publicly available.

In terms of retailing some data is collected on national and regional level. According to the official Central Statistical Office definition a shop is a “permanent retail trade point, with a designated space with shop window and interior accessible for clients”. This can be a single entity or one of many outlets of one retailer. When a part of a larger space is rented by a smaller merchant – it is also treated as a unique service point.

Apart from that there are two other classifications. The first one is their industry type (or prevailing type of industry in total sales) and their sales area. According to Central Statistical Office (GUS), shops are divided into basic business/industry classes:

- with major share of fast moving consumer goods (FMCG),
- department stores with broad range of products,
- specialised shops,
- factory shops (incl. factory warehouses and outlets),
- pharmacies and petrol stations,
- markets and mobile sales points.

When classifying according to sales area there are two basic groups. The first group are shops with prevailing FMCG sales. These are hypermarkets (above 2 500 sq m sales area),

supermarkets (400-2 499 sq m) , general shops (120-399 sq m) and other shops (below 119 sq m). The second group are shops with broad and diverse product range. These are department shops (above 2 000 sq m) and merchants' shops (600-2 000 sq m).

According to GUS shops are also divided by the prevailing range of goods sold. This could be:

1. grocery,
2. fruit and vegetables,
3. butcher's,
4. fishmonger's,
5. bakeries,
6. liquor shops,
7. cosmetics and toiletries,
8. textile,
9. clothing,
10. shoes and leather,
11. furniture and lighting,
12. radio, television and household appliances,
13. stationery and book shops,
14. mechanical vehicles,
15. other shops.

The official data Central Statistical Office (GUS) does not allow for detailed analysis of retail network. This is mainly because the data is available only in aggregated form, meaning that there are only total numbers for the whole voivodship area, which in Poland is the equivalent of state in other countries. None of this is georeferenced. There is more detailed data, but that is available only for purchase. Data is also stored in other registers, but these use different codes (e.g. PKD 2004, PKD 2007 – Polish National Codes for Business), depending on the time they were collected. And the link to spatial location is through the registration address of the business, not the sales venue.

The above classifications show, how they can be diverse and differ between each other, depending who is surveying and what is the main concern of data collection. As the main interest of the spatial analysis is in retail, the basic analysis collected classes are narrowed down. In the methodology described in this article the surveyed data is classified in division to main types. These are grouped in 30 main classes, and then break down into subclasses that total for 103 categories. Then these are aggregated for basic analysis into 12 main types as follows:

- A. food – shops with food shops, including specialised shops (e.g. meat shops, baker's, liquor shops),
- B. fashion – shops with clothing, cloths, fabrics, lingerie, etc.,
- C. multimedia, press, books, gifts – shops in the multimedia section, press books, gifts, including computers, phones and television,
- D. health and beauty – shops with health care products, beauty, including cleansers and pharmacy,
- E. accessories, jewellery, watches – shops with accessories, jewellery, watches and luxury items,
- F. sport and recreation (shops) – shops with items for sport and recreation,
- G. shoes and leather – shops with shoes and leather,
- H. interior design – shops with interior design items, decorations, household items and appliances and furniture,
- I. gastronomy – restaurants, bars, cafes, pubs and food vendors,

- J. services typical of shopping centres – services that usually can be found in shopping centres, such as flower shops, post offices, telecommunication shops, travel agents, insurance, finance, real estate etc.,
- K. services not typical of shopping centres – a major part of services that are not usually found in shopping centres (often or at the moment) such as: petrol stations, warehouses, second-hand, hotels, agencies, construction companies, renovation companies, transportation companies, offices specialising in services for business (lawyers’ offices, accountancy, design companies, interpreters, advertising etc.), cultural, associations, museums, theatres, entertainment, gambling, car sale, educational system and others,
- X. not classified, vacant – vacant spaces, refurbished spaces, unknown or unclassified operations.

The first part is often used by shopping centres managers to divide their shop listings into basic classes. Therefore it is easier to use this data for comparison and also analysis of city centres. Most of the retailers (A-H) generate pedestrian activity, the same with gastronomy (I). Services are divided into those that are usually found in shopping centres (J) and those that are not (K). The latter with vacant outlets (X) do not add much to the attractiveness and walkability of city centre. Other services (K) are important, but their existence in large numbers along pedestrian areas means that it is not in best shape.

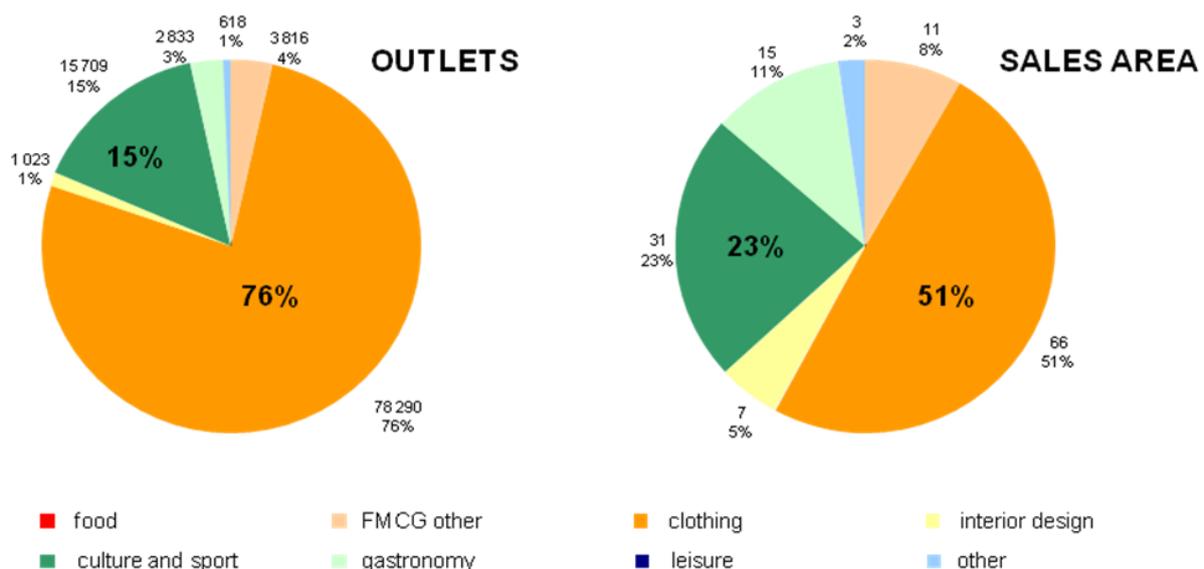

Figure 1: Number of outlets vs. sales area in Bullring Shopping Centre in Birmingham, source: Bullring data, own analysis

The main issue, concerning the methodology, is that collecting data based on the number of shopping outlets, not their sales area might be misleading and inaccurate for the retail impact or change analysis. In terms of retailing, the most important factor is sales area of an outlet. When surveying only the amount of services this figure is not taken into account. But in reality it is the most important factor/weight of such impact. To illustrate this problem above is a comparison of the number of outlets to the sales area in Bullring Shopping Centre in Birmingham, based on the centre’s official data. The most visible difference is in clothing shops attributes. More than the half (51%) of all sales area are clothing outlets, while their share total number is more than three quarters (76% and 78 290 sq m). As for the other types, the rule is opposite – the share in number exceeds the share area. For example 23% of all outlets is connected with culture and sport (31 shops), while the total share in area is only 15% (15 709 sq. m). There difference is more visible in case of FMCG non-food items

(8% of the number to 4% of the area), while the biggest disproportion is in interior design items (8% of the number to 1% of the area) as well as gastronomy (11% to 3%). This means that the latter have small sizes, but are quite large in number.

3. Android application

In order to simplify the surveying procedure a special smartphone application has been developed. It allows the surveyor to record identified outlets in the field using their mobile device. We were looking for a simple solution that would aid the available and free tools for data analysis.

The application has been conceived by the author and written by an application developer – Paweł Fierek. It works on all Android devices (smartphones and tablets) that have 2.3 or higher version of the operating system. Other requirements are – GPS functionality of the device, camera for taking photos and internet connectivity. Although making phone calls is not necessary, it is advised that the device is constantly connected to internet by mobile network (needs a SIM card with a data plan).

The surveying procedure is quite simple. First the surveyor has to set up the app for work. They input the user name (text string) and user ID (3-digit number). The user name will later allow for easier identification who was collecting the data. It does not have to be unique, though it is advised. User ID will later be used to assign individual ID of surveyed places, therefore it has to be unique among all surveyors working in one place. Another field in the settings screen is for defining an object (building, centre etc.). It may be a nick name or short name that will later be used to assign surveyed outlet to a certain object. Later, when analysing the data it is easy to extract points located for example in given shopping centre.

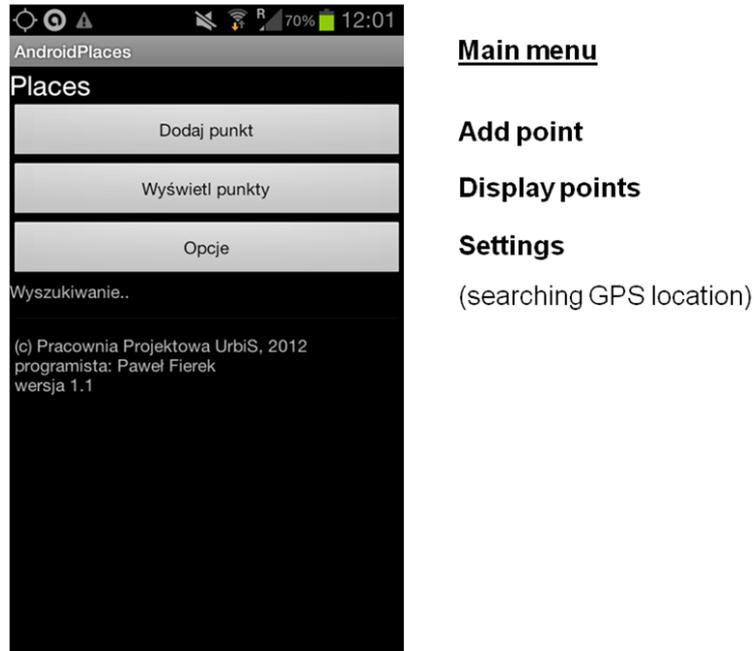

Figure 2: Main application screen

	Add point
Name	Name
Main attribute (id1)	Main attribute (id1)
Secondary attribute (id2)	Secondary attribute (id2)
User	User
Object	Object
Add photo image	Add photo image
Save point	Save point

Figure 3: Application – adding new point input screen

Work in the field means repeating input steps for all points. The surveyor inputs the name of the outlet (or a short version of the name). Then chooses the main attribute (id1) from a predefined list of 30 main classes. After choosing this another attribute has to be chosen (id2). It is a subcategory for the main one, that usually gives a further choice of outlet's specialisation from a list of usually 3-6 classes (up to 12). They are also taken from a predefined list. On this input screen user name is displayed, but cannot be edited. There is also a drop down list of objects to choose from (by default it is set to "none"). These are predefined by user in the settings section.

	Main attribute (id1)
finanse	finances
interesy	business
kultura	culture
rozrywka	entertainment
organizacje	organisations
administracja	administration
auta	automobiles

Figure 4: Application – choosing main attribute (id1)

Next, the surveyor takes a photo of the outlet's shop front, window or building. It is not obligatory, but highly recommended. Storing the image will make it possible to check the input data after the has been finished. Later on it may also be useful for comparing how the place has changed – when there is another survey performed. The image is stored separately on the device. It is advised to turn on the geotagging option in the device photo application, so the images are georeferenced automatically.

Last stage consists of locating the surveyed point on map. By default Google Street Map is displayed with a current GPS location of the surveyor. It can be switched to display the satellite image, if necessary. Though most mobile devices are quite accurate on the (especially these equipped with A-GPS), there might be some errors. When such need occurs the surveyor can manually relocate the placemark on the map. It is also advised to check in GIS software prior to field work, how the satellite image is overlaid on a specific working map. Usually the image is an aeroplane image taken from an angle, meaning that the bases and roofs of buildings are not in the same place. Usually the image is aligned by base. With that the surveyor is aware where to place the placemarks to be most accurate.

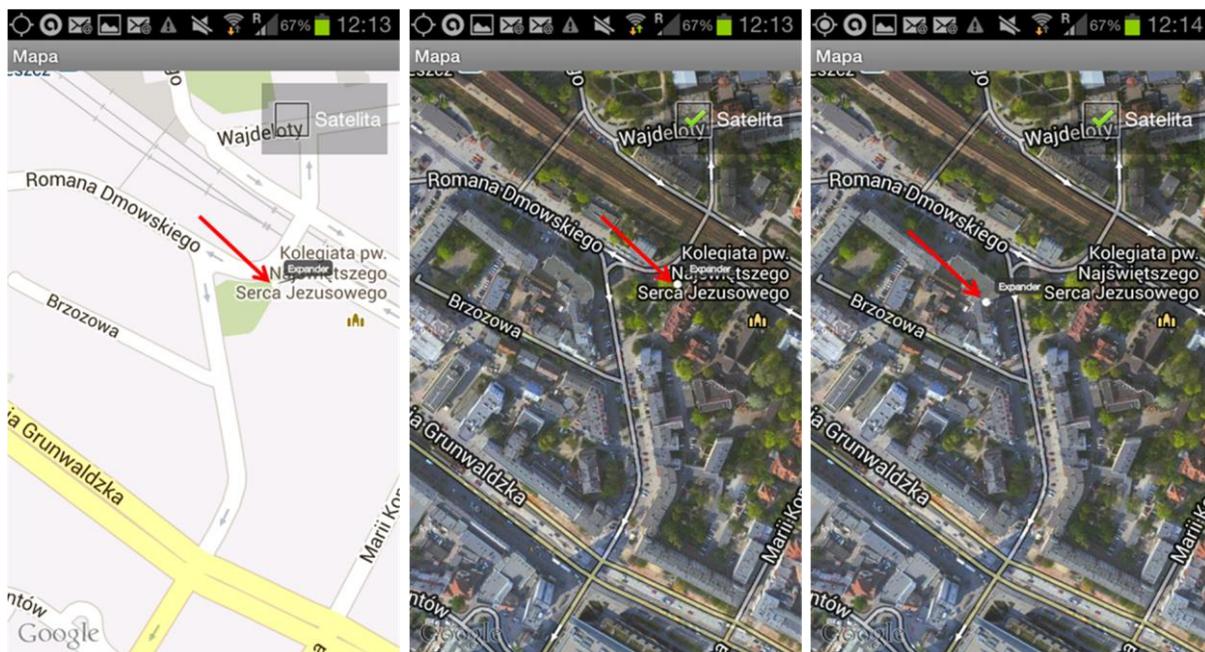

Figure 5: Application displaying and correcting point location
(left – google maps, middle – google satellite, right – manually corrected location)

Later the point is saved and the procedure is repeated for all the outlets in the analysed area.

The data stored by the application is as follows:

- Point ID – unique, consisting of 3-digit user ID with following 5-digits, being consecutive numbers for each point; this field is assigned automatically.
- Name – manually entered outlet name.
- Main attribute – stored as ID number, based on surveyor's choice from the list.
- Secondary attribute – as above, but referring to the secondary sub-class.
- Main attribute – automatic, descriptive text string of main attribute for easier reference.
- Secondary attribute – as above, but for the secondary sub-class.
- Object name – a text string from a chosen list, based on the choice of surveyor (or "none").
- User name – automatic field for the user name.
- Date and time – automatic time stamp of the survey.

- Latitude and longitude – these are based on the device GPS values or manually relocated point while inputting.

In order to analyse the data in GIS it has to be imported into the software. There are many commercial as well as free programmes for GIS. This application has been tested with QuantumGIS, which is an open source, free tool. In the app's settings menu there is an option to save all stored data to a file in the device memory. A unique comma separated values file format (CSV) is created. This can be easily imported into GIS. For latitude and longitude WGS 84 (EPSG:4326) is used as a coordinate system. Points may be also again manually relocated, if there is such need to adjust them to the map.

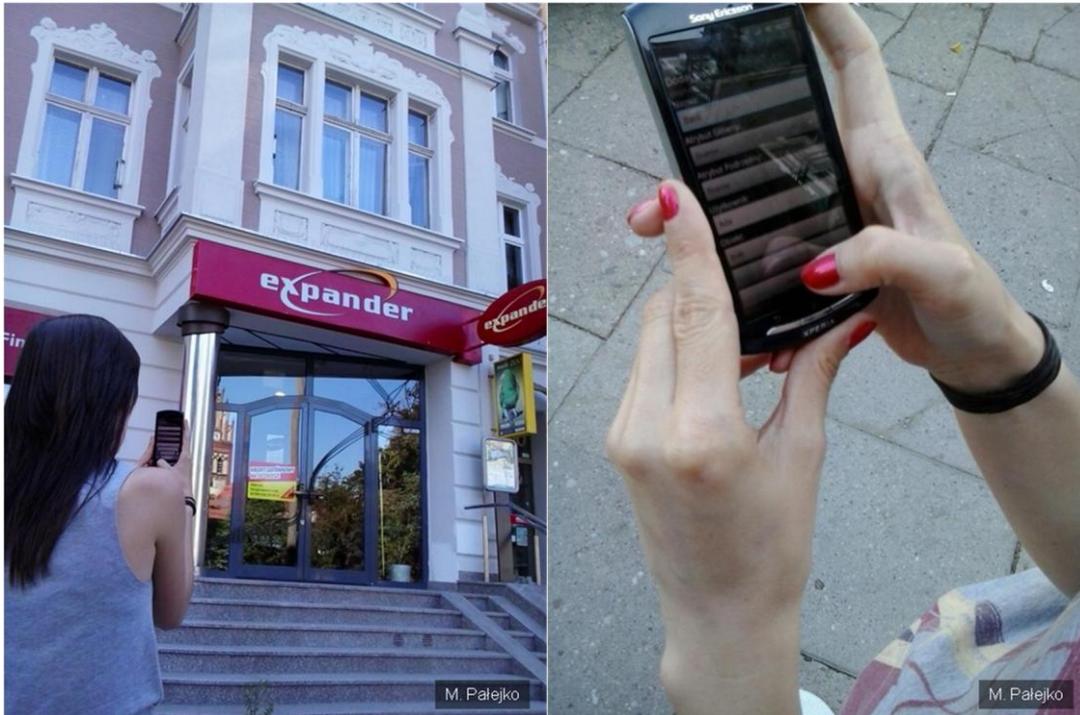

Figure 6: Application – field work, taking images and inputting

Photo images of the surveyed point are stored on the device while working and can be downloaded manually. Their filenames correspond with individual point ID's. When needed these images can be geotagged again using EXIF tools, especially when the original points have been readjusted in GIS software.

4. Main issues

The main issue of this method concerns the type of information surveyed. Each outlet is identified as a point, without any information about its sales area. It is not a limitation of the app, but rather the abilities to judge that in the field. Shop owners are not keen to provide that information. Assessment or approximation would not be a reliable source of information for further analysis. But given that impact is weighted by scale, not only occurrence of an outlet, this has to be taken into account when analysing the data.

Another is that there needs to be specific person who would be collecting data – a surveyor. This means that the data collection and analysis needs to be performed on purpose, and requires engagement of people. But operating the application is very simple, though some basic training is needed – especially regarding assigning to classes. The variety of types allows for better retail network analysis, but in some cases may be misleading to the surveyor.

In terms of the hardware there is a noticeable limit of battery life. Using GPS and having the screen illuminated most of the time results in quick battery depletion. Most of smartphones will allow for 4-5 hours of field work. This can be enhanced by changing battery during survey. Also using tablets with longer operating lifetime, although these are less practical for the survey due to their physical dimensions.

Last issue concerns the legal matters of collecting the data in the field. According to Polish law one is allowed to take photos standing in a street that is public. But entering private land and taking there photos needs approval from the owner. And such is the case of most shopping centres. These have set regulations that do not allow taking photos without a written permit. Owners and managers of individual shops and shopping centres often do not agree to any surveying of their outlets. In such cases the survey has to base on publicly available data – such as plans and shop listings.

5. Example of analysis

Below is a description of an exemplary listing of services points in two Polish cities – Elbląg (from 2012, around 125 000 inhabitants) and Gdynia (from 2008, around 250 000 inhabitants). These show how retailing is structured in downtowns and how it changes when looking at broader areas, such as downtown (meaning a larger part of the city, including the strict centre) and the total number of the analysed city part (that includes other districts).

Figure 7: Part of Elbląg downtown – surveyed service points

Service points were surveyed in Elbląg with the use of the Android application. Above is an image showing their locations on map, with different colours meaning different classes. Main shopping streets are becoming visible where the density of points is larger. The data was then used to mark these areas on the map and also analyse the composition of the stock and statistics.

Below is the table containing the aggregated data for both cities.

Table 1: Number of service points in Elbląg and Gdynia

Retail outlet		Number of points/outlets							
		Elbląg						Gdynia	
Type	Description	TOTAL		Downtown		Centre		Downtown	
A	Food	311	13%	142	11%	41	6%	261	10%
B	Fashion	326	14%	130	10%	70	10%	250	10%
C	Multimedia, press, books, presents	146	6%	93	7%	45	6%	185	7%
D	Health and beauty	85	4%	45	3%	15	2%	89	3%
E	Accessories, jewellery, watches	31	1%	18	1%	15	2%	65	3%
F	Sport and recreation (shops)	10	0%	8	1%	6	1%	14	1%
G	Shoes and leather	56	2%	14	1%	9	1%	63	2%
H	Interior design	105	4%	50	4%	17	2%	96	4%
I	Gastronomy	99	4%	73	6%	54	8%	148	6%
J	Services typical of shopping centres	215	9%	154	12%	109	15%	389	15%
K	Services not typical of shopping centres	767	32%	480	37%	273	39%	909	36%
X	Not classified, vacant	241	10%	87	7%	51	7%	85	3%
TOTAL		2 392	100%	1 294	100%	705	100%	2 554	100%

In Elbląg there are 2 392 service points, half of them in the downtown area (1 294) and one third in the centre (705). In Gdynia the number of outlets in the downtown is twice as much as in Elbląg, but the city is also larger (two times more inhabitants). In Elbląg the largest class of retail outlets are fashion shops – 326 (14%), then food (311 and 13%). But the dominant in number are services that are not typical of shopping centres – these total for 767 and one third (32%) of all. 241 outlets (10%) are not classified or vacant.

When narrowing down from the total analysed area to the centre of Elbląg there are some observations to be made. When the area becomes smaller and more central the share of

food shops is also falling – from 13% total, through 11% in downtown to 6% in centre. And the opposite rule is for gastronomy that is increasing from 4%, through 6% to 8%. Similarly services also grow in their share – both those typical of shopping centres (9% – 12% – 15%) and those not typical of shopping centres (32% – 37% – 39%).

When comparing only the downtown areas of Elbląg and Gdynia there are similarities between them in the share of different types. Typically a downtown area would consist in 10% of food and 10% of fashion shops. Then there would be 7% of multimedia, press and book shops and 6% of gastronomy places. Other retailers' share would be below 5%. In terms of services there were 12-15% of services typical of shopping centres. The largest group (36-37%) would be services not typical of shopping centres. This is mainly because these central areas serve also as business districts rather than purely main shopping and leisure streets.

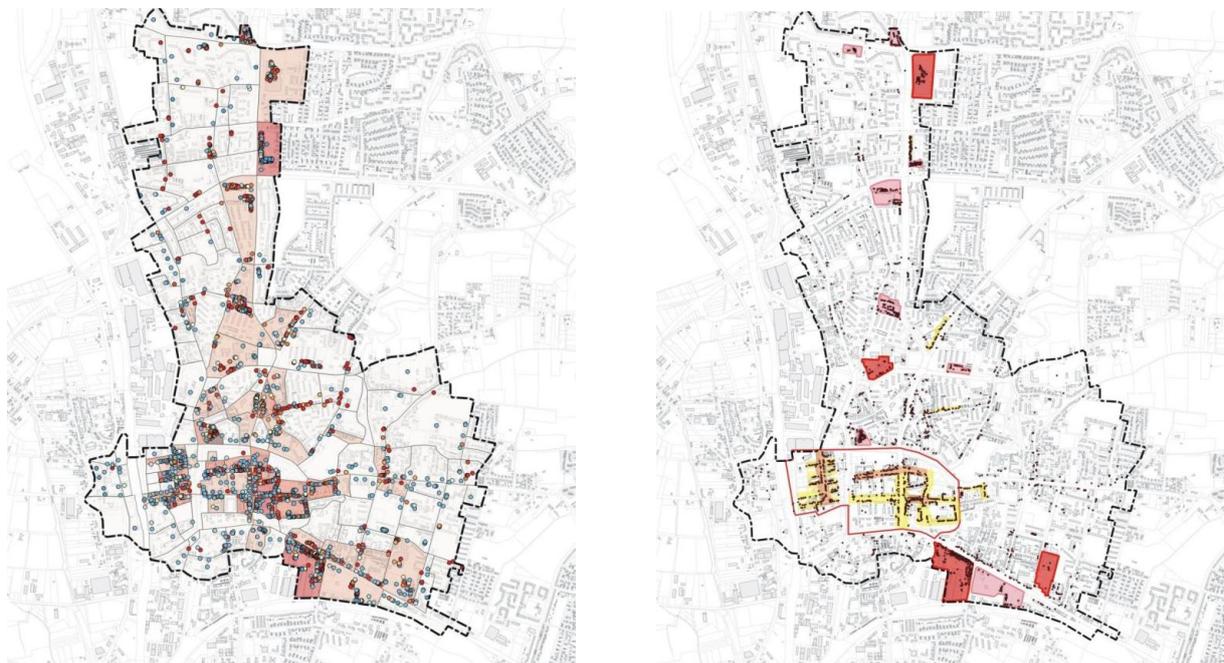

Figure 8: Elbląg – retail and service analysis

6. Comments

The application is easy to operate, also for unskilled surveyors. There is no special hardware necessary, as most of people own cell phones and many already have Android smartphones. Therefore it is a universal tool for data collection on services and retail location. Almost anyone can be engaged in surveying.

It is quick and accurate. It takes less than one minute for an experienced surveyor to enter one outlet into the database. Depending on the density of services and proximity to another surveyed place it takes on average 2-3 minutes per one outlet. The data is reliable and precise, as it is collected by a trained person and the application allows for validation of the location on map and also manual relocation, if needed. There are reference photos for reference if there should be a need to check the data in the future.

Although the current version is in Polish, the classes of services are universal for surveying worldwide. Using common classification for all surveys allows for comparability of the data between different cities and countries. It does not immediately relate to official census and record classes, that are specific in each country.

7. Planned future development

There are some improvements to the application already planned. First of all the collected data should be stored on a server or in the cloud, which would simplify the access to the database. It would also allow instant access to the full database without the need to import parts of surveyed. This would be helpful especially in case of surveying large areas, where more surveyors are working at one time.

Another development planned is to make possible comparison with previous, surveyed states. In such case the application would display suggestions for the surveyed place, based on the data from previous data collection. This would allow the user to simply confirm that the outlet is the same as previously or enter new data for a place that has changed. With this it will be possible also to easily identify places that have not changed their use – at the moment they are surveyed, not afterwards while analysing in GIS.

Apart from that the application will be translated into English to make it applicable internationally. Currently the application is only available in Android version. If there is such need it will be developed for iOS and other operating systems. Classes are stored in a separate file, which makes them editable and it is possible to change them. In such case the application can be used for other purposes. It is possible to survey other spatial occurrences, as long as the classification does not require more complex division than into two classes – main and subcategories.

It may be useful to be able to make possible importing customised maps or underlays from separate files – such as AutoCAD dwg/dxf formats or shp references to shapefiles. This would help working in areas where immediate reference to a preset data is necessary. Or it would make working offline possible, when the preloaded map would be footprints of buildings – therefore saving the data transfer needed to operate the application.

The Dynamic State of Historic District and the Effectiveness of Historic Conservation Plan---Case Study of Shanghai

Yang LIU, Tongji University, China

Synopsis

This research concerns about the effectiveness of the Historic District Conservation Plan in Shanghai. By focusing on the change that happen both before and after the implementation of the conservation plan, this paper reveals the advantages and disadvantages of this model of planning practice and the causes of the problems.

1. Introduction

Historic districts are integral parts of the city, the conservation of them needs to protect the historic elements, atmosphere, as well as promoting their development. The conservation needs to integrate historic districts into the housing, transportation and social system of the whole city. China launched the conservation of historic cities in 1982. In 1997, the "Shanghai historic city conservation plan" designated 12 historic districts in Shanghai central area. In order to deal with the disjoint between the conservation and the construction activities of historic districts, the Shanghai government started to formulate the Historic District Conservation Plan in 2003, and finished and implemented them in 2005 (Wu, 2007).

A lot of previous researches concerning conservation areas have been focused on the effectiveness of historic conservation (Shiple, 2011), the effect of conservation on local development (Gilderbloom, 2009), and the sustainability of conservation areas (Vehbi, 2009).

This paper focuses on the Old City Historic District, which is located in the central part of Shanghai and has extremely high density of population. By field survey, resident interviews, and research on second hand data and governmental files, we reveal the conditions of historic districts, identify the deficiencies, trace the causes and propose some suggestions.

2. Condition of the Old City Historic District before the Historic Conservation Plan

2.1 The Old City of Shanghai

The Old City (also named as Laochengxiang) is located in the central area of Shanghai and was the traditional core of Shanghai before Qing dynasty. Among the 12 Historic Districts of Shanghai central area, the Old City is the only one that famous for its traditional Chinese buildings and ancient Shanghai characteristics. As a typical unplanned city area, it has a clear boundary and unique city form, possess a large number of pleasant small-scale alleys and diverse architecture types. It is also an important part of the urban tourism system, with the famous Yuyuan Garden and City God Temple located in the center of the district. The outstanding universal values of the Old City lie in its unique city form, natural urban texture, diverse alleys and buildings, which need comprehensive conservation. (Figure 1&2)

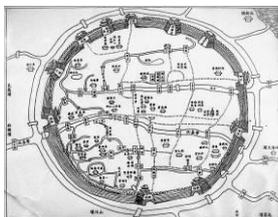

Figure 1: The Old City in history (Wikipedia) Figure 2: Location of the Old City (SUPDI 2005)

2.2 High population density and bad living condition

The Old City has an area of 199.72 hectares. In 2005, its population was 133.2 thousand and the population density was 66.7 thousand per square kilometers (SUPDI, 2005). Meanwhile, most of the residential buildings in the district were 2~3 storeys, so the per-capita housing area was very low. The overload of historic buildings was harmful to their conservation.

There were also lots of unauthorized buildings and shanty houses in the Old City, which were unsafe and had negative impacts on the environment of the historic district.

2.3 Inadequate conservation of heritage

Among the various historic buildings in the Old City, just 19 buildings were listed as Culture Relics or Shanghai Excellent Historical Buildings and protected by laws. Other buildings, which form the historical features of the whole area together with those listed buildings, were unprotected and confronted with the danger of demolition.

Under the enormous pressure of urban renewal and redevelopment, a lot of historic buildings were dismantled, the diverse alleys and pleasant-scale spaces were demolished, and the traditional urban textures were altered. By 2005, about one fifth of the texture of the Old City had been transformed.

Due to the lack of specific planning and construction controlling, the intensity of new developments was enormously higher than those of traditional blocks. These new high rises and large scale buildings had a negative impact on the low-rise characteristic of the Old City.

2.4 Trend of Redevelopment in Old City

The old city was facing increasingly strong redevelopment pressure. As the Chinese government had launched a strict restriction on the transformation of rural lands into urban lands, the expansion of cities was limited and the need to reuse the land in inner cities had increased. In the years before 2005, the new constructions gradually infiltrate into the old districts of the city. Since the Old City locates in the central area of Shanghai where land resources were extremely rare and precious, there was a trend that more and more land in the Old City was going to be redeveloped, as the land in the surrounding areas of the Old City available for redevelopment were decreasing.

Figure 3: The Old City periphery in 2000 Figure 4: The Old City periphery in 2005 (Google Earth)

2.5 The Outlook of the Old City in Government Plans and Policies

In the plans of Huangpu District (the administrative district where the Old City locates), the functional orientation of the Old City was a touristy and commercial area, with sound residential function. The Yuyuan Garden and its surrounding areas in the Old City were planned as an important part of the central commercial area of Shanghai, function as a commercial and tourist node, with strengthened cultural and entertainment services, accompanied by some business services. The development of those functions and the increase of tourists would bring the need for various facilities, which will trigger the enormous amount of development and construction in this area.

According to reports by the Huangpu District Government, they had been pushing forward the urban residential area renewal in the past few years. During 2000~2005, 2.3million km² of old houses were demolished, 50 thousand residents were relocated from their houses. Until 2005, there remains 1.6million km² of Lilong old houses (a type of Shanghai traditional low-rise house), 1.1million of them need to be reconstructed or renovated (Huangpu District Government, 2005).

In order to respond to those rapid urban redevelopments and preserve valuable historic buildings, as well as coordinate the new developments with existing urban texture, plans were needed to properly regulate those redevelopments and constructions.

3. Historic Conservation Plan Analysis

In order to make up the deficiency of historic conservation in the Old City Historic District, the historic conservation plan was launched in 2005. It functions as a regulatory plan which combines historic preservation with construction controlling, providing a comprehensive basis for the conservation and urban redevelopment of the Old City. Apart from the conservation of historic elements, the plan also requires the continuation of the region's historical features in the urban regeneration process, as well as improve the regional function and quality to meet the demand of comprehensive rehabilitation.

All the contents of the Historic Conservation Plan can be divided into three levels, namely historic district rehabilitation, historic conservation and construction controlling. Besides, the plan proposes some requirements and suggestions to improve residents' heritage awareness and encourage public participation. In this part, we analyze the Historic conservation plan from the perspective of balancing conservation and development.

3.1 Historic district rehabilitation

Comprehensive improvement of the district is the premise of good historic conservation, the conservation of the Old City must be based on the rehabilitation of the whole district. By regulating and adjusting to the changes in the Old City, the conservation plan proposes a way of rehabilitation that coordinates with the continuation of heritage and community.

(1) Functional orientation and development of the historic district

The built environment of the Old City is relatively stable, therefore the functional orientation needs to fully consider the existing conditions and the requirements of conservation. The scale and layout of buildings determine that the functional possibilities of reusing them are restricted in a relatively small scope. The functional orientation of the historic district is a complex historic city center which is "a residential area with traditional features", "a public service and commercial area" and "a cultural tourism area".

Since conservation is the prior thing in the historic district and some residential areas are not suitable to compatible with other functions, the conservation plan put forward functional guidance for each area. In "public function restriction area", facilities that incompatible with residential environments will be prohibited; in "public function promotion area", specific public functions will be encouraged.

In "public function promotion area", in order to coordinate with the development of the whole city and link up with Pudong CBD, the plan proposed to regenerate the areas alongside the Fuxingdong Road, which is the major road in the Old City and lead to Pudong CBD. The regeneration next to the road would focus on improvements of business functions, as well as strengthening the commercial and cultural functions, so as to improve the viability of the Old City and lead the revitalization of the whole district. The plan also proposed to optimize the commercial area of Yuyuan Garden and the cultural tourism area of Confucious' temple, to form an integrated tourism area with multiple themes and outstanding features.

(2) Social structure problems and Mode of historic district redevelopment

Different modes of redevelopment would bring different type of spaces and will affect the social structure of the Old City. The redevelopment mode of "large-scale demolition and renovation" would not only alter the historic feature of spaces, but also relocate large amount of residents and reduce the job opportunities for low-income residents. In the redevelopment of an historic district, more concerns need to be paid on the benefits of the original residents in the area.

In order to continue the residential diversity and improve the viability of the Old City, the historic conservation plan advocates gradual "small-scale renovation" to solve problems flexibly for different residents, so that pleasant scale new buildings are harmoniously inlaid in historic surroundings, and avoid damaging the functioning-mixing feature of the Old City. The plan also advocates the supply of small apartments in the redevelopment projects in the Old

City, which would provide available housing for the middle and low income residents, in order to avoid severe change of social structure.

The historic conservation plan advocates attracting various kinds of small investments to renovate the area, as long as they obey the rules of the conservation plan. It also encourages the participation or dominance of local residents during the renovation process, with the support of community-base organizations, so as to conduct a “bottom-up” improvement of the historic district.

(3) Improvement of public facilities and infrastructures

Since the land resources available for redevelopment is quite limited, the public facilities for the Old City could be shared and balanced with the surrounding areas. The facilities could adopt lower quotas of land area as long as the gross floor area of those facilities meets the demands of basic functions.

Infrastructures, such as sanitation, drainage and gas, were insufficient. The plan proposed to adopt multiple measures suitable for the Old City, to meet the demands of infrastructure and the requirements of historic conservation at the same time. In order to improve the streetscape, electric wires above ground would be reinstalled and buried underground together with other infrastructures.

(4) Transportation strategies of the historic district

In order to conserve the historic feature and scale of streets in the Old City, the conservation plan proposed to minimize road widening and make full use of the existing road network.

In solving the transportation problems of the Old City, the conservation plan suggests to set up a traffic demand management system with various strategies, apart from the effective supply of transport facilities, to balance the traffic demand and supply. By advocating the multifunctional use of land and avoiding excessive development of commercial and business buildings, along with restriction of through traffic, to reduce the traffic volume.

The plan also promotes a public transport oriented transportation system. By setting proper bus routes and bus stops, together with sound connections among subways, bus and bicycles, accompanied by proper transportation policies, to promote a unified and coordinated public transportation mode.

(5) Improvement of public space and green environment

There was a low green coverage and lack of public open space in the Old City. On the one hand, the conservation plan proposes to retain all the public green space, street trees and other trees that are more than 30 years old, retain the existing public space and alleys; on the other hand, to improve green coverage and increase public open spaces at the proper place, and set up “public walkways” to connect those public open spaces and facilities.

3.2 Historic conservation and construction controlling requirements and measures

3.2.1 Historic conservation requirements and measures

(1) The objects of conservation

The distinguishing features of the Old City are not only about its old buildings, but also its space and historic environment. The objects of conservation are classified into four categories: historic buildings, space (historic roads, alleys, parks, square, etc.), texture (historic urban texture formed by alleys, blocks and buildings), and other elements (historic places, intangible heritage, etc.)

(2) Building conservation and renovation

The Old City is in a constantly changing condition and different buildings have different needs for renovation. Basing on detailed field survey and assessment, the conservation plan classified all the buildings into five categories according to their values and set the preservation, renovation and demolition requirements of each building. They are: Strictly

conserved buildings, Retained historic buildings, Ordinary historic building, Class A Ordinary Historic Buildings, Class B Ordinary Historic Buildings, Buildings to be demolished, Other buildings.

(3) Historic street space conservation

The future of the Old City is also demonstrated by the historic streetscapes and experienced by humans on the street, but the traffic pressures are threatening the conservation of streetscapes. In order to handle this contradiction, the historic conservation plan designated 1 historic road and 34 historic alleys. The alley alignment and width are restricted by “alley control line”, while the height and setback of buildings are also regulated.

(4) Historic texture conservation

The historic texture of the Old City contains messages of urban development, but the modern developments are destroying and erasing them. Urban texture is affected by the layouts of streets, block divisions and buildings etc. In order to preserve the integration and continuity of urban texture, as well as control the scale of new buildings and preserve the diversity of spaces, the historic conservation plan takes the historical avatars as the basis for the set up of redevelopment unit. According to the layout types of traditional buildings in the Old City, the conservation plan sets up guidelines of building layouts for each block.

3.2.2 Historic district construction controlling

In order to coordinate redevelopments with existing historic features, the historic conservation plan sets up regulations and guidelines for the new constructions, basing on the requirements of both historic conservation and district development.

Those regulations include: Building height control, Building density control, Building interval control, Gross floor area control and Building setback control.

3.2.3 The strictness of the conservation plan

The various regulations and principles in the historic conservation plan have different levels of strictness. In the aspect of “historic conservation”, the “strictly conserved buildings” have the most strong restrictions and are conserved according to laws; the “retained historic buildings” and “historic roads and alleys” also have mandatory regulations in the plan but have no laws to support their conservation; the conservation of “ordinary historic buildings” and urban texture are guiding and non-mandatory requirements. In the aspect of “historic district development”, besides the regulations of function in each block, all the other regulations are guiding requirements. In the aspect of “construction controlling”, all the requirements are mandatory.

The strictness of those regulations is different, which is an important factor for the huge difference in the conservation effectiveness in different aspects of the Old City conservation.

3.3 Promoting public participation

The conservation and rehabilitation of the Old City will be confronted with large amounts of various interest groups, bring with them intense conflicts. Being a plan that takes the protection of public interests as its starting point, the conservation plan needs to take the various interests into full consideration. Besides, the plan also advocates taking measures to improve the residents' heritage awareness.

During the process of planning, including the data collection in the early stage and the medium-term outcomes reporting period, comments and suggestions from relevant government departments, developers, and resident delegates are collected with seminars or in written form. Those comments are considered as references for the optimization of the conservation plan. In the process of planning implementation and feedback collection, media announcement or consulting seminars are held for the participation of residents. The plan also suggests optimizing the announcement, consultation, feedback and complaint system during the conservation and rehabilitation process.

4. The dynamic state of the historic district after the conversation plan

4.1 The developmental state of the whole Old City

4.1.1 Measures taken for the improvement of facilities, public space and social services

In order to improve the environment quality, living standard and facilities for the residents in the Old City, the local government has carried out lots of “down-to-earth projects”. These projects include the management and renovation of the old residential quarters, optimization of infrastructures such as water facilities, renovation of street and alley space for the benefit of pedestrians and improvement of the streetscape.

In respect to transportation facilities, the Henan road and Zhoujin road, which are major roads in the Old City, have been widened. Two metro lines were opened in 2007 and 2010, both of them have a subway station in the Old City. As for public green space, Xiaotaoyuan park in the central part of the Old City has been built, green belt on the southern edge of the Old City is under construction.

Meanwhile, measures have been taken to improve the community facilities, such as setting up community health stations, community education and cultural facilities. Community services such as assistance for the elderly and low income families, training and medical service for floating migrants have been provided.

4.1.2 Economic development in the Old City

(1) Commercial developments

Since the implementation of the conservation plan in 2005, the commercial developments in the Old City are mainly around the Yuyuan area, while the other parts of the Old City have been focused on improving residential and community facilities. Yuyuan area is one of the three key areas of development in the Huangpu district from 2006 to 2010. (Huangpu district government, 2011) During this period, the core part of Yuyuan area has strengthened its character as a traditional commercial area with specialty commodities and restaurants, hotels and shopping malls have been built in the intermediate parts, while the outer parts have been focused on the renovation and optimization of transportation and the environment.

During 2006~2010, the Yuyuan area has attracted the investigation of 313 enterprises and provided tax about 20 million dollars to the Huangpu district government. It has also created 8349 new job opportunities. (Yuyuan sub-district, 2011)

(2) Changes in housing prices

By searching the property transaction data from the economic database and housing transaction prices on housing sales websites, we sort out the average commercial housing prices of the Old City, the Old City surrounding areas (less than 500 meters from the edge of the Old City) and the Huangpu districts (the administrative district where the Old City locates in) of the past few years. Because of data availability, we take the housing prices from 1999 to 2009 as subjects of research. The changes of housing prices in those three areas are shown in the chart below (Figure 5):

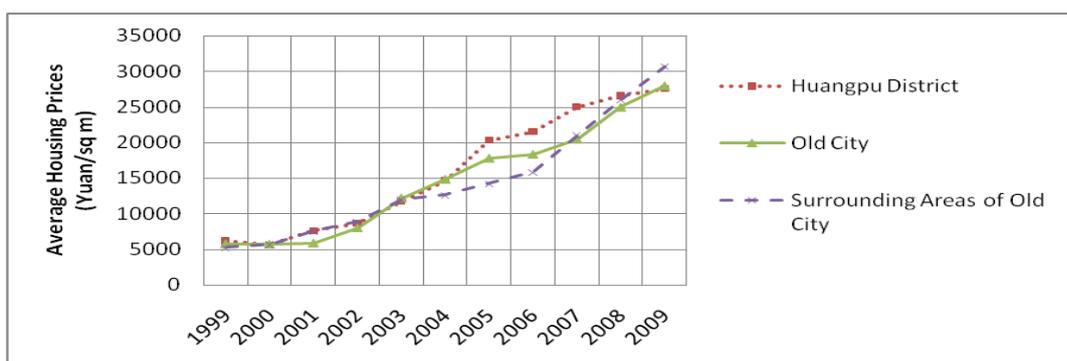

Figure 5: Housing prices 1999~2009 (<http://house.baidu.com/sh/>; <http://www.gtarsc.com/p/sq/>)

As can be seen from the chart, the housing prices of those three areas have been increasing during the years. Since 2006, the average housing prices in the Old City and its surrounding areas rose faster than that of the whole Huangpu district. During 2008~2009, the average prices of the Old City and its surrounding areas gradually surpassed that of the whole Huangpu district. Those facts show, to some extents, that with the improvements of environment and facilities, the economic and living conditions in the Old City and its surrounding areas have been improved, which attracts more residential investments and lead to the faster upgrade of commercial housing prices.

Meanwhile, the average commercial housing prices in the surrounding areas of the Old City rose faster than the prices in the Old City. As can be seen from the housing prices map for the year 2009, 2011 and 2013, the Old City was gradually becoming a “low land” of housing prices. There exists a circle of high-price housing surrounding the Old City. (Figure 6)

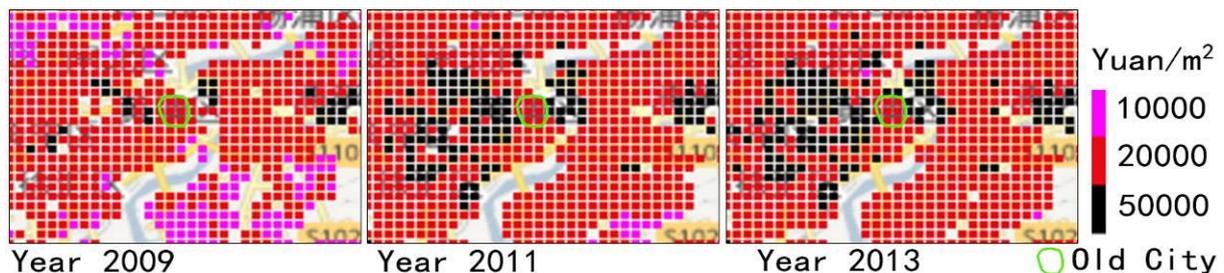

Figure 6: Housing prices map (2009- 2013) (<http://data.cityhouse.cn/historymap/shanghai/1.html>)

According to the property development data, since 2007, there have been much more high-grade real estate developments in the surrounding areas than in the Old City, which show that the restriction of redevelopments has slowed down housing prices rise in the Old City.

4.1.3 Community development and residents' living standard

(1) Change of population composition

As a district that locates in the central part of Shanghai, the Huangpu District has been experiencing a decrease in its total resident population. The resident population of Huangpu district was 678.7 thousand in 2010, decreasing at a pace of 20.3 thousand per year on average since 2005. While during 2000~2005, the resident population decreasing pace was 24.7 thousand per year on average.

Meanwhile, more migrants have moved into and reside in the Old City. Take the Yuyuan sub-district in the Old City as an example, in 2005, its registered population was 98.5 thousand, and transient population was 10 thousand. While in 2010, its registered population was 99 thousand, and transient population has reached 30 thousand. (Yuyuan sub-district committee , 2006, 2011)

As the original residents of the Old City were moving out and the transient migrants moving in, the population composition of the Old City has changed significantly and social structure becomes more and more unstable.

(2) Community population density and living environment condition

In the Conservation Plan, population relief in old residential quarters is proposed, and improvement of per capita living space is needed.

According to the census data of the Huangpu district in 2010, the Laoximeng sub-district in the Old City has the highest population density, which is 60.1 thousand/sq km, followed by the Yuyuan sub-district, with a population density of 51 thousand/sq km.

From the population data of each neighborhood committee, it is shown that in the residential areas without redevelopments, the population density is above 125,000 per square kilometer, among them the Fuchun community has the highest population density of 209 thousand/sq km, while that of newly built high-rise building areas are generally 40 to 50 thousand/sq km.

In the Conservation Plan, gradually relieve population by small-scale renewal is expected. But population relief way in the Old City is complete removal and relocation. That small-scale renovation that has been implemented in each old residential community is just a temporary measure for transition. It just improves basic element like the interior pipeline of the building, the roof, facades, outdoor road surface and can improve the residents' basic living environment, but cannot relieve the population problem. By surveying houses renovated, residential density in old house remains high.

(3) Way of residential removal

From whereabouts of removing residents in the Old City historic district, we can see that all original residents were removed and nobody came back. House compensation sites available for the removed residents are mainly located in Sanlin District in Pudong and Zhoukang District in Nanhui. Both of the districts are suburbs. House resource located nearby is just Dongyuan Lane in the south of the Old City. Just 650 suits of house there cannot meet the need of the residents to relocate in nearby.

On the redevelopment blocks in Luxiangyuan, the Old City, new buildings like villas are generally developed to a high grade for high profits, because of the restriction on floor-area ratio and building height. In the development of high-rise residential buildings in Luxiangyuan, the size is generally large. The acreage of every house is generally above 200 square meters. Small-sized house is scarce. So it is impossible for the original residents to remove back. High grade of the residential brings strong gentrification.

Therefore, that small-sized apartments should keep a certain proportion in the newly built residential buildings, which is proposed in the Conservation Plan, is just a suggestion and guiding requirement and non-mandatory. It cannot limit the development of completely high-grade new house building and large-sized house.

4.2 Conditions of heritage conservation and construction controlling

4.2.1 Heritage conservation condition

We sort out all kinds of development projects in Laochenxiang after the approval of the historic conversation plan, according to the statistical yearbook of Huangpu District over the years and project management information from Planning Bureau. 13 development projects have been approved before the historic conversation plan, and 6 projects are approved after the plan. The category of the project includes the development of housing, commercial office building, public facilities and so on (Huangpu District Government, 2006~2011). (*Figure 10*)
(*Table 1*)

Besides, the government renovates all old residential areas which are temporarily unable to be redeveloped or regenerated in the historic district. The main goal is to improve the residents' basic living environment, including the roof, the repair and rain preventing construction of metope, water pipeline renewal above and under the ground, wire renewal, road surface renovation, green replanting and so on.

(1) Condition of historic building conservation

Historic buildings under different protection level are in different conservation status. Among the 6 development projects approved after the plan, buildings that are designated as "strictly conserved buildings" or "retained historic buildings" are mainly located in Luxiangyuan. In this area, "strictly conserved buildings" are all reserved. Only one third of "retained historic buildings" are conserved, which violates the rules in the Conservation Plan that "retained historic buildings" cannot be demolished. Ordinary historic buildings in the areas which the development projects involve, including class A and class B ordinary historic buildings, are almost demolished completely (except for Greenfield project in Xiaotaoyuan) (*Figure 7~9*). In the Conservation Plan, Class A ordinary historic buildings are ruled to be restored to their original state after demolishment. But it is obvious that class A ordinary historic buildings demolished are not restored according to their original scale and style, seeing from the design drawing of Luxiangyuan.

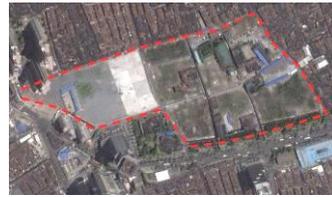

Figure 7: Luxiangyuan plot before demolition; Figure 8: After demolition ;(Google Earth)

Figure 9: Building conservation requirements (SUPDI, 2005)

(2) Conditions of historic street and space

Some projects involve protection of historic roads and streets. The shape of all historic streets is kept. Apart from early commercial office buildings which didn't meet the demand of width, borderline and height, projects completed after 2007 obeys the demands of historic streets by installing architecture podium.

During the year from 2008 to 2010, Huangpu District comprehensively renovated all the streets. The renovation includes clearing off obstacles on the sidewalk, sidewalk pavement, clearing off and demolishment or position adjustment for those non-compliant facilities, repair of the road surface and so on. In the course, the shape and the width of historic streets are kept, and the historic streets environment is improved.

(3) Conditions of urban texture

Most of the projects that approved before the formulation of the Conservation Plan didn't continue the feature of texture nearby, except several buildings with relatively low height and small volume. In the blocks of the Luxiangyuan project, which was approved after the Plan, the original texture type is mainly low-rise Lilong row texture. And some are traditional courtyard texture. The design drawing of Luxiangyuan shows that the row texture of newly built low-rise building coordinates with periphery, but the configuration format of the texture is not so abundant, compared from original texture. In the newly built high-rise residential areas, though the architecture texture format is row texture, the scale is huge and almost totally different from original texture. (Table 1)

Approve date	Year of Finish	Project	Building conservation			Historic street			Texture

Table 1: Heritage conservation condition of projects (Data Source: Year book 2006~2011, field survey)

4.2.2 Construction controlling

In the historic conservation area, the change of land function basically lives up to the original demand of the conservation plan. For height controlling in the area, in the early years after the implementation of the Conservation Plan (in 2006), some projects have made a breakthrough; for height controlling along the streets, apart from projects completed early in 2005 and 2006, all projects following meet the demand of height controlling of architecture along the streets by podium installing. For the architecture density, the density of newly built

buildings is smaller than that of the original lane house; for the building interval, the volume of newly built buildings is larger than the original lane house, so the interval is relatively larger and meets the demand of the plan. For the gross floor area of buildings, some projects completed during 2006 to 2008 are beyond the planning limits, while projects in other years all meet the planning demand. (Table 2)

Approve date	Year of Finish	Project	Function	Height in block	Height along street	Density	Building intervals	Gross floor area
Before Conservation Plan	2005	Elison office	P	P	N	P	/	P
		Senlian Commercial	M	P	N	P	P	P

Unfinished		Luxiangyuan Low-rise	P	P	P	P	P	P

P:Positive Comment; M: Moderate comment; N: Negative Comment; /: The project has nothing to do with this; -- : Data Unavailable

Table 2: Construction control of projects (Data Source: Year book2006~2011, field survey)

In conclusion, for projects approved before the Conservation Plan, some didn't meet the planning construction controlling regulation, while all projects approved after the conservation Plan satisfied the demand.

4.3 Activities to increase residents' heritage awareness and public participation

The conservation and rehabilitation of the Old City need the support of local communities. Apart from the legal conservation and regulations, measures have been taken to increase the local communities' heritage awareness and attract them to participate in the conservation and rehabilitation process.

Since 2003, the Shanghai government has published albums and maps about the designated historic districts and historic buildings. Conservation seminars were also held to introduce those heritages to local residents. Every year, series of activities are held during the days before and after the "National Cultural Heritage Day". Activities such as "Approach Old Buildings" were organized to encourage residents' visit to historic buildings. Photography activities were also organized to promote the participation of photographers in presenting the characteristics of historic buildings.

In order to promote the local residents' awareness and understanding of the historic conservation plan, planning exhibitions were held in the local community. Brochures about the regulations and laws of historic conservation were distributed to residents, community neighborhood committee and property management departments.

In addition to these activities, however, there was inadequate participation of residents in the conservation of the Old City and a lack of dissenting voices when the historic buildings were dismantled. No community organizations for heritage conservation were set up, and there is a lack of bottom-up conservation.

4.4 Summary

Overall, the public space, transportation, infrastructures and community facilities in the Old City have been improved. Commercial developments mainly concentrated in the Yuyuan area, more job opportunities were created. Average housing prices in the Old City and its

surrounding areas have risen faster than that of the whole Huangpu district; less real estate developments happened in the Old City than in its surrounding areas.

With the moving out of original residents and the moving in of transient migrants, the social structure in the Old City is changing constantly, which aggravated the unstableness of the community. There lacks the cooperation among residents for the revitalization of the Old City.

The current transformation and development style in the Old City historic district is large-scale removal. The goal that trying best to conserve historic buildings, continue urban texture, retain original residents, maintain social structure stability and community diversity, give full play to the residential role and so on by gradual small-sized renewal and development advocated in the conservation Plan didn't realize basically.

In the large-sized removal, those protected by law were kept, but most historic buildings which just appointed by Conservation Plan were demolished without regulation of law. The new buildings accord with regulation of height, density and other regulations formulated in the Conservation Plan, but the original city texture and historic look undergo tremendous changes. Newly built high-grade houses after redevelopment also bring residential segregation. Comprehensive improvement measures adopted for old buildings just improve the most basic living environment. Residential density doesn't drop, residents' need of house improvement is not met, and residential environment improvement is badly needed.

Although there were measures for increasing heritage awareness of residents, there still lacks the support and participation of residence in the conservation and revitalization of the Old City.

5. Factors for existing problems

Large-scale removal results in demolition of large amount of historic buildings, change of texture and appearance, drastic alteration of social structure and so on. But such redevelopment and renovation mode of removal is inevitable because of the comprehensive effect of the current conservation plan, related policies, resident composition and their needs, the demands and interests of government and developers. In view of the current trend, large amount of other old areas in the Old City will also be redeveloped through this way when it is possible in the future. Following is the analysis of reasons behind the inevitability.

5.1 The mode of redevelopment dominated by developers for maximizing profit

At the present stage, various redevelopments undergone in the historic district are led by government and developers. In the whole process, residents just passively accept redevelopment and removal and don't take active part in it. By analyzing the existed redevelopment mode of the removal, we can find that in the whole operating process, the government and developers remove residents completely, and then demolish most buildings, except for those "strictly conserved buildings", in the redevelopment area. After the removal and site formation, the land will be sold to developers for development.

Because of the large cost of residents' removal (according to redevelopment statistical data in old area of Huangpu District, per family removal needs 1.5 suites of house as compensation), developers usually spare no effort to get reward from new development by increasing the amount of development and high-grade development.

The removal mode adopted is basically complete demolition. So the area developed again is to a great extent on the developers' own. In the historic district, historic buildings which need conservation and reservation are not centralized in certain areas; instead, they scatter in the whole featuring area. Therefore, if the small-scale transformation mode is adopted to reserve more historic buildings, the developable land will be fragmentary. It will be greatly affected by existing buildings reserved around. By this mode, high-grade development is impossible. Only common house development is suitable. Environment around and buildings reserved should be governed well, or this kind of houses will be unable to stand in the market. Therefore, this kind of development not only has to pay for residents'

removal in the redevelopment area, but for renovation of buildings reserved in non-development area and exterior environment and for partial residents mediation in the non-development area. Besides, Earnings from newly built house by this mode cannot compete with that from high-grade houses after massive demolition. Thus, developers tend to invest in vacant land after large-scale demolition.

If suggestion in the historic conservation plan that just renovates the majority of buildings and mediates some residents in these buildings is adopted, the government (or the developers) not only has to compensate residents who are mediated, but also provide funding support for renovation of buildings. The fund the government has to input is still tremendous even if the residents who stay were willing to offer some certain fund support.

Another way that might be adopted is to develop the historic old area towards high grade. The government (or developers) sells historic buildings after elaborate refurbishment and the original residents remove away. This way maybe suitable for some old houses with large acreage and good structure, but for many old houses in the historic district, their space is narrow and quality is low. Buildings transformed under this way would not get greater appeal from rich house buyers.

Therefore, the transformation led by the government and developers adopts mode of large-scale demolition and removal in the Old City, so as to gain maximum profits with minimum cost.

5.2 The function of the Conservation Plan on restricting demolition is insufficient

In the conservation plan, there is strict protection stipulation in “Law on the Protection of Cultural Relics” and “Regulations of Shanghai Municipality on the Protection of Excellent Modern Historical Buildings” about listed buildings (strictly conserved buildings). However, for the preservation of “retained historic buildings” and “ordinary historic buildings”, protection requirements are only determined in conservation plan and there is no clear legal protection. Thus, the large scale demolition of this kind of building is made possible in renovation and reconstruction.

As there is relatively strict restriction in the historic conservation plan about building behavior in the historic district, the reconstruction and re-development in the Huangpu district mainly concentrates on the surrounding plots of the Old City historic district in the last few years. However, along with the gradual completion of reconstruction in the surrounding areas of the Old City, the blocks within this historic district will face relatively large scale reconstruction. It can be seen from the schematic diagram of demolition plot of Huangpu district in the “12th Five-Year” Plan (figure 11), in the next few years, there will be larger scale demolition in the Old City and nearly half of this kind of demolition will be within “central conservation area” with relatively strict protection requirement in the historic area. (Huangpu Government, 2011)

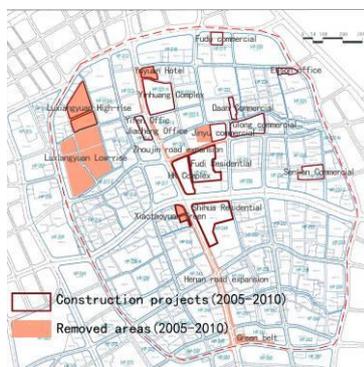

Figure 10: Constructions and removes during 2005~2010; (Data source: Year book,2006~2011)

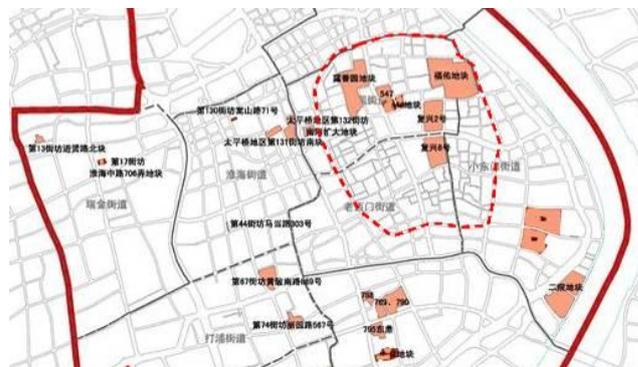

Figure 11: Removes during 2011~2015;(Data source: The 12th Five Year Plan for Land Use, 2011)

In the Luxiangyuan plot, the one that is under demolition in Old City, most part of it is within the central conservation area of the historic district, and includes many retained historic

buildings and ordinary historic buildings determined to be preserved in the historical conservation plan. Although this plot belongs to the area with relatively strict protection requirement in the whole historic district, the large scale demolition of it is not able to be restricted. Therefore, the current conservation plan measure cannot well protect the large amount of historical buildings in the Old City except the “strictly conserved buildings”. Under the circumstance of such huge development pressure, it can be predicted other “central conservation areas” within the historic district and the area with less strict conservation requirement than the Luxiangyuan plot might face with this kind of large scale demolition.

5.3 Lack of community support and participation, why?

In historic conservation plan, it puts forward that residents shall be encouraged to participate in the conservation and renovation as much as possible. It hopes to achieve the gradual renovation effect and then gradually improve the living environment of the whole historic district through the spontaneous housing improvement and renovation of residents.

(1) Uncertainty about the future of the Old City

However, when residents are asked whether they are willing to participate in the reconstruction of old houses, different residents have a different attitude. Through the interview with residents living in old houses, it is found although most residents know the area where they live is an area designated as a historic district, they have no idea about whether the houses they live will be demolished or not in the future. For residents with private property right, some residents express that they are unwilling to spend lots of money on house repair and renovation as they don't know if the houses they live will be demolished or not in the future. If the house they renovated is demolished in the future, the money they spent on reconstruction will be wasted. Meanwhile, some residents also express that if it is determined that their houses will not be demolished in the future, they would like to make repairs together with the government.

(2) Inadequate ability and unwillingness

In addition, a majority of the original residents who lives in the Old City say they cannot afford to make relatively large scale renovations due to economic condition. They hope the government could make removal and relocation as soon as possible, which then could improve their living conditions to a great extent. A large amount of the residents in the old city are tenants and those houses with non-private property right is also the houses with highest residential density and the worst using condition. During the survey, almost all those residents express they are unwilling to make reparation to the houses they live.

(3) Lack of community cohesion

Sense of community identity is the prerequisite for community cohesion. In the Old City, there is a high level of mobility and unstableness in population composition. The unstable mixture of commercial housing dwellers, migrant workers and low-income original residents brings a sense of alienation among them. Migrant workers lack a sense of ownership and responsibility; some residents (relatively wealthy residents or some original residents) have a sense of superiority and disdain to cooperate with other new dwellers. They are unconcerned about the common interest of the whole community; community participation lacks the psychological base of community identity.

(4) Lack of heritage awareness and real power, passive participation

The activities that were addressed to increase heritage awareness were mostly introductory and limited to a relatively small group of people. During the conservation and rehabilitation process, just a few residents have the opportunity to participate and most of the residents were just informed about the plan or redevelopment projects after the decisions had been made. A lot of the residents consider that their opinions and suggestions were not going to be accepted by the developers and the participation process was just going through the motions, so they chose to passively participate in the conservation and rehabilitation.

Therefore, although residents in the old city have a strong demand for renovation and reconstruction, they lack the ability to make renovations of houses due to their own economic condition. Meanwhile, as they have uncertainty about whether the houses they live will be demolished or not in future, they are unwilling to spend too much on the renovation of their own houses. The instability of the community population composition brings low community cohesion and a lack of cooperation among the residents. The activities for increasing heritage awareness and promote public participation was inadequate, local residents didn't actively take part in those activities. All these factors then result in the failure of bottom-up renovation by residents advocated in the historic conservation plan.

5.4 Summary

(1) In summary, as the redevelopments within the historic district is often led by government and developer, they tend to adopt large scale removal and relocation method for development in order to make up for the cost spent on large scale residents relocation and land acquisition for the renewal in old city.

(2) In historic conservation plan, there is no relevant strict supporting regulation for the preservation of "retained historic buildings" and "ordinary historic buildings" that is determined in the historic conservation plan, thus there is not enough strong and effective protection regulation for this kind of building at the time of demolition and then a large amount of buildings forming traditional historic feature will be completely demolished. Although relatively strict control for new building density and height is made, the texture protection and maintenance of social structural diversity put forward in conservation plan is hard to be realized as only recommendatory instead of mandatory stipulation is made to the building type, house type and development mode of newly built buildings. Within the possible limitation stipulated in the conservation plan, both government and developers will select the development method with minimum cost and maximum profits.

(3) Due to the limitation of the economic ability of the residents themselves and the uncertainty about the demolition of their own houses, the residents will seldom make bottom-up small scale renovation. Because of inadequate heritage awareness, high mobility and lack of community cohesion, there lacks the concern about heritage conservation and neighborhood cooperation among the local residents.

6. Conclusion and suggestions

(1) On the whole, the conservation plan has had positive effects on the conservation of heritage and the regulation of redevelopments in the Old City historic district. The environment and facilities of the Old City have been improved; economic condition was becoming better.

(2) However, community problems such as inadequate community cohesion, high mobility and instability still exist. The living conditions of residents in the historic district are badly in need of improvement. The mode of large-scale removal brings the demolition of large amount of historic buildings, eradication of historic urban texture, and severe change of residents' lives.

(3) Factors such as the domination of commercial developers in the rehabilitation process, the inadequate strictness of regulations on new developments, the lack of public support and participation resulted in the problems of conservation and rehabilitation in the Old City.

Measures should be taken to deal with those problems:

(1) The conservation and sustainable development of the historic district need more supporting policies, the government need to input more and pay more concerns on historic conservation. The mode of large-scale removal should be restricted, gradual renovation of small scale should be encouraged and supported both financially and by policy.

(2) The conservation plan should set more strict and explicit regulations on the conservation of historic buildings and urban textures, and proposes more detailed rules on redevelopment of each block. Laws and ordinances about conservation should be compatible with the plan and should pay more attention on historic buildings that have no clear legal protection before.

(3) The conservation of historic districts also calls for more participation of local residents. Activities for increasing heritage awareness should cover more residents and be held more frequently; those activities should also be more diversified. Measures should be taken to strengthen the cohesion and stability of the communities. The conservation plan and other government policies about the historic district (such as the removal plans) should be made clear to the residents. Various kinds of bottom-up renovation should be supported and encouraged by the government.

Strategic Spatial Planning's Role in Guiding Infrastructure Delivery in a Metropolitan Municipality Context: The Case of Johannesburg

Peter Magni

Synopsis: Strategic spatial plans have been used with limited success to guide infrastructure provision. The paper reviews the example of the City of Johannesburg where processes and mechanisms have been implemented to this effect, highlighting tensions between future visions and the reality of existing infrastructure networks and municipal financing systems.

1. Introduction

Within the practice of town planning, strategic spatial plans are recognised internationally as a tool to guide and locate development outcomes within a given jurisdiction, particularly local government. A significant consideration of strategic spatial plans is public infrastructure (e.g. roads, water, electricity, waste removal, transport, and community facilities). Consequently an academic debate has considered the role of spatial plans in ensuring infrastructure provision (Healey et al. 2003) (Morphet J. 2011). This paper seeks to understand how strategic spatial planning has been used to provide public infrastructure and the success of the endeavour in the context of the City of Johannesburg.

The global experience of using spatial planning to guide public infrastructure provision through the academic debate has been generally negative (Matteringley M, Winarso H.2000) (Baker M, Hincks S. 2009) (Dodson J. 2009). A common challenge being acknowledged is the lack of implementation of infrastructure projects defined by a spatial plan.

The paper reviews an example where strategic spatial plans have been successfully used at the City of Johannesburg over the past ten years to guide infrastructure development and refurbishment. Central to the success of this endeavour has been the acceptance by a range of service providers of the need to prioritise spending given limited finances and to commit to an extensive process of negotiation to finalise the City's capital budget. The tool used to catalogue and prioritise projects based on the spatial planning priorities of the City is known as the Capital Investment Management System (CIMS). The paper highlights the fragility of the approach undertaken by the City of Johannesburg. A key tension is between infrastructure asset management plans which assess capital need based on the condition of existing infrastructure, and strategic spatial plans that use a City wide future based template to define this need. The second tension is the difficulty experienced in monitoring expenditure and the material success in directing capital funding.

Strategic spatial plans are meant to be about creating visions of the future, but they cannot be divorced from the existing material and institutional realities. This is particularly true in relation to applying strategic spatial plans to guide infrastructure development.

2. Strategic Spatial Planning

Strategic spatial plans and associated planning process is a means of taking selective decisions on future actions based on defined existing geographical areas for a defined population, often under the jurisdiction of a government administration (Morphet. 2011). It is essentially an American and European planning concept which has been extensively researched (Healey. 2006) (Albrechts.1992) (Faludi.2009) (van den Broeck.2008).

There is no common agreement of what defines the content of a strategic spatial plan. A view is that it is a plan focused on promoting the future economic development of a jurisdiction (UNHABITAT 2009). Another, is that the plans are there to promote sustainable development through identifying drivers for change' in complex economic, social, political and environment systems (Healey et al 2003). Alternatively, strategic spatial plans are perceived as a future vision for the urban form used to guide land use management decisions (ibid).

There is however agreement on what the process of strategic spatial planning entails. Simplified, it involves the definition of priorities and subsequent outcomes; the drafting of the strategic plan displayed geographically; the implementation of the plan; and the monitoring of the outcomes of the plan (Sartorio. 2005).

Methodologies for undertaking such processes vary and include: visionary incrementalism, objective setting; public participation; the use of a package of instruments or concepts; overcoming specific economic, social or environmental barrier approaches; or a combination of these methodologies (Ko et al. 2000). A common modus operandi is integration. Morphet (2009) argues that the integration of a strategic spatial plan must also occur within government in a horizontal fashion between sectors, but also vertically between other policy objectives of the administration.

3. Strategic Spatial Planning and Infrastructure Provision

Projects identified in strategic spatial plans as outcomes or 'drivers of change' are often service infrastructure related, aiming to meet the needs of the population in question. Morphet (2009) perceives service provision as the primary role of strategic spatial plans,

"the role of spatial planning is to deliver infrastructure within a local governance wide framework which comprises of a vision, objectives and shorter-term delivery plans" (Morphet.2009).

Yet despite this affirmation of the role of strategic spatial plans in service infrastructure provision the experience in the past ten to twenty years is that plans are not guiding infrastructure delivery (Morphet. 2011)(Wong and Watkins.2009)

The relationship between strategic spatial plans and infrastructure provision has been researched in a number of contexts. Studies reviewed included experiences in the United Kingdom (Baker M, Hincks S. 2009), Australia (Dodson J. 2009) and Indonesia (Mattingley M, Winarso H.2000). The outcomes of the reviews are sobering. The three case studies viewed

linking strategic spatial plans to projects as an important initiative to provide direction to development in a jurisdiction. The challenge arose in reconciling the outcomes of the spatial plan to the projects that were, or were not, implemented. The reasons provided for this disjunction included: lack of administrative coordination between planners, budget officials and project implementers (e.g. United Kingdom and Australia); contradictory policies (United Kingdom and Indonesia); political interference and the prioritization of either the cheapest and easiest projects (Indonesia); resistance from town planners who are used to land use management planning and not strategic spatial planning (United Kingdom). Even in Australia, a role-model for integrating strategic spatial plans with infrastructure provision, there are concerns that the broader integrative outcomes of the plans are being overshadowed by a single minded emphasis on public infrastructure provision (Dodson J. 2009). There is a sense from the literature that despite outcome monitoring occurring that the success of such plans cannot be measured by infrastructure projects completed, or the quality of the work. Success requires the commitment of all parties to accept a plan for an area in question and implement infrastructure interventions stipulated within the plan within agreed timeframes and standards.

There are key components, or aspects, of a strategic spatial planning that need to be considered, in order to ensure that there is coordination between the plan and provision of infrastructure. These components include:

1. The existing and future **population** that needs to be planned for. This Information is critical for modelling the appropriate infrastructure intervention.
2. The **location** of the infrastructure project must be defined accurately.
3. **Existing infrastructure capacity** – Without an understanding the condition of existing infrastructure one will not be able to know whether the existing population is adequately provided for.
4. The **nature of the infrastructure project (Project Type)** – A strategic spatial plan's outcomes may require service delivery to be done differently in the future in order to meet changing expectations (e.g. achieving environmental sustainability).
5. The **implementing agent** needs to take responsibility for executing a planned and budgeted for project
6. **Coordination of infrastructure delivery** between implementers of different infrastructure types is critical.
7. A **capital budget**
8. The **Sources of funding** used in paying for infrastructure.
9. **Implementation and Monitoring** (Wong and Watkins.2009)

In order for the above components to be used successfully certain tools and methodologies have been used to bridge the gap between planning and implementation of infrastructure

interventions. Examples of tools used, have been used or proposed in the South African context. The tools include:

1. **Infrastructure cost model** that considers population, population density projection, infrastructure demand, location, existing infrastructure capacity and cost (Biermann and Landre. 2002).
2. The **Municipal Infrastructure Investment Framework** (DBSA.2009) identifies infrastructure need based on infrastructure backlogs, infrastructure standards, population projections, an assessment of future requirements and a cost analysis.
3. **Computer based development models** and associated databases that would consider the range of components detailed above, and link these to custom made software to aid decision making in relation to where resources should be directed in relation to infrastructure provision. Multi-variable analysis is combined with Geographical Information Systems, financial management tools and engineering considerations. Examples include the Centre for Scientific and Industrial Research's Urban SIMS (CSIR. 2011), Integrated Infrastructure Management Environments as proposed by Mamoud Halfawy (2010) and the City of Johannesburg's Capital Investment Management System.
4. **Infrastructure Standards** or guidelines are the most common approach to define infrastructure requirements as a base for future development projections. There are numerous examples of this approach such as the South African Human Settlement Guidelines (CSIR.2000).

In the South African context, the strategic spatial plan used by municipalities is the Spatial Development Framework (SDF). With respect to conceptualising infrastructure SDFs typically use a set of common structuring concepts – namely nodes, corridors, open spaces and areas designated to the intensification of land uses. The focus infrastructure provision is generally poor. There is often little connection between proposed interventions in the SDFs and the execution of these interventions. Over the past five years there has been greater interest in linking SDFs to infrastructure implementation in the Country (Todes (2011)). The emphasis in these deliberations has been on the process to implement the infrastructure outcomes of the SDF and the plan itself.

4. The City of Johannesburg's Experience

The City of Johannesburg (CoJ) is located in the Province of Gauteng, South Africa. The City is located within the urban conurbation of Mogale City, Tshwane Metropolitan Municipality and Ekurhuleni Metropolitan Municipality and the less urban municipalities of Mid-vaal and Randfontein. It is one of the most populous cities in South Africa (COJ 2011) with an estimated

population of 3.8 million people within a broader provincial population of 10.5 million (CoJ 2011a)

The City of Johannesburg's planning regime is determined by the Municipal Systems Act of 2000 (DPLG.2000). It includes a 30 year strategic plan, the Growth and Development Strategy 2040; a 5 year medium term strategic plan, the Integrated Development Plan and three year operational and capital budgets.

5. *Spatial Development Frameworks*

The strategic spatial plan for the City, the Spatial Development Framework, is a component of the Integrated Development Plan. The Spatial Development Framework includes a hierarchy of local level plans namely: regional spatial development frameworks, urban development frameworks and precinct plans.

The key component of the Spatial Development Framework for prioritising infrastructure projects is the Growth Management Strategy. This strategy identifies those areas where, and when, the municipality should direct infrastructure investment. Priority areas include: marginalised areas (former black townships), transit orientated development corridors (as defined by the City's bus rapid transit system and rail network). Other areas in the City are given lower priority for future development and by extension, capital investment. The 'investment footprint' of the Growth Management Strategy is combined with an infrastructure coordination process that negotiates the three year capital budget for the City with technical departments. The computer based multi-variable tool used in this process to store and prioritise capital project information in the City is the Capital Investment Management System (CIMS).

Infrastructure in the City is provided by local government departments and government owned companies known as Municipal Owned Entities. For simplicity's sake these divisions will be referred to as departments.

6. *The Spatial Planning/ Infrastructure coordination process*

The Infrastructure Coordination process has been in operation since the formation of the City of Johannesburg in 2001.

The system was piloted at the Midrand Transitional Local Council in the late 1990s (Herman Pienaar 2011). The City Manager required a means of prioritising Ivory Park, a black township, for infrastructure delivery. The town planning department engaged with technical departments and determined the municipality's infrastructure need. A list of infrastructure projects for Midrand was determined. Subsequently the draft project list was prioritised based on the spatial imperatives.

When the Midrand Transitional Council was consolidated into the City of Johannesburg the concept of linking strategic spatial plans to infrastructure requirements was applied the City. During 2002/3 a Software/Civil Engineering collaborative was appointed by the City to develop a tool to facilitate this process. The operated by the Development Planning Department was the Capital Investment Management System (CIMS) (Herman Pienaar 2011). The function of the system was to facilitate the capture and prioritisation of infrastructure projects and reflect this as a capital budget.

Identification, prioritisation and finalisation of capital projects occur within the broader annual budgeting process of the City. The relationship is portrayed in Figure 1.

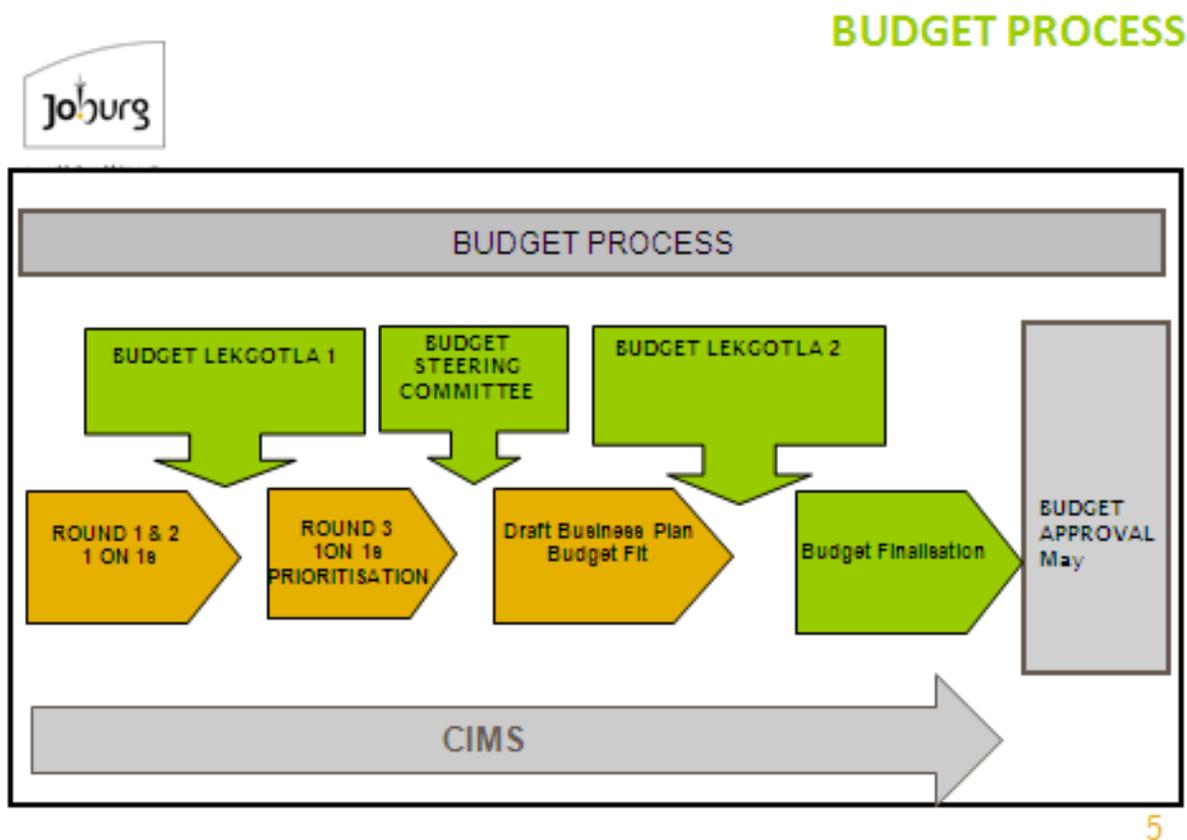

Figure 1: Diagram indicating capital budgeting process within the City of Johannesburg

Central to finalising project lists are sets of one on one meetings that the Directorate: Development Planning and Facilitation has with departments. These meetings are undertaken in order to ensure that departments are capturing their projects on CIMS correctly. The meetings also discuss the strategic prioritised list of projects against the Departments' own

priorities. The discussion attempts to balance the strategic intent of the City against the realities of infrastructure provision in the City.

Financial oversight of the capital budgeting process occurs through the Budget Steering Committee where a panel hears motivations from departments for capital funding in future financial years.

Political input into the capital budgeting process occurs at meetings, known as Lekgotlas. There are generally two Lekgotlas. At the first Lekgotla the broad principles for expenditure are determined. At the second Lekgotla the draft budget for the City is reviewed and inputs made.

The benefits of the CIMS and the capital budgeting process have been:

1. The provision of an annual process within the City whereby all departments' projects are represented on the same platform.
2. The provision of a single capital budget that is recognised across the administration.
3. The ability to link the strategic outcomes of the City as captured in the Growth and Development Strategy and Spatial Development Framework to specific projects
4. For engineering officials CIMS provides a platform on which the technical need can be assessed.
5. A means of directing a higher percentage of capital funding to marginalised and public transport areas for infrastructure service delivery where the funding will benefit the poor.
6. A means to achieve a consolidated overview of the sources of funding required by the City to fund new, refurbishment or operational capital projects.
7. Improved transparency for the public.

The challenges in implementing the CIMS system include:

1. The project list is only as good as the information captured on CIMS by the Departments. If this information is not correctly captured, this is the information that appears in the budget.
2. There is a tendency for departments and MOEs to redirect funding from projects in the budget that are located in strategic areas to other projects during the budget adjustment period. This is in the absence of effective administrative oversight during the adjustment budget process.
3. There is no means of verifying whether the CAPEX spend was spent on what was budgeted, and whether the infrastructure provided was of sufficient quality. The lack of an effective monitoring system is a major concern.
4. The prioritisation model used on CIMS is complex. This makes it difficult to communicate to departments and MOEs why one project is prioritised over another.

The capital budgeting process and the attendant CIMS system have been relatively successful over the past ten in guiding capital expenditure as a means of coordinating capital expenditure. The extent to which it has impacted on achieving the spatial outcomes of the City set out in the Spatial Development Framework is difficult to gauge in the absence of a comprehensive monitoring system. From a subjective perspective, certain areas, such as Soweto and the Inner City, have clearly benefitted from ten years of intensive capital investment. Other priority areas have not benefitted to the same extent.

The future of the capital planning process is closely bound to infrastructure procedures and to the financial processes within the City. Changes to these systems have significant ramifications for whether or not strategic spatial plans will continue to be linked to infrastructure budgeting.

7. Spatial Plans and Infrastructure Asset Management Plans (IAMPS)

The impetus for IAMPs to be undertaken in the City of Johannesburg was a raft of national policy that was introduced by the Department of Cooperative Governance and Traditional Affairs (COGTA) in 2007 and 2008 and was initiated by the Draft Municipal Infrastructure Support Strategy (COGTA.2007).

IAMP is a methodology by which existing assets are identified and monitored so that the condition of the assets of a given department can be ascertained, and that necessary interventions can be undertaken in order to maximize the asset's expected lifespan.

Similarly, Consolidated Infrastructure Plans (CIPS), in the context of a South African Municipality, consolidate the findings of all IAMPs to determine the overall conditions of the capital assets in question, and as a means to understand the infrastructure backlogs of the institution (Manqoba Soni 2011).

Infrastructure backlog in this circumstance is defined as:

1. The Apartheid backlog that resulted in a lack of service infrastructure in areas formerly reserved for Blacks, Coloureds and Indians.
2. The housing backlog which entails ensuring that all South African citizens have access to housing of an approved standard.
3. The maintenance backlog, which concerns the inadequate maintenance history of a municipality's assets. The backlog includes economic and population growth demands considerations in relation to infrastructure provision (SACN 2007).

The need for a standardized tool that assists in the on-going monitoring of the state of existing infrastructure cannot be questioned given the scale of municipal backlogs.

However, the policy does not consider how to integrate strategic spatial policy, in the form of the Spatial Development Framework, with the IAMPs or for the CIP. This was an acknowledged shortcoming by COGTA (Santhurie Naidoo 2011). The IAMP/CIP policy sees the strategic policy link between the CIP and municipal policy as the IDP and specifically the sector plans in the IDP (COGTA.2007b.p9) and not the SDF. This is problematic if strategic spatial planning is to have a future in guiding infrastructure delivery. The nature of IDPs varies from municipality to municipality, as does the level of detail in these plans. Whether the CIP can be 'linked' to the IDP in such a generic manner is questionable. If the current strategic objectives of the IDP is to be altered and driven by the contents of the CIP, the question arises as to whether service infrastructure need should be the only factor to drive infrastructure delivery outcomes?

Service delivery through the provision and maintenance of public infrastructure must be primary intention of a municipality. It is what a municipality are envisaged to do in terms of the Constitution (See 152b and Schedule 4 Part B of the Constitution (RSA, 1996)). However, achieving this intention means undertaking service delivery in a manner that achieves the other desirable outcomes that constitute 'developmental local government' (see 152 c-e of the Constitution (ibid)).

The constraint with IAMPs and CIPs is that the methodologies do not have the means to prioritise projects based on the other desirable factors. Neither does IAMPs/CIP have population projections for the municipality in question, nor a conceptualization of what the densities for a given area will be in the future. Nor do the IAMPs provide a spatial perspective. What IAMPs do provide is critical threshold information regarding infrastructure capacity and design. IAMPs also provide current and historical information relating to infrastructure costing.

What is required is a strategic spatial plan, in the form of an SDF that provides the outstanding information, draws on the IAMPs and CIP for information in relation to infrastructure provision, and prioritizing where new refurbishment and renewal projects are to take place based on priority areas identified in the plan.

8. Spatial Plans and Financial Procedure

The Municipal Finance Management Act's (no.56 of 2003) (Treasury.2003) intention is

"To secure sound and sustainable management of the financial affairs of municipalities and other institutions in the local sphere of government; to establish treasury norms and standards for the local sphere of government; and to provide for matters connected therewith."

The intention of the act is not to enhance service delivery or promote 'developmental Local Government' as per the Constitution (RSA.1996). Service delivery is not the primary outcome of the MFMA, financial prudence is (see also SACN.2007p68). This is not in and of itself a criticism of the MFMA. Sound financial management at municipalities is critical. But when commentators

criticize slow service delivery at the municipal level they need to realize that officials in municipalities work within a financial framework that is not geared to this outcome. Due to the effectiveness of National Treasury's implementation of the legislation the broad financial philosophy has become entrenched in South African Municipalities.

In relation to the City of Johannesburg there are two sections of the Act that influence planning for service infrastructure. The first relates to the municipal budgets set out in chapter 4 of the Act (Treasury. 2003). The second, relates to the acquisition of those goods and services in terms of Chapter 11 of the Act.

In relation to planning and budgeting it is the MFMA that legislates that:

1. IDPs provide the strategic framework for budgeting
2. Expenditure be linked to outcomes and goals as part of the budgeting process
3. That the project name detail be reduced and be standardized
4. Greater public participation be undertaken with residents and with other spheres of government in the finalization of budgets
5. A draft budget be finalised four months before the beginning of the financial year.
6. That formal adjustment budgets be tabled and that these occur once or year or under exceptional circumstances (SACN. 2007. p70).

From the above it may appear that the link between strategic plans and the budget would suffice to link financial sustainability and developmental local government. However, it is in the realm of the procurement of service infrastructure that the City of Johannesburg is feeling the burden of the MFMA's managerial emphasis. In this regard the establishment of tender committees (bid specification, bid evaluation and bid adjudication committees) depending on the complexity and the value of the tender concerned, have negatively impacted on Departments and MOEs ability to spend capital budgets (Manqoba Soni 2011).

The MFMA has become central legislation in defining how strategic spatial plans are linked to infrastructure provision within the City. Yet the linking of budgets to strategic outcomes is being negated in the City of Johannesburg because the budgets for capital projects are not being linked to actual expenditure, and that the procurement procedure is hindering the completion of capital projects in budget and on time.

9. Assessment

The City of Johannesburg has implemented a formal process by which strategic spatial plans have been used to direct infrastructure spending for over ten years. The use of defined and agreed to capital budgeting process has done much to mitigate against arbitrary political interference in the budget, and has provided a platform on which technical and strategic

considerations can be weighed. The process has also gained support for strategic spatial planning from technical departments.

The Capital Investment Management System has been a useful tool in providing a strategic spatial plan's budget that in turn provides the basis for discussions with technical departments and politicians

The capital planning process has also made a contribution to ensuring that capital is directed towards those areas in the City where infrastructure is needed most – marginalised areas, public transportation areas and priority areas requiring refurbishment.

However, it is in the monitoring and determination of the actual impact of the City's process to link its strategic spatial plans to infrastructure where the System has failed. While the CIMS system can indicate what is budgeted for in a given financial year, it does not provide what the actual expenditure was on a given project. This makes assessing the spatial impact of policy very difficult. It also opens up the capital budgeting process to challenges from other existing processes within the City Administration.

Two of these existing processes relating to Infrastructure Asset Management Plans and Financial Systems were discussed in detail. The challenge is to continually re-negotiate policy interventions where responsibilities of departments in relation to strategic spatial planning, budgeting and infrastructure provision intersect. As such the role strategic spatial plans play in guiding infrastructure delivery is far from secure, and shifts in relation to new policy interventions and changing staff compliments.

10. Conclusion

Unlike other cities, Johannesburg has had relative success in coordinating strategic spatial plans with infrastructure delivery over the past ten years. The success has been due to an intensive well defined capital budgeting process in conjunction with an internet database, CIMS, that prioritises projects based on the developmental outcomes of the strategic spatial plan. In addition, on-going support from technical departments and politicians has been critical to this success.

However existing policies relating to infrastructure and financial management mean that the strategic spatial planning's role has to be constantly re-negotiated especially in a circumstance where the impact of the capital budget planning process cannot be fully understood in the absence of detailed and consistent information relating to expenditure on previous annual budgets.

System of incentives to urbanistic operations with municipal interest

Emilia Malcata Rebelo, CITTA

CITTA - Research Centre for Territory, Transports and Environment, University of Porto - Faculty of Engineering, Department of Civil Engineering, Territorial, Urban and Environment Planning Division; PORTUGAL

Abstract

The research reported in this article presents a proposal to develop a system of incentives to urban municipal-interest operations intended to improve the use of already existing buildings and sites that meet municipal strategic urban goals (despite these buildings and sites are valueless for real estate promoters). The current system of incentives proposes a device that vests municipal powers with the right to assign construction credits – that represent tradable edification rights -, directed to those that pursuit certain kinds of urban operations that refer, namely, to (i) repopulation concerns; (ii) rehabilitation of buildings (iii) restoration of heritage buildings; (iv) integration within the municipal domain of municipal land parcels aimed at green spaces; (v) demolition of existent buildings in urban spaces or spaces aimed at consolidation; (vi) promotion of buildings', infrastructures' and public spaces' energetic efficiency, and integration of bioclimatic concepts in a more efficient use of resources; and (vii) provision of additional parking in new urban operations with parking shortage.

Keywords: urban regeneration; construction credits; territorial management instruments; private initiative

Introduction

This research fits the revision of the juridical regime of the instruments aimed at territorial management, currently taking place in Portugal. The proposed system of incentives is an instrument of urban management that should be applied together with other planning and fiscal instruments (which revision is under way). The current assessment of the instruments aimed at territorial management is especially important in the scope of the current Portuguese economic crisis that strongly impacts on municipal finance and it pursuits the goal to provide municipalities with policy tools that enable them to defend and sustain the interests of their populations. These concerns are currently being approached by the revision of the municipal regulation of the system of incentives to urban operations with municipal

interest carried out by the municipalities of Lisbon and Porto¹ (the two main cities in Portugal, with rather important historical centres) (Câmara Municipal de Lisboa, 2012; Câmara Municipal do Porto, 2007)

Framework of official works

The main goal of the system of incentives to municipal-interest operations consists in the assignment of building credits to those that pursue urban development operations that meet the urban strategic goals stated in the correspondent Municipal Master Plans. This instrument of urban management is intended to be applied together with municipal development charges, special contributions, property transfers and compensations, and systems to assign the surplus-values engendered by plans to social uses.

According to n.º 3 of the 84th article of the regulation of Lisbon's Municipal Master Plan (Diário da República, 2012), the municipal regulation of the system of incentives to urban operations with municipal interest carried out by this municipality (Câmara Municipal de Lisboa, 2012) proposes a better use of the existing buildings, and sets a device to assign tradable building rights to certain urban development initiatives that pursue municipal goals (despite being valueless from a real estate promotion perspective).

As stated in point II of the preamble, these municipal interests refer to:

- Repopulation;
- Rehabilitation of buildings, namely:
 - Promotion of housing and protection of resident occupants;
 - Improvement of housing conditions, accessibility and building's security
 - Safeguard and valorization of the built heritage;
 - Energy performance and environmental sustainability;
- Incentives to the restoration of assets identified in the national or municipal heritage maps;
- Integration within the municipal domain of private parcels aimed at green spaces;
- Demolition of already existing buildings within green spaces or spaces assigned to consolidation;
- Support to the integration of bioclimatic concepts, and promotion of a more efficient use of resources, namely buildings', infrastructures' and public spaces' energetic efficiency;
- Provision of additional parking spaces in new urban development operations within the areas showing parking shortages.

In n° 2 of the 1st article, building credits are defined as tradable values ascribed by the town council to promoters of urban development operations that fulfil municipal-interest solutions stated in the Municipal Master Plan, according to a multi-criteria assessment that considers, namely, the location coefficient according to surfaces, and the land or floor surface. The number of building credits to grant is computed as a function of the merit of the operation (expressed in square meters as a multiple of the licensed building surface). This increase may take place either in the proper original operation or in another one, according to the rules stated by the Municipal Master Plan and in the current regulation. Maximum building indexes for the different types of spaces shouldn't be exceeded, neither should the maximum height or gable depth.

The project of municipal regulation of the information multi-criteria system in Porto city (SIM-PORTO) proposes a similar assessment, also based on the assignment of concrete building rights.

Methodology

The research herein reported proposes the adoption of the formula suggested by the system of incentives to urban operations with municipal interest carried out by the municipality of Lisbon, which is based on an exhaustive multi-criteria assessment:

$$CC = PP \times LO \times W/100$$

where:

CC – value of the building credits, expressed in square meters of floor surface, assigned to the urban development operation the request refers to;

PP – score assigned to the urban development operation concerning each criterion referred to in appendices II and III of respective regulation (an adaptation is proposed in Table 1)

LO – location coefficient, according to the considered surfaces:

- Residential areas or primary intervention areas (LO = 2);
- Systematic rehabilitation areas (LO = 2);
- Simple urban rehabilitation areas (LO = 1,5);

- Remaining city areas (LO = 1).

W – Floor surface or land surface on which the computation of the building credits is focused.

The assignment of building credits in urban rehabilitation operations or in the restoration of assets identified in the National or Municipal Heritage Maps starts with the request of an integrated inspection in order to assess the real estate asset aimed at rehabilitation (survey of its physical and preservation characteristics), followed by the assessment of the rehabilitation project according to a set of criteria (that supports the evaluation of the proposal in relation to the pre-existent situation).

The integrated inspection leads to the working out of inspection proceedings and of a technical report on the proposed intervention. The integrated inspection – carried out by a technician or a technical team with appropriate qualifications – points out the building pathologies and lack of functionalities, identifies the environmental and patrimonial values, and describes the socioeconomic situation of the resident households.

The technical report of the intervention, by its turn, should include the description of the proposed intervention based on the characterization reported in the inspection proceedings. Both the integrated proceedings and the technical report are, then, submitted for the approval of the entity entitled to assess the urban development operation (despite it may delegate this power to the heads of the municipal services or to the entities that manage urban rehabilitation societies or similar ones from legal or regulation grounds).

The assessment of the rehabilitation project finishes with the attribution of a score to the project that requested the license (or to the prior communication inherent in the urban operation) as a function of the following goals:

- Provision of dwellings subjected to a maximum rent or selling price;
- Promotion of housing and protection of the situation of its occupants;
- Evaluation of the housing qualification and security;
- Evaluation of safeguard and valorization of the built heritage;
- Integration of bioclimatic concepts and promotion of the buildings' efficient use of resources, namely energy ones.

The achievement of these goals is gauged as a function of the appreciation of the project in the light of the criteria and sub-criteria listed in Table 1 (considering the situation prior to the inspection proceedings):

Criteria and Subcriteria		PP
1	Provision of dwellings subject to maximum rent or selling prices	
1.1	It is expected that more than 75% of dwellings are subject to maximum rent or selling prices.	2,5
1.2.	It is expected that 50% to 75% of dwellings are subject to maximum rent or selling prices.	1,5
1.3.	It is expected that 25% to 50% of dwellings are subject to maximum rent or selling prices.	1
1.4.	It is expected that less than 25% of dwellings are subject to maximum rent or selling prices.	0,5
1.5.	The provision of dwellings subject to maximum rents or selling prices isn't expected	0
2.	Promotion of housing and protection of the situation of resident occupants	
2.1.	Keeping of households	
2.1.1.	Keeping of all resident households, regardless the existence of a rental contract	2,5
2.1.2.	Keeping of resident households that hold tenancy agreements.	1,5
2.1.3.	Keeping of more than 50% of resident households.	1
2.1.4.	Keeping up to 50% of resident households that hold tenancy agreements.	0,5
2.1.5.	There aren't any resident households or keeping any of the existing ones isn't expected.	0

2.2.	Keeping or installation of trade, services and other facilities compatible with the housing function	
2.2.1.	Creation of equipment within the scope of the social equipment networks, the educational act, the health equipment act, or the sports and/or arts act that belong to the heritage municipal map and/or other trade units relevant from the socioeconomic and cultural points of view.	2,5
2.2.2.	Keeping of historic or artistic reference shops that belong to the heritage municipal map and/or other trade units relevant from the socioeconomic and cultural points of view.	2
2.2.3.	Keeping of preexistent areas assigned to trade, services or equipment units compatible with the housing function.	1,5
2.2.4.	Keeping of the preexistent trade, services or equipment units and introduction of new units compatible with the housing function.	1
2.2.5.	Preexistent trade, services or equipment units don't exist or keeping any of the existing ones isn't expected.	0
3	Evaluation of housing qualification and safety	
3.1	Improvement in housing comfort conditions	
3.1.1.	Increase in housing quality patterns are expected with the execution of works in common internal and external areas and inside all the properties, including the upgrade in infrastructures.	2,5
3.1.2.	Increase in housing quality patterns are expected through the introduction of basic hygiene and comfort conditions, with the creation of autonomous kitchens and bathrooms and the execution of works in common internal and external areas (roofs, frontage and distribution areas), upgrading networks' infrastructure.	2
3.1.3.	Assures that legal requirements are met.	1
3.2.	Promotion of accessibility for people with restricted mobility	

3.2.1.	Improvement of accessibility conditions in common areas are expected with the introduction of lifts and/or other mechanical devices, and inside the properties through removal or reduction of architectural barriers, thus promoting the independence of inhabitants, and keeping it compatible with the preservation of buildings' constructive, typological or spatial characteristics.	2,5
3.2.2.	Improvement of accessibility conditions in common areas are expected with the introduction of lifts and/or other mechanical devices, compatible with the preservation of buildings' constructive, typological and spatial characteristics.	2
3.2.3.	Improvement of accessibility conditions in common areas are expected, that are compatible with the preservation of buildings' constructive, typological and spatial characteristics.	1,5
3.2.4.	Improvements in accessibility conditions in common areas and/or inside the properties are expected, at sacrifice of constructive, typological and spatial characteristics of the buildings.	1
3.2.5.	Improvements in accessibility conditions aren't expected.	0
3.3.	Consolidation and structural reinforcement of buildings aimed at reducing the seismic vulnerability	
3.3.1.	The introduction of a component of seismic reinforcement is expected, resorting to low-intrusive techniques compatible with the preservation of original buildings' typologies.	
3.3.2.	The introduction of consolidation and structural reinforcement measures are expected, at sacrifice of the maintenance of architectural and constructive characteristics.	
3.3.3.	The introduction of any measure of consolidation or structural reinforcement isn't expected.	
3.4.	Installation and updating of a detection and protection fire system	

3.4.1.	The introduction or upgrade of detection and protection fire systems is expected.	2,5
3.4.2.	The introduction or upgrade of fire detection means or systems isn't expected	0
3.5.	Provision of additional car parking spaces for resident people	
3.5.1.	The creation of additional car parking spaces for resident people is expected.	2,5
3.5.2.	The creation of additional car parking spaces isn't expected.	0
4	Evaluation of safeguard and valorization of the building heritage	
4.1	Conservation and rehabilitation of historic-heritage buildings	
4.1.1.	The execution of conservation or valorization works in classified buildings or in buildings being classified is expected, with recourse to heritage preservation and restoration techniques.	2,5
4.1.2.	The execution of preservation or alteration works that embrace the whole building is expected, from the perspective of a morphological and typological preservation, keeping the implantation surface and the preexistent roof shape in areas where these parameters may be changed.	2
4.1.3.	The execution of alteration works that embrace the whole building are expected, according to the admissible parameters.	1,5
4.1.4.	The execution of alteration and/or enlargement works that embrace the whole building are expected, according to the admissible parameters.	1
4.1.5.	The execution of preservation works in outside common areas are expected, namely frontages, gables and roofs.	0,5

4.2.	Exclusion of dissonant elements	
4.2.1.	The exclusion of dissonant elements that contribute to the architectural de-characterization of licensed buildings is expected, including, namely, the replacement of the buildings' original architectural language, the standardization in the design of the frameworks, and the transference of wiring from the frontage to underground infrastructure.	2,5
4.2.2.	The exclusion of some dissonant elements identified in the previous paragraph and under the same conditions is expected.	1,5
4.2.3.	The exclusion of non-licensed dissonant elements is expected.	0,5
4.2.4.	The exclusion of any of the considered dissonant elements isn't expected.	0
4.3.	Increase in the permeable surface of the public place and respective landscape treatment	
4.3.1.	The exclusion from the public space of licensed cultural valueless constructions is expected, thus enlarging the permeable surface and promoting its landscape treatment and valorization.	2,5
4.3.2.	The public space is expected to be cleared out without increases in licensed floor surfaces.	1,5
4.3.3.	The exclusion from the public space of cultural valueless constructions which lawfulness is not proved is expected, thus increasing the permeable surface and promoting its treatment and landscape valorization.	0,5
4.3.4.	Increases in permeable areas aren't anticipated, nor the existence of public space.	0
5.	Integration of bioclimatic concepts, and efficiency in the use of resources, namely energy efficiency	

5.1.	Implementation of measures to improve the energy performance and the quality of the inside air (according to the energetic and quality of inside air certification system)	
5.1.1.	The accomplishment of measures to improve the energetic performance and the quality of the inside air is expected, in order to increase the current energetic classification of the building in two classes, if the urban development operation is classified as a big rehabilitation.	2,5
5.1.2.	The accomplishment of measures to improve the energetic performance and the quality of the inside air is expected, in order to increase the current energetic classification of the building in one class, if the urban development operation is classified as a big rehabilitation.	1,2
5.1.3.	It isn't expected the introduction of any measures, even if the urban development operation is classified as a big rehabilitation.	0
5.2.	Promotion of the local production of energy that excludes the compulsoriness to install thermal solar systems from buildings' valorization

Table 1. Criteria and sub-criteria to assign scores to urban development municipal-interest operations (Source: Regulamento Municipal que aprova o Sistema de Incentivos a Operações Urbanísticas com Interesse Municipal” (Lisbon), adapted)

Conclusions and recommendations

The incentives proposed in this research fit into the overall concern to value what already exists, as they: (i) enable the cities to preserve their identities; (ii) thwarts urban degradation processes and the abandonment of ancient sites; (iii) supports private initiatives of urban regeneration and qualification, (iv) curb urban sprawl, keeping urbanization processes within the urban perimeters thus promoting the rational use of already existing infrastructures; (v) protect historical heritage sites and neighbourhoods, while contributing to lodge people into the existent urban fabric; (vi) improve the already existent heritage buildings and sites; and (vii) fosters community involvement in already settled neighbourhoods, thus upgrading the quality of their urban life.

Considering the methodology used and the common urban problems identified in historical centres, this research is applicable to other urban realities all around the world.

Delineation, transformation assessment and intervention initiatives for 'Grey zones' of Kolkata, India

Tapas MITRA, School of Planning and Architecture, Bhopal, India

Sheuli MITRA, School of Planning and Architecture, Bhopal, India

Synopsis: *This paper focuses on the aspects of dynamics of change in older residential areas of Kolkata, India, which do not necessarily qualify as 'heritage districts'. It assesses the areas from spatial, perceptual and socio-cultural perspectives and eventually presents a rapid appraisal template to initiate processes of developing design intervention strategies.*

1. Introduction: study background

The city of Kolkata has been documented and interpreted by authors of various backgrounds who have portrayed the city in its multiple and complex layers. The city, as is known, rose to prominence from the mid 18th century, as the chosen Capital of British India. As a natural outcome of being the seat of power, the settlement developed as a major urban centre of the British times providing the ambience and amenities befitting a capital city. Thus, public edifices representing British colonial architecture are strewn all across the city. As a result of this process of concentration of wealth, undeterred urbanisation occurred, and Kolkata grew to become a primate city with large concentrations of population. It also became a culturally vibrant city, being an arena for significant cultural movements. The city continues to represent the splendours of the Raj coexisting with abject poverty and squalor of the large in-migrant population.

The pressures of population on the city's economy and infrastructure over time coupled with the reduced political role of the city from a colonial capital to a provincial capital, has led to transformation of the city socially, spatially and perceptually. The many dimensions of this process of transformation have been documented through various seminal works on Kolkata, both in English and Bengali. The subjects of much of the critical writings on Kolkata are seen to focus majorly on three key aspects of the city- a) the Colonial Splendours, b) City and its poverty and c) City and its culture.

The focus of the old city areas in academic works has thus either been on the social and cultural setting, which existed in the colonial times or on the recent infrastructure inputs to the areas as urban renewal projects in recent times. Some attention has also been given to individual historic buildings and their conservation. There however, remains one area of interest in urban studies, namely, academic discussions on the **older residential neighborhoods** of the city, which has found comparatively lesser thrust in the context of Kolkata. The image of the city through the perception of its neighborhoods, as they exist in the collective memory of its residents, has not been a major area of focus in academic studies. One of the ways of understanding a city is about understanding its residential neighborhoods which form the major bulk of its building stock and are woven all over the body of the city. This, as classified by Rossi¹, is one of the two 'permanences' of a city. Significant work in this regard is found in the west, but has remained by and large unexplored in the Indian context. Kolkata, with its many layers of history and development, has many old residential areas, interwoven and strewn across large parts of the city. The visual and social character of these areas, possess an identity, distinct even today, from the newer planned areas of the city. The transformation which has occurred in them as a result of the city's growth is also of interest, as these areas form a large chunk of the city core.

This research work focuses primarily on the older residential parts of Kolkata, analysing them in spatial, perceptual and socio-cultural perspectives, and tries to capture the dynamics of transformation which has occurred therein.

2. Academic structure of the research

The Perception School spearheaded by Lynch², and the works of Jane Jacobs³ and Habraken⁴, have raised strong point against Modernist City planning advocated by Corbusier during the heydays of modernism in the 30s and 40s, which saw great architecture but not great liveable cities, where the automobile becomes the major protagonist and situates the participator (to borrow a terminology from Edmund *Design of Cities*⁵) in the automobile dominated realm. Jacobs and her compatriots strongly advocate local interventions and reorganisation of the urban fabric at the local levels as against the monumental urban renewal proposals that dominated the 60s American city planning practices. The whole movement of *New Urbanism* is an offshoot of this world view.

In the city of Kolkata, many of the neighborhoods are heavy with important architectural artefacts, but are more importantly, consistently made up of 'structures of the ordinary'. A large part of the 'native' or 'black' towns which developed over a period of time demonstrate the characters of this 'structure of the ordinary'. Interestingly, the temporal variations in the development of the different neighborhoods, give rise to variations in their perception and character. Notably, the older black town in North Kolkata forms a contrast to the newer neighborhood developments in South Kolkata, and the metamorphosis which they undergo over time.

The Perception School continues to be a major influence in the work of two other major thinkers, Tridib Banerjee and William C. Baer, who in their seminal book *Beyond the Neighborhood unit*⁶, use perception techniques to delineate the extent of what they call 'residential neighborhood areas' which disqualifies and outdates the neighborhood unit concept of Clarence Perry⁷ in his work of 1929.

3. The purpose and process of research

This work attempts to understand the city of Kolkata as a continuum of residential neighborhoods which form a predominant structure in its urban fabric. Perception of the inhabitants, presence of the past and the future, permeability within the neighborhood patches and the presence of the particular, the *solus locus*, as Rossi⁸ puts it; all form part of a combined approach in this study.

The present research work tries to identify the 'quintessential' Kolkata neighborhoods and examines them in the context of the city's development patterns.

The first part of the study establishes the morphology of the city and identifies parameters and attributes of defining the neighborhood typologies which fulfil the requirements of 'quintessential' Kolkata residential neighborhoods. The term "Grey Zone" as a definition of such areas is coined. In this part, a detailed inventory of works on city morphology and neighborhood structures, available in research works across the world, is critically examined and then the appropriateness of these available models, when applied to Kolkata, is also adjudged. The spatial structure of the city, its chronological growth and impact on older city areas are analysed. Selected case study areas are then identified as representative samples of residential neighborhoods in transformation, from the possible qualifying zones.

In the second part of the work, detailed surveys (physical, socio-economic and cultural) of the two chosen case study neighborhood areas of Kolkata, are undertaken. An examination of the data collected, reveals patterns of development and neighborhood transformation. The transformation of neighborhoods and also individual residential properties, are documented through chronological spatial data analyses and socio-economic surveys to understand household level transformations and the impact of these on neighborhood characteristics.

The study concludes with an analysis of the key attributes, which help retain the essence of

'quintessential Kolkata neighborhoods'. An attempt is also made to assess the vulnerability of neighborhoods to total transformations and identify the different attributes which are responsible for the transformation correlating their own inter relationship, which affect the dynamics of change. Based on the cumulative impact of the effect of these attributes, suggestive intervention strategies are put forward, with a commentary on the possibilities of taking this research forward.

3.1 Research methodology

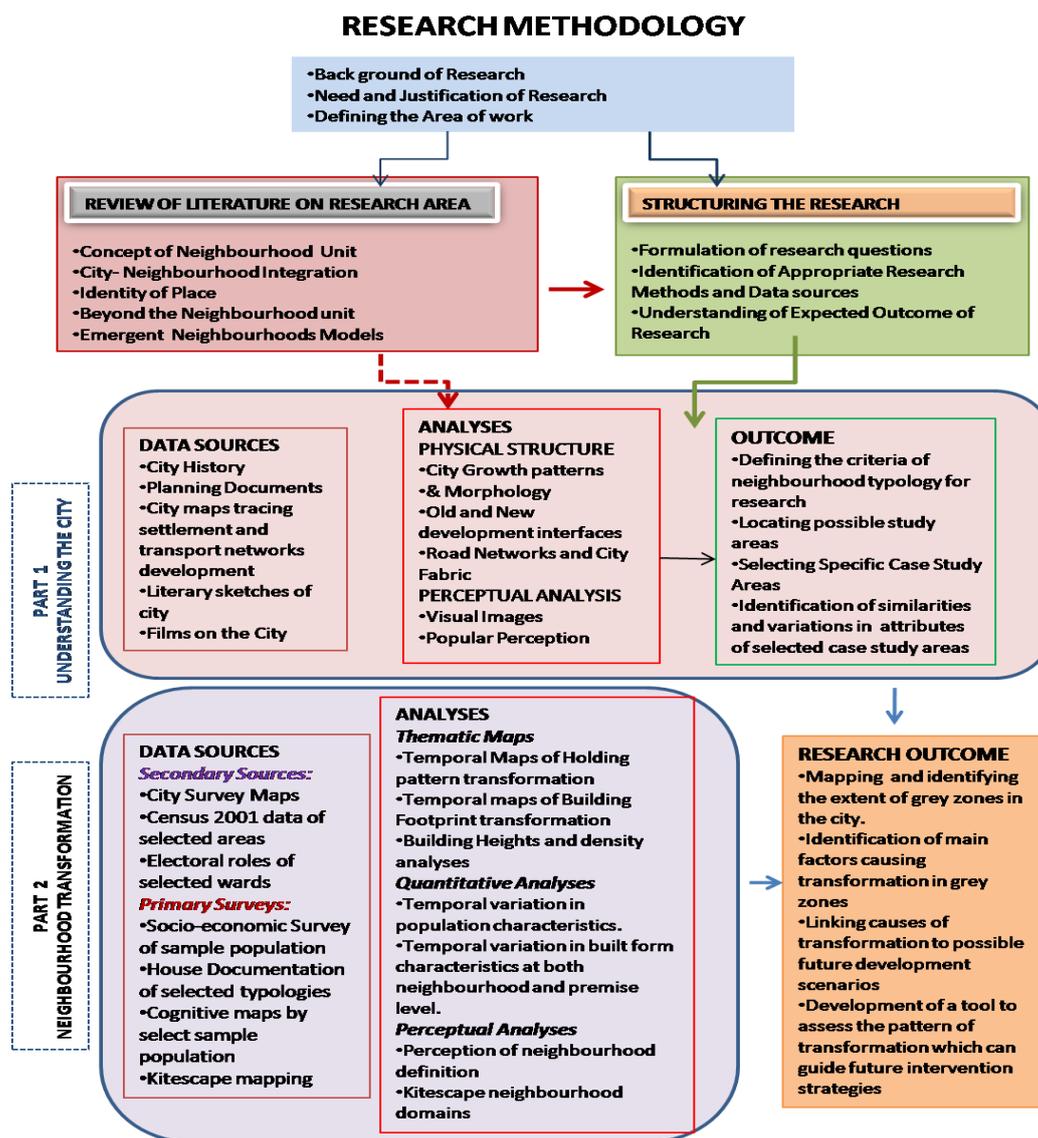

Figure – 1: The Methodology flow-chart (source: Authors)

The core focus of the present research work can be put forth by the following Research Hypothesis and sub-questions, which would be answered in the course of this research work, by application of various research methods and techniques.

The hypothesis to be tested is as follows:

If there is a pattern of transformation, there is a pattern of intervention. This is tested in the context of Kolkata's older 'quintessential' residential neighborhoods.

The sub-questions which have been answered to be able to test the hypothesis are as follows:

- A. Which areas of the city have neighborhood patches with 'quintessential characteristics' which can be identified for testing the hypothesis?
- B. Do all residential neighborhoods in old town areas have similar characteristics, or are there location-wise variations?
- C. Within a neighborhood, which are the attributes that contribute to 'transformation' of the built environment?

Sub questions A and B pertain more to the entire city with its structure and fabric as it is today. Through an overview of the chronological development of the city, the areas with 'quintessential characteristics' and criteria qualifying them as 'grey zones' are defined. This is followed by identifying the 'grey zones' at the city level and attempting to compare such grey zones for similarity or variations in characteristics. The next question, C would have to be addressed with reference to specific neighborhoods and analysing factors affecting change would have to be demonstrated with specific case studies of prototypical neighborhoods in transition. Case specific observations of more than one case study from different 'grey zones' would then be compared to find out how similar, causes of transition for different 'grey zones' are, and whether a common framework of intervention guidelines could be developed for all grey zone areas of Kolkata.

3.2 Research Techniques

Various techniques of data collection and analyses have been used in this research work as found appropriate. The techniques are discussed in the following section based on the classification of data targeting the three sub-questions.

- A. Which areas of the city have neighborhood patches with 'quintessential characteristics' which can be identified for testing the hypothesis?

In order to define which neighborhoods would qualify as neighborhoods with quintessential characteristics, largely references from secondary sources which discuss the history of the city and its development (social and spatial) were used.

References to documents on popular culture, cultural sketches from different periods of time, academic work on city growth and documents from planning organisations involved in city restructuring and new development works over a period of time, form the base for identifying the quintessential neighborhoods. Visual depiction of these neighborhoods in films and literature are also taken as bases for identifying key parameters of subject area definition. A rationalisation of perceptions and data is then done to list out the parameters which define neighborhoods with quintessential characteristics.

Other data sources referred to for answering this question, are city maps showing the chronological growth of the city, which help identify these 'grey zones'.

- B. Do all the residential neighborhoods with 'quintessential characteristics' have similar attributes, or are there variations based on different factors?

The areas are compared on the following parameters:

- **Street Network:** Satellite images and city maps are used to understand basic road and street network patterns in different parts of town and the impact on size and scale of the neighborhood blocks. These are analysed to find out if the patterns are similar or differ with locational differences.
- **Visual Impact:** A visual documentation of the streetscapes of some of these neighborhoods is undertaken, also to help identify visual attributes of neighborhoods in different parts of town.
- **Perceptual Image:** References to films and literary sketches set in different parts of the town, but all in these 'grey zones' are used to analyse perceptual similarities and variations in neighborhoods in discrete grey zones and the causes for these variations, if any.

C. Within a neighborhood, which are the attributes that contribute to 'transformation' of the built environment?

Attributes, which contribute to a neighborhood's identity, when modified, lead to transformation of the neighborhood, beyond the threshold of retaining the quintessential nature.

As this section forms the main body of the research, many different surveys were designed to obtain the required data in the most appropriate manner. **Two major case study patches** were selected from two parts of the city, **North and South Kolkata**, based on the findings of the previous section.

Each case study area is then analysed in terms of **Physical transformation**, wherein primary physical survey of the entire study patches is done to generate thematic maps for the following attributes:

- Present Land Use (roads, residential-non residential distribution)
- Time series maps of Holding size pattern (1910, 1950, 2011)
- Time series maps of Building Footprint (1910, 1950, 2011)
- Map of Building Heights, 2011.

Analyses based on the map generated:

- Percentage Distribution of road and plots areas within the patches and comparison between the two study patches.
- Quantitative Analyses of the maps on Holding Size showing transformation over time in holding sizes and comparisons between the two study areas.
- Quantitative analyses of built and un-built space in each study patch and comparison between the two study areas.
- Quantitative analyses of the heights of buildings and comparison between the two study areas.

Social attributes of the neighborhoods were obtained and analysed with Census Data (2001) and Electoral rolls (2010-11) and a primary socio-economic survey was conducted through survey questionnaires of a random sample of the households in the neighborhood.

For **Premise level variations and attributes**, Stratified sampling of the households and premises was done to get a fair representation of most types of houses in the neighborhood

to comprehend premise level transformations which affect the overall neighborhood area and generate clues for intervention scenarios.

Image and perception of the neighborhoods were generated through **Cognitive maps** and **Kitescapes** of the patches. The following snapshots from the city core portray the urban fabric and building typologies of a typical 'Grey Zone':

The urban fabric:

- The raised platform on the outer wall
- The corner grocery or the cigarette shop
- Little open space or the neighborhood park
- A certain patterned balustrade
- The occasional colonial lampposts

Figure – 2: Urban fabric of a typical 'Grey Zone' (source: Authors)

the building typologies:

- The central courtyard type building
- The common wall type connected at the roof level
- The balconies with certain patterned ironwork
- The projected plinth

Figure – 3: the building typologies within a typical 'Grey Zone' (source: Authors)

4. Delineation of the 'Grey Zones' of Kolkata

A study of urban morphology and transportation network at the city core of Kolkata, as depicted in the map below, helps delineate the 'grey zones' of the city.

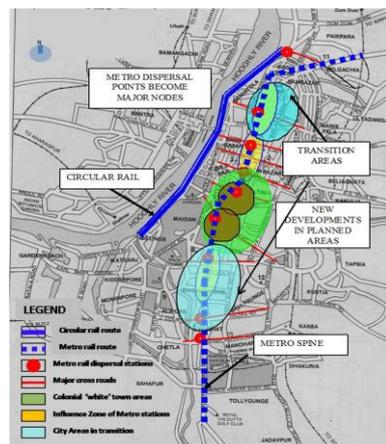

Figure – 4: Transportation network and city morphology (source: Authors)

It is observed that large areas along a major North-South Spine (Central Avenue under which the Metro Passes), even though are having the locational advantage of prime properties show stagnation and trends of a gradual degenerative process.

After the introduction of the Metro Rail, locations of the surface dispersal points have become major areas of passenger interchange, but inspite of this, the areas have not been considerably rejuvenated, nor have their land values escalated to the extent envisaged.

Due attention needs to be given to the 'block behind' – one block deep from the main artery where the built structures speak of a craftsmanship of a bygone era but the activities housed in them abuse the original structure to extents that mutilate the structures beyond recognition.

On taking a close look at the areas discussed in preceding sections which form the areas of research, following characteristics, which would help identify a 'grey zone' can be enlisted:

- Old city districts, which have undergone/are undergoing considerable transformation already, and neither possess a large number of individual buildings of historic relevance to qualify as a historic district.
- Areas where the overall built form however retain a flavour of the past and can in no way be confused with the anonymous new development of the remaining city.
- Areas located near major arterial corridors/ commercial districts of the city, having strong forces of land use change and redevelopment acting upon them.

These neighborhoods are representative of Kolkata. The ad-hoc and gradual transformations that have happened to the neighborhoods have not changed the perception of their essential character. They remain static in the collective memory, frozen in the frames of the films which have been made on them. The architect, urban designer and planners, who would work on neighborhood rejuvenation and housing intervention will have to work within these multiple layers of mythic spaces and changing urban structure. In the following map, it is evident that large chunks of the city fall under the 'Grey zones' which are formed along the north- south Metro spine and along the perpendicular street network which intersects it at intervals.

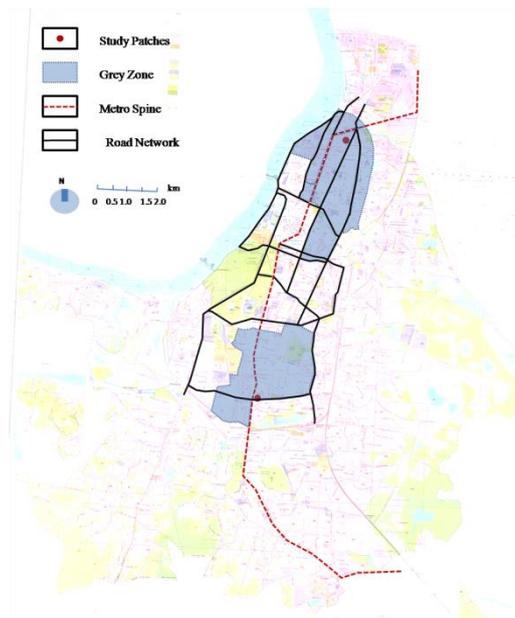

Figure – 5: Map showing 'grey zone' delineation, study patches, the Metro spine and major road network (source: Authors)

Having identified two residential patches in the 'grey zone' of Kolkata, empirical studies on physical transformations, socio-economic factors and perceptions of residents were conducted. Representative Housing typology documentation and transformation studies were also undertaken as mentioned in sub-section 3.2.

5. Conclusion; a development blueprint

The future of the neighborhood patch depends largely on the transformation that happens in each premise. The nature of new development that takes place then determines the transformed character. This new development is dependent on the existing bye-laws. In addition to the transformation scenarios discussed, the present building regulations play an important role in determining the character of the neighborhood.

In the present scenario, the impact on the visual character of the environment, over time, is presented in one of the case study areas in the following section through a series of three images:

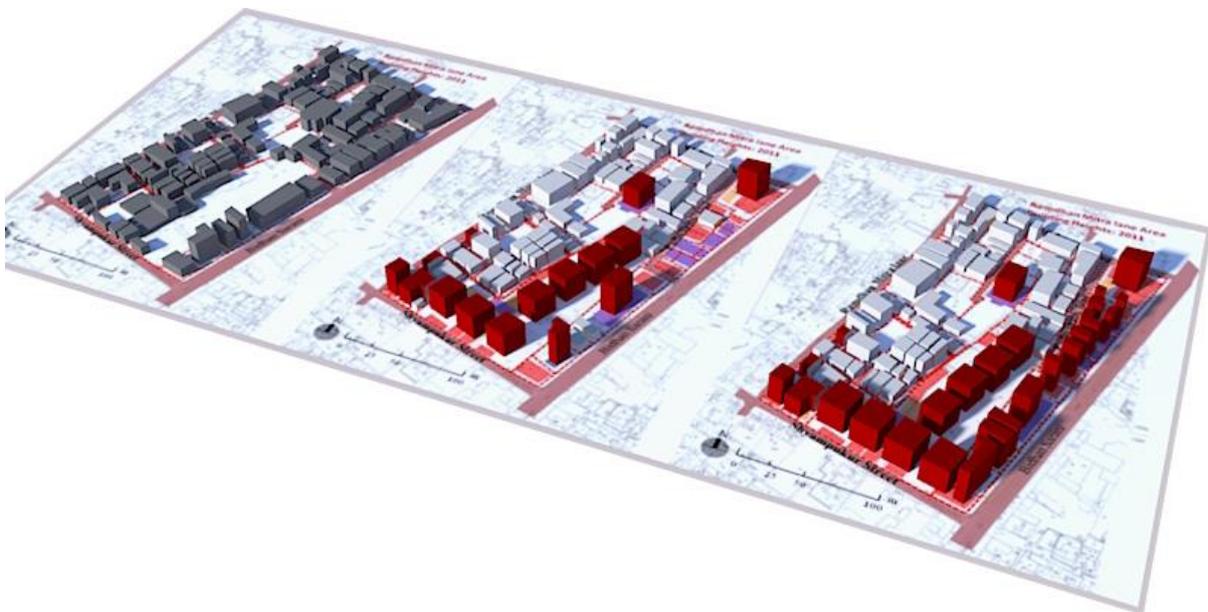

Figure – 6: *Ramdhan Mitra lane area (one of the study patches in North Kolkata): development scenario over time (source: Authors)*

The series of three images above depicts the gradual transformation in the physical fabric and hence the visual perception of the neighborhood over time, in the present context of development regulations applicable. The first image shows the existing fabric and the next two are possible future scenarios over time.

In the first stage of redevelopment, larger premises with few stake holders would be prone to new development. Vacant plot areas would succumb to market forces and start having new developments utilising maximum FAR, giving rise to clusters of blocks within the sanctuary areas in place of the open spaces. This would propel the transformation of the visual perception and character radically.

A review of the present day scenario reveals, that the clauses of the Kolkata Municipal Corporation Building Rules (2009), linking road widths to maximum permissible FAR and building heights, is one of the main reasons of transforming neighborhoods from their earlier forms. House owners and builders have chosen the ubiquitous apartment typology

developing in newer parts of the city as the preferred building typology even in these grey zones, to leverage on the benefits of height and FAR, wherever possible.

The result in the visual and perceptual impact on the streetscape and ambience of the neighborhood is depicted in the figure below through a comparison of the cases discussed above.

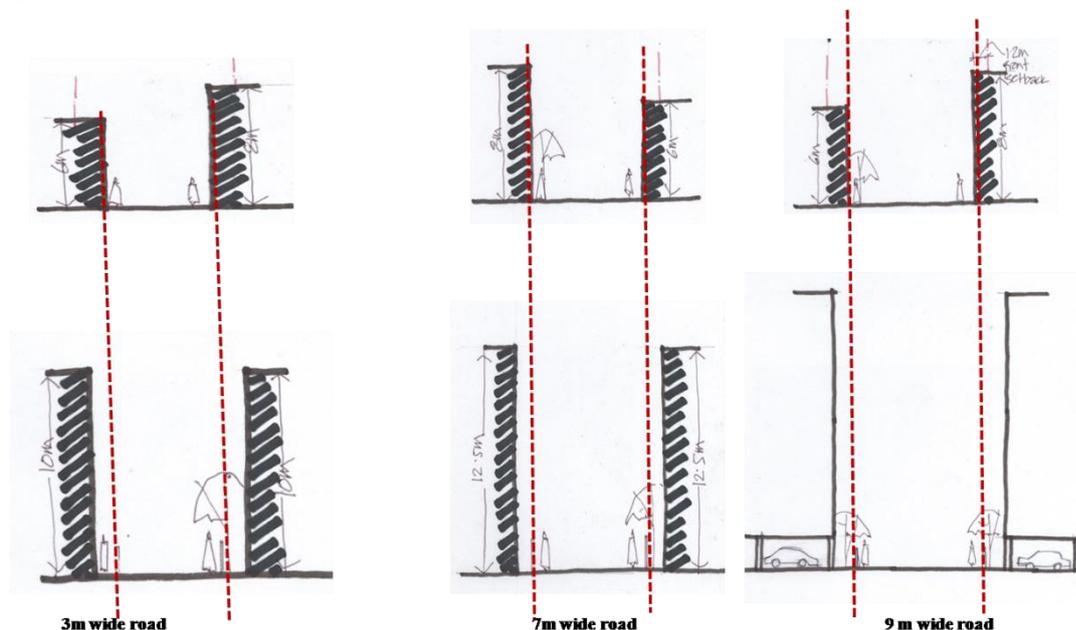

Figure – 7: *Early development and new development possibilities on different road widths*
(source: Authors)

The objective of the research work has been to establish the importance of entire neighborhoods in the imageability of the city and establish these areas as a distinct type of city zone. In this section it is argued that the existing building regulations are inadequate to handle the complexities of re-development in these zones and have actually contributed to the destruction of the imageability of these areas.

The need for:

- i. identification of 'grey zones' within the city,
- ii. declaring 'grey zones' them as a distinct type of zone,
- iii. working out a different set of building regulations and
- iv. introduction of urban design control guidelines for these areas

emerge strongly from the study.

At the individual premise/plot level, three possible outcomes can happen:

1. **Maintenance of status quo:** The existing building is in good condition and the socio-economic conditions have not changed significantly over time, and the building has retained its architectural expressions.
2. **Decay:** The structure has gradually decayed, because of various factors, some of which include, lesser use of the building due to outmigration, downgrading of socio-economic conditions, inability of aged family members to maintain the house etc.

3. Transformation:

- a. This may include modifications in the built structure to accommodate changes in family structure. This can either change the original character totally or can continue to retain the old characteristics.
- b. Other transformations may include demolition of old structures and construction of new buildings. The apartment typology has found much appreciation and has come up on many plots. However, there are no urban design guidelines for the visual expression of these new buildings.

And hence, upon summing up, it can be asserted that the emerging scenario of transformation would need a thrust in terms of intervention focus, mapping, as it were, a web of patterns of transformation to a pattern of interventions. The summary can be presented through the following figurative representation:

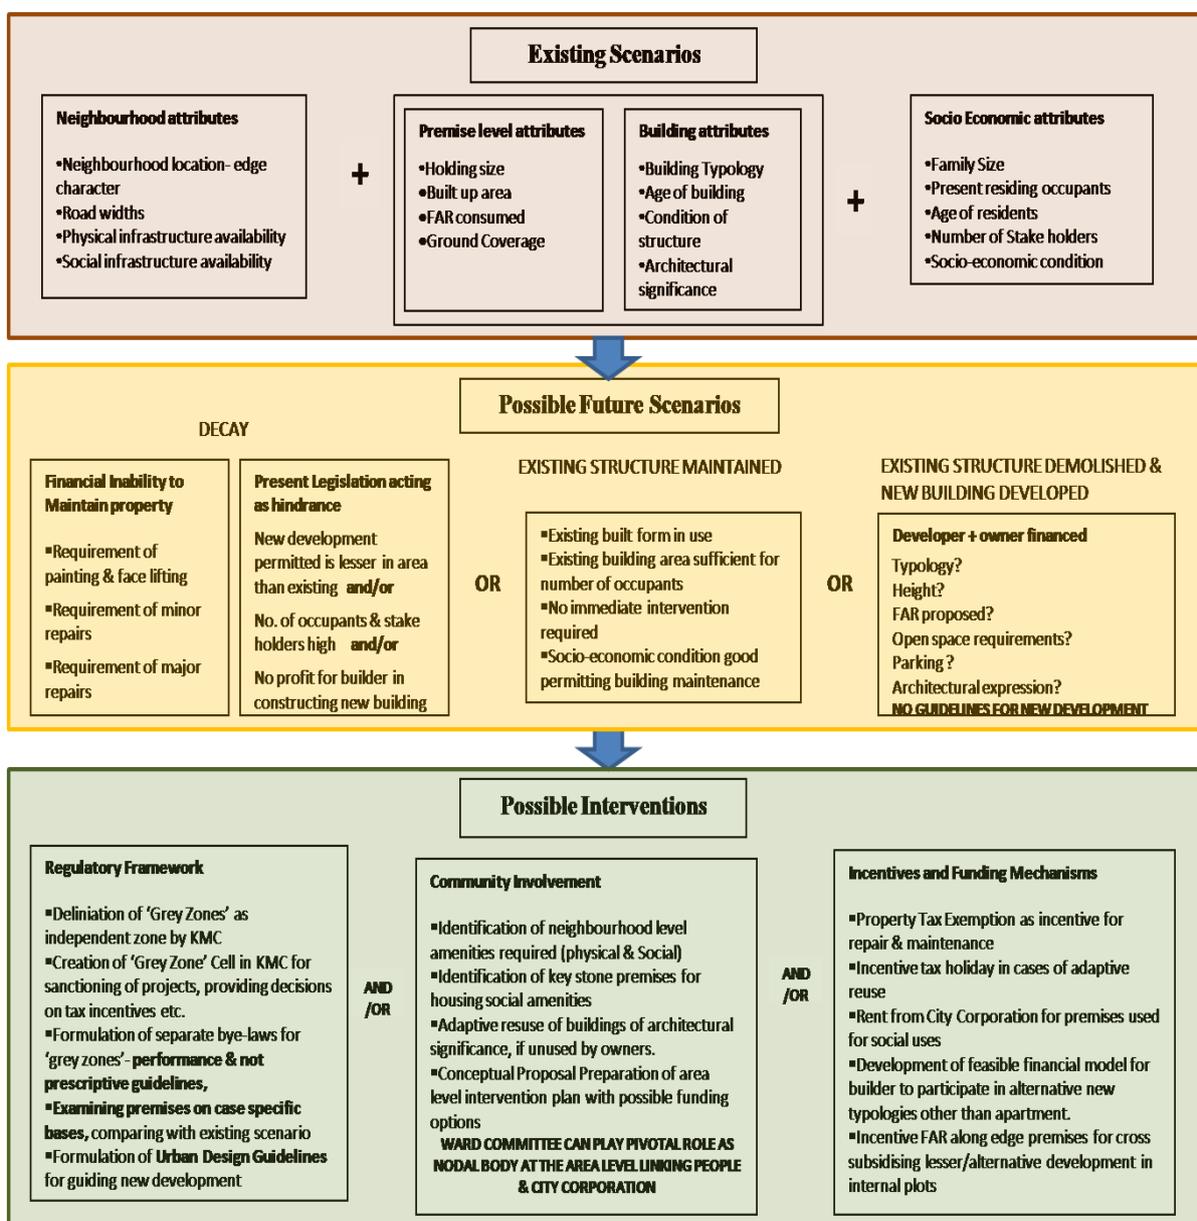

Figure – 8: Transformation- intervention patterns; a summary of findings (source: Authors)

The development which occurs on each plot is a result of the combinations of the values that each of them take in each class of attribute. A mapping of the individual values of each attribute for each plot and the links between them can give the pattern of transformation it will take. The cumulative patterns of transformation of all plots in the neighborhood, gives the overall transformation possibility for the patch. The interventions required can be suggested based on the pattern of transformation emerging.

A comparison of the two case study areas citing the main reasons for these transformations are represented graphically as under:

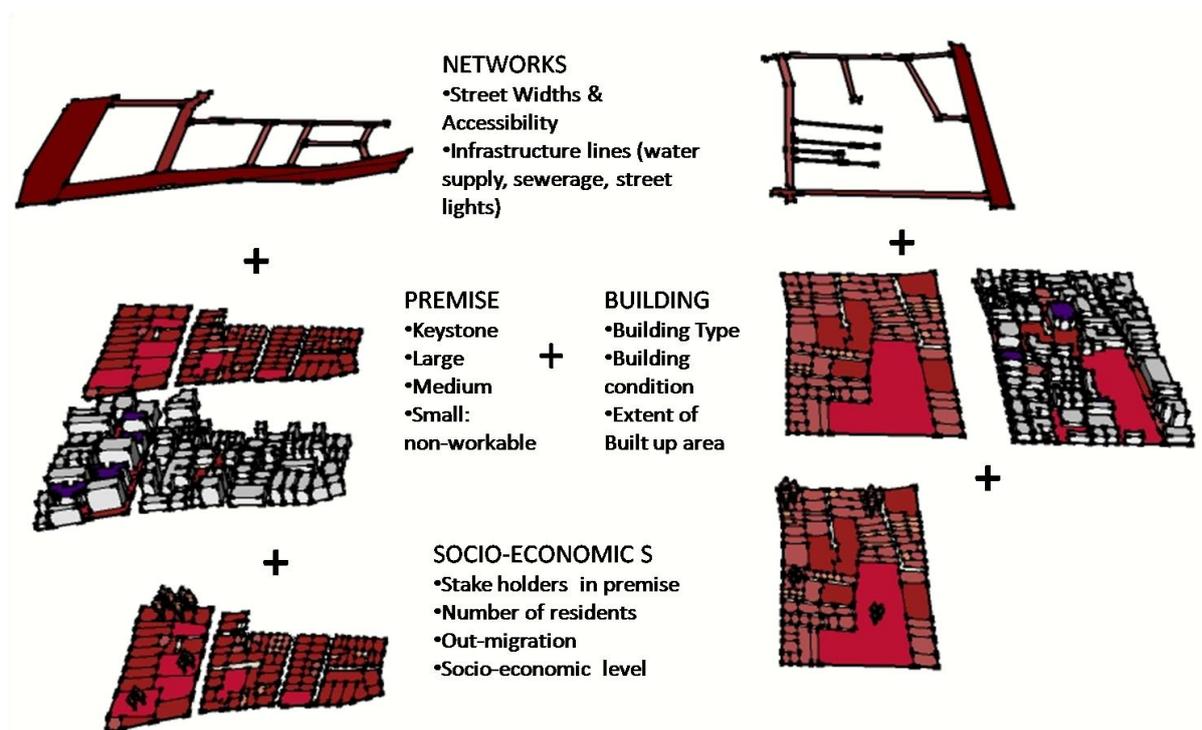

Figure – 9: comparison of the two study patches (source: Authors)

In the process of research of this study, it was found that the absence of base maps and the methods of mapping old city areas is a major cause of projects not taking off in these areas. A major hurdle in working in these areas is to find ways of rapid appraisal, which can initiate the path of project identification.

Through the methodology used in the research, a template of mapping the attributes identified along with their values has been devised, which can be used as a rapid appraisal tool to assess the health of the neighborhood and its propensity towards transformation. Based on patterns which emerge, a directory of possible thrust of interventions can be referred to, to identify the degree of intervention possible and the methods of appropriate funding required.

As shown in map (Fig.5), large parts of the core city area can be classified as grey zones. If the tool is applied to identify the causes of transformation and provide pointers towards the direction of intervention, for all the wards of the grey zones, many Urban Rejuvenation projects can be identified on priority basis and detailed project reports then submitted for funds which are available.

This research can contribute to accomplishing the first task of identification and prioritising of areas of intervention, from where access to project funds can then be garnered. A sample template which can be used to document the premise level characteristics and form a tool of rapid assessment of the pattern of transformation is designed. The pattern which emerges would be linked to the pattern of possible interventions to get the development blueprint guidelines. The template is presented below.

RAPID APPRAISAL OF NEIGHBOURHOOD: TEMPLATE FOR PREMISE TRANSFORMATION									
WARD NO. _____		STREET NAME _____		PREMISE NO. _____		OWNER'S NAME _____		DATA ENTERED BY, on date: _____	
ROAD NETWORK	PREMISE SIZE	GROUND COVERAGE	NO. OF FLOORS	BUILDING TYPE	BUILDING CONDITION	TYPE OF RESIDENTS	NO. OF RESIDENTS	NO. OF STAKE HOLDERS	OWNER-TENANT MIX
Road width < 2.4 m	Small (< 100 sq.m.)	Nominal (< 20%)	1 or 2 storey	Heritage bldg on large plot	Good	Large family	1 or 2 members	Many	Full owner
2.4 - 5 m	Medium (100-200 sq.m.)	< 50%	3 or 4 storey	Courtyard type	Medium	Scattered large family	3-4 members	Few	mainly owner
5-9 m	Large (200-500 sq.m.)	50-60%	5-6 storeys	Common wall type	Poor	Small nuclear family	5 members		Owner-tenant equal mix
9-15 m	Key stone (< 500 sq.m.)	High (> 60%)	G+4 or more with utilised parking	New bldg with mandatory open spaces		Old couple	6-8 members		mainly tenanted
Width > 15m			High rise with basement parking			Young Couple	10 or more members		fully tenanted

Figure – 10: The Rapid Appraisal template (source: Authors)

The template above is devised as a tool to map the interrelationships between various values of attributes. For a given premise, a single line joining the various attributes can be drawn. Each value of every attribute is marked with a colour code on a scale of red-yellow-green. **Each value that an attribute takes up, represents whether it resists transformation/is neutral to transformation (i.e. maintaining status quo)/ or is prone to transformation.** These three cases are depicted by the colours red, yellow and green respectively. The line which joins the values across attributes would pass through a combination of red, yellow and green dots and would suggest appropriate strategies for redevelopment.

5.1 Scope of further Research

The research methodology can be further developed by initiating pilot studies in various grey zones of Kolkata, using satellite images, updated Smart maps from KMC (survey maps of Kolkata to a scale 1:600 done between 1903 and 1910) and using the Rapid Appraisal Template developed. While undertaking this study it was noticed that while the attributes of transformation identified in this study are the prime factors affecting neighborhood character, there are other parameters which differ from case to case and have a bearing on the future of neighborhoods. The pilot studies would bring out specific attributes and further research could attempt to find the relative weight assigned to these additional attributes in case specific areas and modify the template further to account for these. Further research could

also extend to other cities having similar development patterns of juxtaposition of new and old areas. This would test the validity of the template and the methodology applied as a research method of a better informed decision making tool to develop city specific intervention strategies in older city core areas, to address their inherent conflicts between financial feasibility and place imageability.

Expansion and Abandonment **The urban duality in planning metropolitan Lisbon**

Inês MOREIRA

CIAUD / Murbs – metropolitan studies and forms of urbanization research group
FAUTL (Faculdade de Arquitectura, Universidade Técnica de Lisboa) and
DUOT-ETSAB (Departamento d'Urbanisme i Ordenació del Territori, Escola
Tècnica Superior d'Arquitectura de Barcelona, Universitat Politècnica de
Catalunya)
Rua Sá Nogueira | Pólo Universitário | Alto da Ajuda |1349-055 Lisboa – Portugal
ineslmoreira@gmail.com

The paper addresses the expansion and abandonment of urban areas related to the presence of economic activities in metropolitan Lisbon, generated by the growth of the tertiary/quaternary sector and the process of deindustrialization, by discussing the policies and plans that have shaped them.

1. Expansion and abandonment in Lisbon's metropolitan area

The changes in the physical, economic and political context of the last twenty years have strengthened the transformations in the structure of Lisbon's metropolitan area, arising from processes of concentration of economic agglomerations specialized in the production, distribution and consumption activities. These changes are the product of the metropolitan infrastructuration and densification, resulting in a system of clusters of high concentration of economic activities related to the tertiary and quaternary sectors and, in parallel, the abandonment and restructuration of large peripheral industrial areas, with obsolescence processes, aggravated in the last decades.

The spatial production related to these activities reflects a set of economic dynamics, policy strategies and the national and external contexts, which are materialized in their morphology, location and functional specialization. However, the influence of the public policies over the territory is not direct, assuming various forms and creating conditions and opportunities that shape the urban morphology, the business investments and the behaviours of the users and inhabitants of the metropolitan area. The spatial articulation of these policies is accomplished through urban planning, determined by the public sector and with the primary objectives of predicting and regulating the urban development, by formalizing ideas and strategies that characterize a particular time context.

The following reflection about the spatial planning process is based on the interpretation of the policies as the support of the urban production and as the base for the construction and delineation of the planning instruments. Despite the difficulty of their dissociation or the identification of their localized impact, the public policies (economy, transports, technology and innovation, employment, etc.) reflect and have contributed to the shift from an economy centred on the manufacturing sector to a service economy. The industrial production model of concentration in large areas with high territorial presence was gradually altered to a *post-Fordist* model, characterized by the segmentation of the production cycle and its consequent relocation to distant places, inducing the growth of processing and distribution activities. The change from a local to a global economy resulted both in a cause as well as a product of the creation of a network of relationships, supported by the improvement of the transport of goods and passengers and the telecommunication innovations which allowed the contact over long physical distances.

Keeping pace with contemporary European cities and regions, Lisbon has suffered dynamics of rapid urban expansion and increasing functional complexity (George and Morgado, 2007). On one hand, after the 90s the pressure to adapt to the new economic and social demands of the emergent knowledge society, along with the setup of the mobility network, the motorization of the population and the changes in the way of inhabiting the city, resulted in a

distended urban system with axes of great concentration of economic activities related to the tertiary and quaternary sector connected to the transport infrastructure. On the other hand, the global changes in the industrial production processes and the restructuring of the economic system had consequences in the obsolescence of the vast peripheral industrial complexes, originating a wasteland landscape. Recently, the present economic and financial crisis has aggravated this trend, with the punctual abandonment of medium and small enterprises integrated in industrial and logistic clusters.

In this scenario, the main question addressed by the paper is the role of the public policies and planning in the creation of the segregated, marginal, expectant or abandoned (built and open) areas in the metropolitan dynamics, and how they may contribute to reduce these spatial discontinuities. The methodology is based on a theoretical approach in parallel with an empirical contact with the territorial reality, by resorting to fieldwork, cartographic and documental analysis of the public policies and planning instruments that respond to the dynamics of expansion and abandonment of specialized urban areas in Lisbon's metropolitan area, during the last twenty years.

Figures 1 and 2: Science and Technology Park Almada. Own elaboration, 2012.

2. *Europeization* and the national public policies

The recent institutional and social changes led to profound transformations in the functioning of the national metropolitan areas, with consequences in the land use, functions, structure and morphology, as well as in its governance. The growth of the real estate and its importance in the process of accumulation of capital in the cities resulted from the increase of the functional relation between the economic development, the control and regulation of urban uses (Portas et al., 2011).

The presence of economic activities is an important aspect for the competitiveness between municipalities, for its ability to create jobs and to attract population, complementary activities and infrastructure investment at the local level. Therefore, the presence of these activities is intended, but they often have incompatibilities with existing programs, such as agriculture or housing. This situation originates specialization and clustering in peripheral areas, with defined perimeters, for which infrastructure improvements are developed (often realized as counterparts negotiated between the public and private spheres). Moreover, the restructuring of the economic fabric due to the emergence of the knowledge society has introduced a new territorial issue, stressing the inadequacy of the existing industrial structures to the new challenges. Comparatively, despite the reduced area that the activities related to the quaternary sector occupy in relation to the heavy industry complexes, they have a greater capacity to generate wealth. In this sense, their location is in the centre of the competitiveness discussion, as happened in the past with the industries.

In the last four decades there was a political restructuring of Portugal, accompanied by economic and urban changes initiated with the opening to foreign markets by the integration of the EFTA, in the 60's (Lopes, 1996). Joining the European Union (EU) in 1986, preceded by a period of adjustment and consolidation of the democracy after the 1974 revolution, was the turning point for the process of public policy and planning restructuring. The access to EU structural and cohesion funds enabled the financing of strategic sectors, with a great

impact in the regional and sectorial development, as well as in the organics of the national planning activities. Thus, the approach to the planning of metropolitan Lisbon can't be limited to the national policies, since it was influenced by global interconnections and the EU integration and cohesion policies (Knieling and Othengrafen, 2009).

The strong centralization that marked the history of the Portuguese political system, until the establishment of democracy, led to limitations in the capacity of planning at regional and local levels. The inversion occurred after the European integration, stimulated by internal and external motivations – however, the process started before the revolution, since the demographic pressure on metropolitan areas and the need to provide infrastructures (energy, sanitation, mobility and telecommunications) demanded for a more complex urban planning activity. Subsequently, the decentralization of the political and administrative system, with the allocation of new powers to local authorities and the emergence of new territorial dynamics, as well as the involvement of Portugal in a growing number of European programs and actions in order to stimulate modernization and territorial development, contributed to greater openness to external influences and to the transformation of the centralized state (ESPON, 2006).

By joining the EU, Portugal integrated a group of countries and a strategic vision for common development, which policies have influenced the economy, politics and administration of the country. Although urban and regional planning isn't part of the EU's competences, common procedures and policies with spatial impact are translated locally through sectorial policies and legislation agreed between the member-states, and subsequently implemented in the national systems. Thus, the macro-economic, regional cohesion, environment, agriculture and transport policies, related to the financing, to spatial strategies and to transnational cooperation contribute to an homogenization of national systems (Dühr et al., 2010), allowing for the reshaping of the planning system, with direct impact over the metropolitan spatial dynamics, as may be observed in Lisbon.

The strong influence of the European policies in the transformation of the national territory had greater consequences on the metropolitan areas of Lisbon and Porto (Dühr et al., 2010), as prime locations for the concentration of economic agglomerations, wealth generation and as nodal points of international networks. The most present territorial impact of EU's sectorial policies was materialized in the infrastructure network, with the goal of supporting the macro-economic dynamics and allowing for the economy to open to international markets. In parallel, the shifts in the activities and employment structures and the change in the role of the state as market regulator and provider of services catalysed the attraction of multinational companies which assumed a strong presence in metropolitan Lisbon.

On the other hand, with the intention of reducing regional disparities in order to support the single market and the movement of people and goods, the common transport and European cohesion policies presented as objectives the creation of a trans-european transport network, encouraging sustainable mobility, as well as the construction of telecommunications and energy infrastructures within the EU. At national level, assisted by the Community Support Frameworks¹, the transport policy has stimulated the road circulation, through the construction of a network of highways articulating different parts of the country and establishing international connections. The setup of this network had a strong impact on the development of Lisbon's metropolitan area, by creating high connectivity areas in the periphery of the urban centres, with a strong attraction of activities related to processing, storage and distribution of goods (supported by the growth of trucking). The multinational companies that settled after the EU integration organize the production in different phases that are geographically separated, resorting to the mobility network for the movement of goods. This change resulted in the obsolescence of the vast heavy mass production industry complexes, built until the 70s, and the emergence of new industrial and logistics structures in locations of high connectivity areas.

The impact of supranational integration policies, or the *européanization*² process didn't occur solely through the EU funds, but also by the operational changes in the urban planning

process (Ferrão and Mourato, 2011). The consequences were fast, and the 90s were very active with regard to the production and approval of masterplans, supported by the new legislation³ for municipal planning (*Planos Municipais de Ordenamento do Território*) and driven by the access to funding. At the same time, the influence over the administrative processes through the introduction of a strategic dimension in the plans, as well as through the restrictions over the involvement of the public authorities, contributed to constrain the state's role in urban development, to stimulate the private sector's intervention and the increase of partnerships. The consecutive funds and the European programs specific for supporting urban regeneration (URBAN URBANACT, URBAN II and URBANACT II) contributed to stimulate the development of national urban policies integrating community guidelines, concerning territorial competitiveness, environmental awareness, sustainable development, urban regeneration and social cohesion.

With regard to the direct influence on the processes of urban expansion and abandonment related to economic activities, the EU policies were decisive, with a direct influence over the territory by the programming and application of funds. The first Community Support Framework (1989-1993) represented a major boost for the economy and for reduction of disparities in relation to the European average, concentrating several public initiatives through the creation of economic infrastructures, supporting productive investment, human resources development, improving competitiveness and industrial adaptation. There were large investments in equipment, sanitation infrastructure, energy and in the construction of the highway network, as well as programs to support the industry, of great relevance to metropolitan Lisbon – RENAVAL program (conversion of shipyard areas) that focused on the area of *Lisnave*, in Setúbal peninsula and the PEDIP program (industry development) which contributed to the effort of modernization of industrial structures, stimulated the economies of scale, as well as the introduction of interface structures between universities and companies such as the Science and Technology Park *Tagus Park*, in Oeiras.

The following Community Support Frameworks (1994-1999 and 2000-2006) benefited from the introduction of the cohesion fund, in 1994, with a high incidence over the environment and transports, with direct effects on the consolidation of the articulated highway network in the metropolitan area of Lisbon. The urban areas and their regeneration was also subject of specific programs, that have continued during the National Strategic Reference Framework-QREN (2007-2013), leading to the city policy-POLIS XXI, integrated in the operational agenda for territorial development.

2.1 Urban planning system in Portugal

The introduction of the Law on policies of Spatial planning and urbanism⁴ (*Lei de Bases da Política de Ordenamento do Território e Urbanismo*) in 1998, determined the policy framework for spatial and urban planning, as well as its territorial management instruments, articulating the various scales (national, regional and municipal):

- Territorial development instruments – National Program of Spatial Planning Policy (*Programa Nacional da Política de Ordenamento do Território*), Regional Plan (*Plano Regional de Ordenamento do Território*) and Intermunicipal Plan (*Plano Intermunicipal de Ordenamento do Território*);
- Territorial planning instruments – Municipal Plans (*Planos Municipais de Ordenamento do Território*): Municipal Masterplan (*Plano Director Municipal*), Urban Development Plan (*Plano de Urbanização*) and Detailed Local Plan (*Plano de Pormenor*);
- Sectorial policy instruments – plans with territorial incidence, from the responsibility of the various sectors of the Central Administration;
- Special nature instruments – Special Plans (*Planos Especiais de Ordenamento do Território*).

The delineation of this multi-level system and of the legal instruments of urban and regional planning began after 1974, through successive attempts to respond to the rapid and disorderly urban growth. However, despite the articulated and hierarchical definition of the

current territorial management instruments, their implementation fell short of its potential. As their definition was not simultaneous, extending over more than two decades, there were systematic delays in the programs' implementation that prevented the integration of a strategic dimension and the correlation between the different scales. From this situation arose numerous territorial fractures and the lack of dialogue in the metropolitan articulation of Lisbon, present among the first generation of Municipal Masterplans (PDM) produced in the 90s, the Regional Plan (PROTAML) from 2002 and still in force, and the National Program of Spatial Planning Policy (PNPOT), from 2007.

The spatial planning policies, expressed in PNPOT⁵, define the great options of relevance for the organization of the national territory, establishing the framework for the planning and management instruments. Additionally, it constitutes an instrument for cooperation with remaining state-members for the organization of the EU territory⁶. The integration of the EU options and visions in Portugal's territorial organization is present in the *European Spatial Development Perspective (ESDP)* with the explicit integration of the guidelines of the *Lisbon Agenda* (set in 2000). The objectives of strengthening territorial competitiveness, promotion of polycentric development and territorial cohesion are part of the strategic dimension that supports the increasing territorial specialization and the functional concentration of economic activities. The policies define the reinforcement of the infrastructure systems in order to support national and international connectivity (objectives 2.2 and 3.2) and the strengthening of cities as engines for development, investing in the knowledge economy and attracting foreign investment (objectives 2.3 and 2.4).

Along with the nationwide production of municipal legislation in the 90s, Lisbon's metropolitan area⁷ was officially established in 1991, and its PROTAML⁸ from 2002, defined as a strategic territorial development instrument. One of its goals is the definition of actions concerning land use, occupation and transformation of the territory, with a pivotal position between the national and municipal planning. However, regardless of the municipal efforts, the metropolitan area was formed by a fragmented set of uncoordinated masterplans, carried out without the prior presence of a supra-municipal metropolitan plan, as the PROTAML was simultaneously in preparation. The consequences were present in the first generation of PDM, in which the municipalities defined individual strategies for their economic development, promoting industrial and technology parks with locations related to the connectivity improvement provided by the implementation of the National Road Plan⁹ (Pinho et al. 2010). This fragmented approach to the territory reflected an individualistic planning by the municipalities that resulted in a centre-periphery dichotomy within their boundaries, giving rise to the definition of several peripheral areas for potential industrial and logistics occupation. This way, the identification of these *opportunity areas* generated their development, through the classification of land use for economic activities or the creation of strategic development programs.

Despite the direct influence of environmental, agricultural and transport policies on urban planning, which are formalized in the strategic instruments (PNPOT and PROT) that support the municipal planning, the European policies are diluted in the planning instruments through visions, in the adoption of concepts or in the implementation of programs (e.g. URBAN, PEDIP or URBANACT). On the other hand, although regional planning introduced supra-municipal coordination, the spatial planning activity is still based almost exclusively on PDM and Special Planning (related to protected areas, public water reservoirs, shorelines, estuaries and archaeological parks). The PDM defines zoning, functions, buildable indexes and generic regulation, while the Special Plans result from analyses and sectorial objectives that do not establish the dialogue between municipalities nor relate to their individual strategies (Portas et al., 2011). The lack of definition of national urban policies, until 2007, created a gap that allowed for the urban development to be structured by sectorial plans of infrastructure, private investments and municipal interests (Pinho et al., 2010).

The result of these past incoherencies is present in today's metropolitan reality, which relies on the spatial planning developed independently by each municipality, which was defined after the construction or from changes to the PDM, without an integrated vision for the

territory. This scenario presents difficulties for the identification of how plans, policies and built projects really changed and refocused the process and urban dynamics, raising a doubt about the effectiveness of the plans in response to the fragmentation of the urban space, their heterogeneity and excessive functional separation. The time difference between the polarization of growth and the production and approval of plans, suggests the need, on the one hand, for a normative regulation adjusted to the formal and spatial reality (Domingues, 2006), and secondly, the possibility of defining multi-scalar planning with varying degrees of formal definition, development rhythms and programmatic flexibility in order to deal with the uncertainty and the time factor.

3. Competitiveness as an engine for urban expansion and abandonment

Lisbon is the most dynamic region of the country, concentrating the highest population density and business turnover. Thus, this is territory where the greatest spatial transformations resulting from economic dynamics take place, and simultaneously this region gathers a large number of plans of different natures and scales – the metropolitan area of Lisbon comprises 18 municipalities that develop a set of plans for municipal planning, articulated with the regional spatial planning, special plans and the national policies.

The regional strategy *Lisboa 2020* (CCDRLVT, 2007) was developed for the implementation of EU funds between 2007 and 2013, in accordance with the objectives of the *Lisbon agenda*. The priority areas of development were science, technology and innovation, the environment and human resources development. In order to reduce the effects of the peripheral geographical location in relation to Europe, the strategic plan for the region promotes internal and international competitiveness, through the presence of industries organized around economies of scale and activities related to research and development. Thus, the strategy specifically addresses the issues of urban expansion and abandonment, by supporting the creation of specialized areas for interface between research and industry (Operational Program 1) and the revitalization of abandoned industrial structures and harbour areas on the north and south riverfront (Operational Program 3). In both cases, the integration in the transnational mobility network plays a role of great importance with regard to the competitiveness and attraction of new businesses and urban regeneration.

The territorial model of PROTAML, present in the revision of 2010¹⁰ (CCDRLVT, 2010), embodies all of these strategic options, resulting in a broad and articulated vision for the metropolitan area. It provides the principles for the integration of urban areas with high concentration of economic activities, represented in the *model of urban and economic systems*. These areas are interpreted as a network, through the enhancement of the functional polyvalence of the existing structuring agglomerations, creation of complementary areas supported by the projected mobility infrastructures and the regeneration of the large industrial areas. One of its main objectives is related to the adoption of a new territorial development model, which implements the principles of the compact city and polynucleation, where Lisbon is understood as a metropolis of two banks around the Tagus Estuary (CCDRLVT, 2010).

The competitiveness is presented as a set of objectives across the various planning documents at municipal and regional levels as well as in the national policy program, with the goal to create centres related to the quaternary sector, with the focus on knowledge production. Regionally, this vision aims at attracting private investment, the promotion of business parks, the establishment of new enterprises and the consolidation of the link between research and production. However, the issue of competitiveness is also part of the local agenda, leading to the competition between municipal entities in order to create conditions for the attraction of business. The result is the contradiction of the networking goal and the logics of territorial balance, with isolated actions and urban areas segregated from the surroundings.

In this context, parallel to other European metropolitan areas, new business parks have emerged in Lisbon's peripheral areas, supported by the blurring of traveling times and the high degree of connectivity (Graham and Marvin, 2001). Hence, the combination between the mobility network, the proximity to the centre and the existence of unoccupied spaces acted as a catalyst for the emergence of these new structures in strategic locations, with functions related with logistics, high technology industry, R&D, trade and leisure. These areas differ from the old heavy industry complexes with *fordist* production methods, by presenting different logics in terms of dimensions and of the relation with the infrastructure and the centre. Thus, after the 90s, this duality became clear, with the adoption of competitiveness policies with greater visibility in the urban expansion and the creation of new structures directed to the quaternary sector, while the old industrial complexes became obsolete and abandoned despite the efforts of the industrial update programs.

These dynamics are present in the expansion movement along the axis between Lisbon and Cascais, with the highest concentration of business parks, in contrast to the south bank of Tagus, where were located the large industrial complexes in Lisbon, currently abandoned or expectant. Paradoxically, this emergent new areas don't have a territorial presence comparable to the vast areas occupied by the industry in 70s or the logistic clusters in the 90s, but they assume a great economic importance, responsible for the centralization of financial and corporate sector, which makes this area the metropolitan economic centre¹¹.

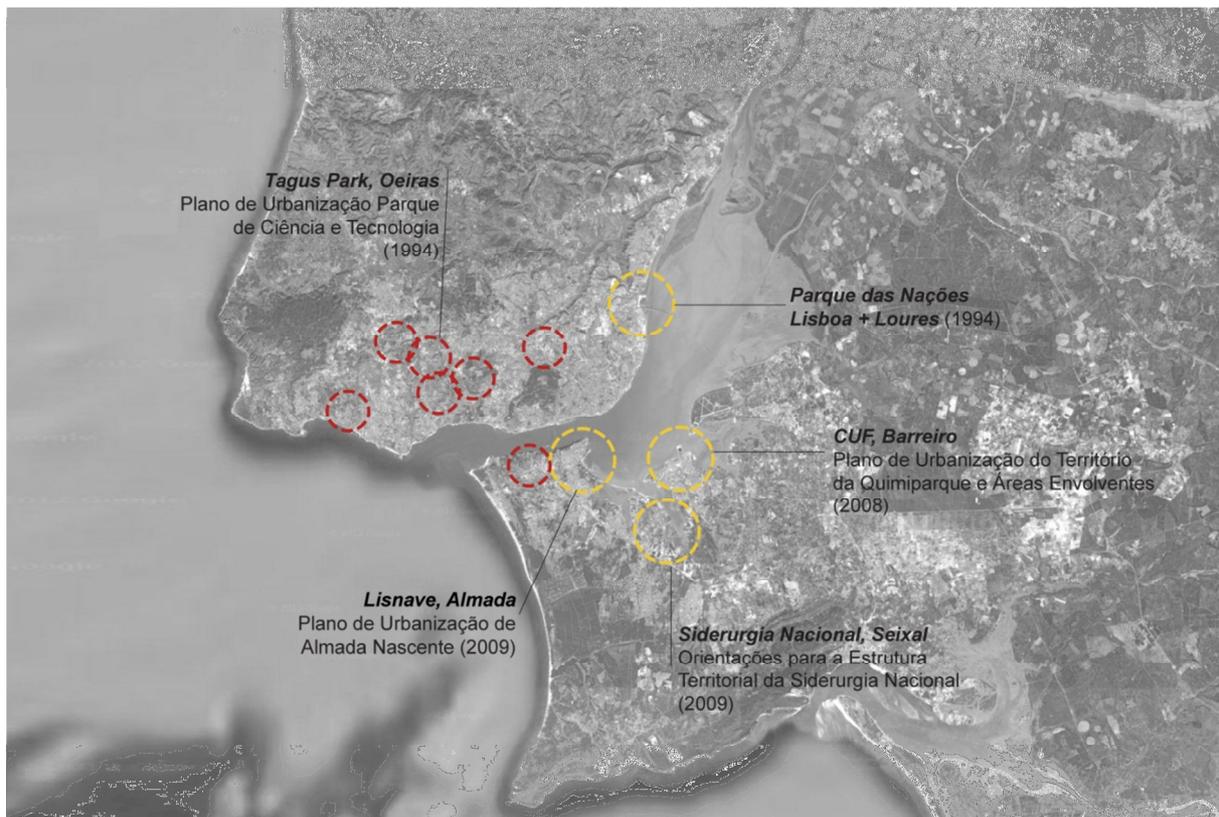

Figure 3: Identification of the Urban Development Plans and Detailed Plans that respond to the expansion and abandonment dynamics in Lisbon's metropolitan area. Own elaboration over images taken from *Googlemaps*, 2013.

3.1 Expansion and creation of new business areas

The process of urban expansion and the establishment of business parks along the Lisbon-Cascais axis began simultaneously with the production and approval of the Municipal Masterplans of the municipalities that form this axis (approved between 1994 and 1997). The business parks that have installed in this area during the 90s were oblivious to the criteria of zoning and the land uses that were later defined – the general criteria for their location logics

was related to the land availability and value, connectivity to the mobility network and synergies with complementary activities. Thus, the masterplans defined later the adjacent growth and intensification of the existing areas, contributing to the consolidation of the defined economic agglomerations, without specifically addressing the issue of urban expansion.

On the other hand, the municipal strategies for attracting the quaternary sector acquired an important presence in the municipal development plans, as exemplified by the PDM Oeiras. This plan expressed the intention of intensifying knowledge intensive activities by stimulating the creation of business parks and investment in technological industries. The strategic programs determined a set of territorial interventions that contributed to the achievement of the economic development model, with the inclusion of business parks (which concentrate offices, corporate headquarters and high technology industry).

The process of the establishment of the Science and Technology *Tagus Park*, in Oeiras, is an example of the materialization of competitiveness, economic, and innovation policies that resulted from the integration of European guidelines into national policies. In its origin was an Urban Development Plan¹², with an area of around 360 hectares in the municipality of Oeiras, the result of the conjugation of a local and a national strategy. In order to face the modernization and the need for technological innovation, the strategy aimed at increasing the international economic competitiveness, linking teaching to research and development. This was the first Science and Technology Park in Portugal, fruit of the *Economic Development of Portuguese Industry Program (PEDIP)*, integrated the First Community Support Framework (1989-1993), which outlined the steps towards the creation of this type structures at national level, proposing also a similar one for the metropolitan area of Oporto. In this sense, the park was established as an instrument of innovation policy and the formalization of a governmental will, integrated in a European competitiveness discourse, in order to respond to international competition, by promoting the interaction between companies, R&D institutions and universities, developing business, innovation and education.

The park opened in 1995 with the central buildings, but the process had begun in 1992, with the setup of a company (*Tagusparque – Sociedade de Promoção e Desenvolvimento do Parque de Ciência e Tecnologia da Área de Lisboa, S.A.*) responsible for its implementation and management. The project resulted from a public-private operation of municipal and national involvement, in which the public sector assumed a central importance in the start-up phase by attracting structural EU funds. On the other hand, the Oeiras Municipality has played an equally important role through the establishment of the *Integrated Plan for the Science and Technology Park*, part of PDM Oeiras. In this plan were outlined the basis for the construction of the *Tagus Park* and its surroundings, divided into five areas, conjugating residential and leisure uses to the science and technology activities, which occupied 200 hectares corresponding to 58% of the total area (Câmara Municipal de Oeiras, 1996).

The impact of this project relies on the setup of an interface structure between education and business, with the aim of upgrading industrial structures and the investment in research and development. This was the turning point for the transition to the knowledge economy, which would become one of the strategic objectives later defined in the PNPT policies in 2007. The Strategic Program for the *Tagus Park* promoted the logic of expansion and relocation of R&D activities, by their dissemination in the metropolitan area, as had happened before with the process of relocation of industrial activities.

However, the Urban Development Plan didn't promote the integration of Tagus Park in the surrounding urban fabrics. The special use buildings (Business Park, golf course, shopping areas) form an isolated cluster, segregated from the surroundings, with different language, morphology and character that don't relate to the existing urban fabrics.

3.2 Abandonment and transformation of old industrial areas

The heavy industry relocation to strategic areas in the metropolitan context, started in the 40s, led to the establishment of an industrial fabric located in direct contact with the mobility infrastructures. The large industrial complexes settled in the periphery of Lisbon along the railways and in the proximity of the harbour of Sado and Tagus. In this way, the current deindustrialized areas occupy prime locations at the riverfront and in the surroundings of urban centres that grew based on the employment provided by the former structures. These spaces constitute an opportunity in environment terms, for the decontamination of industrial soils, as well as in symbolic terms, in the contact with the river and in economic terms, with the urbanization these vacant areas.

In parallel to the loss of importance of the heavy industry and its inability to adapt to new technologies, there was a general awakening to environmental and urban quality, expressed in public policies. This vision supported, the increasing importance of the tertiary and quaternary sectors, as well as the emergence of a widespread awareness about biophysical and environmental aspects. The regeneration project of Parque das Nações, in the former industrial area of Lisbon, in 1998, was a model for the process of industrial activity removal and the consequent reconversion of the industrial area.

This project represented a radical intervention in an area of great potential, which importance lies not only in the created spaces as well as in the opportunity of regeneration of obsolete areas. The Expo'98 international event was the engine for this redevelopment in the eastern part of Lisbon, with a strategy based on new infrastructure, programmatic mixture and the articulation between the city and the old harbour, resorting to an Urban Development Plan and to six Detailed Local Plans. The example of the Parque das Nações started the debate on urban regeneration and metropolitan integration of former peripheral industrial areas.

The identification of this other type of *opportunity spaces* is present in the regional strategies, (expressed in PROTAML) and in the municipal masterplans, leading to the discussion and reflection about the obsolete industrial areas on the left bank of the Tagus. In order to deal with this issue, a management company *ARS (Arco Ribeirinho Sul)* was created and, in partnership with the municipalities, presented a set of actions for the regeneration and urban revitalization of these areas – Almada (where *Lisnave's* shipyard was located), Barreiro (where *CUF* was located) and Seixal (where *Siderurgia Nacional* was located). The main objective of this action was the recentralizing of the metropolitan area, promoting a social, economic and environmental balance between the two banks of the Tagus. However, reflecting the current financial and economic crisis, the implementation of these projects was stopped indefinitely, as well the projects of transport infrastructure planned for the region.

The Urban Development Plan *Almada Nascente*¹³, approved in 2009, was developed for an area that occupies about 115 ha at the city's riverfront and extends from Cacilhas to Arsenal do Alfeite, including the area of the former *Lisnave's* shipyards. After the activity of the shipyard was stopped, in 2000, an urban regeneration project that promoted the contact between the city and the river was developed, through an international competition that selected the design team (Consortium *ATKINS, Santa-Rita Arq^{os}, Richard Rogers Partnership*). The plan proposes a close relationship with the riverfront, through the construction of a marina and cruise terminal, eco-park, occupation by diversified functions and cultural facilities while maintaining the industrial memory that characterizes the local identity.

After a large number of initiatives that have emerged from the identification of the declining activities of *Quimiparque* (former premises of *CUF*), a preliminary proposal of the Urban Development Plan *of the territory of Quimiparque and surrounding areas* was presented in 2008. The plan is the result from the consensus between the owners and the Municipality of Barreiro over the need for a planning instrument to guide the change of land use, the soil decontamination and accounting for the project the third Tagus bridge, in anticipation. The regeneration of this brownfield plays an equally critical role for the metropolitan development, present in PROTAML as an area capable of generating new economic dynamics and

improvement of environmental quality for the region, implementing the strategic vision which classifies Lisbon as a city-region and development centre of the country.

For the area of the former national siderurgy, a document designated *Guidelines for the Territorial Structure of Siderurgia Nacional* was produced, integrated in the revision of PDM Seixal. This document constitutes the first step for the preparation of the Base Program that sets the guidelines for the conversion process of this area, with 535 ha and a significant environmental liability that arises from the steel production. This vision aims at the urban and environment articulation, through soil decontamination, creation of a new port terminal and recreational facilities. The industrial activities currently operating in the Industrial Park of Seixal, after the siderurgy ceased its activity, are integrated in the plan, as well as a new multifunctional area in the north and a business area in the south, connected by green corridors in order to integrate the urban centre, the productive areas and the riverfront.

4. Planning for Uncertain Times?

Despite the efforts of coordination between the national and metropolitan planning with the local planning, the implementation of public policies at the municipal scale related to the urban expansion and abandonment still lacks a supra-municipal articulation and more specific planning tools.

The ability to generate wealth and the business attraction promoted a sectorial approach to the territory regarding the classification of land use and functions. The production of municipal masterplans, held at the municipal scale, creates introspective and fragmentary logics for the metropolitan area. The specialized areas relate directly to the economic dynamics and transport, which projects are developed regionally or nationally, ignoring the municipal limits, and in this sense, the plan for these specialized areas should follow the same logics and relate to a broader area overstepping the municipal borders. This means that the articulation and strategy for the spaces for economic activities, in regards to the logics for urban expansion or revitalization and reuse of abandoned obsolete spaces, should be conceived based on the coordination between the local scale and the metropolitan territory, as the coherent space for the competitiveness discourse and for establishing regional networks.

A response to nowadays' uncertain times requires an approach to the territory which combines these different scales, creating concrete bridges between national, metropolitan and municipal authorities, in order to find new connections through an operational project (Meijmans, 2010), joining the demands of planning with the project concerns, with the convergence of the different parties in order to give rise to changes in the global system (Weller, 2006).

This way, the role of the planning would undergo the creation of an articulated global structure with the comprehensive integration of abandoned spaces, emerging specialized areas and the spaces with ecological potential. By redirecting the need for expansion to the reuse of abandoned areas, the investments could focus on the redevelopment of the brownfields by promoting functional mixture and exploring their potential symbolic relation to the Tagus estuary.

Reading Conflicts and Congruencies in the Built Environment

Melissa Anna MURPHY, Norwegian University of Life Sciences, Norway

Cities today are full of conflicts and complexities. Globalization and densification trends in particular have led to the tight dwelling of a diversity of people, values, desires and demands upon the built environment. Planning attempts to plan for a level of general good, but this makes the expression of individual identities and ideals of social equity difficult (Fainstein, 2009). People in cities must live together and planners hold a great deal of power over the quality of spaces shared in this coexistence. As Heidegger (1971) has defined it, the act of dwelling defines who and how people are. When places are planned, built or upgraded, the people who experience them are affected. Some residents may win, being happy with outcomes, but others lose, potentially feeling displeased, out of place – or at worst – discriminated against and marginalized.

The physical quality of a city is thus dually affected by the past goals of urban planners, the current planning efforts of spatial management, and the ongoing actions of people's life. This effective link between planning and city fabric and city life can potentially illuminate past gaps and oversights that have occurred between plan and built translation. Through comparing the life in, and use of, places against planning intentions this paper argues that a basis for reflection over decision-making, planning input, execution can be informed.

While this paper does not attempt guidance through the morally loaded prioritizations that urbanism asks of planning, it will describe a tool for tracing the complex relations between built outcomes of planning and human actors. The aim is to illuminate an option for reflection that relates planning and management entities to built outcomes and user behaviors. This paper builds a theoretical argument for, proposes, and then tests a framework to contribute to practice of assessing built results of planning efforts. The proposed framework provides contextual, relational information that can be applied to understand the root of local urban conflicts and which groups or individuals are intentionally or unintentionally being prioritized in local planning.

1 Planning and managing the built environment

The built environment is composed of physical materials that dwellers experience and are informed by each day – most of which have been effected by past planning and current spatial management practices. In the built environment, management and planning authorities (hereafter referred to as Managers) can provide amenities, restrict particular uses, and control the maintenance and upkeep of the environment. These actions are largely exercised through the physical components, or materials, forming the environment.

The overall impression of one's environment has been strongly related to human wellbeing and identity in the field of Environmental Psychology. Marco Lalli (1992, p. 285) explains that “the environment attains its symbolic significance as a substrate of social, emotional and action related contents.” Understanding the built environment as a foundation for people is a basis from which planning can be judged. How solid of a social, emotional, and behavioral foundation is being provided in cities today? Is this foundation equal for every resident, or are some prioritized? Do management practices reinforce the intended substrates in place after projects are built? These questions of the built environment can be framed through the concept of place, as theory in this realm links people and their actions to their location and its environmental conditions.

To better understand the human implications of planning and management practice, this paper will first provide a survey over academic thought on the notion of place as it may connect people to their environment. Discussion then follows based on the impacts of the materials that compose an environment – how they physically and symbolically link users of place to planning and management authorities (referred to as ‘Managers’ henceforth). In the final sections, the paper will explain a material and behavior-based framework using a case study about local conflicts and congruencies found after an urban renewal project. The paper is concluded with potential guidelines to assess places. The aspiration of this paper is largely influenced by place-keeping thought which hopes to integrate a long term, holistic sustainability perspective into everyday places.

2 Defining place through its use

Similar to ‘environment, the term ‘place’ is difficult to delimit. ‘Place’ and its extent have long been contested through many nuanced definitions. This paper will focus on how place describes connections between human activity and qualities of the space in which it occurs. Geographer John Agnew (Agnew, 2011) has synthesized academic discussions on space and place into with three general definitions of place –‘Form’, ‘Meaning’, and ‘Representation.’ Geographical thought on place through history can generally be sorted through these definitions or some combination therefrom, resulting in varying degrees of the human in place discussions. The ‘Form’ definition of place is the simplest - a measurable location in space usually with recognizable characteristics (Setten, 2006). The next two reinforce human relationships to and within such a location - ‘Meaning’ follows thoughts on Relph’s (1976) ‘sense of place’ to include feelings, identities and roles of people at a particular location, while ‘Representation’ regards place as the “setting and scale for people’s daily actions and interactions” (Setten, 2006, p. 39).

Form, meaning and representation are paralleled in humanist Robert Sack’s definition of place from generic space. Sack (1992, p. 20) names the following three overlapping “forces” that form a relational framework which reemphasizes the meaning of the environment to human life:

- Nature – including the force of the physical aspects of place on people.
- Meaning – including attributed meaning of a place to its local people.
- Social Relations – aspects of a setting impacting how people interact.

By understanding the three together as “dynamically interdependent forces” (Sack, 1992, p. 20) – place can be interpreted and defined through human use, or activity, in space. Many academic fields build further upon the definition of place to produce theories that link nature/form, meaning, and social relations/representation to use. The chart in Figure 1 provides some examples of relevant theories from interdisciplinary literature.

While many fields focus only on physical or social phenomena, it is useful to see those which begin to near a realm of socio-materiality. Since contemporary planning thought is greatly influenced by sustainability goals and ecological perspectives, a prevalent understanding is that different systems are intertwined and all must be seen in relation to context. Here, socio-material realms become more applicable to a holistic perspective, defining importance of both human and physical characteristics. Socio-material thought departs from the positivist and modernist trends of separating and simplifying phenomena, moving towards the understanding that the social and material effect and produce each other (Law, 2008).

Place Trends in Interdisciplinary Theory and Design Practice

	Material <<<<<< Socio-material >>>>>>> Social	Implication of/to Use	
Form - Nature	<p><u>Architectural Design (esp. modernism)</u> Selection of materials and forms by an expert, form follows function</p> <p><u>Architectural Determinism</u> social actions based on materiality and physical setting (Hillier, Burdett, Peponis, & Penn, 1987), for example: <i>programming, place-making</i></p>	<p><u>Behavior Settings</u> social actions based on type of environment (Barker, 1968)</p>	Physical form and environment guides types of use
Meaning	<p><u>Material Semiotics</u> material selection and design to convey meaning and intent (Goss, 1988)</p> <p><u>Natural Place Identity</u> meaning of a place affected by normative value to physical attributes (Scannell & Gifford, 2010)</p> <p><u>Attachment/Sense of Place</u> importance of a place to local people (Relph, 1976)</p> <p><u>Urban Semiotics</u> materiality and detail of urban settings hold social meaning (Gottdiener & Lagopoulos, 1986)</p>		Use based on the fit between the material and social expectations; sense of what belongs and is identifiable.
Representation - setting for Social relations	<p><u>Urban Design (esp morphology)</u> Selection of materials in arrangements, forms, proportions to fit into a setting</p> <p><u>Aesthetics</u> material quality affects perception and ambience (Kaplan, 1988)</p>	<p><u>Dwelling</u> "to remain at peace within the free sphere that safeguards each thing in its nature." (Heidegger, 1971)</p>	Social uses affected by physical and perceived setting.

Figure 1 Implications for use of place from various theoretical backgrounds.

3 Use controls - and is controlled by - place

Delving into the socio-material, one concept that spans all three dimensions of place definition is that of territoriality. Architect Mathias Kärrholm’s (2007) writing describes territoriality as “power exercised over space”, or the controls of spatial use and behavior in place. While it is often assumed that formal planning and governing bodies hold control over the built environment, Kärrholm’s thought also considers informal controls in place. With this understanding, each person and group holds agency to control their environment, overlapping the responsibility of common residents and governance bodies.

“Territorial regulations affect our behavior and movements in urban space, both explicitly and in more obscure ways, and these types of regulation are often supported by material forms and designs.” (Kärrholm, 2007, p. 438)

Kärrholm’s description of controls in space include the implicit and explicit, formal and informal, variable and complex – attributing importance to spatial use. Types of use do not

always align with intentions for place and materials of place. This complexity highlights the need to observe the realities of space rather than assuming adherence to proscribed rules. Territoriality is a truly socio-material phenomenon, encompassing all of Sack's forces and explaining how place, its form, meaning and representation, are affected by the interplay between physical and human entities:

- The physical characteristics of a place ('Form' or 'Nature force') guide and deter different types and amounts of human activity. In example, a locked gate controls access to a park; smooth pavement encourages faster car and bicycle traffic.
- Use of place is based upon the fit between the material and the expectations of the social. User groups assign 'Meaning' to places based on the activities performed or observed in the space. In example, a cemetery achieves sanctity due to quiet contemplation that happens there; a dark, graffiti covered street invokes apprehension among the vulnerable.
- Social desires and amount of place use is affected by condition and perceptions of place. Social relations can also impact the local feelings of belonging that determine the regular users of a place. In example, broken benches detract staying, lessening spontaneous meetings between neighbors; successful playgrounds gather like-aged children and their parents.

Humans and place are irrevocably intertwined. As different people encounter a place, congruencies and conflicts in and across these realms tell a story of how social and physical phenomena impact each other in a given context. Traces left by use on a place's materials can illuminate such encounters. From the definition of place and territoriality, it is understood that the physical environment impacts our concept of it – that concept in return impacting the perception, hopes and desires of ourselves in a place.

4 Tracing use to planning, management and external forces

Place materials and use are susceptible to change over time. By comparing the conditions of a place at a given time to greater intentions for the place, elements and their responsible actors can be evaluated. Usage types and amounts can be assessed against the positive and negative effects on materials. Material conditions can be rated against intent and functionality over time. Supplementing and layering observation of material and use with place histories from local interviews, material effects can be traced to social actors. This will introduce a framework for this linkage.

Places can be defined but are never closed systems. While many uses in space are cyclical or self-reinforcing, outside forces can also be responsible for putting patterns into motion. Use and effects of use can be understood as products of larger and smaller trends affecting responsible parties – budget fluxes following governmental prioritizations in planning for example. The question then turns to what informs decisions and actions that impact a local built environment, and how suited are the physical outcomes of planning to those who inhabit it? This paper proposes that the observable quality of the materials of place and their conditions lend them to traceability back to greater social and administrative dynamics.

Despite an amount of controversy over the past decade, Actor Network Theory (ANT) has been deemed useful in mapping socio-material relationships in architecture and urban design (Fallan, 2008; Kärrholm, 2007). While ANT is not actually a theory (Latour, 2005), its use as an approach or meta-method may be fruitful in illuminating human-object relationships within and across physical borders. Understanding social and material components thus as interrelated parts of a network can move contemporary place ideology away from both social-

neglecting architectural determinism and material-neglecting social constructivism ideologies (Fallan, 2008; Latour, 2005).

An ANT approach encourages description through the mapping and tracing of actions between people and materials. Latour (2005) explains that ANT's aim is to "render social connections traceable by following the work done," explaining that entities within an Actor Network become important through the way they 'work' upon or affect adjacent ones. In the realm of planning and management, it seems prudent to expand this concept with that agency - understanding also the type of 'work' that different entities could potentially act upon others. The immediate environment can thus be understood as assemblages of materials linking to and from human actors. Through description of place elements as parts of a relational network, planning and spatial management practices can be translated into effects on life within the built environment. Influences on personal choices in place use and on management priorities can be dynamically balanced. Conflicts and congruencies between intent and actuality then pose a telling story - reflecting over practice.

In its simplest form the base network template appears as such:

User → Material ← Manager

Figure 2 Implications for use of place from various theoretical backgrounds.

The following two sections will describe a case which will be used in a later section to elaborate on this framework, its potentials and implications.

5 Conflicts and congruencies

A case of conflicts and congruencies after planning is described here to illustrate the framework's application in assessing an outcome of a planning initiative. The case information is extracted from two observation studies conducted in an Oslo neighborhood, Nedre Kampen. This area was upgraded under the initiative "Miljøbyen Gamle Oslo" ('Environment city' Old Oslo), which focused on bettering living conditions among the diverse, inner-city population. A series of projects were executed under the initiative, particularly in traffic calming between 1993-2000. Most built implementations have been in place for at least 10 years prior to the referenced studies.

Both studies providing the source material for the following case narrative were conducted with a phenomenological approach, attempting to understand the neighborhood as it is through the experience of a pedestrian resident. One study was fieldwork conducted for Master's thesis in 2010-2011 to describe tensions in the neighborhood's communal space (Murphy, 2010). Both photos and interviews from this study are drawn upon for reference. A 2013 (ongoing) pilot study for a doctoral research (Murphy, expected delivery in 2016) provides further observation data and photographs. The doctoral project's aim is to trace use and perception of place and understand motivation conflicts in spatial management.

Episodes from these two studies have been extracted here regarding one of the pedestrian plazas built under Miljøbyen Gamle Oslo. The episodes demonstrate conflicts and congruencies between the place's original intent and its actual life.

6 Case: Oslo's largest speed bump

"A good ANT account is a narrative or a description or a proposition where all the actors do something and don't just sit there. Instead of simply transporting effects

without transforming them, each of the points in the text may become a bifurcation, an event, or the origin of a new translation.” (Latour, 2005, p. 128)

This section will describe a case through various episodes of observation. Each episode is broken into actors (human and material entities) connected by actions (use and transformations). A diagram follows each narrative, denoting materials in CAPS, actions as vectors with explanations in parentheses, and human actors in lower cased text. The plaza was built as part of Miljøbyen Gamle Oslo’s traffic calming plan, described under a heading “From driving and parking to play and entertainment” (MiljøbyenReport, 2000, p. 192). The plan intended to reduce traffic and increase area safety and sociality for residents. This case project aimed to block what used to be a throughway with the addition of a pedestrian plaza.

Determination of ‘conflict’ or ‘congruency’ is associated with the plan intentions of Miljøbyen Gamle Oslo (Miljøbyen Report, 2000), practical place-making theory from Jan Gehl (2011), and place-keeping theory by Nicola Dempsey (2011). The term ‘conflict’ here implies that the result does not match the intention. For simplification purposes, entities are often collected into groups, limiting the network – which could be extended through detailed follow-up along each branch.

Figure 3 The pedestrian plaza residents refer to as Oslo’s largest speedbump seen from the north – Image from Google Maps Street View, image date June 2009, available at <http://goo.gl/maps/JGFW4>.

Episode 1 - In the snow, this pedestrian plaza is covered in tire tracks. Cars drive across it. The curb is high and continuous across the plaza’s edges – higher than most curbs at around 20 centimeters - but this is apparently not substantial enough to stop larger vehicles looking for a shortcut between Kolstadgata and Sigurds Gate. In the winter, snow drifts nearly eliminate the curb, providing an icy car ramp from street to plaza.

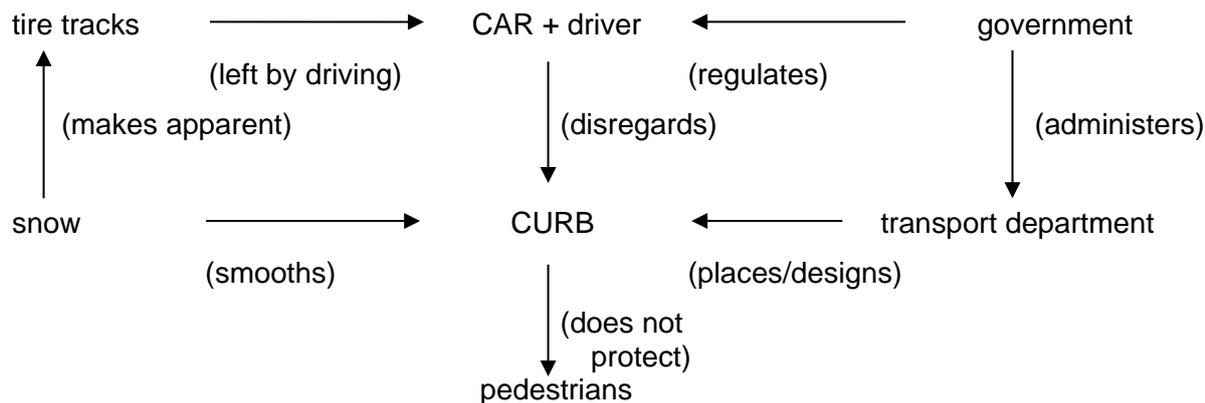

Figure 4 Conflict 1: Cars misuse materials.

Episode 2 - Benches and trees along the plaza are arranged neatly to one side, clearing a wide cobblestone plaza. The two adjacent streets are planned to direct cars around wide turns, away from the plaza. The materials of the plaza are nice, bright, and typically clean - a welcome, albeit more labor intensive change from the asphalt streets and asphalt sidewalks typical to Oslo. A bronze bust of a well-liked former mayor stands in the plaza, holding the potential to introduce a bit of civic pride and dignity to this otherwise marginalized neighborhood. The space is open enough to get full sunlight for large parts of the day. The design itself has many of the same elements that were successful just a few blocks away, deeper into the residential blocks - elements which the residents helped the planners choose under Miljøbyen Gamle Oslo's participation processes.

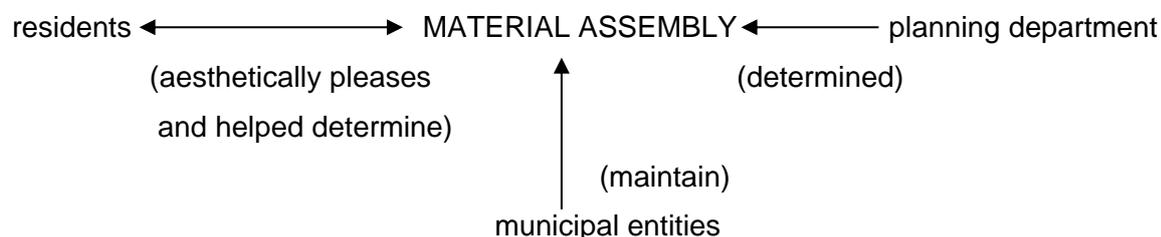

Figure 5 Congruency 1: The materials should be conducive to a safe, social place.

Episode 3 - There are few windows or doors facing the plaza and little reason to use the space. One adjacent building is a private residential cooperative, while two others hold centralized public housing leftover from the 1970s. The two benches of the plaza are often occupied in nice weather by local alcoholics who hide the beers in plastic bags from the nearby grocery store. On those days, their fellowship dominates the space, lessening the comfort of other potential 'stayers' in the space. A small bike rack is there, covered in graffiti and seldom used. This plaza is not a particular destination and the adjacent buildings all have their own bike parking close to entrances. The plaza has been the sight of at least one shooting and one stabbing in 2012.

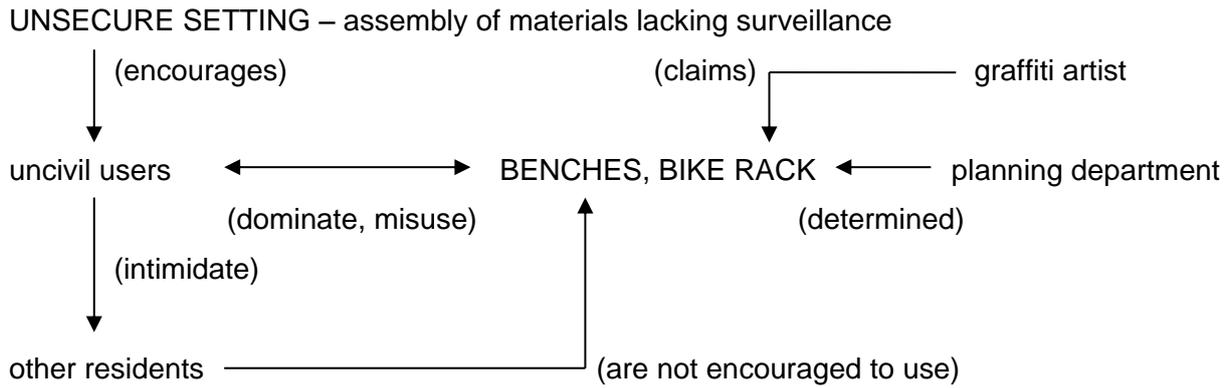

Figure 6 *Conflict 2: Domination of the material by uncivil groups*

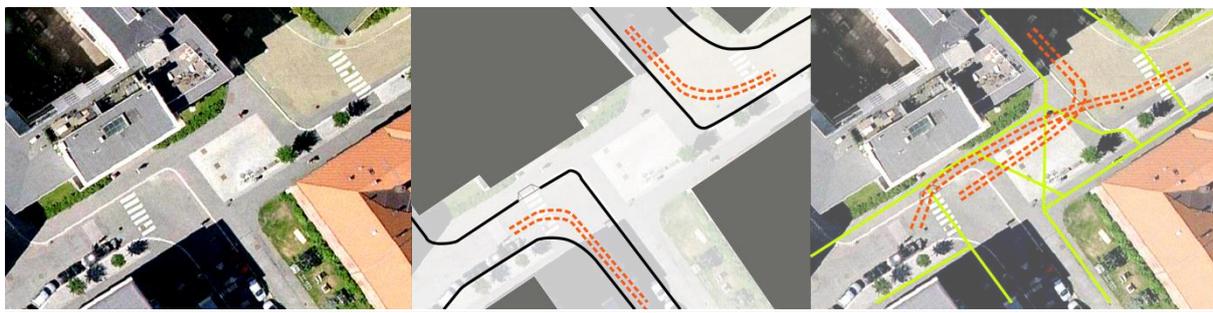

Figure 7 Aerial view of the plaza (left), drawing of traffic intention, traffic and pedestrian conflicts (right – car traffic in orange, pedestrian in yellow-green).

Episode 4 - From the car perspective, the road appears and perhaps should be continuous. Following either of the roads leads cars in a circuitous, non-intuitive route requiring many turns to cross the neighborhood. There are several businesses, particularly grocery stores, in the neighborhood which are stocked daily. Large trucks that carry goods have no problem jumping the curb. Smaller cars and trucks make use of a curb cut slightly south of the plaza – it becoming an awkward, lopsided ramp.

The plaza connects a dense residential district with bus stops, grocery stores, and subway plaza to the north. If pedestrians follow traffic rules and marked crossings, what appears as a straight sight line becomes a convoluted path. The tight line of trees and benches to the east provides obstacles for diagonal pedestrian crossing. The often occurring but unexpected presence of cars and trucks on the plaza further complicates being on the plaza.

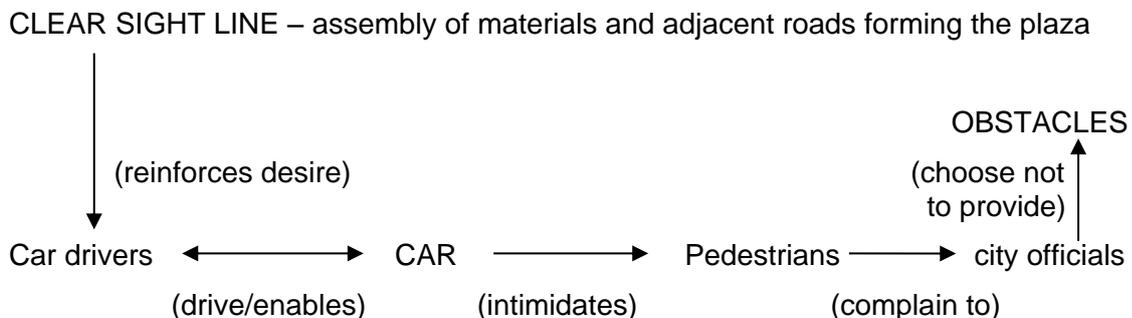

Figure 8 *Conflict 3: Sight lines are direct but the paths are not.*

Episode 5 - Children do play and parents do socialize in this neighborhood, but not in the plaza as intended. Just around the corner to Kolstadgata, a first floor apartment often has a window open to a kitchen. Children play on the small sidewalk outside, checking in with the mother through the window. Sometimes neighbors also stop to chat there despite the narrowness of the sidewalk. This place is more trafficked by pedestrians, cars heed the curb, and drive slowly as they approach the bend in the road. The street is quieter, calmer, and safer overall since the nearby traffic calming implementations.

CALM STREET – assembled ambience from reduced, slow moving traffic

Figure 9 Congruency 2: Nearby areas function as safe social arenas

7 Lessons of the framework

This summary will relate these episodes to the base framework illustrated earlier (Figure 2). The following 7 points are keyed with numbers into an elaborated framework in Figure 9.

1. Managers are those responsible for materials, their existence, and the upkeep of their condition. (Episodes 1-4)
2. Users can also be responsible for materials and changing the material conditions. (Episodes 1, 3, 5)
3. Use of place can guide the perceptions of and inform use by other people. (Episodes 4, 5)
4. The physical presence of material (singular or as an assembly) can guide, allow, and discourage uses. (Episodes 1-3)
5. Material conditions determine planning and management needs and workloads. (Episodes 2-4)
6. Individual motivations can make later use and misuse difficult to predict. (Episodes 1, 3, 5)
7. Circumstances external to a project may limit the resources for management.

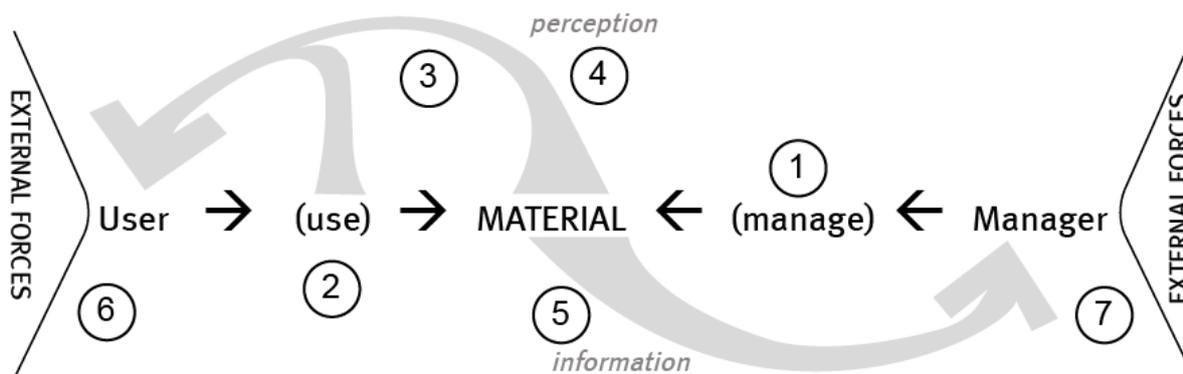

Figure 10 An elaborated framework of the material in the built environment

Indirectly, following these steps through the framework, further points can be concluded. Inconsistencies in both manager and user realms often appear in the built environment. The

suitability of planning and management decisions impact perceptions and inform use (Episodes 1-5). Managers often have the agency to counteract detrimental use and negative perceptions (Episodes 1, 3, 4).

8 Lessons from the material

Materials and their condition can be dually understood as products of use and as products of governance; the two actions counteract each other in space. Signs of material misuse often relates to local social dynamics, while the toleration of misuse and unchecked use of place may comment upon ignorance, disengagement, or inability of a place's managers. The following general lessons are gleaned from this study which can become important reminders for planning and management practitioners in assessing their own place work.

- The lack of use in place can be as significant as the presence of use.
- Use does not always follow intention.
- Seasonal and temporal conditions change material and use.
- Agency of different actors can inform projections and remediation measures
- Materials can enable civil or uncivil user groups
- Management resources and mechanisms may be limited after construction
- Inflexible existing conditions may impact use more than new implementations
- Perceptions of use are as important as physical condition in determining use, but:
 - Pleasant conditions do not always lead to desired behaviors
 - Desired behaviors can occur as secondary effects of planning projects

Many of these lessons are context dependent, but can be considered in new place planning projects.

9 Implications on place

Summarizing the framework's lessons in terms of place definition and place theory can help to explain the role of materials in the built environment and its life. The life of a place, divided into the entity groups of User, Material, and Manager can be used to describe and analyze the effectiveness of decisions in the built environment over time. A goal for such potential can be found in place-keeping thought, encompassing both planning and maintenance of place with the aspiration "to create a high quality, sustainable space which is valued by users who want to visit it again and again" (Dempsey & Burton, 2011).

Reflection over this study and framework concludes with a suggestion for further empirical work to test its extents and limitations. It could also be analyzed against different user-manager relationships to understand how action, information and perceptions change.

The framework together with the place definition implicates a base for judging place-keeping effectiveness. This study proposes the following indicators as a starting point for such:

- Form- If materials and their arrangement in place are sustained in a non-detrimental manner despite continued use, then place-keeping is effective.
- Meaning- If the actual and intended uses of space are congruent, then the meaning is sustained over time. Place-keeping then can be effective as long as the actual management of place follows the anticipated management needs of place.
- Representation- If materials and their arrangement are congruent with the actual use of the place and management can sustain the balance of wear for continued use, place-keeping is effective.

Further study is needed to test and potentially elaborate upon these points, but conceptually holes and dissonances found in place could significantly inform practice. Possible patches to the physical and managerial aspects of place can be illuminated alongside cost analyses to determine the overall benefits of better suiting the built environment to the life that inhabits it. While social trends, personal expectations and desires may not be controllable by a place

project, accounting for effects of the place use will strengthen the future place plans and sustainability.

10 Conclusions

Planners cannot control the life that their plans inspire, but they can learn from it. The uncontrollable aspects of human populations and behavior will always impact place. This quality of the urban demonstrates the usefulness of planners and spatial managers to reflect over the outputs of their practice. The type of reflection framed in this paper is one seldom found after projects are built. Reports after plan implementations such as Miljøbyen Gamle Oslo often show before and after-construction pictures, but spaces are not typically studied over a long term or critically documented as everyday life and time has makes its marks.

The Miljøbyen Gamle Oslo plan initiative has been critically evaluated using demographics data from the census. The city now has published and realizes that most living condition increases since plan implementation are actually attributable to new populations moving in (Miljøbyen Report, 2000). Such results are important and valuable information to the municipality and planning professionals, but they offer little insight over how to make meaningful improvements in the daily lives of the residents who are already there, in place. This urban renewal effort turned into a classic case of gentrification, which may have been expected given the aesthetic focus of many of its projects. Observing materials and life in the spaces now could inform simple solutions to better local places – some central benches to block traffic in the described case for instance - but funding for the project and its spaces ended over a decade ago.

Too often, budget and resources for planning and local implementations often stop short after a project's end. This tradition in practice does little to support planners' ability for reflection, evaluation, and learning after project completion. Reflection over the products of practice could contribute to holistic assessments of works past to inform current planning and management needs. This framework demonstrates the capacity to be far more detailed and suited to the context of place than a before and after surveys. Observation studies are demanding in time and human resources, but offer great potential for guiding place betterment and increasing maintenance efficiency. Collaborative, cost-sharing efforts could be encouraged across different public and private sectors to share burdens and strengthen the sharing of local information.

One of the key learning points in this type of reflection is the difference between how a planned space or project may seem on a drawing and how it may be perceived and used in everyday life. Planners and spatial managers today must realize that their jobs cannot be accomplished sitting behind a desk – they need the invaluable local knowledge only acquirable in the field. Professionals without the resources to open intense evaluations over planning projects past, could work such strategy into the early documentation phases of planning projects. Implementing material observation and learning early could provide plans a basis relevant to a locale's existing life. Such a strategy could effectively pinpoint and encourage positive local behaviors, while learning the sources of detrimental ones – grounding future interventions in what already exists.

Siting Green Infrastructure: Synthetical Solutions for Leading the Oasis City's Sustainable Development In Wuyi New Town

Jie Ren, School of Architecture, Tsinghua University, China

1. Introduction

As a popular framework for smart growth and conservation, urban green infrastructure aims at constructing a natural support system in urbanized areas through protecting nature resources and considering social, economic and cultural elements. The formation and stability of this green framework could not only guarantee the security and stability of ecological environments, but also offer a basic ecological security pattern and development control framework and finally provide a foundation for city's future resilient development.

Owing to the particular conditions of oasis cities, the stability and security of ecological environment seem to be quite more crucial especially when dealing with urban sustainable development. This article showcases how Wuyi New Town constructed its sustainable developing strategy by the strategic method of green infrastructure.

2. Background

Wuyi new town, covering 11.2sq km, is located in the north foot of Tianshan Mountain in the western arid land of China, about 26km from west of downtown Urumqi (Figure 1, Figure 2). In order to meet the need of the ecological and sustainable development, protect the regional ecological safety, and guide urban future rational special expansion, the idea of green infrastructure was presented at the beginning.

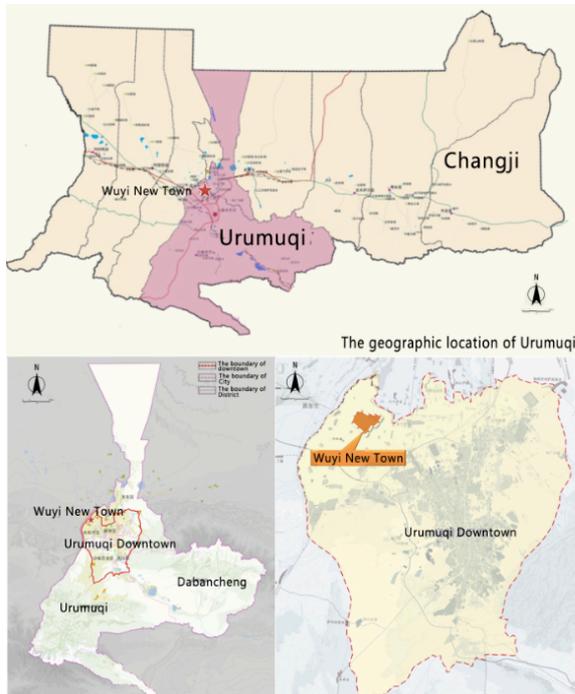

Figure 1 Location of research site

Figure 2 Research areas

2.1 The formation of the idea of green infrastructure

2.1.1 The constrain of ecological environment: important oasis areas in the north foot of Tianshan Mountain

The Tianshan Mountain lies in the north of Xinjiang and it is the largest mountain range located in Central Asia. Owing to the difference of topographic slope and the distribution of rainfall, the north foot of Tianshan Mountain forms a special MODS (mountain-oasis-desert system) ecological pattern, that extends roughly north-south and distributes layered (Figure 3). Among those three systems, the oasis regions in the north foot of Tianshan Mountain are the key factors of maintaining the ecological safety of Tianshan Mountain, and Wuyi new town is just in the core region of the oasis.

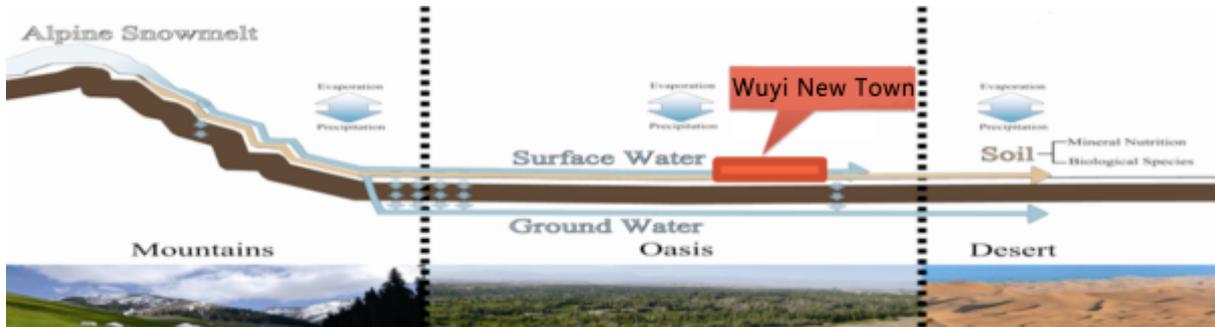

Figure 3 MODS system: Mountain-Oasis-Desert

Recent years, because of entering into the phase of rapid urbanization, the amount of urban construction lands of Wuyi new town have experienced a significant increase. The urban layout pattern has moved from “punctate distributed layout” which is single axis-based on main traffic lines, towards “multi-point and multi-axes” network layout” gradually, while interfered many ecological elements’ north-south circulation seriously and leading to a sharp increase of the fragment of regional ecological landscape. Meanwhile, owing to the continued expansion of large scale land reclamation and unreasonable farming practices, the resource of surface water and ground water have been overexploited, and caused more serious phenomenon of funnel-shaped ground water.

Under the background of increasing changes of ecological pattern in north foot of Tianshan Mountain, it is important and crucial to pay attention to the building of ecological environment and the construction of rational urban green space in order not only to curb the oasis degradation, prevent the desert southward and maintain the stability of regional ecological patterns, but also promote the sustainable expansion of Wuyi new town’s future urban space.

2.1.2 The need of urban development: the key location of regional economic development

Wuyi new town located in the northwest of Urumqi downtown, the east of Changji downtown, the north of Diwobao International Airport and the middle of Urumqi-Changji economic integration, and it owns better advantages of location and resources (Figure 4). However, for now, because of the constrains from economic structure and political system, there existed some issues which could not been ignored maybe hinder the future urban development. Meanwhile, seen from the point of the development of Bingtuan Area and the update of regional future development, it further reinforced the sustainability of development path and the important role of city’s function.

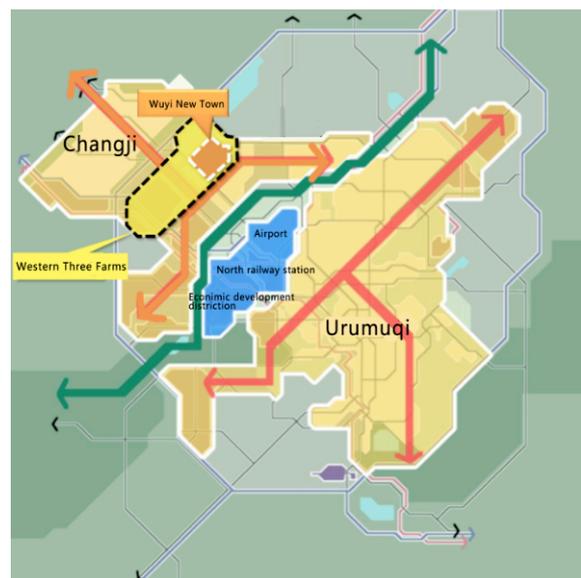

Figure 4 Regional future development layout

2.2 The constrains and challenges of green infrastructure planning

2.2.1 Serious degradation of vegetation and relative shortage of water resources

Wuyi new town is located in semi-arid continental climate regions with an average annual evaporation of 1787mm, which is 9.77 times than the rainfall, and the problem of water scarcity is very prominent. Meanwhile, as some other oasis cities, Wuyi new town is also exposed to a multitude of conundrums on natural environment deterioration, such as dry weather, dust storm, inadequate green areas, soil depletion, vegetation degradation, etc. At the same time, owing to the relatively limited water environmental capacity, Also, because the whole area's water environmental capacity is relatively limited, the phenomenon of sandy soil and the soil with low organic matter is also going to be troubleshooting. So, the reasonable construction of region's green space is particularly important.

2.2.2 Sandstorm impact on the town significantly

Wuyi new town lied in the "Qitai-Shihezi hot wind zone" with frequent sand blowing weather which not only reduced the air cleanliness, but also affected the local crop production and the life of local residents seriously. Since the dust weather, the process of Wuyi new town's urbanization will experience an exchange from the pattern of "farm-protective forest network" to the pattern of "town-green space". Therefore, rely on the current situation of vegetation, how to enhance the protective capability of green space from the level of spatial arrangement and vegetation choice is also a problem this green infrastructure planning will face.

2.2.3 The construction of urban green land needs to be improved

The construction of Wuyi new town's green land is still in its infancy. There is only one current agricultural sightseeing garden for urban residents' daily recreation and the other main form of green land is protective green land, including current road protective forest and farmland shelter forest network. In addition, the types of vegetation are still in limited and the form of greening is relatively simple, that make the size and quality of green space and the future need of urban development both have large gaps.

2.2.4 The promotion of agricultural landscape faces challenge

Agriculture has been not only a basic industry of Bingtuan but also the regions of north foot of Tianshan Mountain. After a long period of development, agriculture has been a typical type of landscape and important landscape resources that could embody and strengthen the geographical characteristics. However, the agriculture's character of large consumption of water seems to contradict the ecological safety of those oasis regions seriously.

Hence, during the process of changing from traditional agriculture to modern agriculture, It also seems to be an challenge for Wuyi new town to extend the characteristics of agricultural landscape properly, enhance the overall efficiency of agriculture and reshape the regional landscape.

2.3 The core content of green infrastructure planning

On the one hand, green infrastructure emphasizes an interconnected network of green open spaces; on the other hand, it is more a method of land preservation, the green space network it formed could not only offer a framework for urban future development in foresight, but also present a path to guide both urban future development and the greening of other municipal infrastructure systems.

Therefore, during the research of green infrastructure of Wuyi new town, the contents from above two aspects have been documented into three facts: the construction of green space system, the setting of urban development path and the guidance of municipal infrastructure.

In addition, because of the convenient regional traffic conditions and abundant resource superiorities, in the future, Wuyi new town will also undertake a pivotal role in regional development. The ecology, security and sustainability of oasis city are emphasized during the planning progress of Wuyi new town from government decision-making, innovative

planning conceptions, and technological means to practical approaches. Basing on the core idea of maintaining and enhancing the regional ecological environment mostly, the conception of green infrastructure was presented to guide Wuyi new town's sustainable development. As a city's natural service system, Wuyi new town's green infrastructure aims at exploring a planning and design operation mechanism, and forming the "Wuyi Model" that features rational and efficient oasis city development.

3. Green infrastructure planning in Wuyi new town

3.1 Basic concept: using green infrastructure to guide urban development

3.1.1 Green infrastructure first

At the beginning of the design, the concept of treating natural environment and green space as one part of urban infrastructure to be constructed first was determined. It emphasized a comprehensive analysis of current land resources and the synthesis of society, economy, ecology and some other factors. It claims to delimit the boundary of preserved land first and finish the planning formulation before new land allocation. Through protecting the rationality and integrity of green land system, it could guarantee the continuity of the natural and biological processes, while reserving sufficient development space and providing the possibility of high efficient land preservation and development, and enhancing land's natural service capability and urban resilience to natural disasters.

3.1.2 Not only emphasis on green indicator, but also eco-efficiency

Although owned favorable regional advantages and resource endowment, Wuyi new town experienced a relatively fragile ecological natural environment because of the affection of oasis climate. Therefore, it is crucial to pay attention to the capability of natural service, enhance the attention to green space and strengthen natural spaces' important role in urban sustainable development. Basing on the emphasis of protecting green indicator, this planning paid more attention to the interconnection and ecological efficiency of green land. Through the construction of perfect network of green space systems, those green land space not only could be seen, but also could be used and enhanced the ecological efficiency of green land fundamentally.

3.1.3 Full recognition of the economic contribution value of green spaces

On the basis of full recognition and emphasis of the comprehensive benefits that urban green land could produce, building a sound green infrastructure network and improving ecological environment dominated by efficient management of green land could make the environmental advantages convert into economic advantages, which will led Wuyi new town's future economic development. At the same time, urban environment with high quality will also help enhance the city's image and visibility, then further promote the city's tangible and intangible asset value.

3.1.4 The combination of passive preservation and positive development

The planning emphasized the combination of passive preservation and positive development, that is to form a network which addressed both the protection of green space and urban development, and this protective overall green network could draw a boundary for urban future development and require future development activities carried out within this boundary. Yet, this mode is not to place land preservation in opposition to land development, it stressed a transformation from a simple only protection of green space to a much systematic and guiding overall urban development network through the consideration of future development, urban expansion and some other development planning.

3.2 Multi-layered research perspectives

In the case of Wuyi new town, in order to improve the veracity and comprehensiveness of the planning, the research prospect of green infrastructure was expanded to a larger medium-level of Wuyi Farm and a macro-level of Western Three Farms (Figure 5), and those

three different spatial levels corresponded to the microscopic specific design methods, the formation of medium planning countermeasures and the construction of macroscopic strategic guidelines, respectively.

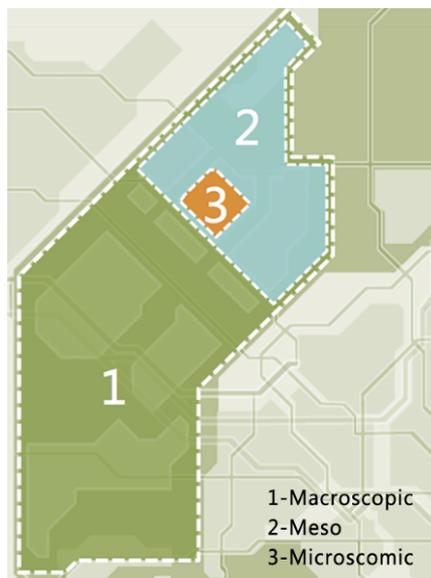

Figure 5 The mode of planning levels

Sheet 1 The relationship between three research levels

Research Level	1. Macroscopic	2.Middle	3.Microsmic
Research Area	Western Three Farms (including Wuyi Farm, Sanping Farm and Toutunhe Farm)	Wuyi Farm	Wuyi New Town
Land Area (Km)	181.2	61.2	11.3
Planning Content	The construction of macro strategic guidance	The formation of medium planning countermeasures	The realization of micro design measures

3.3 Strengthen the construction of ecological green space

3.3.1 The ecological strategy of green space in macro Western Three Farms

The macro-level research determined the idea of using green infrastructure to guide urban development and five basic principles about valuing the ecological benefits, advocating green infrastructure advance, combining the passive protection and positive development, realizing the economic value of green space, and compromising the urban public space and green space. Under this planning conception and principle, the macroscopic green infrastructure system was constructed through collecting and analyzing the oasis's special natural conditions and the other social, economic and cultural elements, And this system offered a strategic framework for the whole Western Three Farms' spatial development and land layout. Meanwhile, the overall strategy about green space, urban development and urban infrastructure were defined in the meantime.

(1) The functional diversification of green land

According to western three farms' current developing situation and its development goals in 12th Five-Year Plan, at first, the project made three east-west agricultural landscape belts based on produce function, which are mainly composed of forestry, vegetables and fruit, respectively. Those three landscape belts were urban delicate agriculture oriented which featured in ponds leisure, flowers economy and farmhouse experience, and aimed at forming a big scale farm landscape with both productive and entertainment. Second, on the basis of meeting with the need of bit lines and safety requirements of municipal pipeline corridors, the project separated those regions by five green land corridors. Those corridors were mainly used of country parks with strong public participation and public activities. The design proposed for a subject of plant cultivation and used the large-scale farming of sunflowers, lavenders, canola flowers and some other landscape plants to extent the beauty of agricultural landscape while kept the balance of the flexibility of space usage and the low maintenance costs. Besides, as the balance space of urban construction and nature protection, those five green country parks would also accomplish a great deal in the safety of storm water for the function of storing water (Figure 6).

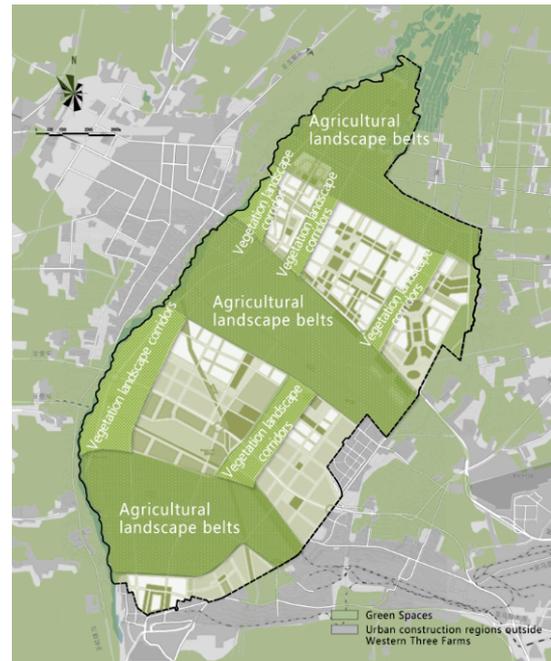

Figure 6 The strategic framework of green infrastructure in Western Three Farms

(2) The features of landscape

The project adjusted the original planting mode of Western Three Farms, combined the original topography and morphology of Western Three Farms, and then used the landscape effects of special flowers and shrub plants to create a flat open landscape.

3.3.2 The planning countermeasures of green space in medium Wuyi Farm

The medium-level confirmed the specific countermeasures, like specific location, control range and main function of green infrastructure system of Wiyi Farm.

(1) The refinement of green spatial structure

This level emphasized its connection with macro level, and it added a next level of green belt to perfect the overall green spatial structure. Through the formation of a number of park zones, it connected all the parks, ecological corridors, green belts and some other large green space, kept the continuity of the green land in Wuyi Farm, boosted ecological factors penetrating to urban regions step by step, and finally improved the natural environment and micro climate.

(2) Keep the ecology and versatility of green land

Firstly, as urban agricultural ecological corridors, there was a need of promoting the transformation of agriculture structure through strengthening the construction of agricultural water-saving facilities and building high efficient ecological agriculture systems, marked by

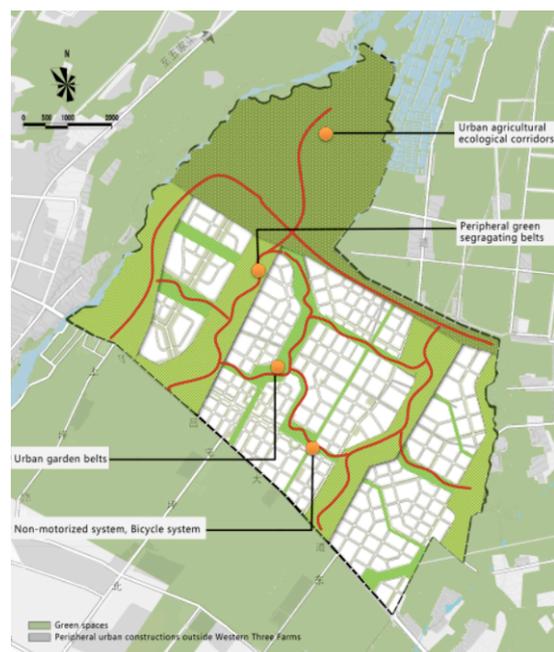

Figure 7 The spatial layout of green infrastructure in Wuyi Farm

ecological green agriculture, tourism agriculture, modern high-tech agriculture and so on. Secondly, for the peripheral green belts, it should strengthen the green construction of current villages, roads and some other constructions, control the construction strength, move away the construction projects which were heavy impact on environment gradually and do ecological restoration. Meanwhile, the project promoted an agricultural forest mode of "big grids, wide belts" in green belts' upwind regions to build a source of oxygen and a protection from sands. Finally, all the urban park belts should pay much attention to ecology first and highlight the ecological function of water-saving and protection against wind during the choose of plants and planting methods. In addition, based on those urban park belts, it constructed more connective pedestrian systems and exercise biking systems.

3.3.3 The design measures of green space in micro Wuyi New Town

In the micro-level of Wuyi new town, green infrastructure system became not only green space system but also a basic functional carrier which could coordinate multiple urban infrastructure, such as open space system, transportation system, water supply and drainage system, under the principle of "green".

(1) Adaptive vegetation choice

Because the special climatic conditions in Urumqi, it was crucial to choose proper vegetation to adapt such middle temperature and drought environment.

The regions around the east, south and west of Wuyi new town were both country green ways and the fields of those regions were relatively fertile and owned a large proportion of arable land. In the future, the productive ways would be dominated by agroforestry which were mainly protection forestry of "narrow belts and small grids" with part small economic trees and timber forest. By doing so, it maintained the safety of regional ecological system. The green ways inside Wuyi new town were all urban green ways and road greening were important part of urban green ways, that they own significant role of decreasing dust, replenishing groundwater, improving outdoors' high temperature in summer, purifying the appliance of city and some other aspects. In the tree species selection, elm, maple and conifer were the main kind owing to their long-life, less flower drop and better effect in the development of desert and temporary development.

(2) Strengthen the ecology of green land

In the design of green space, proper allocation of different vegetation was significant measures for improving the ecological efficiency of green land. Firstly, the design used large areas of large arbors and shrubs in green ways inside city. On the one hand, by doing so, intensive big crested species could enhance light shielding effect and reduce urban green ways' wind speed (green ways could reduce wind speed between 35% and 75% [1]); on the other hand, transpiration could enhance the air humidity of around regions (The air humidity around green ways are about 10%-20% higher than that around urban district. The air humidity of big parks could be about 27% higher [2]), form pressure differences between green ways and urban constructions, and then improve the circulation of air humidity and ameliorate air condition.

For arbors and shrubs, the lawn has a better performance of dust extraction. The complexity of the combination of above three will directly affect ecological benefits of dust extraction, wind-resistant and noise canceling, and the more complicated combination, the higher ecological efficiency. When the width of the combination of arbors, shrubs and lawns achieved 3 to 70 meters, the noise would be reduced between 3.7 to 7.5DB(A). Therefore, it was important to pay attention to the structural equilibrium of those three vegetation in Wuyi new town's plant arrangement.

(3) The effective integration of urban public space

The goal of green infrastructure system in Wuyi new town was not only connecting constructions and natural environment, but also offering urban residents more comfortable, convenient and efficient urban public service through giving ecological green land more active roles. Hence, this design corrected the problem of considering and planning green land systems and urban public space systems separately, and it considered those two

aspects together to set proper comprehensive parks, community parks, topic parks and green areas nearby street to meet the need of urban function.

The combination of city green ways, parks, squares and green land formed Wuyi new town's public open space system. It not only offered ecological securities for Wuyi new town, but also supplied the possibility of peoples' high usage of green land through injecting many kinds of urban functions in green land.

(4) The reasonable convergence of urban public service facilities

The urban green public service systems were mainly composed of Bingtuan-level facilities, New town-level facilities and residential facilities. Based on the formation of green infrastructure network, this planning ensured residents can have green space within 500 meters. Meanwhile, it distributed urban public service facilities along main roads and important green corridors to improve the convenience of peoples' daily usage of public service facilities and formed urban green public service facilities network systems.

3.4 Construct a low-impact water environment

Wuyi new town's distribution of vegetation has closing relationship with the water level and water quality of regional underground water. Hence, under limited water resource, it was significant to guide rainwater, enhance the water storage ability of regional soil and improve vegetation's ability to survive.

3.4.1 The building and control of urban rainwater network

(1) Rainwater network

There were no rain drainage facilities in Wuyi new town and the rainwater usually evaporated or flowed to low lands along roads. This design emphasized the artificial guidance of rainwater and claimed to use green land's ability of water content and water storage to amplify rainwater's infiltration time and infiltration areas. Meanwhile, under the basic principle of respecting site's original hydrological direction, this design complied with natural original context and formed drainage direction of main north-south and accessory east-west. It combined the artificial water channels and natural water channels, and enhanced their benefits.

(2) Rainwater control

Forest infiltration and drainage systems: combined with the construction of road protection belts, this planning formed artificial channels to collect rainwater from roads and residential areas by two levels. At the same time, all the forest infiltration and drainage systems were made of natural stones to enhance their ability of infiltration.

The control of rainwater in residential areas: set sunken green land to centralize rainwater and form rain gardens that could infiltrate water and decrease the concentration of initial rainwater's pollutant by the ways of plant purification.

The control of rainwater in public space: built water collection and water infiltration facilities in densely public buildings. In addition, used porous pavement on ground parking lots, sidewalks and new roads to increase rainwater's infiltration rate and reduce runoff coefficient. The treatment of excessive rainwater: firstly, used forest infiltration and drainage systems to absorb parts of excessive rainwater. Then, through organized control and whole-process monitor of excessive rainwater's surface runoff, when faced with extreme rainfall, the traffic measures of restricting access roads will ensure city's water safety.

(3) Rich green land's function

The project used green land's interior function, like grass swale system, detention system and low-lying permeable landscape, to change traditional mode of drainage rainwater and chose more natural ways to manage rainwater.

Firstly, the pebble grass swale systems were used to collect and purify rainwater. Then, based on the network of green ways, grass swale systems were made to form region's ecological basis. Finally, lots of "green pots" were constructed to replace the structure of "single line" through comprehensive detention (small wetlands). In most part of site, it chose traditional gravel basin-shaped depression. In the other urban central park and ecological demonstration garden, it used wetland detention and shallow swamp detention owing to

their higher demand of water and the ecological demonstration effect. Besides, the project also used large amount of low-lying permeable landscape to reduce surface runoff and replenish urban groundwater source.

(2) Efficient urban sewerage system

Current urban sewerage was discharged through original open trench and closed canal and there was no perfect drainage facilities that caused serious pollutant for downstream water and its surrounding soil. According the characteristics of climate and terrain conditions in Wuyi new town, the design emphasized the combination of current terrain and the usage of natural line, and used the method of gravity flow. By doing so, it saved the length of pipes with large diameter and constructed a concise layout of drainage pipes.

(3) Strengthen the reuse of recycle water

According to the types of land use, it determined the main application of recycle water to be the supply of landscape water (water for amusement in urban park) and urban common use water (irrigated water, washing closets of some public buildings, cleaning roads and washing cars). On the sequence of usage, it gave priority to irrigated water, then the supply of landscape water, finally the washing closets.

4. Conclusion: Taking green infrastructure as synthetic solutions for leading the oasis cities' sustainable development

As on kind of complicated work, the theoretical research of green infrastructure integrated landscape ecology, conservation biology, regional planning, geography and many other subjects. In addition, it also followed some basic principles, such as connectivity-emphasized, preservation parallel with development, planning and preservation first, important public investment and some others.

The ecology, security and sustainability of oasis city are emphasized during the planning progress of Wuyi new town from government decision-making, innovative planning conceptions, and technological means to practical approaches. Basing on the core idea of maintaining and enhancing the regional ecological environment mostly, the conception of green infrastructure was presented to guide Wuyi new town's sustainable development. As a city's natural service system, Wuyi new town's green infrastructure aims at exploring a planning and design operation mechanism, and forming the "Wuyi Model" that features rational and efficient oasis city development.

When facing the particular environmental conditions of oasis, the green infrastructure of Wuyi new town turned out to be an effective planning strategy to ease environmental pressure, adjust the ecological benefit of urban vegetation and balance the environmental capacity and city's sustainable development.

The green waterfront of a city - Where are the limits of good planning? Gdansk case

Aleksandra SAS-BOJARSKA

Faculty of Architecture, Gdansk University of Technology, Poland

The paper presents the role of strategic planning of green areas of waterfronts in shaping the image of cities, and the threats to them which may be caused by wrong planning decisions. The case study of city of Gdansk in Poland serves as an example to illustrate both the values and potential of the seashore landscape and the risk of its possible deterioration.

1. Introduction

Strategic planning of green areas plays important role in shaping the image of cities. It requires broad and complex approach to maintain, improve and develop green system as the important element of city structure. Wrong planning decisions, and exceeding the limits of good planning practice, may cause serious threats to green areas and to the city landscape.

The case study of Gdansk's seashore is presented as an example to illustrate the values and potential of fragile landscape, which can be easily destroyed by the inadequate spatial development. Crossing certain frontiers – not only in physical, but also in mental sense – will be presented as a potential threat to the green waterfront of a city.

The goal of the article is to discuss the planning policy of Gdansk related to its green waterfront in the context of sustainable development, and to assess, whether Gdansk meets the challenges of ecocity in this area.

2. The problem of limits

One of the most important questions to pose by urban planner is, whether there are any limits in the world of nearly unlimited technical possibilities, which should not be exceeded during the process of town development? For sure, there are not any longer technological, physiographic or economic limits. We can construct towns or their fragments, using the best available techniques, even in the most difficult circumstances: in the water (Palm Island, Dubai), on the desert (Masdar, Abu Dhabi), or in the middle of nowhere (Las Vegas, USA). In such cases only high costs are the problem, and the risk is taken by developers. Nevertheless, considering all the circumstances and effects, we should admit that some frontiers of planning should not be crossed.

Crossing certain frontiers may lead to uncontrolled urban growth and sprawl, chaotic development, disintegration, accidental mixture of form and functions, esthetic disturbance, ugliness, chaos of architectural banality, and may create ecological barriers, and various **negative environmental impacts** (water, soil and air pollution, flora and ecosystems degradation, vibration, noise disturbance, light pollution...). They all affect the city landscape, because landscape is the manifestation of the changes occurring in various elements of the environment. The landscape, as the synthesis of all elements of the environment, reflects the character and condition of all natural and cultural city elements, including the built environment (Fig. 1).

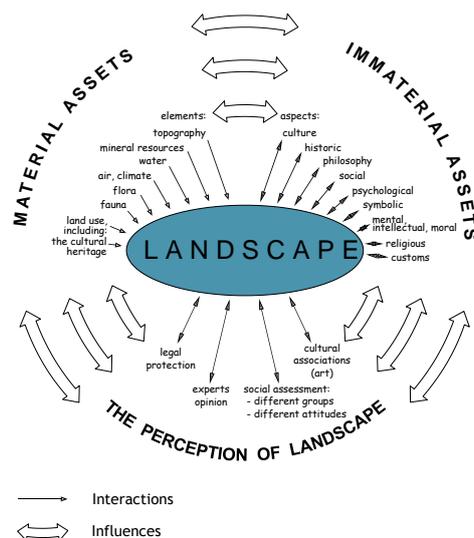

Fig. 1. Landscape – the synthesis of the environment (A. Sas-Bojarska).

The state of the city landscape is a real indicator of sustainable town planning. By protecting the landscape we may improve the quality of life and well-being in cities.

The green areas and city parks play important ecological and social role, so they should become one of the crucial elements of management of metropolitan areas, as well as of governmental and local authorities' policy. It becomes more and more important, especially regarding contemporary trends. The population of towns systematically grows – it is half of world population now, in 2050 it will be 75% [Global City Indicators ...]. So the number of users of city public spaces and green areas, is growing as well. People spend more time in the city because of lifestyle and economic circumstances. The distance to open areas (due to urban sprawl) and the costs of travels (expensive energy) are increasing. At the same time, we predict the growing amount of free time. Therefore, we can observe the growing expectations for the recreation and leisure within the city borders, in attractive green public space, accessible to everyone. They should fulfill the requirements of nowadays social, economic and ecological needs.

The questions to answer in relation to **limits of city growth** should thus be:

- which areas should be excluded from the development, because of environmental and landscape values?
- where and how should we plan the future development?
- to what extent will the city landscape be affected by new development and activities?
- how to predict and mitigate future negative changes?
- what tools should we use for better conservation and protection of the city landscape?
- what is the role of public space in urban planning and how should we plan it?

The answers can help to make better decisions concerning city's sustainable development.

3. Ecocity idea

The fundamental paradigm in decision making process, still seems to be sustainable development. What does it mean in town planning? Complexity of planning (spatial, economic, social and environmental aspects considered together), revitalization, energy saving, environmental protection, public transport system integrated with spatial development, mixed-use development, reuse of space, recycling, considering local circumstances... These and many other aspects are the subject of world-wide discussion as well as of many programs, documents, strategies, rating systems, conferences, competitions and publications.

The document *Ten Principles for Sustainable City Governance*, presented during the world congress of International Federation for Housing and Planning in Copenhagen, Denmark in 2007, presents the need for radical changes, as well as new strategies, models and principles of city governance, supporting sustainable development.

System LEED (Leadership in Energy and Environmental Design) for Neighborhood Development 2009 ND, created by Green Building Council in USA, presents set of environmental standards for the design of buildings, in relation to the neighborhood, surrounding landscape and regional context. It creates guidelines concerning location, design and construction of new developments (residential, commercial, mixed use), related to design and decision-making stage. System stresses the role of local circumstances in defining pro-ecological solutions. System BREEAM (Building Research Establishment's Environmental Assessment Method), created by Building Research Establishment in UK, implemented in 2009, is the "sustainable assessment framework" based on the Regional Sustainability Checklist. The aim of this independent method, used to describe the sustainability of a building, is the assessment of the overall sustainability of a future development (individual buildings, multi-residential and mixed-use developments), at the early master planning stage. One of the sections outlined in the Regional Sustainability Checklist is the ecology, related to ecological enhancement within and around the development, maintaining green corridors and landscaping. BREEAM supports planning system, e.g. allowing efficient use of resources and increasing ecological consciousness.

There are many competitions related to ecological design all over the world. The results of one of them, related to the ecological city of the future, have been described in the book *Self Sufficient City. Envisioning the habitat of the future*, edited in 2010 by the Institute for Advanced Architecture of Catalonia. More than 700 participants from 116 countries presented solutions for implementing the idea of sustainable development. The problem of creation of public spaces as the areas "of freedom and contacts" was stressed as one of most important.

Many authors present the idea of sustainability. Douglas Farr presents the possibilities of pro-ecological design in many scales and aspects, giving examples from all over the world (Farr 2008). He stresses among other factors the need to balance human needs and nature, maintaining ecological corridors, providing walking access to green areas. Herbert Girardet stresses the dependence of man on the environment, and the necessity of lifestyle changes to minimize environmental threats (Girardet 2004). He presents the possibilities of eco-city creation as a challenge for contemporary world, and the socio-economic profits. In the book *Sustainable urban design. Perspectives and examples* (2005) many ways and trends of environmental design are presented, as well as examples from Holland. The need for urban design improvement, as a tool for implementing sustainable development, and the need for improving urban spaces and open spaces have been stressed. The ecological, social and economic aspects, as well as local identity and public participation in contemporary urban planning are underlined. Martin Treberspurg describes the famous example of Linz city in Austria, where the existing city has been extended by building new ecological, densely built district for 10 thousand of inhabitants (Treberspurg 2008). Complexity of design, construction and operation was the base of the success of this model city, combining all pro-ecological features, including public green areas for sport and recreation.

Many conferences in recent years have been related to the city sustainable development: V session of World Urban Forum, Rio de Janeiro, Brazil, 2010 (*The Right to the City: Bridging the Urban Divide*); 46 International Congress ISoCaRP, Nairobi, Kenya, 2010 (*Sustainable City/Developing World*); Expo 2010, Shanghai, China (*Better City, Better Life*); Ecocity World Summit 2011, IX International Ecocity Conference, Montreal, Canada, 2011 (*People. Ecology. Urbanity. Moving Towards Ecocities*); 24. World Congress of Architecture, UIA 2011, Tokyo, Japan (*DESIGN 2050, Environment, Culture and Life*); VI session of World Urban Forum, Napoli, Italia, 2012 (*The Urban Future and the prosperity of cities. Dialog, Network, Exhibit at the World's Premiere Conference on Cities*).

The common goal of all these activities is to help the authorities, developers and designers to implement the ecocity idea in practice. Presented approaches do not reflect all the possibilities related to ecocity, but they give some idea of direction of changes. They all relate directly, or indirectly, to the green areas in the city, and they all stress the need for environmental protection. The result of these efforts will be reflected in the townscape. The idea of ecocity will evaluate and change in relation to environmental, spatial and economic circumstances, as well as the social needs and expectations. One thing we can predict for sure – people will always need green public spaces in close walking distance from their housing estates, and they will always admire attractive city landscape.

4. Gdansk: ecocity?

Gdansk is a thousand-year old city (455 thousand inhabitants) located at the northern coast of Poland, at the seashore. Together with Gdynia and Sopot it creates Gdansk Agglomeration (Fig 2).

Fig. 2. Europe, Poland, Gdansk Agglomeration (A. Sas-Bojarska)

It is the only one of three polish biggest harbours located just at the seashore, not – as the others – at the rivers estuaries. Gdansk reach cultural heritage, complicated history and symbolic events are known worldwide. It is considered as the World Capital of Amber. Here the Second World War started in 1939. The Solidarity movement initiated great political changes, breaking the communistic system in Eastern Europe. Over half a million of tourists visit it every year, not only because of these tremendous facts, but also due to the amazing Gdansk landscape: 23 km of wide sandy beaches from the east and forested hills surrounding the city from the west, the port cranes, sea and the vessels, and a lot of unique historical monuments (Fig 3). They all are unique not only in Poland attractions.

Fig. 3. Some attractions of Gdansk Agglomeration waterfront. The city is almost invisible from the seashore! (Photo A. Sas-Bojarska)

Planning documents have been established to protect these valuable areas. Obligatory documents at national level are e.g.: *Polityka Ekologiczna Państwa* (2009) [translations of all titles of polish documents are attached in the References]; at voivodship level: *Plan zagospodarowania przestrzennego województwa, Program ochrony środowiska dla województwa pomorskiego* (2010); at local level: *Studium uwarunkowań i kierunków zagospodarowania przestrzennego gminy* (2007) and local land use plans. The supportive documents, established especially for Gdansk region, are e.g.: *Pomorskie Studia Regionalne: Studia przyrodniczo-krajobrazowe województwa pomorskiego* (2006), and *Studia obszarów problemowych województwa pomorskiego* (2004), *Studium Lokalizacji Obiektów Wysokościowych - SLOW* (2008), *Program Ochrony Środowiska dla Miasta Gdańska 2011 z uwzględnieniem perspektywy 2012-2014* (2009); *Studium koncepcji regulacji estetyki miasta - Raport z badań przeprowadzonych wśród przedstawicieli Rad Dzielnic i Rad Osiedli w Gdańsku* (2012); *Pas Nadmorski Zachodni. Studium Funkcjonalno-Przestrzenne* (2010).

One of the main goals of *Polityka Ekologiczna Państwa* is the improvement of the state of the environment, implementing sustainable development, and the protection of natural resources and the biodiversity. Main goals have been formulated in *Program Ochrony Środowiska dla województwa pomorskiego*, including: the improvement of the state of the environment and the ecological safety, enhancing the environmental management and improving the ecological consciousness, the protection of natural heritage and rational use of natural resources. The *Program Ochrony Środowiska dla Miasta Gdańska...* established main goals and challenges, including: elimination of noise disturbance, increasing the ecological consciousness, the protection of natural and landscape diversity and stopping the processes of its degradation. The protection and restoration of valuable natural resources, the limitation of development on the green areas, maintaining city green areas as open spaces, shaping the ecological system of natural areas using land use plans, improving the access to natural resources, including the creation and modernization of touristic infrastructure and the protection of valuable and fragile resources, have been especially stressed. In other documents similar goals have been presented.

One could say, that having such goals and guidelines in so many higher level documents, the environmental protection can be implemented without any doubts or problems. However the practice shows quite the opposite situation, especially at the local level.

Spatial order requires taking into account the specific features of Gdansk Agglomeration structure, like its spatial, technical, social and cultural circumstances, as well as its green area system and the landscape (Baranowski 2001).

But in practice these specific features are often being undervalued, ignored, or they have no chance in the comparison with the investment pressure.

Main reason, observed in whole Poland, is the low ecological consciousness not only of the developers, but also of the decision makers and the society, as well as the complicated, not stabile and not effective planning system.

There is a big gap between two main planning documents at local level: *Studium uwarunkowań ...* (scale 1:25000), which plays strategic role for the municipality, and land use plan (scale 1:1000), a legal instrument for the investment procedures. Moreover, the public participation is often treated as inconvenient duty, therefore the society and NGO's, regarded as opponents who disturb the authorities and hinder the process of decision making, are sometimes not fully informed. Public participation in such cases only pretends to be objective and has no influence on decisions, which were already undertaken before. Moreover, the landscape is being considered as less important element of the environment and of city's planning policy, as value which can't be measured. It is not protected sufficiently, especially if it is not formally declared as the area of outstanding natural or cultural values. All these shortcomings are being observed also in Gdansk, thus influencing the image of the city.

Baranowski argues that contemporary situation in Gdansk may be characterized as the process of accidental, disintegrated activities, aiming to gain local selective effects, with no respect to their influence on the whole system. Environmental costs of new developments are being usually ignored (Baranowski 2001). *Studium uwarunkowań...* enables to implement incoherent development.

The SLOW, prepared by the Gdansk Development Office, is not an obligatory document. It seemed to be the most adequate document related to city landscape protection, but it has been negatively evaluated by many professionals. Baranowski says that the content of this document is based on logical mistake. The study defines the areas recommended, indicated, or excluded from construction of high-rise buildings, but it does not answer the fundamental question: whether the high-rise buildings should be built in Gdansk, and what circumstances should be taken into account. In architecture and urban design, the question “how” (“how and where to built?”), should follow the fundamental question “what to built and what for?” and “what kind of function and structure is recommended due to socio-cultural, environmental, economic, spatial and technical circumstances?” These fundamental questions should be the subject of open public debate, with the participation of NGO’s (Baranowski 2009).

Gdansk coastal belt, the natural green “waterfront” of the city, may serve as an example of defective decision making process that allows for chaotic development.

5. Gdansk seashore case

One of the most important elements of Gdansk landscape is its seashore, very valuable because of environmental, landscape and cultural values. Its development and functioning should take advantage of its unique location and features.

The undeveloped, semi-natural, multi-scale green areas, sandy beaches and dunes between Gdansk and Sopot, form part of Gdansk ecological system. It borders the Protected Area *Natura 2000* of Zatoka Pucka Bay, part of the European System of Protected Areas (Fig. 4).

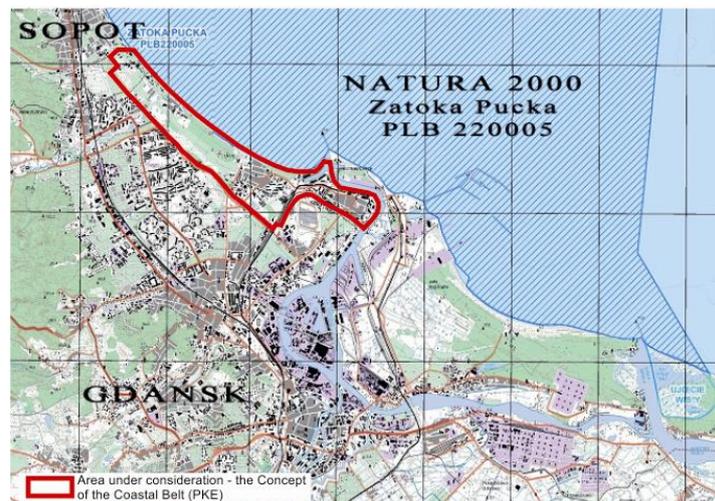

Fig. 4. The area “Natura 2000”, <http://natura2000.mos.gov.pl>, and the Gdansk Coastal Belt.

It is a popular place of recreation for inhabitants of Gdansk Agglomeration and for tourists. At the same time – as very attractive investment area – it is exposed to strong investment pressure and potentially chaotic and environmentally harmful development. Therefore, this area is now a subject of conflict and public debate, followed by many studies, expertises, meetings and workshops.

Due to cultural and landscape role of the waterfronts - shaping waterfront identity of the town, they become the most attractive areas from the economic, social and cultural point of view.

Waterfronts are the exceptional examples of rare spatial values because their dimensions are limited.

They are very attractive to many users with different, often conflicting goals. Therefore, they are often the subject of fragmentation (Baranowski 2001).

Such a situation took place at the Gdansk seashore area. The history of conflict starts in the 1980's, the time of serious economic crisis in Poland. The protection zone of underground water intake at the seashore belt has been transformed by the inhabitants of Gdansk into illegal allotments. After 20 years 800 allotments have been eliminated by the authorities of Gdansk (with some protests). Part of the area was transformed into the Reagan's Park, the biggest park in Gdansk. It became a very popular recreation area for thousands of inhabitants. In 2006, it was awarded as the best public space in Gdansk Voivodship. The rest of the undeveloped area located in coastal belt became very attractive for the investors.

In the meantime, the authorities of Gdansk changed attitude to the policy of coastal belt development. The new *Studium uwarunkowań...* and the SLOW, enabled new development. The policy of privatisation of these green open areas – which should remain public property – resulted in new developments. Two gated communities (gated communities are the subject of criticism for example by BREEAM) and accidental buildings have been built in this area (legally!), causing the landscape fragmentation and imposing physical barriers (Fig. 5). They created a precedence, threatening future decisions. We should stress, that legal building approvals do not comply with the ideas of harmony and sustainable development defined in the planning documents of higher level.

Fig. 5. Gated communities in the seashore area are the examples of dividing not only the space, but also society. They cause the fragmentation of unique public space – common value (Photo: A. Sas-Bojarska).

The *Pas Nadmorski Zachodni...* prepared by the Gdansk Development Office, seems rather to be the catalogue of different concepts, than coherent vision of sustainable development and real guidelines for land use plans. The thesis of this study supports the plans of developers (for example housing estates are presented as a factor increasing touristic attractiveness). The strong opposition of Gdansk inhabitants against high-rise buildings (authors noticed it!) was described as a “problem” of a costal belt, not as the opinion of its users which should be taken into account. Another problem was defined as a conflict with City Historic Preservation Department, not as a real threat to historical objects, which may be caused by investment plans. It shows clearly the attitude of Gdansk Development Office to this area. General guidances presented as a base of the concept pretend to be sustainable,

but in fact they have nothing to do with the final plan, creating real possibilities to build up big fragments of open area of coastal belt.

Therefore new land use plans related to this area (aligned with *Studium uwarunkowań...* and SLOW), accepted by Gdansk authorities, allow for construction of housing estates, leisure and sport centers, multilevel parking facilities and high-rise buildings (hotels, in some parts with no limits of height!) in accidental locations (Fig. 6).

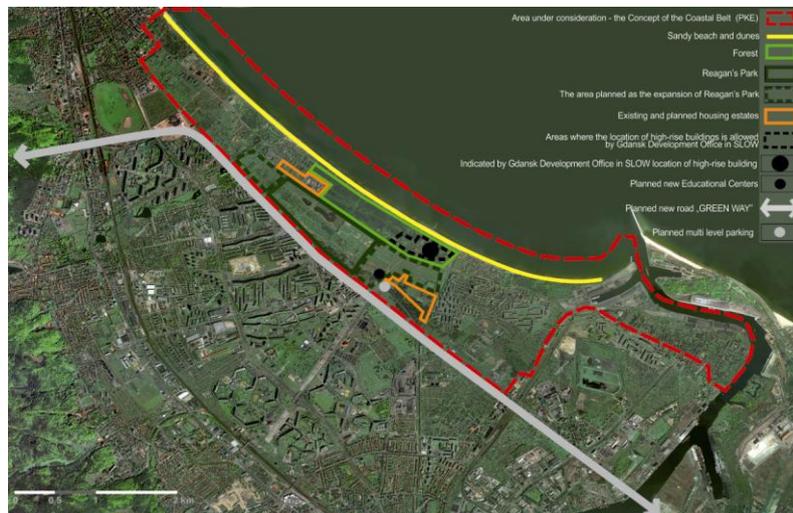

Fig. 6. The Coastal Belt - existing and planned gated communities and planned high rise buildings (A. Sas-Bojarska).

New development may cause serious environmental degradation, e.g. underground water changes, flora degradation, negative landscape impacts, or high traffic growth causing noise and air pollution. But the most serious threat seems to be the fragmentation of open land area, because its dimensions and natural character are the greatest values, especially regarding the close proximity of big housing estates. Therefore, city plans caused serious protests and started public debate on the future of Gdansk seashore.

Polish Ecological Club (PKE) – non-governmental, non-profit organization (the oldest in Poland) was the first institution, which highlighted potential threats and proposed solutions contrary to technocratic vision of city authorities and contrary to commercialization of this unique space. To protect Gdansk seashore, *Spółeczna Koncepcja Zagospodarowania Pasa Nadmorskiego (The Concept of the Coastal Belt)* was prepared in 2010 by PKE and the team of experts. It was the first such a complex initiative undertaken by a non-profit organization in Poland. It was a kind of manifestation against ignoring of public opinion by local authorities (we should remember, that improving public participation and ecological consciousness in decision making process, and supporting initiatives of NGO's and local inhabitants aiming to improve the state of the environment, are still crucial tasks in the *Program for Environmental Protection for Gdansk City!*).

The *Concept of the Coastal Belt* contains natural inventory, social survey, analysis of city plans and urban study (analysis, evaluation, concept and guidelines). During the nature inventory many interesting and protected species have been discovered. The social survey demonstrated that Gdansk inhabitants wish that the coastal belt – as a common value – should remain a public space used for recreational purposes.

The *Concept...* fulfils the guidance concerning the noise disturbance reduction, presented in the *Program Ochrony Środowiska dla Miasta Gdańska*. Coastal belt is the largest area free from noise in walking distance from neighboring big housing estates from 60's and 70's, where thousands of people live (Fig. 7).

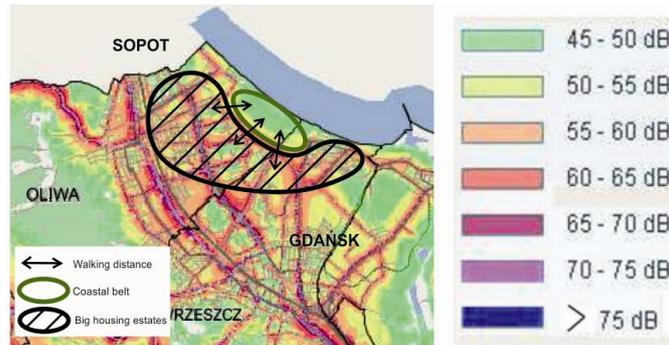

Fig. 7. The acoustic map of Gdansk (road noise) - existing state [Program Ochrony Środowiska dla Miasta Gdańska], the coastal belt and big houses estates (A. Sas-Bojarska).

General rules and guidelines, presented in the *Concept...*, pursue the long tradition of public parks in Gdansk - the first public park in Europe was created in Gdansk in 1832 -1837 (!) (Rozmarynowska 2011). Consequently, the *Concept...* continues the idea of the expansion of Reagan’s Park. The aim of *Concept...* was to sustain the original quality of environment, culture and landscape and to stop the negative changes caused by planned development. Wherever it was possible it included the concept established in the *Studium Uwarunkowań...* However, alternative solutions and important changes have been proposed, to create the “City Garden” at the coastal belt (Fig. 8). For example, areas exempt from new development were indicated within green corridors which are fundamental to maintain the connections between important elements of city ecosystem (coastal belt, Natura 2000, forests).

Fig. 8. The overall Concept of Coastal Belt Development (PKE), www.pke.gdansk.pl

The *Concept...* has been publicly discussed with Gdansk inhabitants, experts and other non-profit organizations during many meetings, symposiums, conferences and public presentations. It has been presented a few times by PKE, with many remarks concerning city plans, to the Authorities of Gdansk and other official institutions. The remarks sought to prohibit the development in some areas of coastal belt, to minimize the height of buildings in other areas, and to incorporate the idea of “City Garden” into the planning documents. Over 2000 inhabitants of Gdansk signed the protest against high-rise buildings in coastal belt in 2011/12. And this was not the casus of NIMBY, because there are no housing estates near the locations indicated in SLOW. The civic protest concerned the availability of public space. But all suggestions presented by PKE have been rejected with no argumentation.

External experts evaluated the *Concept...* as innovative, successful voice in public debate, presenting the vision of sustainable development articulated as real public initiative. They stressed that it shows not only the alternative vision of development of this area, but also the alternative way of thinking about the spatial policy, contrary to city planners' way of thinking. The proposal to create great city garden has been evaluated as fulfilling highest European standards. According to their opinion it should therefore be implemented, regardless of formal difficulties and shortcomings of Polish planning system and economic problems.

The same area was the subject of international workshop *Towards Eco-city. Gdansk seashore area development*, organized at Gdansk University of Technology in 2011, and the subject of students projects at the Faculty of Architecture, Gdansk University of Technology. The *Concept...* served students as the source of information. Students' projects were the continuation of the *Concept...* Students identified the existing environmental, social, spatial and transport conditions and threats, assessed the values and potential of the area, created the vision of sustainable development of the whole area and designed some urban / architectural / landscape objects. They presented many ideas and solutions, stressing the values of Gdansk seashore, and maintaining the continuity of green area, as accessible, well organized and attractive public space (Fig. 9). Therefore they showed the alternative possibilities to create the new image of Gdansk ecocity. Unfortunately, authorities are not interested in such solutions for this area.

Fig. 9 The international workshop *Towards Eco-city*, conducted by the author of the article, Gdansk, 2011 (Photo: A. Sas-Bojarska, students).

6. The outcomes of studies

The discussion of the planning policy of Gdansk should relate, among other topics, to its green waterfront.

The assessment of the proposal prepared by Polish Ecological Club, concerning the alternative development of green waterfront, has been compared to city plans. Theoretical and field studies, comparisons with other case studies, and outcomes from the international workshop conducted by the author, as well as outcomes from student's projects, were the basis to formulate the findings. Gdansk does not fulfill the requirements of ecocity, regarding the policy of its seashore development. Landscape values are not protected sufficiently and may be easily destroyed.

The planning procedures cannot respond only to the needs of those who can defend their rights but also should cater for the needs of those who are voiceless: e.g. urban poor, people with health problems and disabilities, minors and the elderly. The open green areas belong to everybody and any laws allowing any form of discrimination and exclusion (like fencing public open green areas and creating gated communities) are not good examples for cities of tomorrow. They are rather dead end ideas and therefore can be labeled as declining model of urbanization, as we can observe in Gdansk's seashore.

When open land is becoming the subject of development, the fundamental question arises: should we destroy the environment and repair it after years? Maybe it is better to take advantage of the potential of a place and develop it respecting the existing values, and to build up other areas, which are not so attractive, or even degraded? Rich cities sometimes create green areas even on contaminated lands (Barcelona, Berlin, Montreal, Jokohama ...). In this context the policy of Gdansk authorities allowing for accidental development and fragmentation of the seashore area of high environmental and landscape values, seems to be a paradox. The best thing to do with this semi-natural area, is to maintain its character and natural state and preserve it for recreation and sport purposes. It has a potential to become unique in Europe, huge City Garden. Unfortunately, it undergoes negative changes, depreciating values and quality of this beautiful seashore area.

But still there is a chance to protect this unique area. We should look for evolving models. Presented study case proves that there is a need of strategic planning of city landscape, at the level of Gdansk Agglomeration. The landscape studies should be connected with the processes of town planning, especially in the context of rapid urbanization, technological and social changes, and increasing consumption and pressure on the environment. Special tools and methods should be implemented, like Environmental/Landscape Impact Assessment. The growing knowledge on potential environmental consequences of different activities is a warning, showing how serious may be crossing the frontiers of planning. It may in consequence destroy nonrenewable resources, and cause irreversible threats to environmental and landscape values. Values, which often decide about the quality of life in the city. Some of the impacts are irreversible and permanent, while some may be mitigated, although it is usually time consuming and costly. It is better to avoid potentially threatening impacts altogether, than to repair landscape changes. The crucial conclusion relates to the duty of predicting environmental and landscape threats related to the development, caused by wrong decisions. There is the need of reinterpreting the approaches related to city landscape, especially to enhance or restore the green and recreation areas within the cities. Therefore there is a demand to consider the limits of good planning.

7. The lesson for future - towards a better city landscape

European Landscape Convention stresses, that *"the landscape contributes to the formation of local cultures and that it is a basic component of the European natural and cultural heritage, contributing to human well-being and consolidation of the European identity"*. Landscape plays an important role in the cultural, ecological, environmental, social and economic fields. Its protection and management can create new jobs. It is a key element of individual and social well-being. On the other hand, any development may accelerate the negative transformation of landscapes. Therefore *"its protection, management and planning entail rights and responsibilities for everyone"*.

The problems of green area degradation urge to define new approach to city development and shaping its landscape. The public debates indicate, that the beauty of landscape becomes important for city inhabitants and is being recognized as a factor influencing the quality of life and the future of the city. It becomes significant in city promotion. Well maintained public space becomes the factor of social integration, counteracting the social exclusion (like famous beaches Ipanema and Copacabana in Rio De Janeiro, accessible to everyone).

The awareness is growing that green public space should be an important factor in city planning strategy and policy. Only long-term planning of city landscape, integrated with urban planning (we may call it strategic landscape planning), may be effective. The possibilities and ways of strategic landscape planning should be individually recognized in every case, with the aim to take advantage of city potential, based on its location, history, cultural and natural heritage, identity and tradition.

Each city has its own conditions and ways of sustainable development. For many cities it is the unique landscape, which should be protected and enhanced as the individual ecocity indicator. Landscape may demonstrate the threats to the city environment, as well as its good condition. Beautiful landscapes reflect a healthy, clean environment and spatial harmony. Landscape preservation and improvement can therefore enhance quality of life, and promotes the idea of ecocities.

The thesis presented in this article may support good practice in urban planning, especially in relation to landscape protection and shaping. The role of public participation in decision-making, and the need of reinterpreting the approaches related to city landscape were stressed. It may influence decisions made by local authorities, concerning the green areas in city planning strategy, to value and better protect what already exists.

“The Future is Urban” Challenge of Sustainable Urban Development in the Caribbean: The Search for Sustainable Urban Forms

Stacey THOMAS, the University of the West Indies (UWI), St. Augustine, Trinidad.

Abstract

The purpose of this paper is to provide an overview of urbanisation in the Caribbean and to determine a way forward in achieving sustainable urban development. The Caribbean has had a long urban history, yet urban management has not played a significant role in guiding development. Limited resources make future planning imperative in the region and urban form is being explored as an option. Increasing urban populations coupled with the peculiarities of the Caribbean urbanisation process, leave governments and policy makers grappling with how to manage and guide future urban development in a sustainable manner. Will urban form either through compaction or decentralisation be the way forward?

Keywords: sustainable urbanisation, Caribbean, urban form, development

1.0 Introduction

Current statistics by the United Nations (UN), show that the Caribbean is one of the most highly urbanised regions in the world, with 66.2 percent of its population living in urban settlements (UN, 2011) – a proportion almost twice as high as those for Africa and Asia (39%). Yet, this data belies the popular representation of Caribbean life, a fact which may give insight into the low priority given to urban specific policies. With the exception of the larger cities - for example Port of Spain and Kingston – Caribbean urban environments do not discernibly represent severe environmental degradation (Heileman et al., 2003). Since urbanization and urban planning are not viewed as crucial issues, the consequence has been ineffective land use, culminating in the avoidable loss of valuable lands which could be used for other pressing environmental and social interventions (UNEP, 2003). Prior land use decisions, coupled with the continued growth of urban populations, have meant that environmentally sensitive and hazard-prone areas such as mangroves, hillsides and flood plains are increasingly being utilised for development.

Understanding the problems related to urbanisation in the region however, is a less complicated enterprise than finding solutions. Historical, physical and contemporary forces - which have shaped Caribbean urban development - only add to the complexities of managing the urban sphere. While several publications have addressed the urban issues of Latin America and the Caribbean (LAC) collectively (e.g. UN-Habitat, 2009, 2012), according to Potter (1989), literature covering the related issues of urbanisation, territorial planning and development options specific to the Caribbean region is limited. As Portes et al. (1997) state, generalisations about urbanisation in LAC have been mainly based on the experience of the larger countries and applied by extension to smaller ones. Hence, urban trends and projections for the LAC aggregate will naturally mask considerable regional diversity (e.g. Beall et al. 2010). Although common features can be observed such as urban primacy and large urban populations, variations will be reflected in both the *nature of* and *response to* urbanisation and its problems (Drakakis-Smith, 1995). The negative impact of non-indigenous solutions is highlighted in the document by UN-Habitat (2002) 'Sustainable Urbanisation: Bridging the green and brown agenda', which states:

"..... the current situation in developing countries has its roots in a history of urban development which has frequently been characterised by inappropriate policy. Early attempts in replicating the approaches and solutions developed by the urban agenda in developed countries were ineffective at best and counter-productive at worst"

Caution must therefore be exercised before policies that were created *by* and *for* other regions are adopted. As part of the effort to address urban problems, the region has already been looking to internationally formulated models. One such model is that of the 'compact city'. Internationally, the compact city has almost become synonymous with sustainable urbanisation, yet the arguments raised by the imperative of sustainable development in *developed* versus *developing* countries highlights the issue of transferability. This challenges the viability of the compact city model in achieving the goals of sustainability in the Caribbean context. The paper first addresses the meaning of sustainable urbanisation and the ongoing debate concerning compact city form as a response mechanism, drawing parallels between the sustainability goals in cities of the developed nations versus the Caribbean.

2.0. Sustainable Development and Sustainable Urbanisation

Sustainable urbanisation principles find their genesis in the concept of sustainable development, a term first popularised by the Brundtland Report. The report defined sustainable development as ".....development that meets the needs of the present without compromising the ability of future generations to meet their own needs" (WCED, 1987). While most agreed that sustainable development was a noble and necessary objective, it was the source of much global debate about the sustainability of the world's environment and economy. Today we understand sustainable development to be the convergence of the goals of environmental preservation, economic growth and social equity; however, the concept still remains elusive. The constraints and contradictions of the premise become quite apparent when attempting to move from theory to practice (Mitlin and Satterthwaite, 1996). Some of the main issues include (1) the continued dominance of economic growth over environment and society (Giddings et al., 2002), (2) the significance of individual responsibility i.e. the impact of lifestyle, consumption and behaviour (Spaargaren et al, 2000), (3) equating 'development' with economic growth (Purvis et al, 2013), (4) avoidance of the questions of power, exploitation and even redistribution (Robinson et al., 2004). While we could go on, the goal here is not to enter into the debate on sustainable development but to highlight the difficulties in operationalising the concept. As we will show, much of the contention surrounding sustainable development has pervaded the discussion on sustainable urbanisation.

2.1. Urban Form and Sustainability

Given the premise that there is a strong correlation between land use characteristics and consumption, it is expected that urban form would become a focus for urban sustainability. As with the discourse on sustainable development, consensus on the need to promote sustainable cities is underlain by significant differences regarding what urban sustainability means and how to promote it. Central to the debate is how cities should be developed in the future, and what effects, if any, does form have on resource use and social and economic sustainability. The relationship between form and sustainability is therefore a contentious one. According to Brehney in Jenks (1996), the scope of the debate is heavily polarised between those who favour decentralisation and those who believe in the virtues of high density. The compact city is viewed as the antithesis to the current 'sprawling' development patterns which are deemed unsustainable. The vast literature on urban form however, shows the debate is tending to favour

heavily one solution i.e. the compact city, though questions as to how compact is sustainable and how sustainable is compact have yet to be answered.

Compaction vs. Sprawl

Urban sprawl as defined by Nelson et al. (1995) is: "...low density, mismanaged, and uncoordinated single use development that does not provide for a functional mix of uses and/or is not functionally related to surrounding land use". This type of development tends to be characterised by automobile dependence, excessive land consumption, congestion, socioeconomic segregation due to exclusionary housing markets and significant infrastructure provision costs (see Carruthers and Ulfarsson, 2002; Burchell and Mukhrji, 2003; Sturm and Cohen, 2004). Bruegmann (2006) however, contends that sprawl is not an "aberration in history but the norm", stating that throughout history high density was almost always considered "the great urban evil". This reveals what Neuman (2005) refers to as the 'paradox' between urban desirability (compaction) and suburban liveability (sprawl). In many cases, sprawl has been encouraged with support from public financing of infrastructure to service the developments of mortgage subsidies to promote homeownership. The attractiveness of 'suburbia' is therefore undeniable and one of the main criticisms lay against supporters of compact city development with regards to quality of life.

According to Scheurer (2001), "the compact city paradigm seems strangely out of tune with the realities and the momentum of everyday life within sprawl". It is a habitat of adequate extent to be of central importance for the future of cities and though condemned by compaction theorists, it is unlikely that sprawl will cease to exist. So strong is the draw of suburbia that according to Blowers in Breheny (1992) "people will be prepared to put up with a great deal more congestion, pollution and general environmental deterioration, so long as they continue to enjoy the freedom and comforts of modern consumerist society". This has led many to believe that a compromise position is required which balances the benefits of urban desirability with suburban liveability (Breheny in Jenks, 1996).

But what, if any, are the benefits offered by more compact models of development? While the compact city has practically become the synonym for the sustainable city, what exactly is it? Despite the terms common usage, there is little by way of a working definition, making differentiations between what *is* and what *is not* compact urban form difficult. Density, though one of the main features, is quite insufficient in describing the compact city (Burton, 2002). Further refinement of the concept has been advanced through practice and research (e.g. Elkin et al., 1991; Goodchild, 1994; Williams et al., 1996; Burton, 2000) to include characteristics such as mixture of land uses, residential density and transport infrastructure. Though not exhaustive, Figure 1 lists some of the characteristics required for compact city development. Essentially this type of development is intended to: be more energy efficient - particularly in the area of transport, conserve land resources, reduce infrastructure costs, reduce greenhouse gas emissions and improve the general quality of life. Conceptually, compact cities make sense, if 'sprawl' is bad then 'compact' must be good? The ideal has given way to reality in terms of whether intensification can actually deliver on its promises of a more sustainable urban future.

Many of the claims made in support of compaction have been proven through practice, to fall short of expectations. Testing the relationship between certain indicators of urban form to selected environmental variables has been inconsistent and oftentimes contradictory (Crane, 2000; Hall, 2001). This has led several researchers to argue that associations previously assumed to exist between urban form and a number of sustainability benefits were either unsubstantiated by fact or dependent on a range of intervening variables – some of which were far more significant than urban form (Williams et al., 2000). For example, the scientific case for

Compact city characteristics.

1. High residential and employment densities
2. Mixture of land uses
3. Fine grain of land uses (proximity of varied uses and small relative size of land parcels)
4. Increased social and economic interactions
5. Contiguous development (some parcels or structures may be vacant or abandoned or surface parking)
6. Contained urban development, demarcated by legible limits
7. Urban infrastructure, especially sewerage and water mains
8. Multimodal transportation
9. High degrees of accessibility: local/regional
10. High degrees of street connectivity (internal/external), including sidewalks and bicycle lanes
11. High degree of impervious surface coverage
12. Low open-space ratio
13. Unitary control of planning of land development, or closely coordinated control
14. Sufficient government fiscal capacity to finance urban facilities and infrastructure

Figure 1: Compact City Characteristics

Source: Newman, 2005

compact cities has been centred on the supposedly lower levels of travel and hence lower levels of fuel consumption and emissions associated with higher densities. Yet, Hall (2001) propose that travel had a much stronger relationship to fuel prices and income than density.

The fatal flaw is the reductionist view that compact city proponents have of urban areas. As Durack (2001) asserts "...science has discovered that we cannot understand the world by reducing it to its constituent parts and examining the laws under which these parts behave". Despite the challenges concerning 'burden of proof' the main concern is whether or not the 'compact city' is actually sustainable. According to Newman (2005), "preliminary evidence testing the compact city with regard to sustainability suggests that the relationship can be negatively correlated, weakly

related, or correlated in limited ways'. This idea of sustainability and the compact city is explored by Burton (2000) and Hofstad (2012). Burton (2000), in a review of twenty five English cities, found that social equity – as measured by forty four indicators – had a mostly negative relation with compactness. Hofstad (2012) on the other hand, assessed the economic, environmental and social goals linked to densification and mixed use development in four Scandinavian countries. Through this research, it was evident that *economic* considerations "enjoyed the more favourable position", while social and environmental goals had a low level of impact on real planning outcomes.

Based on the ongoing discussion, claims for the compact city are neither self evident nor as yet convincing as concluded by Welbank in Jenks (1996). Nevertheless, these critiques of the compact city model do not advocate for a return or continuation of sprawl, but shows that "all hope of achieving sustainable urban form should not be pinned on just one option" (Williams et al., 2000). That being said, Thomas and Cousins (2000) propose that *any* future urban development form will need to address the issues of: accommodating growth, energy consumption, accessibility, economic viability, ecological integration and protection, political achievability, popular aspirations of quality of life and the burden of proof of success. Any changes in the built-environment are a major, costly undertaking and should not be performed without a deeper assessment of the forces driving changes at the urban level.

3.0. The Caribbean Urban Experience

Contrary to the stereotypical representations of the Caribbean with their miles of white sandy beaches and warm tropical breezes, the region has had a long and distinctive urban history. Since the 1950s the level of urbanisation in the Caribbean was already exceptionally high, with 35 percent of its population living in urban areas. By 1970, the figure rose to 45.6 percent and as of 2010 urban population has increased significantly to 67 percent (UN, 2011). Interestingly, Table 1 shows that Caribbean urbanisation levels have exceeded those of the world in aggregate, keeping pace with the More Developed Regions (MDR) as well.

Table 1. Comparative levels of urbanisation in the Caribbean, 1950 - 2011

Year	Total population of the Caribbean living in town and cities (thousands)	Total MDR population living in town and cities (thousands)	Percentage of total population living in urban areas		
			Caribbean	World	MDR
1950	6 301	441 845	36.9	29.4	54.5
1970	11 537	670 573	45.6	36.6	66.6
2011	28 106	964 240	67.0	52.1	77.7

Source: UN World Urbanisation Prospects (2011)

Despite these surprising statistics, Caribbean cities and their *process* of urbanisation are considered an underexposed phenomenon (Jaffe, 2008). Very little has been published in relation to issues of urbanisation, territorial planning and development options specific to the Caribbean region (Potter, 1989). The study of Caribbean cities is essentially a study in the effects of globalisation, regarding its economy, polity and society. According to Mintz (1971), as the first part of the non-Western world to endure an era of intensive Westernising activity, the Caribbean became 'modern' in some ways even before Europe itself.

3.1. The 'Urban Bias'

The urbanised nature of Caribbean nations has its genesis in the mercantile and colonial eras, where the form and function of Caribbean cities, articulated in their spatial, social and economic features, are rooted in that history. This legacy is apparent in the form of dependent urbanisation, the realities of which are clearly expressed in the highly skewed and spatially uneven settlement patterns found throughout the region (Potter, 1989). Colonial settlements normally proceeded through one – or in some instances a limited number of - coastal gateways. These port cities were not created as centres of industrial development but primarily served as points of administrative, commercial, political control and points of extraction. However, the global flows and colonial powers that shaped the Caribbean in the past are continued in the form of present-day dependencies. The post independence era saw the newly independent territories seeking prosperity and ultimately "equating the state of development with the process of urbanisation and industrialisation" (Potter, 1989). Economic development in sectors such as tourism, manufacturing, service and industry resulted in further intensification of infrastructure expansion within cities and coastal areas. This in turn makes the capital city even more attractive for future growth. As Potter (1989) states "...the geographic pull of accessible and previously well developed sites with good infrastructural facilities for industry and of safe scenic beaches with regard to tourism, have served to skew recent developments to those very same coastal locations that centuries earlier had first attracted mercantile capital".

The pull of the city is evident in the proliferation of urban primacy throughout the region. Urban primacy – the percentage or share of national population living in the largest city or town - is a characteristic of urbanisation in the Caribbean (see Fig. 2). In the smaller Caribbean island nations this could not be otherwise, because their size prevents the existence of many secondary cities and, hence, the development of a sizeable urban system (Portes et al., 1997). In more recent times, the physical expansion of cities and economic development have led to the emergence of new urban expressions across the region and established phenomena such as conurbations, metropolitan areas, and urban development corridors for example POS in Trinidad, Bridgetown in Barbados, Castries in St. Lucia and New Kingston in Jamaica (Ransawak et al., 2005)

Typically the Caribbean primate city tends to attract to itself a disproportionately large share of the island's wealth, political power, professional talent, skilled labour, health, education, and other social services. Reinforcing this primacy is the policies of past and present governments in combination with the centripetal agglomeration effect of market forces. This skewing of resources towards urban sectors has been done at the expense of rural development. As Cross (1979) so pertinently conveys, "People have been prised from the land by the impossibility of making an adequate income and weaned from it by education that has effectively denigrated agricultural employment".

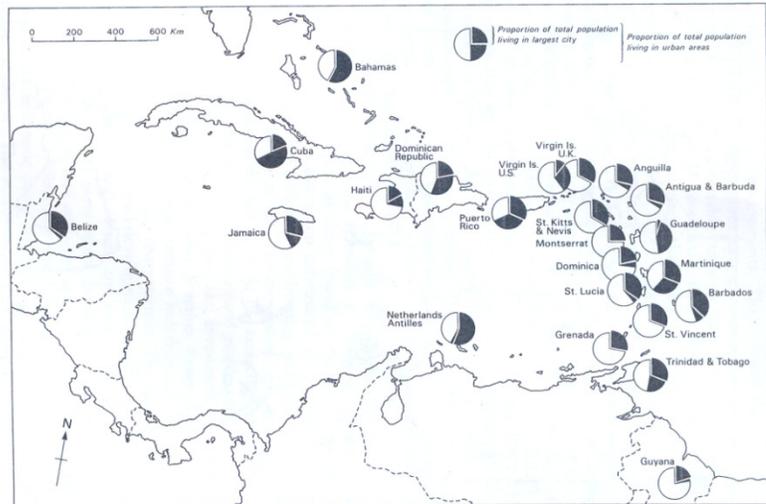

Figure 1: Levels of urbanisation and urban primacy in the Caribbean
Source: Potter (1989)

This has caused the agricultural sector to be relegated to insignificance in many islands, a factor which may potentially explain the continued annihilation of prime agricultural lands for housing and other types of development. Considering all these factors the ultimate concern is whether this form of development is environmentally and socially sustainable in the future.

3.2. Urban sustainability in the Caribbean

Despite its highly urbanised character, urban settlements are hardly on the Caribbean development agenda. While the region understands the sustainability issues being experienced locally, it has been more of a debate concerning a development agenda as opposed to an urban development agenda. Most of the research and documentation concerning urban sustainability in the Caribbean is largely driven by international organisations such as the United Nations and the World Bank. However, several problems arise in analysing the data presented. First is the issue of the LAC aggregate, generalisations about urbanisation in this grouping tend to be based on the experience of the larger countries (e.g. Mexico and Brazil) and applied by extension to the smaller ones (Portes et al., 1997). Hence, urban trends and projections for the LAC aggregate will naturally mask considerable regional diversity (e.g. Beall et al. 2010), making the information less useful for understanding the Caribbean context. Second is the very definition of urban areas. The data used in urbanisation reviews do not relate to the *process* of urbanisation but to urban population growth, the latter being a function of the respective governments' definition of 'urban'. The implications of the range of definitions for urban areas can be seen in the array of populations and areas attributed to selected Caribbean Islands. For example statistics for Anguilla – based on a lack of available data - state that the island is 100% urban, however this represents a population of 12,000 while the total land area is 90km². This statistic does not infer any spatial information that may be of use in understanding urbanisation in the Island.

Steps however, have been taken to focus on the issues of the Caribbean region. Within the United Nations, the Small Islands Development States (SIDS)-Unit, located within the Division of Economic and Social Affairs (DESA), is exclusively engaged with the region. Two core documents form the basis of their work: the Barbados Program of Action (BPOA, signed 1994)

and the Mauritius Strategy for the Implementation of the BPOA. Still, neither of these documents focuses specifically on urban issues nor do they often make reference to urban specific policies. Despite these limitations we can still attempt to extrapolate the issues which affect the sustainability of urban areas and by extension national sustainability. The following table gives a summary of the main challenges facing future urban management within the Caribbean region. It can be observed that the most obvious challenge that islands have to endure relates to their geographic limitations of small size and isolation, as well as the acute external economic orientation. In the case of the Caribbean size matters. It influences every aspect of development in some way, hence, the major long-term land management issue in most islands is to balance economic growth with conservation of limited land space.

Table 2: Challenges to Urban Sustainability in the Region

Factor	Challenge to urban sustainability
Small Size	Limited space for expansion High competition between land uses Immediacy of interdependence in human-environment systems (provisioning services) Limited Resource base
Physical	Limited developable land (topographic constraints) Increased cost of infrastructure provision Low lying coastal zone Susceptibility to natural hazards (hurricanes/earthquakes/volcanic eruptions)
Demographic factors	Limited human resource base Small populations High urban growth rate Urban primacy Concentration of population in coastal zone Dis-economies of scale leading to high per capita costs for infrastructure and services Mobility explosion
Economic Factors	Small economies; limited fiscal base Dependence on external finance Growing middle class Dependence on natural resources for economic development High specialisation of production High dependence on energy imports

Source: adapted from sources: Pelling and Uitto (2001), Lockhart et al. (1993), Conway (1998), Armstrong and Read (2006) and Slade (1999)

Albeit, if the current urban development trajectory continues, it serves to undermine any potential rewards made in other conservation policy areas. Rapid, unplanned and uncontrolled urban growth has characterised Caribbean towns and cities since the 1960s (Barker in Palmié et al. 2011) resulting in urban sprawl, inadequate housing in inner cities and squatter settlement in vacant and often hazard prone areas. The general dominance of decentralisation trends have been effected by both private and public enterprise. According to UN-Habitat (2009), “permissive land-use planning and the growth of affluent populations have facilitated urban sprawl, which in turn has contributed to the number of cars, distances travelled, length of paved roads, fuel consumption, and alteration of ecological systems”. For example Table 3 shows the vehicle ownership and associated road network for a sample of Islands. Interestingly, out of a list of 167 countries St. Kitts and Nevis, Barbados, St. Lucia, Dominica and Trinidad and Tobago ranked 39th, 42nd, 47th, 48th and 51st respectively. Based on local studies however, these values may be significantly higher, recent statistics for Trinidad and Tobago show that while the annual population growth is of the order of 6,500 to 8,500 persons, the annual rate of growth for private cars is currently about twice the national population growth (Newsday, 2012). This means car numbers are increasing more rapidly than population.

Table 3: Upper Middle Income countries

Country	Total Land Area (sqkm)	GDP Per Capita (constant 1995 US\$)	Vehicle ownership (per 100ppl)	Gas Prices (US\$ per litre)	Paved Roads (km)	Highways (km)
Barbados	430	8610	188	\$1.00	1600	1793
St Kitts and Nevis	360	6535	223	\$3.27	163	320
St Lucia	620	3771	166	\$1.26	48	1210
Dominica	750	3291	163	\$1.40	393	12,600
Trinidad and Tobago	5130	5553	151	\$0.36	4,252	8320

Source: CIA factbook

This trend has significant consequences for both the energy and infrastructure sectors. The main issue here, is that Caribbean countries are heavily dependent on fossil fuels. Up to 50% of their export earnings, including revenues from tourism, are spent to import oil products. Economic growth and increased energy demand are closely linked, Figure 3 shows that economic development contracts as a result of higher oil prices. In Barbados, the two largest consumers of imported fuel are electricity generation at 50% and transportation at over 30%, where electricity generation accounts for 74% of all CO₂ emitted by the country and transport contributing 14% (European Commission, 2006). Despite this, the Caribbean is considered a very low emitter of CO₂. The annual CO₂ emissions per country table, lists the Caribbean at 0.3% of the total carbon emissions worldwide. However, when emissions from land use change are taken into account, the results are slightly higher (UNEP, 2001).

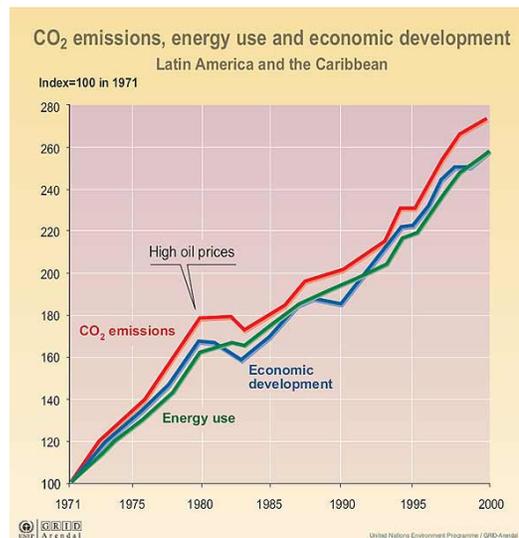

Figure 3: energy use and economic development

Source: World Resources Institute

Fuel imports represent approximately 21% of the regions GDP, a figure which is almost four times the cost of food imports, such large expenditure on fuel leaves little for investment in other key development areas (CNULM, 2012). On average the region spends less than 2% of GDP on infrastructure, while 3-6% is needed to simply catch up with urbanisation and population levels (Fay et al., 2007). Essentially governments are the main providers of major infrastructural projects in the region, with little input from private enterprise. This general dependence on the 'public purse' means that resources are stretched to their limits, a fact particularly evident in the housing sector. The region has continued to grapple with the issue of affordable housing provision to meet the needs of the population. According to Rambarran (2013), in Trinidad and Tobago, the median price for a 3-bedroom house (with land) increased from TT\$237,770 (US\$36,920) in 1993 (when the economy had stabilized after almost a decade of negative growth) to TT\$721,481 (US\$112,031) in 2003 just before the economy was about to experience its third energy boom. At the end of September 2012, the median price for a 3-bedroom house jumped to TT\$1.0 million (US\$155,279). The search for solutions to housing shortages –by both private and public entities - has led to the acceleration of urban sprawl, as low-priced undeveloped sites, particularly agricultural sites, on the periphery of urban areas are being acquired for housing developments.

In spite of these limitations, there have been major improvements in access to water, health, education, sanitation, electricity, income, telecommunications, ports and airports. Based on data from the UNDP Human Development Index (HDI) the Caribbean countries fall within the Very High Human Development countries (Barbados), High Human Development countries (Antigua and Barbuda, Bahamas, Belize, Dominica, Grenada, Jamaica, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and the Grenadines and Trinidad and Tobago) and Medium Human Development countries (Guyana and Suriname). The question now is what does all this mean for future urban development?

3.3. The Urban Sustainability Challenge: Is Compact Urban Form an option?

While the dominant motive behind the sustainability imperative is global warming and hence the reduction in greenhouse gases, the Caribbean is a low emitter of carbon and is more concerned with other priority areas such as impacts of climate change, economic growth, energy costs and retaining the provisioning function of natural areas. Most of the challenges are consumption-related and are linked to demands on key resources such as land, water, energy and food security. Data presented in the previous sections show that the region already features many of the problems experienced by more developed countries, however, limitations due to sheer size, capacity and resources in light of rapid population and economic growth make the search for solutions critical (Gakenheimer, 1999). Given the regions sustainability goals can compact urban form be seen as an entry point to more sustainable urbanisation? While many of the benefits attributed to compact city development converge with the sustainability goals of the region at certain points they also diverge at others. From the research it is evident there are three major obstacles to the implementation of compact city form (1) Data Availability (2) Geography and Climate and (3) Feasibility.

It became obvious during the course of this research that very little urban data exists for the region. Several documents touch on urbanisation as a root cause of ongoing environmental degradation, but little has been done by way of analysing the very nature of the urban development that is currently taking place. Pertinent information required to make decisions concerning urban sustainability is absent. Knowledge of urban densities, how the city functions, transport systems, distribution of land uses, the urban morphology and how exactly energy is being utilised are significant contributors to understanding the links between urban land use and resource consumption. Given the distinct physical and geographic characteristics of the Caribbean, data scarcity proves to be even more critical to achieving sustainable urban development.

Population densities for the Caribbean are relatively high - a function of both limited developable land and small size. For comparison's sake, the entire island of Anguilla is 134 sq km (52 square miles) the size of Washington, D.C and Barbados has a population density of 621 persons per sq km, twice the population density of the United Kingdom and three times that of Japan. It therefore seems like a contradiction to define development as low density or sprawl. So at what point do we call city expansion sprawl? The problems lie more in the pattern of development along coastal strips and consumption of ecologically sensitive and productive areas. Approximately 60% of the Caribbean's population already lives within 1.5 km of the coast where the risk of submergence, flooding and storm surges is heightened (Simpson et al, 2010). Any intensification of development within these cities would therefore place more people and critical infrastructure into already vulnerable locations. Climate Change adaptation is essential for future urban development, yet little is mentioned within the compact city discourse concerning building resilience to the impacts of climate change. Failure to adapt to climate change could cost an estimated average of 5% of 2004 GDP across the Caribbean by 2025. Predicted costs rise

to as much as 75% by 2100 for smaller nations. Other interventions such as building design and green infrastructure measures may prove to be more implementable and economically viable options.

As discussed earlier any development options are based on economic objectives. In the Caribbean context economic growth and energy demands are tightly linked. Energy has become central to the Caribbean region's existence. The Electricity and transportation sectors are the two most prevalent applications. Necessity, convenience and luxury have been the drivers of this dependency that does not seem to subside, even in the face of global climate change (ECLAC, 2009). The main issue with regards to energy is not necessarily emissions but rather the high cost of import. While densification and intensification may bring marginal benefit, greater benefits would be gained from utilizing alternative energy sources such as wind, solar and hydro power. While the provision of combined heat and power (CHP) is a selling point for the compact city, the Caribbean does not require heating but rather cooling, and denser development leads to higher cooling costs due to the Urban Heat Island effect. It is also suggested that urban form may do little in terms of the mobility explosion occurring in the region. The Central Business Districts of many islands are in decline, losing residential populations, yet, due to urban primacy, they maintain large transient populations accessing employment and other services. Therefore decentralisation of these activities to other peripheral concentration nodes may prove more beneficial than increasing residential densities within the city. Other factors such as climate, lifestyle and gas prices may also influence the applicability of other transport modes such as walking and bicycling.

Policies which affect land use are also inextricably bound with overall strategies of economic development and thus by extension to societal and political goals. The enormous debt burden of many islands – which already severely hampers their development options – limits their capacity to invest in the urban sector. In the face of scarce economic and financial resources, short government term-limits, and fragmented political publics, some governments make decisions which may provide short term benefits with negative long term effects. Overall there seems to be a general lack of commitment to sustainable development objectives. For example while theoretically there has been a commitment by governments of the region to the principles of sustainable development (e.g. BPOA, MDG), the implementation of the BPOA had fallen short of expectations and has yielded considerably fewer concrete results than were anticipated (UNEP 2003). One reason for this according to Williams (2003) is that in many islands bureaucratic infighting and passive resistance often lead to paralysis and an inability to take any action towards sustainable development imperatives. While urban planning is viewed as the mechanism for managing land use, it is a slow and protracted process in many of the islands. In many instances notwithstanding the resources, finances and time in preparation of development plans and legislation, there is perceived to be a general malaise with regard to implementation of projects and adoption of many policies.

4. Conclusion

Planners in rapidly urbanizing regions in the Caribbean are under immense pressure to address urban issues and thus they often propose short sighted planning measures. The multitude of pressing problems that confront the region—such as informal settlements, environmental degradation, resource exhaustion, and underdeveloped infrastructure—necessitate immediate attention by planners. However, it becomes difficult to advocate for *any* type of sustainable urban form, compact or otherwise, with limited supporting documentation and a general lack of research on urban areas. Population statistics convey little of the social, political, economic, and demographic changes which predicate the increasing trend towards urbanisation. It would

therefore be imprudent to attempt to advance simply by translating a few physical continental solutions to the Caribbean. While a level of compaction is desirable, there are many other factors which need to be assessed. Therefore, increasing the scope of national assessments to include the urban sector with regards to the relationships between urban densities, city functions, transport systems, urban hazard vulnerability, urban morphology and energy use will allow planners to leverage government support for a more sustainable city form.

Mining, environment and society: Contribution of the thought of Whitehead to the methodology of assessing the water that can really be mobilized in the Kimberley and Canning Basin, Australia.

Summary of the presentation

The presentation will begin with a short film to take the audience directly into the region. The film will showcase the human, cultural, social, environmental and economic capital. These assets must be balanced when considering development in the region. The film will be followed by the presentation of a paper by the author. In application of the AIATSIS Research Charter (2011, ref. 01), Anne Poelina and Ian Perdrisat will be available to take questions.

Background to the case study: the research network

The main lines of research and case study chosen.

The location and local context (Maps)

§ 1 - Drop of experience n°1: teaching from Walmadany / James Price Point

§ 2 - Drop of experience n°2: What can we learn from this teaching for the Canning Basin (area concerned, Native Title, national consultation)?

§ 3 - Drop of experience n°3: good practices, a methodology IWRM in Canning Basin -

Need to take into account the intercultural issues; Multiculturalism;

Review of the scientific assumptions of Western culture

The contribution of the drop of experience method in Integrated Resource Management (IWRM / IWRM)

§ 4 - Drop of experience n°4: The proposed action

Conclusion: A contribution to the national debate regarding planning law reform to promote co-existence and co-management of Australia's sovereign land, waters and food security

We must hold this land all together for all of us (Paddy Roe, Nyikina Elder and Senior Lawman)

The "drops of experience", also termed "actual entities" are "the final real things of which the world is made up" (PR 27). "Like the atoms of Democritus they are microcosmic entities, aggregate of which, termed societies or nexus, form the macrocosmic entities of our everyday experience –tree, houses, people. But whereas the atoms of Democritus are inert, imperishable, material stuff, Whitehead's actual entities are vital, transient "drops of experience, complex and interdependent" (PR 28)." Donald W. Sherburne (1965, ref. 02)

Background to the case study: the research network

The impact of resource extraction on the social, cultural and environmental landscapes of the world are of international interest. The geographical Laboratory "Loterr" from the University of Lorraine (Nancy 2) is specialized in the study of landscapes, including mining landscapes across the world. Michel Deshaies, its director published in 2007 *Mining areas, exploitation and conquest*, and in 2013 *Natural resources and settlement* (Ref. 03).

This research contributes to ongoing training of the author who is committed, to exploring water issues, at the local level (City of Charleville-Mezières, France) and at international level (NGO-UNESCO International Forum to be held in Africa on the issue of water in 2014).

In the laboratory Loterr on 13 December 2008, the thesis (PhD) *Territorial experience enlightened by A.N. Whitehead Thought: Convivial regions' potentiality and applications to the region "between the Vosges and Ardennes"* (Ref. 04) was obtained. The concept of "conviviality" refers to the work of Ivan Illich (Ref. 05). This thesis questions the assumptions of geography, urban planning and wider the modern science, from the "hard core of common sense", i.e. "what everyone assumes in practice, even if it denies verbally" (Griffin, Ref. 06). This leads to the organic philosophy, and its evolutionary scheme. The most complete expression of the organic scheme was given by AN Whitehead in 1925 (Harvard University).

Other authors who have contributed to the development of organic philosophy include CS Peirce, W. James, Bergson, Teilhard de Chardin, Hartshorne, and closer, N. Rescher, D.R. Griffin, J.M. Breuvert, H. Vaillant, M. Weber, JC Dumoncel (Ref. 07). A.N. Whitehead uses the most demanding scientific criteria: logic, coherence, adequacy, applicability and necessity (Ref. 08) the "drops of experience" that formed the world (see below, § 4). Despite being created 80 years ago, Whitehead's approach remains unsurpassed to this day. His approach is grounded on a trans-disciplinary and generalist approach to sustainable development and include an alternative economy that respects territory. Concerning water, we will show how it can effectively expand and deepen the methodology of IWRM proposed by UNESCO (ref. 09). This methodology allows the research process to be action oriented.

During a trip to Australia in the summer of 2011, the Nyikina people, through one of their leaders Anne Poelina expressed interest in the organic approach to understanding and managing local and regional geography. A dialogue was born, to put organic thought into action. (ref. 10)

The dialogue continued on 1 June 2013 in France with a presentation to the NGO-UNESCO Joint Commission on Human Rights on the situation of the Kimberley Region in regards to the proposed establishment of the world's largest gas hub at Walmadany-James Price Point (abbrev. JPP), with a very strong pressure for intensive mining (more than 500 exploration licenses to date) Following which several conferences in France in June 2012 in Vienna, Metz, Lyon, the Forum of the Association " Men Women in the City "(Brainville, Haute-Marne), and the University of Nancy 2. A meeting with M. Deshaies gave rise to the project for a post-doctoral research programme for one year in 2013-2014, included in a five year research programme from 2013 to 2018 with the Laboratory Loterr.

An international partnership is being initiated with the International Water Centre (IWC). The research is also linked up with the Institute of Social Territorial Dialogue in Poitiers, which made the "drop of experience" the basis of its pedagogical approach (Braconnier, ref. 11). The case study of the Kimberley / Canning Basin could also be a contribution to the Franco-Australian Forum which has initiated a research programme on "Water, Land and Food security" (ref. 12).

The programme focuses on mining companies and sustainable development centred on the theme of "Water Source of Life".

A basic principle of the programme, in accordance with the AIATSIS Charter for joint scientific research will be a partnership agreement between the University of Lorraine, IWC and Nyikina people (ref. 01). This programme is also be integrated into the ISOCARP consultative membership to UNESCO-Liaison Committee, and is linked up with UNESCO-LC - Africa Forum water research in 2014.

The main lines of research and case study chosen.

Indigenous peoples have often lived in their territories for thousands of years, even tens of thousands of years, as is the situation for Nyikina people of Mardoowarra-Fitzroy River. Nyikina people identify themselves as yimardoowarra, meaning "*people who belong to the Mardoowarra: the lower region of the Fitzroy River*" (Poelina & Perdrisat, McDuffie, ref. 10). The river sustains their life and is central to their culture and heritage. They know and have practiced coexistence and balance between society, culture and the environment over a long period of time. They coexist with birds, snakes, animals, nature, an approach that is not individual, but community life. The important issue for today to share and teach the multi-millennial living experience, not only for Australia but for the world. Indigenous peoples represent 300 million people worldwide, and they have about 24% of the land, on which they live in harmony. Nyikina people, like almost all indigenous people, is peaceful, non-violent, "protectors" of the environment and not simply "protestors" to industrial development, "actionists" and not "activists", i.e. eager to act and to participate in decisions, and not just "talk". Dialogue and the action must be "clearly informed" by evidence.

The federal and state/territory governments do not recognize the sovereign rights of Indigenous Australians over their lands (ref. 13). Without the right to veto destructive industries on their land, indigenous lands are effectively "available" to increasing pressures from strong multinational mining corporations. An operational framework for engagement is

required to promote dialogue and to involve local populations in decision, in order to reduce and manage conflicts that may arise. It is important to be open and honest about the risk and effects of pollution and destruction of the territories. In the territories, the water is known to be a finite resource, limited, and the calculation of water really available should be included in any project feasibility study.

The question is how to achieve a different industrial or mining development in a process of dialogue and action to create participatory planning and informed decision making for a better humanity. This case study provides the basis for such an approach, with a view to contributing to the Australian national debate on the renewal of planning.

The location and local context

The West Kimberley region of Western Australia is considered one of the last great wildernesses of the world. Vast areas of the region were National Heritage Listed in 2011 for multiple world values containing the world's largest footprints and most complex dinosaur trackway, ancient rock art, pristine coast lines, rich ecosystems, and unique living Aboriginal cultures co-existing with Asian and European heritage. Many Indigenous peoples from around the world share the view that land, water and people are intrinsically entwined.

Figure 1: Map of Australia and the situation of the Kimberley (450 000 km²) and Canning Basin (approximately 500,000 km²) in northern Pilbara.

The territory has seen a similar size to France and Germany combined.

Figure 2: Left : roads ; Right : Catchment of Fitzroy River (93 829 km², 733 km, average 2 400 m³/s, discharge 84 760 m³/s) which is the size of the Rhone (96 000 km², 812 km, average 1 690 m³/s).

Others :

- Negro River, Argentine (102 000 km², 550 km, average 762 m³/s)
- Pô River, Italy (71 057 km², 652 km, average 1 500 m³/s)
- Sanaga River, Cameroon, (129 219 km², 918 km, average 2 072 m³/s)
- Rhine, Swiss, France, Germany, Netherland (1233km, 185 000 km², average 2 300 m³/s, max. 12 900 m³/s 1926)

Source data and left map Wikipedia . Right map : Government of WA Department of environment

In Western Australian (WA) the government has singlemindedly promoted industrial development without demonstrating responsible engagement with regional WA. I shared a

criticism of the WA Premiers autocratic decision making process in September 2011 with the Australian planners ISOCARP. A planner quoted to me the legality of pre-industrial work and an agreement of the Aboriginal Traditional Owners in October 2011. In November 2011, the agreement was invalidated by the Western Australia's Supreme Court of Justice (ref. 14a) ... This and other examples particularly from the families of Broome who gathered together to show that there is a need to engage participatory planning. There needs to be an operational framework for engagement to establish regional governance mechanisms. Responsible and representative regional governance needs to include a wide and diverse range of views regarding how the Kimberley is to be developed now, for current and future generations. Contemporary industrialisation plans for the Kimberley are not grounded in responsible planning methods based on good science or industry best practice evidence; planning is being determined primarily for a political and economic interest.

The Native Title Act (1993) created laws that effectively create conflict, manipulation and division within and outside of Indigenous Native Title Claim groups (ref. 15). Australia's Native Title law cannot stop mining because there is no capacity for Indigenous Traditional Owners to veto destructive industry on their ancestral lands. It only gives Traditional Owners a right to negotiate with resource extraction companies. The United Nations states indigenous people need to give « Free, Prior and Informed Consent » before extraction can take place. Native Title law has become an instrument of oppression as Aboriginal people are forced into signing mining agreements before all of the science, heritage and industry knowledge is gathered and evaluated. State and national mining approvals ignore traditional knowledge, science and industry best practice. Governments are weakening environmental laws and regulations; annexing land from local government and disregarding international obligations to all Kimberley people (ref. 16).

Australia has a two tiered environmental assessment process. Each state/territory has an Environmental Protection Authority (EPA) legislation and the federal government has the Environmental Protection and Biodiversity Conservation Act (1999, EPBC Act). There has been a great deal of pressure on the federal government from extractive industries to 'remove the green tape' by removing the EPBC Act and leaving the state EPA's as the single environment assessment process. The state EPA assessment process for the multi-corporation LNG processing hub proposed for Walmadany-JPP north of Broome demonstrated political influence created sufficient flaws in the process resulting in a loss of community confidence in the EPA's credibility and independence (ref. 17).

This paper advocates a new way of doing business around integrated management of land, water and food security in the Kimberley region of Western Australia. People in the region are looking for a co-operative way to develop northern Australia's multiple economies from a wide body of information and world views (Crough, & Christophersen, 1993, ref. 18). The inclusion of Indigenous views is required to provide genuine participation in the process in order to overcome the colonial paradigm that has shaped the region's development.

Indigenous Australians have been trustees from the beginning of time, guardians of Australian land, waters and natural resources for current and future generations. The United Nations Charter of Human Rights promotes the wellbeing and sacredness of all life not just human life (ref. 16). Australians need to think carefully about engaging in the destruction of Australian lands and waters and surrendering food security. Together, we must recognise and protect all inhabitants who are connected to these living water systems.

The report on the water for the Kimberley and the Canning Basin in 2013, entitled "Regional Kimberley water level from 2010 to 2030" written by the Water Department of the Western Australian Government is particularly incomplete in relation to forecasting the water needs of the industrial sector, as can be seen in the following two chapters: the lack of presentation of the needs assessment for water for the Gas Hub James Price Point, and no comment on the water needs of Canning Basin (ref.19). The strategic objectives are generous and ambitious, however there is uncertainty regarding the implementation process.

Australia has developed an integrated water management plan for the Murray-Darling basin due to public concern over the scarcity of water, drying wetland areas, salinization. Furthermore biodiversity at risk with fauna now less than 10% of the situation before colonization. The centralised technocratic approach of the Murray-Darling Basin Authority (MDBA) with minimal level of interactive engagement with stakeholders is inappropriate (K.A. Daniell, ref. 20). The calculation of really available water has to be reviewed three times in a century, each time in a downward trend. The responsible governance of water is of great importance to take regular measurements, to inform decision making so that water use can be adjusted to protect the environment. Why has this device not been developed for other watersheds BEFORE the ecological disasters? Barriers to stakeholder engagement and collaborative approaches have to be analysed to prevent their rejection for wrong reasons (Barreteau, ref. 21)

§ 1 - Drops of Experience n°01 : teaching from Walmadany-James Price Point

The WA Government decision to select Walmadany-James Price Point for the site of the world's largest liquefied natural gas (LNG) processing facility generated competing waves of

human energy to promote or resist the projects development. These drops of experience inform future actions particularly in relations to planning. The Walmadany-JPP experience has demonstrated the need to widen community involvement through participatory planning including citizen science in regards to considering the development of resource extraction of the Super Canning Basin and the Fitzroy River catchment. There needs to be investment into generating the body of evidence from the Walmadany-JPP experience and transferring that knowledge into a regional Kimberley land, water and food security governance model. The focus is to build the knowledge base from multiples sources to establish an operational framework for engagement to enable the people of the Kimberley to fully participate in determining what is best for their region, whilst simultaneously contributing to the national growth and development.

State Planning reform is of particular interest as the WA Premier has used parliamentary powers to enact new laws and agreements to protect the rights of corporations and multi-national resource extraction companies over the rights of ordinary Australians (ref. 22). Planning laws and policies have seen state rights over ride local government rights. The State Government is excising Crown Land out of the Local government planning jurisdiction however; local governments are expected to regulate planning and development conditions without the investment to ensure standards and compliance of large scale projects are maintained. Projects between 3 – 7 million dollars bypass local government assessment processes and are assessed by an independent Development Assessment Panel that has been appointed by the Premier. Furthermore the WA Environmental Protection Authority (EPA) was subject to legal challenge in the Supreme Court by the Wilderness Society to make transparent the structural and systemic processes that approved the development of Walmadany-James Price Point.

The WA Aboriginal Heritage Act (1972, ref. 23) is supposed to protect Aboriginal heritage for all West Australians, however in the case of the Walmadany-JPP the Aboriginal Cultural Material Committee (ACMC) took public submissions. These submissions clearly demonstrated the rich living culture heritage values of the Walmadany-JPP site over many decades. All of this information was ignored by the Minister for Aboriginal Affairs who supported Woodside Pty Ltd plans to clear endangered ecological communities and dig amongst sensitive Aboriginal registered and unregistered cultural and burial sites.

Robin Chapple MLC Member for Mining and Pastoral Region questioned the Minister for Aboriginal Affairs who admitted that “there are currently a massive 6,234 lodged Aboriginal heritage sites awaiting assessment by the ACMC (ref.24). According to the Department of Aboriginal Affairs latest annual report, the ACMC has been working for 40 years, and there are approximately 15,000 registered sites with another 15,000+ heritage “places” – so a charitable view would be 30,000 assessments over 40 years – equals about 800 assessments per year. At that rate, the admitted backlog of over 6,000 sites will take around 8 years to clear! “If we allow that they can also consider site assessments at the same rate – the backlog now looks more like 40 years! Mining companies are equally frustrated by the lack of certainty which results from not knowing what sites are in areas where they are looking to develop projects”, according to Mr Chapple.

The decision by Woodside and its joint venture partners to extract and process gas from the Browse Basin off the West Kimberley coast by a floating LNG processing plant out in the middle of the Indian Ocean is an example of maximising profits by shifting to the world’s best practice. Moving to Floating LNG shows Australia’s capacity to embrace cutting edge technology without the destruction of ancient living Indigenous cultures and the environment.

The development of Walmadany-JPP as the largest liquefied natural gas plant in the world is now a dirty handkerchief, no company wants to touch it. It’s now time to leave its cultural and environmental heritage values intact, leave its precious environment in pristine condition and avoid any further community unrest and division by rescinding the Browse (Land) Agreement Act (2012, ref.25). This way the Kimberley can be saved for sustainable development and for future generations of Australia and the world to enjoy. The West Australian Premier Barnett, has confirmed that the jetty proposed for Walmadany-James Price Point was the hidden agenda for the industrialisation of the Kimberley. The passage of the Western Australian Natural Gas (Canning Basin Joint Venture) Agreement Bill 2012 state (Bill No.

324, ref. 26) agreement over the Canning Basin has provided the Premier with renewed obsession with an onshore gas hub in the Kimberley regardless of the relative merits of any associated project.

§ 2 - Drop of experience No. 2: What can we learn from this teaching for the Canning Basin (area concerned, Native Title, national consultation)?

The development and subsequent temporary abandonment of the proposed Walmadany-James Price Point gas hub has distracted attention from a much larger and riskier series of industrial projects. There has been little media coverage of the exploration of shale/tight gas in the Canning Basin: a systematic exploitation of a shale gas project estimated the volume of gas to be about 400 tcf-trillion cubic feet or 11,200 km³ or GM³- on 550 000 km² in the Canning basin (which covers the northern part of the basin downstream of the Fitzroy River) see map above about exploration licenses- (Buru Energy, ref. 27).

Since 2010 companies such as Oil Basins Ltd., and now Buru Energy and Rey Resources have undertaken exploration and fracking of the savannah rangelands and river country east of Broome and are considering transporting unconventional shale and tight gas 170 kms to Walmadany -JPP. The mighty Mardoowarra-Fitzroy River is one of the world's last great wild rivers. However, from the catchment to the coast it is covered by mining and gas fracking exploration tenements. The proposed Duchess Paradise thermal coal mine would be the first mine in an 8000km² coal mining province and there are plans to mine uranium and other rare mineral sands. These types of developments risk poisoning and depleting the Canning Basin groundwater and contaminating the Mardoowarra-Fitzroy River and everything that lives in and off that water (see ref. 10).

The Kimberley is at a critical point where some of the proposed developments present a real threat to the land, water and food security as well as the unique way of life. Many people in the region are not anti-development rather they are anti-unethical development and share a particular concern for the notion of development at any cost. The mining and fracking laws are extremely unfair and do not reflect the values of the Kimberley region. There is no opportunity to consider the 'facts' about the real impacts of resource extraction, processing and transporting methods. Transparent participatory planning is needed to support an operational framework of engagement to reveal the real impacts of each resource extraction project and the cumulative effect of all of the industries proposed for the West Kimberley.

There are generous government incentives for investment in the resources industries to create employment. Similar levels of government investment and tax concessions into exploiting the natural resources that the Kimberley already has in culture and conservation would create jobs, research and investment.

§ 3 - Drop of experience No. 3: good practices, a methodology IWRM in Canning Basin

Intercultural issues

Modern Australia was established on a brutal history of conquest, annexation and colonial occupation of Indigenous lands, waters and liberty. In a little over two hundred years the Aboriginal population has been reduced from around two million to about 410 000 (2% of the Australian population) (ref. 28). Contemporary colonisation speaks the language of global trade agreements, international need for resources and multi-national corporate investor rights. The impact is still as it has always been; private industry and government working together to remove Indigenous people from their land, lifestyle and spiritual connection. Colonisation is a conflict paradigm which continues to raise intercultural issues in Australia.

This issue is particularly important for this presentation today at the 49th Congress of the ISOCARP. Aboriginal culture is closely linked to the land, plants and animals, and the stars. Aboriginal culture disconnected from land losses meaning (Preaud, 2009, ref.29). "There" (Berque 2000, ref. 30) sense to territory, "here and now". It is the loss of meaning that causes degradation of the lives of Aboriginal peoples: abuse, addiction, dislocation, imprisonment (30% of the prison population ...Indigenous Disadvantage Report) (ref 31).

Abstractions of globalization are here confronted with a unique territory, singular, specific, particular. It was as late as 1992 that Eddie Koiki Mabo won an appeal to the High Court of Australia to overturn the theory of Terra Nullius that maintained the legal fiction that

Indigenous Australians were not connected to their land (ref. 32). The deeds of possession are in Indigenous culture: relationships, dreaming stories and songs, paintings, rituals, dances and land management.

Resource extraction corporations can avoid confrontation by negotiating an agreement with Traditional Owners under the Native Title Act (1993). Legality may obscure the legitimacy, as Indigenous people often feel compelled/ coerced into making mining agreements because of the short timeframe, lack of recognition of their rights and no power for Traditional Owners to veto destructive development on their land.

In order to engage Indigenous people there needs to be an intercultural participation process that is permanent, scalable, regular, and can be formalized by the IWRM model of UNESCO in support of sharing the cultural diversity, science and education of all peoples of the world (ref. 09). This model seeks to articulate, deconstruct and resolve confrontation between different interests, and different cultures in regard to their scientific assumptions, cosmological, culture and spirituality.

This necessarily requires us to consider these assumptions to lay the scientific and philosophical bases of intercultural dialogue, an approach that respects the Charter of AIATSIS and work of Turiha Smith "Decolonizing Our Methodologies" (ref. 32). These databases allow you to see the IWRM process in a new light, and ground participatory planning proposals that contribute to the debate on how local, state and federal governments maintain water, land and food security.

Review of the scientific assumptions of Western culture

This review is essential to allow, perhaps, an intercultural dialogue on a common basis, in accordance with the differences.

Who can doubt that the philosophical and scientific roots of our Western science comes from Aristotle, Plato and Leibniz, Descartes, Hume, Locke, and Kant ? In the book *Process and Reality; An essay in cosmology* (see ref. 01a), A.N. Whitehead a career mathematician and physicist undertook a critical review of Western science and synthesised the most advanced science in terms of "philosophy of organic science".

This work is eighty years old but it remains relevant today because it incorporates reflection of quantum mechanics, and scientific verification of quantum assumptions. The famous EPR paradoxe (Einstein-Podolsky-Rosen) has been established so truly essential that it has been recognized by the International scientific community in 2002 by the work of Bernard Aspect (ref. 34). Science also has its slowness ... This slowness of science, and the recent work calls the organic scheme in the more immediate present, as evidenced by the growing number of works from the New Covenant I. Stengers and I. Prigogyne, Nobel Price (ref. 35).

The organic scheme respects the Redstone Declaration of Indigenous Peoples (ref. 36): interrelationship between all the elements of Nature, ... Planners who signed the Charter of the Town Planning for the twenty-first century of the SFU Europe will also find themselves their new principles.

The organic scheme meets the most rigorous scientific criteria: logical coherence, adequacy, applicability and necessity (see ref. 6). In summary, in place of the subjectivist principle of Descartes takes place a reformed subjectivist principle, whose final expression by Griffin after 30 years of research could be the pivot of the new scientific paradigm (ref. 37). On this renewed basis, materialism is henceforth not scientific (it does not respect the coherence and facts), dualism is replaced by a duality without dichotomy. Dichotomies become contrasts: the aesthetic, architectural and urban vocabulary of the Renaissance is now integrated in the organic scheme, both philosophical and scientific. The concept of substance is no longer the transition between two of the "drops of experience" which has formed the world (see figure XX below).

The geographer Eric Dardel refers to Whitehead (ref.38). The geographer Augustin Berque describes "moments of existence" that all have their resonance with the "drops of experience" (Ref 31). These organic groups are categories of feeling, and renew the categories of thought of Aristotle and Kant. These categories are listed by Gilles Deleuze (ref. 39), Stengers and Ilya Prigogyne (ref. 35).

The organic approach is the basis for a growing number of jobs in all areas of aesthetics, anthropology, ecology, economics, education, ethics, history, metaphysics, psychology, public policy, sociology, theology, theories of knowledge, and finally: urbanism and architecture. (ref. 40). For urban planning and geography, the work of Joseph Grange deserves dissemination and implementation debate, yet this remains to be done (ref. 41).

Openness to all disciplines also means opening the songs, dances, rituals and symbols of indigenous peoples, and for this study, the Nyikina people. In an experience-based approach, the "drops of experience" cannot be limited to disciplinary segregation. The organic scheme provides an opportunity for indigenous cultures innovative, open, scalable scientific expression. The recognition of internal relations, the removal of the distinction between subject and object open the possibility of a base of intercultural dialogue and the development of a tool, where the ontological and cosmological foundations are explained.

In this approach, this vision, Western science and Indigenous knowledge work collaboratively (Bohensky, Mahu, 2011, ref. 42). The asymmetry highlighted by Bruno Latour between ethnography "others" and the Western culture disappears: we are equally exotic to indigenous peoples (Latour, Rist, ref. 43). There are only men and women who have to organize the same territory. Sustainable development is driven by the drop of experience and advanced in a "spiral", as we will show below.

Clearly, the categories of organic scheme are classes of feeling and not only of thought, which means that every part of the experience has a combination of sensory information. The second phase operates abstraction from experience, i.e. the "imaginative generalization" that allows the emergence of the third stage of new proposals. At the end of the fourth phase of decision, the winning proposal "happens in the real," "is a new reality." These new realities are offered in the fifth phase of new transformations.

It is all of these phases as "drops of experience" or "seed of thought" (Teilhard de Chardin, ref. 44), or even monads (Berque, Tarde ref. 45). The technical term is "current entity" or "quantum discount" (Ref. 8, PRX, AN Whitehead). The pattern resulting from gout experience is as follows:

It is possible to develop a simple approach to sustainable development around the theme of water, set in motion by the "drop of experience." What is it? The "Drop of experience" is the essential process for any action of each person in their daily or professional life or professional, the simplest action the wisest. This is what each of us does "in practice". In practice, every action takes place in five stages or phases:

a - A stage of apprehension, **a**nalysis or "**a**udit" allows to manage a network of **a**ctors, and their interactions. The question is "Who are we ?". This generally leads to a diagnosis and "inventory" This is also a good first step in our approach. Going further, what is it?

b – (in French: "**b**ut" = aim) A stage of vision. It means to have a goal, a vision, a purpose, namely, "where are we going ?" or "what can we expect ?". These are signs / buoys that can guide us, as in mountains, on the sea, or in the sky. Sometimes referred to as purpose but the notion of purpose is ambiguous: there are long-term purposes (the headlights of a car), or short-term (the sidelights on a car). In the long run, those are the goals, vision. In the short term, it is proposed the next step.

C – A stage of proposition. This is the stage of development of **C**ollaborative proposals. These proposals **C**oordinate information in the sense of vision, and require strong **C**ooperation to finalize these proposals. The question is "what can we do ?" The transition from vision to strategy is proposed: it is in fact trying to achieve the vision taking into account the real state of the place, to adjust possible solutions. These proposals may form a programme. But what about all the proposals that emerge?

d – A stage of decision. The **d**ecision allows to achieve a particular proposal, to **d**etermine which will be implemented, to make a judgment in a **d**ecision process. The question is "What do we do ?"

e – A stage of commitment. The last step is the commitment of the action and its **e**valuation. The question is: "what have we done ?".

Each human group has his own expressions for the five stages. You can see I have proposed several for each above stage. The terms may change, but the steps are essential because a project, whatever it is, will be poor if there is no vision, ineffective without good proposal inadequate if not starting from a good inventory (and ultimately equally ineffective), wavering if not a good decision-making, and aborted if not a concrete commitment, implementation.

The simplest, example shows that it is applicable to any situation in ordinary life: when a housewife prepares a meal **(a)**. She receives friends, and dreams of a convivial meal **(b)**. The menu suggestions depend on the state of the refrigerator and the usability of its reserves **(c)**. However the availability or not of other items in the stores will quickly influence decisions that will alter initial proposals **(d)**. Then she starts preparing dishes, and guests are responsible for the evaluation, keeping in view the satisfaction of all **(e)** ...

From there, the examples can be more professional, more scientific, more members. I want to make the point that a drop may experience scientific extensions (its scientific name may be "quantum discount" or current entity) but also philosophical (systemic philosophy / or organic philosophy of the process) and even cosmological (approach micro / macro, ontology underlying ...) It can account for the diversity of cultures because it freezes nothing, and in this sense this approach is "universal." If that is not taken into account, then you must change it. It is flexible and scalable.

Therefore, it is not surprising that many operational approaches seem to have many practical applications such as the development of local Bernard Vachon, territorial governance of the Foundation for Human Progress, the tool educational association Men Women in the City, Patrice Braconnier PhD (Vaillant, PhD, ref. 04).

The contribution of the drop experience in Integrated Water Resource Management (IWRM)

United Nations –Word Water Assessment Programme, in collaboration with UNESCO –Hydrological Programme wrote in 2006 a specific method to solve water problems all around the world, called International Water Resource Management (IWRM, see ref. 09). Water is in close link with the living culture of people, and no success can be reached without taking in account of these lived experiences, these feelings.

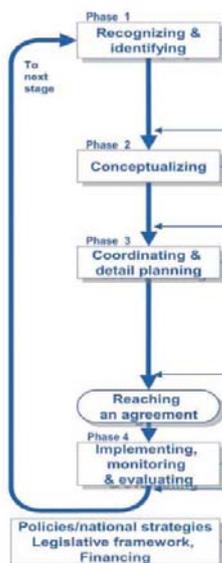

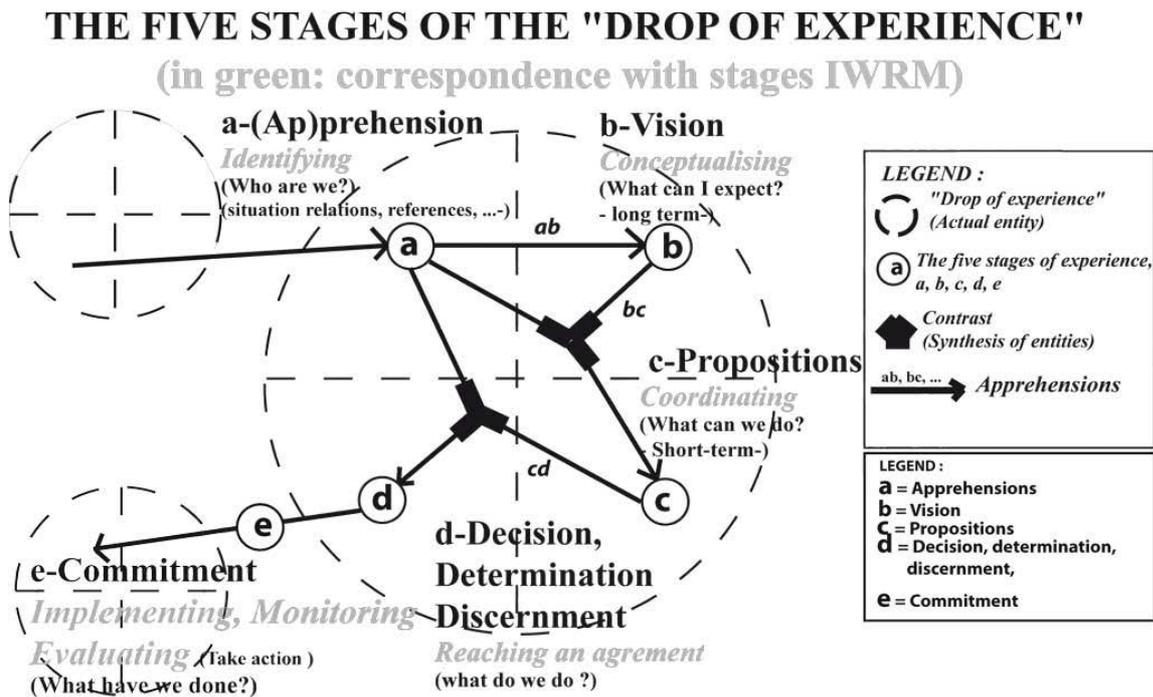

Figure 5 : IWRM Process See Ref. 09, Part 2.1: Features and Structure of "the Guidelines for IWRM Coordination"

In the left diagram , it is possible to compare the phase to phase "drop of experience" and the IWRM process to observe that IWRM is a "drop full experience", with technical oriented formulation "project".

The purpose of the organic approach is to provide an ontological, metaphysical and scientific basis for both the IWRM plan. A less technical formulation appears possible, even desirable for IWRM becomes universal, "unity in diversity", and in connection with all scientific approaches of different disciplines mentioned above. **The organic thought gives its full depth to the expression of values in integrated intercultural approach to northern Australian water planning and development that takes into account traditional knowledge, rights and interests.**

When we compare term by term phases of the "drop of experience" and phases of IWRM, we see ther is synergy in each phase. The diagram of the drop of experience with the phases of IWRM can then be as following

Figure 6 : FINDINGS 1 : the drop of experience with the link with IWRM (UNESCO/IHP – UN / WWAP)

Integrated water management is a spiral movement in time: the cycle consists of several phases that to lead to a decision, approval, or implementation of actions. Below is the schematic diagram of the spiral and its application to Murray-Darling integrated water management.

Figure 7 : IWRM Spiral Source: UNESCO/IHP & UN / WWAP IWRM Guidelines at River Basin Level , Part 2-1, page 3 ; Right: IWRM spiral of Murray-Darling River (page 107)

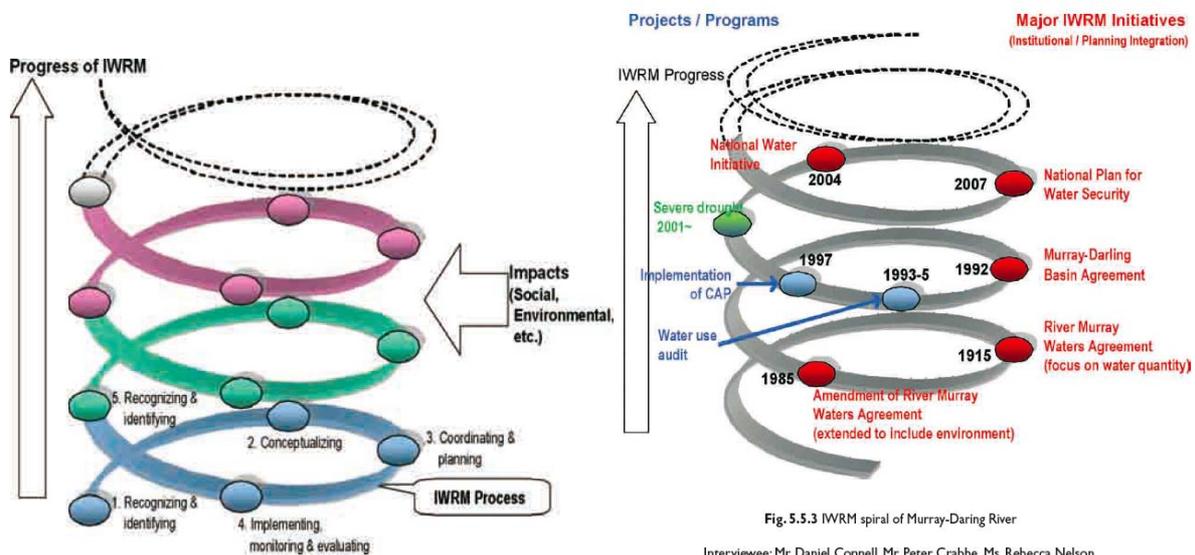

Fig 4.1 Spiral evolution of IWRM

Fig. 5.5.3 IWRM spiral of Murray-Darling River

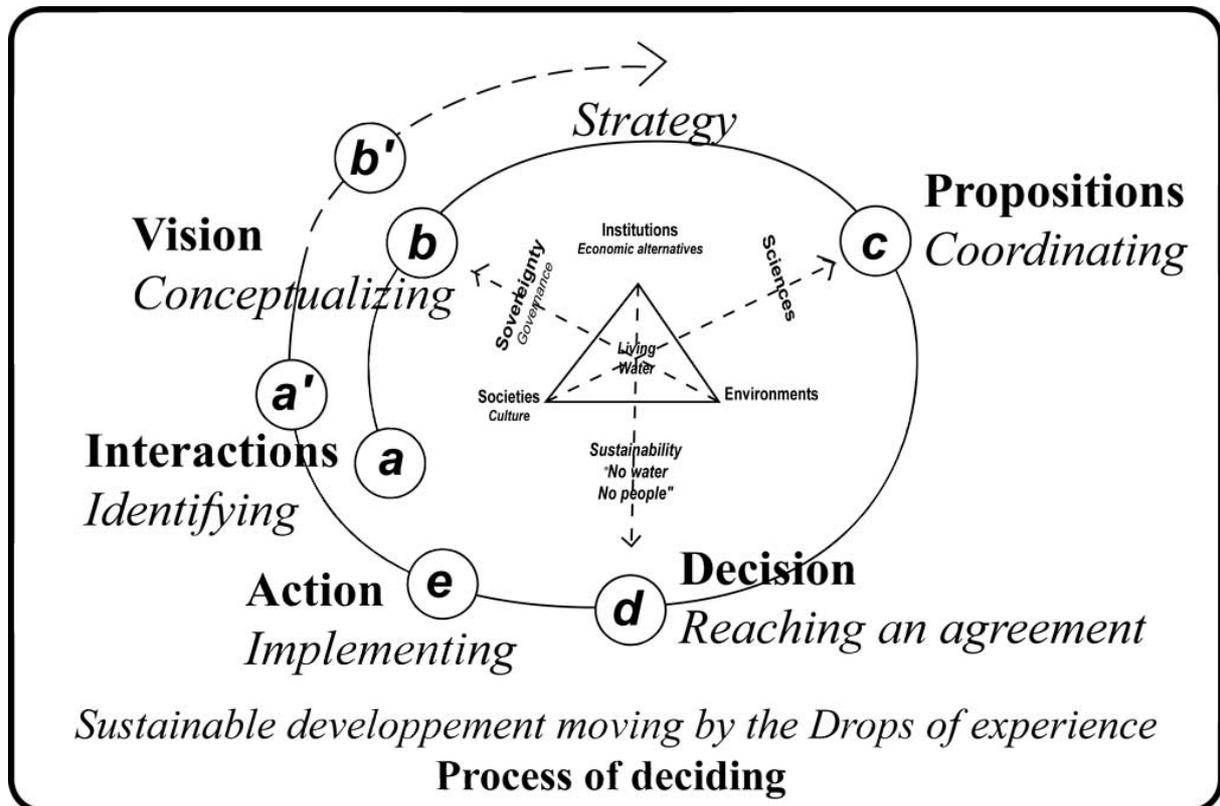

Interviewee: Mr. Daniel Connell, Mr. Peter Crabbe, Ms. Rebecca Nelson (Murray Darling Basin Authority)
 [Interviewer: Junko Sagara (CTI Engineering)]
 [Report: Prof. Anthony Jakeman (Member of the Steering Committee), Ms. Serena Chen (Australian National University), Mr. Junko Sagara (CTI Engineering)]

In this approach, there is more to obtaining indigenous peoples "approval" under (Native Title) law as information would need to be + - complete. It's about working together permanently, from local communities, the state, to federal government throughout in common and intercultural process, with measures, following up common criteria, the definition of successive goals, adjustments.

The heart of this case study is the expression of this method of consultation to experiment in the Canning Basin first, then all the Kimberley. This is a proposal, which starts from an observation, which is guided by a vision.

It is now possible to provide a comprehensive scheme of sustainable development, moving by the drop of experience in terms of the integrated management of water resource. This scheme, developed for taking action is the following:

Figure 8 : FINDINGS 2 : Sustainable development moving by the drop of experience

§ 4 - Drop of experience n° 4: The proposed action

The proposed action can be developed by grouping the actions according to the five stages.

4.a - Apprehension / Recognizing & Identifying

- **The proposed action can be developed by grouping together the actions according to the 5 stages**

- Stakeholders participation: proactive disclosure of information for facilitating coordination and negotiation among stakeholders reaching agreement on a plan.
- Identify potential priority areas.
- Inventory of initiatives already completed or in progress (TRaCK, Kimberley Water Plan, Kimberley Land Council, Broome Development Plan 2030, PhD in process, University engaged)
- Roughly estimate the available amount of water in the rivers basins and the extend of water use. If the basin water resources are used (previously) extensively, study in detail the natural or original capacity of the basin. Determine the water budget in the basin.
- Accounting for social, economic, and environmental needs and the demands and requests of various sectors, and future forecasts.
- Enhancing public awareness. (show various combinations of problems and solutions)
- Be selective when collecting data by setting priorities based on the problems
- Always keep eyes, ears and mind focused on the real situation in the field
- At this stage, recognize the necessity of IWRM process.

4.b – Vision / Conceptualizing

- Develop the capacity of a leader who can recognize problems, find necessary solutions, and implement them.
- Conduct interviews with relevant people/sectors can prove effective.
- Prepare an institutional framework to aggregate experience and traditional indigenous knowledge

- Harmonize related plans including those from outside the water sector (enlighten the hidden agenda, obtain full information for future full consent, ...)
- Take into account the appropriate balance among water-related sectors in the whole basin.

4.c - Proposals collaborative / coordination & detail planning

- Prepare multiple options which may be acceptable to stakeholders.
- Prepare a framework for stakeholders participation to build consensus among stakeholders
- Coordinate in such a way so that the resulting changes will be favourable for an equitable relationship among stakeholders. (in the event that the coordination process show no sign of reaching an agreement, return to the previous process and review the propositions as necessary).
- Consider ways, including policy interventions, to secure water supplies during extreme events.

4.d - Decision process / Reaching an agreement

- Determine the cost allocation acceptable to all stakeholders by ensuring that it is justifiable.
- Develop infrastructure with an eye to long term sustainability
- Continuously collect necessary data and share among stakeholders

4.e - Commitment to action / Implementing, Monitoring & evaluating.

- Continuously monitor and evaluate the effectiveness of IWRM activities (plans, projects, infrastructures, legal framework, organization, etc ...)in the basin.

This process can be renewed over the years.

In conclusion:

This case study is only the beginning of a process of research and action. It seeks to articulate the assumptions of research, required for integrated management that are transferable to any other part of the world water methodology.

Due to remoteness, hot tropics and arid deserts northern Australia has not experienced the intensity of colonial impost as the south. Many Australians view the north as wild wasteland that can be manipulated by technology for agriculture or resource extraction. Lurking deep within these ancient lands are mining corporations' extractive dreams: coal, uranium, bauxite, copper, iron ore, coal seam and shale/tight gas, diamonds, and other precious metals. The vast number and magnitude of potential resource projects is placing the region under overwhelming social, cultural and environmental pressure. Despite the attractive presentations on the mining companies' websites, mining often leads to the loss of connection to the land and of social ties for indigenous peoples (Hill et al, 2006, ref. 47). Moreover pollution generates public health problems. Calculating, assessing and managing water that can really be mobilized inevitably raises questions of governance, the implementation of scientific impact studies, and practical development of every unique and singular space (eg Nyikina Country). This issue concerns all potential or current operating resource extraction sites in the world particularly where indigenous peoples live.

Cape Town's V&A Waterfront Project

Adaptive Re-use as a Foundation for Sustainable Urban Renewal

Pieter VAN ZYL

Head of Department: Environmental Affairs and Development Planning
Western Cape Provincial Government
Cape Town, South Africa

Synopsis

The Victoria and Alfred Waterfront Project in Cape Town, South Africa, is an urban regeneration project that has over the past twenty-five years successfully transformed the historic and previously under-utilised part of the Port of Cape Town into the City's premier tourist, retail, entertainment, commercial and residential destination. This paper gives a brief historical overview of the project and its cultural and social context. It then describes how the new facilities for residential, commercial, retail and leisure uses have been developed, through adaptive re-use of harbour sheds, workshops and stores, while retaining the character of Cape Town's waterfront as a working harbour. The paper is a case study on how a development idea was turned into action – it will also describe how an innovative planning and land use management process (known as the "Package of Plans Process") has been used by the developer, Victoria & Alfred Waterfront (Pty) Ltd and the Cape Town City Council in facilitating an urban regeneration success story. The paper concludes with an assessment of the sustainability of the Victoria and Alfred Waterfront Project, which could be of benefit to other city and harbour authorities around the world.

1. Introduction

For over forty years some of the world's most innovative real estate developments have taken place at waterfronts. In port and riverfront cities such as Boston, Baltimore, San Francisco, Vancouver and Toronto in North America; Cardiff, London, Rotterdam and Barcelona in Europe; and Sydney, Brisbane, Melbourne, Singapore and Osaka in the Pacific Rim, waterfronts have become the new retail, leisure and entertainment destinations. Successful waterfront projects have re-established the rich cultural and historic links between land and water in many port and river cities across the globe.

About thirty years ago, those who lobbied for what is today Cape Town's Victoria and Alfred (V&A) Waterfront were regarded as idealistic dreamers. When Victoria & Alfred Waterfront (Pty) Ltd (V&AW) was formed in 1988 and work started in 1989, many Capetonians still said 'it will never happen'. Today, the project receives an average of 22 million visitors annually and commercially it has been South Africa's biggest real estate success story.

Furthermore, back in 1989 no financial institution was willing to provide finance for the project when it was announced. It required the backing of the project's then owner, State-owned South African Transport Services (later corporatised to become Transnet Ltd) to provide the initial funding of South African Rand (ZAR) 205 million to kick-start the development of the project.

The V&A Waterfront has given Capetonians a new sense of pride; it has exceeded expectations and it has earned its place as South Africa's most visited destination — bringing new meaning to the romantic description of Cape Town as the 'Tavern of the Seas'.

2. International and National Context

Situated at the southernmost tip of the African continent, South Africa covers an area of more than 1,2 million square kilometers. The terrain varies enormously from sun-scorched deserts, plains and mountains to lagoons and coastal wetlands. Climatic conditions vary from sub-tropical on the eastern coast to the Mediterranean-style climate of the Western Cape. South Africa is the most developed country on the African continent and is home to almost 52 million people.

Cape Town (with a metropolitan population of nearly 3,7 million people) is the legislative capital of South Africa. The City, also the capital of the Western Cape (which is one of the nine provinces of South Africa), is linked to the rest of the country by a modern infrastructure of road, rail and domestic air connections. Economic growth in the Western Cape is forecast to average 3.9% between 2012 and 2017. Finance, real estate and business services, as well as tourism and agriculture (mainly viticulture and fruit) are the economic mainstays of the provincial economy.

Cape Town's breathtaking scenery, pleasant climate, rich history and beautiful winelands make it a favourite for tourists. Many visitors are surprised at the leading edge technology available in Cape Town, with advanced satellite links, cellular telephone and electronic banking facilities. State of the art film and video production facilities as well as recording studios have also recently been developed in the City in response to growing international demand to use Cape Town as a base for film production.

The V&A Waterfront lies on the shores of Table Bay and has a dramatic physical setting against the backdrop of Table Mountain. With easy access to the central business district, Cape Town's two major freeway access routes and the Atlantic seaboard, the V&A Waterfront is favourably located from a business, residential and leisure point of view. The V&A Waterfront is easily accessible from most parts of metropolitan Cape Town and is within twenty minutes' drive from Cape Town International Airport.

South Africa received just over 9 million international tourists in 2012, a 10% increase over the previous year. The Western Cape received 1,3 million of these visitors, who spent ZA Rand 18.5 billion in the province (up nearly 2% from the previous year).

Cape Town regularly receives international tourism accolades and awards, with the following being the most noteworthy in the past year:

- Number Two City in the World, *Condé Nast Traveler Readers' Choice Awards 2012*
- Top City in Africa, *Condé Nast Traveler Readers' Choice Awards 2012*
- *Blue Flag Status 2012* – Eight beaches and two marinas.
- Best Beach Destination in Africa, *World Travel Awards 2012*
- The World's Top City in Africa and the Middle East, *Travel+Leisure World's Best Awards 2012*
- Fourth Top City in the World, *Travel+Leisure World's Best Awards 2012*
- Muizenberg voted One of *National Geographic's World's 20 Best Surf Towns*
- Table Mountain announced as a *New Seven Wonders of Nature*

3. Brief Historic Review

The developmental history of Cape Town's Foreshore and Waterfront has its origins in 1652, when the Dutch East India Company established a refreshment station at the Cape to serve its trading fleets en route to and from its colonies in Asia.

Table Bay is not a natural harbour. Although partially protected from the summer south-easterly gales, the winter north-westerly storms drove hundreds of ships aground with periodic tragic loss of life. The first Dutch commander, Jan van Riebeeck, built the first small jetty that remained in use until well into the 19th Century.

Another legacy from the Dutch period was the system of coastal fortifications constructed along the Table Bay coastline, to defend Cape Town against foreign invaders. Two of these fortifications, Chavonnes Battery (circa 1726) and Amsterdam Battery (circa 1794) were located within the area that now forms part of the V&A Waterfront property. The remains of these two fortifications were the subject of extensive archeological investigations. These remains now form an integral part of the Waterfront's cultural-historic landscape and have been and will be incorporated as features into new development projects.

Although the first British occupation of the Cape in 1795 transformed the local economy, very little harbour development took place before 1860. In June 1858 serious winter storms wrecked over 30 vessels in the bay. As a consequence, Lloyds of London refused to cover ships wintering in Table Bay, until a proper harbour structure was constructed.

In 1859 plans were approved by the Cape Governor, Sir George Grey, and the British Imperial Government for the construction of Cape Town's first harbour. On a sunny September 17, 1860 nearly all of Cape Town's inhabitants gathered at the Waterfront. Amidst a carnival atmosphere, Midshipman HRH Prince Alfred, Queen Victoria's second son, tipped the first load of stone to start construction of the breakwater for Cape Town's first harbour. It was a day of great celebration for the town's folk. Apart from the occasion of the first Royal visit to the Cape Colony, it was a significant day for Capetonians who had suffered the vexations, dangers and delays of the previously inadequate harbour facilities.

The Alfred Basin, the first of a number of basins providing shelter in Table Bay for shipping, was completed ten years later in 1870. However, almost immediately it was too small for the increasing fleets and growing size of the ships. Steam ships had replaced sail, while gold and diamonds had been discovered and the development of the South African hinterland had begun. A second basin, the Victoria Basin, was completed 35 years later and served as the gateway to Southern Africa until the mid-1930's.

However, nobody anticipated that Cape Town would lose its gateway status with the growth of air transport, nor did anybody anticipate that by the mid-1940's the City's reclaimed Foreshore would, in effect, cut off the old City from the sea.

In 1937 the South African Parliament approved plans for a new deep water harbour basin to be constructed to the south of the Victoria and Alfred Basins, with an associated extensive land reclamation project to create a new Cape Town Foreshore. Work started in 1938 and was completed in 1945, after being delayed by the Second World War. A 230ha tract of Foreshore land was created in the process for city expansion. City development on the Foreshore was extremely slow and by the 1970's much of the area remained as a treeless wasteland of sand and all-day parking areas. Furthermore, the Foreshore Freeway construction programme of the 1960's added an extensive elevated freeway system to facilitate access and vehicular movement around Cape Town's CBD, but it effectively also cut the city off from its historic water's edge.

Although the Victoria and Alfred Basins became the centre for Cape Town's fishing industry and smaller scale ship repair activities during the 1960's, the area also became increasingly isolated as a result of customs fences, as well as access control due to strategic oil tank farm installations, and by the 1970's the area had become quite derelict and significantly underutilised.

In 1984, after a visit to *The Rocks Project* in Sydney Cove, the then Mayor of Cape Town, Alderman Sol Kreiner, formed a Waterfront Steering Committee and started lobbying to re-establish the City's links with the sea. He also used his office to obtain permission for a festival in the historic harbour precinct, through which he hoped to focus public attention on the area.

It was as a result of this growing public awareness that a committee was established in 1985 by the Ministers of Transport Affairs and of Environmental Affairs and Tourism to investigate the potential for greater public use of harbour areas, in Cape Town and the other port cities in South Africa. The committee was convened under the chairmanship of Arie Burggraaf, SA Harbours' Chief Engineer at the time. The Burggraaf Committee reported on Cape Town Harbour in 1987, proposing that the historic docklands around Victoria and Alfred Basins be redeveloped as a mixed-use area, with the continuing operation of a working harbour. The Cabinet of the South African Government accepted the recommendations in full in June 1988.

In November 1988, Victoria and Alfred Waterfront (Pty) Ltd ("V&AW") was established as a wholly-owned subsidiary of Transnet Ltd to redevelop the historic docklands around Victoria and Alfred Basins as a mixed-use area with a focus on retail, tourism and residential development, with the continued operation of a working harbour. The main planning objective for the project was the re-establishment of physical links between Cape Town and its historic waterfront in order to create a quality environment; a desirable place to work, live and play; and a preferred location to trade and invest for Capetonians and visitors.

From an economic point of view, the historic part of the Port of Cape Town had become underutilised as a result of changing shipping technology and harbour expansion. A valuable land asset had to be converted to alternative uses, in order to generate value and income for the landowner. Extensive market research was undertaken, covering aspects such as retail demand, tourism opportunities, demand for hotel development and the state of the residential market along Cape Town's Atlantic seaboard.

4. Development Programme and Progress

After only a year of public consultation and participatory workshops, as well as negotiations to obtain Cape Town City Council's planning approval, redevelopment started at the end of 1989 with the installation of new services infrastructure. This was a victory for the citizens of Cape Town, who had campaigned vigorously in the late 1970's and early 1980's to reverse the isolation of the City from its waterfront as a result of land reclamation, railway lines and freeway construction. This general public support, as well as the proactive participation by the City Council and other authorities in the planning and design of the V&A Waterfront during the initial master planning stage, were critical elements to ensure a vital kick-start for the project.

Another vital element in the V&AW's overall development concept was the retention of the working elements of the harbour, which provide both vitality and an exciting backdrop to new development. These working harbour features include the harbour tugs, the pilot and fishing boats, as well as shipping traffic to the Synchronlift and Robinson Graving Dock. Authenticity has been a key objective in the replanning and design of the V&A Waterfront area and the restored fabric provides a rich maritime experience for visitors. This approach of valuing what already exists and employing adaptive re-use has been a foundation of the Project's commercial success, as well as for sustainable urban renewal.

The launch of the V&A Waterfront project in 1989 took place at a very difficult time in South Africa's history: It was towards the end of the minority Government rule, but it was still more than five years before the first democratically elected Government would come to power in May 1994. South Africa was politically isolated from the rest of the world and the country was in a general economic recession and experiencing a tumultuous socio-political transition.

There were no Government or Municipal subsidies to kick-start the V&A Waterfront project. It had to succeed commercially from the outset and had to be sustainable on the basis of the domestic support and acceptance of the project by the public of Cape Town. The North American waterfront precedents were encouraging, but nothing like this had previously been attempted in South Africa. Urban conservation, a key aspect of the development plan, was regarded by many to be over-idealistic and costly.

4.1 Development Goals and Objectives

The corporate ethic adopted by the V&AW for its initial Urban Development Framework in 1989 was to make the historic harbour of Cape Town a very special place for Capetonians and visitors.

To fulfill this ethic, the following **Project Goals** were set:

- Create appropriate public places within the V&A Waterfront;
- Develop the V&A Waterfront in ways which account for its special location, conditions and history; and
- Achieve financial self-sufficiency and the maximization of value through development and management.

The following specific **Project Objectives** were set to achieve these project goals:

- Create a rich and diverse environment;
- Promote tourism and recreation;
- Create residential development opportunities;
- Create a viable business base;
- Restore the historic link between the harbour and the City of Cape Town;
- Conserve and enhance elements with cultural significance;
- Improve public access to the waterside; and
- Adopt a flexible development programme that can respond to changing market trends.

4.2 Phase One

Although the initial urban planning covered the entire 123-hectare site, the first development phase focused on the Pierhead Precinct. Within this precinct the original Port Captain's Offices, the City's first Electric Light & Power Station, the warehouses and numerous smaller buildings and dwellings had suffered through years of insensitive and inadequate maintenance, and industrial use. The general environment retained the elements of a working harbour, while the rich fabric of crafted granite quay walls and timber wharves and jetties offered one of the most romantic settings in the City. The refurbishment of these buildings for the new uses took place during 1990, and was largely completed by Christmas of that year.

The Pierhead became the initial public focus of the Waterfront project and the building restoration programme introduced new uses such as restaurants, taverns, speciality shops, the V&A Hotel, a theatre, an arts and crafts market, and the national Maritime Museum into derelict harbour warehouses, workshops and stores. Some new marina moorings and hard and soft landscaping complemented the Pierhead's quayside ambience. The success of the first phase of the development, which would set the overall project on a trajectory of success, was to value what was already there and to employ adaptive re-use techniques in the design and tenanting of the buildings.

4.3 Phase Two

Phase Two of the project saw the completion of the 26,500m² Victoria Wharf speciality retail and entertainment centre at the end of October 1992. The additional restaurants, entertainment and speciality shopping provided the critical mass necessary to make the V&A Waterfront the most visited shopping and entertainment destination in the Cape Town downtown for locals, domestic visitors and international tourists alike.

The restoration of the buildings and other historic structures in the Portwood Ridge Precinct was also part of this development phase. The precinct is a treasury of buildings spanning almost a century from 1870 to the mid-20th Century. There were numerous residences, the earliest being the double-storey Dock House (1870), and the more modest Moorings 1 to 5 (1870-1889). There was also the 1901 Breakwater Prison. By 1905 they had been joined by double storey dwellings like Ulundi (1889), Windermere, Abbotsford, Kinellan, Pentridge, Parkhurst/Lotana and Alfred House – all had been linked with harbour or prison functions for almost a century. The houses have been converted to offices and hospitality accommodation.

The old Breakwater Prison was leased to and converted by the University of Cape Town into its new Graduate School of Business campus. This development included the 330-room Breakwater Lodge, as a commercial venture where accommodation not required for the Business School would be placed on the hospitality market. It has been a resounding success. During 1993 the Waterfront City Lodge hotel was opened and the Caltex service station and regional head office was also completed.

4.4 Phase Three

Phase Three of the project got underway in January 1994. During 1994 and 1995 the following major projects were completed: BMW Pavilion, Auto Atlantic BMW motor dealership, the Two Oceans Aquarium and the Granger Bay shore protection work

4.5 Phase Four

Projects which were completed during 1996 and the first quarter of 1997 comprised an 18,000m² extension to Victoria Wharf Shopping Centre, the 120-room, five-star Cape Grace Hotel on West Quay, where the New Basin had been created through the flooding of the oil storage tank farm, and the 330-room five-star Table Bay Hotel on Quay 6.

4.6 Phase Five

The planning approvals for Phase Five of the project were obtained from the Cape Town City Council during the latter half of 1999. This development phase had two major initiatives: Sector One of the V&A Marina residential development and a mixed use development in the Clocktower Precinct.

Upon completion, the V&A Marina luxury housing project would comprise of some 550 apartments and 150 moorings for yachts and other recreational craft in the heart of the V&A Waterfront. Construction on the first phase got underway at the beginning of 2000. It has proved to be some of the most sought-after new residential accommodation in Cape Town, with the first phase sold out off plan within less than seven months. The first residents moved in during the middle of 2001. Sector One of the V&A Marina, comprising of 10 construction phases with a total of 273 apartments, was completed at the end of 2004.

The development of the Clocktower Precinct has seen the integration of fishing industry activities with new uses such as retail, offices and a public ferry terminal to service Robben Island. Used at various times as a hospital, leper colony and a military base, Robben Island gained international recognition as the site of the political prison where former President Nelson Mandela spent 18 years of his life. The Island, declared a World Heritage Site at the end of 1999, is operated by the State as a museum and public visitor attraction. Linking it with the V&A Waterfront ensured a synergistic relationship between two of Cape Town's most important visitor attractions.

The first phase of the Clocktower Precinct project also included a 25,000m² corporate headquarters for the Board of Executors. The ground floor of the office project incorporated the historic ruins of the Chavonnes Battery, the Dutch coastal fortification dating from 1726. The balance of the first phase comprised the Nelson Mandela Gateway to Robben Island, a 1,000-bay parking garage, 5,600m² of retail shops and restaurants, 3,800m² of offices and 2,500m² of fishing industry uses. This development phase was completed in mid-2002.

4.7 Phase Six

Construction on Phase Six of the V&A Waterfront Project started in 2005 and was completed in 2009. This development phase comprises of the following projects: Sector Two of the V&A Marina residential development (230 apartments), Kerzner International's luxury 150-key One & Only V&A Waterfront Hotel, the 8,500m² Regional Headquarters of BP, a 12,000m² extension to Victoria Wharf Shopping Centre, a 1,600-bay parking garage and an extension to the V&A Hotel.

4.8 V&A Waterfront Sale Transactions

The mixed use character and proven commercial success of the project ensured a highly competitive international trade sale of the property in September 2006, when the owners (a consortium of State-owned transport and logistics corporation Transnet Ltd and its three pension and provident funds) sold it for an all-time South African property sales record of ZA Rand 7 billion. The new owners were a joint venture consisting of Dubai World's investment company, Istithmar PJSC (37,5%), a leading UK-based property company London & Regional Properties (37,5%) and a South African Black Economic Empowerment consortium (25%).

In 2007 the new owners announced their intentions to spend at least another ZA Rand 7 billion to extend the V&A Waterfront's development programme, ahead of the 2010 FIFA Soccer World Cup to be hosted by South Africa, and to also lure high-end international retailers to the Victoria Wharf Shopping Centre. However, when the global financial crisis struck in 2008, Dubai World ran out of money. By mid-2010, most of the offshore consortium's promises had come to naught. As a consequence, the V&AW owners were forced into looking for prospective purchasers and new investors.

In the latter part of 2010 the Government Employees Pension Fund (GEPF), represented by the Public Investment Corporation Ltd (PIC), together with Growthpoint Properties Ltd announced that they had concluded a deal to purchase, in equal proportions, the V&A Waterfront. The transaction represented South Africa's biggest single property transaction to date, with the new owners paying a combined investment of ZA Rand 9,7 billion. The GEPF is Africa's largest pension fund and has more than 1.2-million active members, around 318 000 pensioners and beneficiaries, and assets worth ZA Rand 819 billion. This effectively means that the V&A Waterfront is now owned by more than 1,5 million South Africans, as a result of GEPF's investment portion alone. Growthpoint is the largest South African listed property company and owns a portfolio of some 460 properties throughout South Africa and in Australia, spanning the retail, office and industrial sectors.

4.9 Ongoing V&A Waterfront Development

The new owners wasted little time in confirming their commitment to the ongoing development programme of the V&A Waterfront. In early 2011 they announced plans for the refurbishment of the Victoria Wharf Shopping Centre's Food Court and a further 25,000 m² expansion of the Shopping Centre, as well as the redevelopment of the Clocktower Precinct over the next four years. This latter development will establish a new professional business district at the heart of V&A Waterfront, while maintaining the heritage fabric of one of the oldest development sites in Cape Town. In addition to the refurbishment of the existing Clocktower Retail Centre, the other areas earmarked for development include the unused landmark Grain Silo buildings and the Collier Jetty alongside the retail centre.

The new developments already underway in the V&A Waterfront include:

- The 18,000 m² No 1 Silo Office Project, which is Cape Town's first 6-star Green Star SA rated building by the *Green Building Council of South Africa*
- Construction of 31 apartments, known as No 2 Silo Project
- The proposed redevelopment of the historical Grain Silo buildings into a multi-functional design-orientated space, which may include a design museum, gallery space, auditorium, public market and associated restaurants and shops. A hotel could also be included in the redeveloped Grain Silo space
- Conversion of the Portwood Square Office Building into 271 rental apartments

Further development at the V&A Waterfront is possible since it has nearly 604,000 m² of bulk development rights approved by the City of Cape Town. Approximately 64% (384,000 m²) has been developed and approximately 36% (220,000 m²) remains available for development. The new owners have recently announced that they plan to bring a capital injection of a further ZA Rand 500-700 million per year, for at least the next ten years, to develop the remaining undeveloped bulk.

5. Regional Economic Impact of the Project

Five independent research studies on the job creation impacts of the V&A Waterfront project have been undertaken since 1992. The findings are an independent assessment of the project's contribution to Cape Town's regional economy.

The last survey undertaken in 2004 showed that the total permanent employment at the V&A Waterfront, excluding the fishing industry and industrial activities, amounted to 11,100 jobs. Over 80% of the jobs are newly created jobs. Therefore, it represents real regional economic growth and not displaced growth. The fishing industry and industrial sector jobs within the V&A Waterfront is estimated at 4,220.

The cumulative permanent jobs at the V&A Waterfront are projected to grow to 12,270 by the completion of the development, excluding the jobs in the fishing industry and industrial sectors.

Employment in the V&A Waterfront's construction and development phases since 1990 has amounted to about 15,850 equivalent annual jobs, of which 50% were in the entry-level category of labourer. Over the project's estimated 30-year development horizon, a cumulative total of some 21,000 jobs are likely to have been sustained at the V&A Waterfront through the project's development and construction activities.

The research indicated that an employment multiplier effect of 3,1 is applicable to V&A Waterfront employment creation – therefore, for every new job directly created at the Waterfront, up to 2,1 are created indirectly elsewhere in Cape Town's economy. Similarly, the multiplier for construction is estimated at 2,9.

6. Principles for Sustainable Urban Waterfront Development

The classic definition of sustainable development from the World Commission on Environment and Development's 1987 report entitled *"Our Common Future"* (the *"Brundtland Report"*) bears re-stating: *"Sustainable development meets the needs of the present without compromising the ability of future generations to meet their own needs"*.

Sustainable development therefore has to do with the environmental, social and economic dimensions of urban and regional planning and, fundamentally, seeks to promote a better quality of life for both the community and the individual.

In the context of urban waterfront projects, two international organisations have jointly formulated principles for the sustainable development of urban waterfront areas. At the United Nations' Global Conference on the Urban Future (Urban 21) held in Berlin in July 2000, Wasserstadt GmbH (based in Berlin) and the International Centre Cities on Water (based in Venice) formulated ten principles that can be used to test and evaluate the sustainability of any urban waterfront project. They published the ten principles on the following website: http://www.ware-project.net/index.php?option=com_content&view=article&id=30:10-principles-for-a-sustainable-development-of-urban-waterfront-areas&catid=8:resources&Itemid=60 .

The ten principles are:

- Principle 1 – Secure the quality of water and the environment
- Principle 2 – Waterfronts are part of the existing urban fabric
- Principle 3 – The historic identity gives character
- Principle 4 – Mixed use is a priority
- Principle 5 – Public access is a prerequisite
- Principle 6 – Planning in public private partnerships speeds up the process
- Principle 7 – Public participation is an element of sustainability
- Principle 8 – Waterfronts are long-term projects
- Principle 9 – Revitalisation is an ongoing process
- Principle 10 – Waterfronts profit from international networking

7. The Sustainability of the V&A Waterfront Project

These ten principles have been applied to the V&A Waterfront Project in order to evaluate the key success factors and the sustainability of the project.

7.1 Principle 1 – Secure the quality of the water and the environment

The V&A Waterfront has retained the authentic working harbour character as part of the project's development programme and the adaptive re-use of the historic old dock buildings has created special character and ambience.

A sustained environmental management programme has ensured that the V&A Waterfront's harbour basins are cleaned on a regular basis to remove wind-blown refuse and tidal debris from the water. Resident V&A Waterfront seals have become an environmental attraction in their own right.

However, combined with the theatre of movement provided by pilot boats and tugs, as well as pleasure craft that provide charter trips on the bay, the sight and sound of a commercially working harbour environment is a never-ending source of attraction and entertainment for the visiting public.

7.2 Principle 2 – Waterfronts are part of the existing urban fabric

The V&A Waterfront was conceptualised by the V&AW and the City of Cape Town as an integral extension of the Cape Town's CBD and has contributed in a marked way to the revitalisation of the downtown during the past fifteen years. The V&A Waterfront is being developed in accordance with its unique location against the spectacular backdrop of Table Mountain. A sustainable planning and development vision was formulated that captures the unique selling features of the project, as well as the iconic location.

7.3 Principle 3 – The historic identity gives character

The collective heritage of the water, the historic dockland buildings and the unique working waterfront ambience has been integrated to provide an authenticity which has avoided a 'theme park' development – Cape Town's Waterfront is a real place. The preservation of the industrial past is an integral element of the sustainable development. A key success factor of the project, and arguably the most critical, has been to value what was already there and to employ adaptive re-use techniques in the design and tenancing of the buildings and their integration as key elements in the development plan.

However, as with any property investment, the primary reason for the successive shareholders' ownership of the V&A Waterfront is to earn a return on the capital invested. All other benefits that may accrue, such as the restoration of the historic buildings and structures, and the value of the V&A Waterfront to the Cape Town economy, will be relevant to the shareholders only if they continue to add value to their investment.

7.4 Principle 4 – Mixed use is a priority

The V&A Waterfront has been developed with a view to creating a mixed-use property portfolio with residential, retail shops, offices, entertainment, hotels and industry all co-existing side by side, in a controlled environment. Development and investment focus has been created through anchor projects with critical mass that has established the property's mixed-use development concept. Likewise, the focus on tenancing the various buildings has been on establishing a high impact mix of entertainment facilities, which includes shops, restaurants, cinemas and museums, as well as special visitor attractions (such as an aquarium, tourism and visitor centres), offices and residential apartments. A robust retail and entertainment tenant selection programme ensures a diverse and vibrant activity mix – this is essential in order to retain market share and sustained growth, leading to the financial success of the development.

An important ingredient for commercial success is that a waterfront project should ideally have a single management structure. It is essential that there be centralised control over the tenant mix and the variety of activities or uses. In the case of the V&A Waterfront, the retention of the property as a single management unit under the control of one owner has prevented any potential conflict that could have occurred if the property had been subdivided and sold to several owners.

The V&A Waterfront's experience has also been that the project should be market-driven in order to be commercially viable and therefore economically sustainable – the V&AW has never had the benefit of any national or regional government subsidies or special project grants.

7.5 Principle 5 – Public access is a prerequisite

The V&A Waterfront is both physically and visually accessible to locals and tourists of all ages and income groups. The property has good vehicular access and adequate public parking (over 8,500 parking bays). The V&AW has exceeded its target modal split of 30% for public transport and non-motorised transport (walking and cycling) – the weekday morning peak achieves 42% and the afternoon peak period 35%. This has been achieved through a sustained encouragement of public transport by the V&AW, through the provision of infrastructure such as tour coach holding areas, sedan and mini-bus taxi ranks, a bus station and high quality pedestrian corridors and routes that link the CBD through the various V&A Waterfront precincts to the quayside edges, public squares and promenades.

This high level of public access also underpins the commercial success of the V&A Waterfront project. Public visitorship since the commencement of trading at the V&A Waterfront at the end of 1990 far exceeded the initial expectations. The project has had sustained high levels of visitorship for over 22 years and the V&A Waterfront has now become Africa's most visited destinations, with an average annual visitation of over 22 million people.

Extended trading hours for businesses and visitor attractions offer special visitor appeal and also allow tenants such as restaurateurs to trade beyond the traditional lunch and dinner time, which increases turnover and smoothes out peaks and valleys in trading patterns. The V&A Waterfront pioneered extended trading hours in South Africa, from 09h00 to 21h00, seven days a week. This is strictly enforced in terms of the tenants' lease agreements.

The V&A Waterfront strives not to be a tourist trap where Capetonians and local patrons feel alienated. Recognising the need to cater for both the local and tourist markets, the V&AW believes that visitors will seek out the places favoured and frequented by locals. One of the management strategies employed to ensure repeat visits by the local population has been the V&AW's sustained programme of special events and promotions. This is essential in order to retain market share and the repeat visitation of the locals, which is a requirement for sustained commercial growth. The V&AW also places a high premium on safety and security of property and visitors alike.

7.6 Principle 6 – Planning in a public/private partnership speeds up the development process

Since its origins in 1860, the Port of Cape Town has been the scene of excavations, reclamation, harbour construction programmes and land based developments. Over the past 153 years, the harbour has undergone numerous changes and today that process is continuing with the redevelopment of land and buildings surrounding the original Victoria and Alfred Basins. The V&A Waterfront project was the culmination of nearly three decades of planning and development proposals.

In the case of the V&A Waterfront the respective roles for the public and private sectors were clearly defined from the outset. The Cape Town City Council was the enabling, statutory local authority responsible for the urban planning approvals and the provision of municipal services up to the boundary of the development site. The V&AW, as the landowner and developer, was responsible for the planning, design, development and management of the waterfront project.

However, the City of Cape Town made an enormous contribution in terms of its planning support for the project, by agreeing to establish a flexible urban planning approach to land use management – referred to as the “*Package of Plans Process*”. This was a critical factor during the project’s initial start-up period, as well as during the ongoing development programme. This unique urban planning framework, with its flexible use rights, allows the development plan to be adjusted over time to meet changing market demand. The “package” or hierarchy of plans typically consists of the following plans and policy documents: Contextual Framework, Development Framework, Precinct Plans, Site Development Plans and Building Plans.

At the commencement of the project in 1990, the City of Cape Town’s then Deputy City Planner, Peter de Tolly, noted the following as the City’s key objectives for the V&A Waterfront project and the “Package of Plans” planning approach:

“Cape Town’s Central Waterfront is one of the chief potential amenities and economic resources of the City and the region. Council’s overarching goals for the Central Waterfront are to promote increased public enjoyment and use of the area and to promote economic development and job creation by ensuring that future developments and activities will help to achieve the following objectives:

- *Increase the physical, perceptual, functional and jurisdictional integration of the Central Waterfront with the rest of the City, for all segments of society.*
- *Increase public use and enjoyment of the Central Waterfront by extending the richness, diversity and activity of City life to that area, through new residential, institutional, recreational and commercial development.*
- *Increase and improve public access and open space along the water’s edge and within the Central Waterfront.*
- *Promote economic development and job creation in the Central Waterfront through development in the fields of tourism and recreation, financial services, commerce and light industry.*
- *Protect the role of existing compatible land uses and public utilities in the Central Waterfront as a source of industrial and commercial income and jobs.*
- *Provide aesthetic, environmental and infrastructural improvements.*
- *Promote public/private sector cooperation to achieve financial viability and development of underutilised assets.*

“The Package of Plans approach as developed and used by the City of Cape Town has been designed to serve and reconcile the key interests of each of the public and private sectors. Properly undertaken, the Package of Plans approach should provide both strategic direction and operational flexibility and result in a development of quality and appropriateness, which takes full account of its special location, conditions, environment and history, and which becomes integrated over time into its adjoining city. It will ensure that development derives from a public-private partnership which brings together the relevant government agencies, local authority and private sector investors, developers and publics and which has reconciled and achieved their respective interests.”

The historic cooperation between the City of Cape Town and the V&AW has enabled the City to achieve its Central Waterfront development goals and objectives and the V&AW to realise a commercially successful project.

The V&AW continues to act as the developer of the V&A Waterfront project and also as the property manager – managing the site in terms of tenancing, security, cleaning, maintenance, marketing and administration. Tenants are secured by way of leases ranging from monthly to 99-year lease periods. The V&AW must ensure that real value is added with each investment and that there is continued overall growth in the total investment under management.

The V&AW is responsible for monitoring the pace of development and new buildings are only put up in response to market demand. The rate of development has not been governed by a capital expenditure budget, but by the dictates of the market as interpreted within the guidelines of the overall vision and development plan. A key aspect of the development strategy was the decision to avoid random growth by concentrating the initial development – the V&A Waterfront's initial development was concentrated in the Pierhead Precinct and the project '*started small in the biggest possible way*'. It has grown from there in the most integrated way possible.

7.7 Principle 7 – Public participation is an element of sustainability

The preparation of the V&AW's original Development Framework in 1989 ran in parallel with detailed traffic and infrastructure analyses and was the subject of extensive public participation. City officials from all departments, including finance, engineering, building survey, traffic and transportation and urban planning, were also involved in the process. Public participation included meetings with the local Member of Parliament, City Councillors, public officials, various business organisations, conservation bodies and professional associations. There was also extensive coverage of the draft Development Framework in the local press and media, therefore giving adequate opportunity for the public to express their views before the V&AW was granted its development rights by the local authority.

In addition to the above processes, the V&AW also established and voluntarily maintained a Waterfront Liaison Forum for the first seventeen years of the project. The Forum, comprising of 25 civic, business, conservation and professional non-governmental organisations, reviewed and commented on all major developments in the V&A Waterfront between 1989 and 2006. Another V&AW-initiated review group, the V&AW Design Review Committee, also made a significant contribution to the design quality and success of the V&A Waterfront project, including the urban design, architectural design and landscape design.

Cities should benefit from waterfront development not only in ecological and economical terms, but also socially. International best practice indicates that a crucial part of the enduring success of any waterfront development is the hosting of a sustained programme of entertainment and special events. The V&A Waterfront hosts large-scale events like the series of weekly concerts during the summer season provided by the Cape Town Philharmonic Orchestra, as well as the annual Waterfront Jazz Festival.

These free concerts are immensely popular and draw up to five thousand people who gather at the Waterfront Amphitheatre. There are also regular choir performances as Cape Town has a tradition of choral singing, as well as jazz concerts and appearances by international and local artists.

Buskers, which include street musicians, dancers, acrobats, mimes, jugglers and magicians, also provide an important entertainment drawcard. They are initially auditioned by the V&AW and for those who qualify to perform, the V&A Waterfront has become a source of continued employment as well providing, in some cases, an opportunity for furthering their entertainment careers.

The V&A Waterfront, as a Western Cape tourism industry leader, strives to complement the Cape's other attractions by promoting assets such as the wine, flower and fruit industries, both in terms of annual special events and with appropriate speciality shops and restaurants. The annual Waterfront Wine Festival is a calendar highlight.

7.8 Principle 8 – Waterfronts are long-term projects

In terms of ensuring long term sustainability, waterfronts need to be (re)developed in a planned and integrated manner and must also respond to market potential and demand. This ensures that the entire City benefits from the strategic potential of the waterfront resource. Most waterfront projects are very large in scale and impact and therefore the development objectives should be realizable in terms of long term economic cycles and not just with short-term gains and interests in mind.

The V&A Waterfront project entails the redevelopment of a 123 ha property, with almost 604,000 m² of development rights ("bulk"). By the end of 2012, 22 years after construction on the project was started, about 60% (nearly 364,000 m²) of this development entitlement had been implemented. During the period 2006-2011 the property twice changed ownership and the global economy experienced a downturn of crisis proportions. It has now been estimated that the V&A Waterfront is likely to be fully developed by 2023 – some 35 years after the project was launched in November 1988.

7.9 Principle 9 – Revitalisation is an ongoing process

The redevelopment of waterfronts is a highly complex task that involves professionals from many disciplines. The initial master planning of the V&A Waterfront project was undertaken by a multi-disciplinary team comprising of urban planners, urban designers, market researchers, urban economists, environmentalists, architects, landscape architects, quantity surveyors, urban conservationists, marine engineers, civil and electrical infrastructure engineers and structural engineers. A development vision was formulated which formed the basis of the 1989 Development Framework. As previously noted, the flexibility of the "Package of Plans" planning approach has enabled the development programme and the urban planning to respond to the changing market demands and trends over the past 24 years. This flexibility has facilitated the regular review and application of the original vision for the project and the rejection of financial expediency, which could easily have sidelined this vision.

The V&AW has been responsible for the planning, development and management of the V&A Waterfront project in Cape Town since 1989. During the past 24 years the V&AW Management Team has developed strong capabilities and experience on waterfront and marina projects, based on the disciplines of market research, planning, architectural design, construction management, leasing, marketing and property management.

7.10 Principle 10 – Waterfronts profit from international networking

The exchange of knowledge through an international network of waterfront developers and operators offers support and information about the most important projects being completed or underway. The V&AW has established an extensive network of international project associates and through regular contact and repeat visits to these projects, the latest trends in waterfront and marina design, development and management strategies are monitored and incorporated into V&AW projects.

In the early 1990's the V&AW benefited from visits to San Francisco, Boston, Baltimore, Vancouver and Sydney. Probably the biggest lesson learnt in this review of international waterfront projects is not to look for the quick-fix solution or to adopt a formula that may have worked somewhere else. The V&AW has consciously strived for distinctiveness as it has undertaken the challenge of converting and conserving Cape Town's waterfront resources. Learning from the successes and failures of other pioneering international waterfront projects contributed to the V&A Waterfront being successful. Today, the success of the V&A Waterfront project has made it an international benchmark in its own right.

8. Conclusion

What was a loss-making asset for the owner of the Port of Cape Town in 1988, has become a vibrant and profitable property development project that enjoys an enviable international profile. The charter agreement between the V&AW and the City of Cape Town started with a simple goal: *“To make the V&A Waterfront a very special place for all Capetonians”*.

Twenty-five years after the adoption of this important civic developmental goal, it is clear that the V&A Waterfront project has succeeded admirably in achieving this goal in a sustained way.

The V&A Waterfront is not a theme park – it is a real working harbour, but with a difference. The dry dock and ship repair facilities, the fishing industry and the harbour operations, tugs and pilot boats all contribute to providing a theatre of movement for the visitors and assist in ensuring that it functions as a real peoples' place. There are promenades, piazzas, squares and landscaped gardens which create vibrant spaces in between the pubs, restaurants, shops, cinemas, museums, offices, hotels and residential apartments.

A key success factor of the project, and arguably the most critical, has been to value what was already there before the urban revitalisation project started and to employ adaptive re-use techniques in the design and tenancing of the buildings and other structures and elements of heritage value.

Although it has become Africa's top tourist destination, the V&A Waterfront has achieved much more than that – it has re-united Cape Town with its proud maritime heritage. The success of the V&A Waterfront project has placed Cape Town on par with other international waterfront cities such as San Francisco, Boston, Baltimore, Vancouver and Sydney, which are all highly liveable cities and major tourist destinations.

Endnote

Between 1990 and 2007 the author was the first Planning and Development Executive and member of the management team that developed the V&A Waterfront Project in Cape Town into one of the world's foremost mixed-use waterfront projects. His management responsibility at the V&AW was to integrate the project conceptualisation, urban planning and urban conservation aspects of the V&A Waterfront Project, to obtain the statutory planning, environmental and heritage approvals from the various Government authorities, as well as to manage the development of the retail, commercial, industrial and hotel projects in the V&A Waterfront. During this period he oversaw a development portfolio of ZA Rand 2,5 billion. Between 1998 and 2005 his professional experience with the V&AW also included work as an advisor on a number of international waterfront projects. He travelled extensively to study international waterfront, residential marina and urban revitalisation projects, with a focus on city planning, urban design, urban conservation and city management. The views expressed in this paper are those of the author and do not necessarily represent the views of the Western Cape Provincial Government.

Analysis of the Spatial Characteristics of Commercial Streets in China's Southern Cities:

A Case of Three Commercial Streets in Suzhou

(The Spatial Characteristics of Commercial Streets in China's Southern Cities)

Gang WEI, Zhaohui JIANG,
China Academy of Urban Planning and Design, Beijing, China

1. Introduction

1.1 *Urban Identity Crisis*

In the context of globalization, information transmission and cultural dissemination have been quickening their speed. Starting from the modernism in 1920s, they have exerted significant influence to the architecture, landscape and urban construction of various countries and localities. Concise and easy-duplicated geometric shape, building material with high productivity and modulation, and the rapid assembled construction mode enabled the cities at different localities have similar features, but city characteristics was weakened with each passing day. In 1999, the Union Internationale des Architectes (UIA) showed its concern to the dilemma faced by cultural and regional characteristics in the Beijing Chapter, afterwards which the issue of city characteristics led to more and more concerns and practices.

In the past decades, China's urban construction has experienced a rapid development stage of growing out of nothing, whereas in recent years the resource restriction, changes of industrial types, and the increase of the people's cultural quality called for transition of the city. In future competition and development, cities need to find their positions, highlight prominent features and form differences, so as to win a better development space.

At present, many cities in China have recognized the importance of city characteristics, yet when it comes to materialized space there may exists some bias, resulting in improper construction activities such as removing real historic relics while building *fake antique* and blindly building small towns with exotic atmosphere. These activities not only create unpleasant physical environment, but also waste and damage resources. To this situation, the author upholds that Suzhou has something worthwhile to contribute the shaping of city characteristics. Through field investigation and research analysis in the characteristic commercial street in Suzhou, it can be seen that urban characteristic commercial streets of high quality plays positive roles to various aspects of the city, and deserves being studied.

1.2 *The Concept of Urban Characteristic Space*

The differences between *city feature* and *city characteristics* are quite obvious. *City feature* emphasizes the internal and external expression of the cities, rather than the distinctiveness. Every city has its own style and features, regardless of good or bad. The expression of *thousand cities with one feature* is often seen in Chinese media, which refers the fact that the features of many cities are roughly the same; but *city characteristics* emphasizes internal and external differences of the cities, and the environment corresponding to the distinctiveness of the city, including natural environment, cultural environment and social environment.

The city's materialized space is an important carrier of city characteristics, and specific city characteristics can be recognized by using the urban space. To put it simply, *urban*

characteristic space is the space that can reflect city characteristics. To grasp the urban characteristic space, there is not only the need to take a look at the *surface* of the distinctiveness, but also the need to look at the *inside* of natural, cultural and social environment reflected from behind. Thus, urban characteristic space shall be the urban public space which can harmoniously coexist with natural environment, and reflect the characteristics of local culture and the history.

1.3 Characteristic Commercial Streets in Suzhou

Suzhou is one of the first-batch historic cities, and is also a modern city with fast economic development. In recent years, many urban characteristic spaces have been emerged in various places in Suzhou. Among the urban characteristic spaces of various types, characteristic commercial street is not only an important place to serve the general public and pool talents, but also a platform to display the essence of urban construction and the epitome of urban development, exerting important influence in urban development.

As a representative urban characteristic space, the characteristic commercial street functions as the parlor and business card for a city. The three characteristic commercial streets in Suzhou—Ping Jiang Road, Shan Tang Street and Li Gong Di are widely known. From 2009 to 2010, with their own prominent features, these three commercial streets were rated as *National Street*, with great importance of demonstration. With different resource endowments, the three commercial streets choose different path of development, which can be summarized and compared as follows (Table 1).

Table 1 Comparison on developing modes of Ping Jiang Road, Shan Tang Street and Li Gong Di

Classification	Characteristic commercial street	Type of planning and redevelopment
Historical block + Creative culture	Ping Jiang Road	Protectively renovating and transforming the historical and cultural block, protecting and retaining the characteristic style and features, and inviting outside investments step by step
Historical block + Scenic spot	Shan Tang Street	Protectively restoring and transforming the historical and cultural block, protecting and reshaping the characteristic style and features, and inviting outside investments one-time
Natural landscape + Characteristic commercial activities	Li Gong Di	Developing commercial real estate of the scenic spot, reestablishing and reshaping the characteristic landscape, style and features, and inviting outside investments one-time

2. Spatial Attributes of Urban Characteristic Commercial Street

By studying the three characteristic commercial streets in Suzhou, the paper summarizes four spatial attributes of the urban characteristic commercial street.

2.1 Publicity

Publicity is a prerequisite of realizing characteristic spatial functions. As an important part of the urban public spatial system, urban characteristic commercial street is the space with convenient access and free activities. Thus, it's often in inner part of urban functions, with more concentrated cultures, frequent commercial activities and unique landscapes.

The three characteristic commercial streets selected in the paper are all of this kind. Ping Jiang Road is adjacent to the municipal commercial center of GuanQian Street; Shan Tang Street is located outside the old town of ChangMen and adjacent to the lower-level

commercial center of ShiLu Pedestrian Street; and Li Gong Di is located at the northwest of Jinji Lake of the Industrial Park, belonging to an important part of Central Business District Around the Lake, and adjacent to the Huxi CBD. The three characteristic commercial streets all enjoy convenient transportation, especially public transportation, which ensures better publicity.

2.2 Difference

The *difference* of urban characteristic commercial street can be reflected in the following two aspects.

The first aspect is the difference compared with other space. Characteristic commercial street often has one or more unique spatial and functional elements, e.g. natural landscape, historical site or unique functions (like pedestrian-friendly, concentration of specific commercial activities, etc). In addition, the space of characteristic commercial street often has high artistic and aesthetic values.

The second aspect is the difference compared with other geological space. The big geological difference can be the East and the West, the northern China and Southern China, Southwestern China and Southern part of China, etc.; the small geological difference can even be *ten miles cover different style, and hundred miles cover different customs*. The different geological urban space may also have varied features due to the differences in cultural background, geography and weather. Previously, geological different is natural, and only the wave of globalization reduced the geological difference. Now, we need to consciously protect geological difference.

From these three characteristic commercial streets, it can be seen that Ping Jiang Road and Shan Tang Street have profound historical background, with intact spatial pattern, relatively unified architectural features, numerous historic relics with historic preservation, and prominent historical resources compared with ordinary urban places (Figure 1). Although Li Gong Di has less prominent historical origin compared with the first two commercial streets, it is situated at the lakeside of Jinji Lake, as the only long beach of the lake, with broadened horizon, ripples, beautiful scenery, and unique natural resources.

Figure 1: Distribution map of historical and cultural heritage in Pingjiang Historical and Cultural Block

Figure courtesy: <http://www.suzhou.gov.cn/>

2.3 Reflection

The *reflection* of urban characteristic commercial street is mainly shown in the three aspects. The first aspect is the representation of natural environment, i.e. the reflection of space to such natural features as landform and hydrology. The second aspect is the representation of historical culture, i.e. the reflection of space to regional cultural background and local historic culture. The third aspect is the representation of the characteristics of times, i.e. the reflection of space to modern functions, modern technologies and creative thinking.

If the urban commercial street can reflect one of the above aspects, it will be excellent. And if it can reflect these three aspects at the same time, it will be perfect. The three characteristic commercial streets in Suzhou reflect the three aspects at varied degrees.

So far, Pingjiang Historical and Cultural Block is an area with utmost integrity in Suzhou ancient town. Compared with the Pingjiang Map (Figure 2) at Song Dynasty, the Block basically follows the layout since Tang and Song Dynasties, with the corresponding names of most of the streets, watercourse and bridges. The historical features of the Block, with such historical relics as moat, wall, watercourse, bridge, street, dwellings, gardens, club house, temple, ancient well, ancient trees and memorial archway, all reflect the characteristics and values of Suzhou ancient city, especially the urban pattern of *double chessboard* with land and water, which is specifically reflected in Pingjiang historical block, and referred as the epitome of Suzhou ancient town. The modern cultural-recreation-oriented investment attraction enabled the old street to show fashionable and modern features.

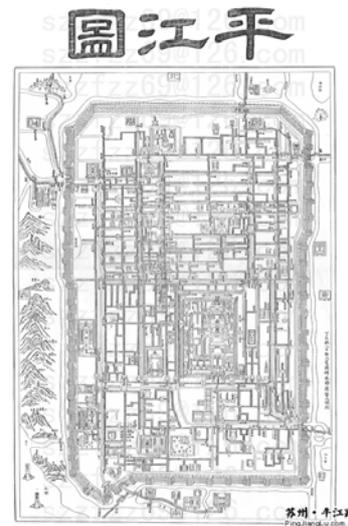

Figure 2: Pingjiang ancient map

Figure courtesy: <http://www.pingjianglu.com.cn/>

Shan Tang Street was established in 825, with a history of 1282 years. It is adjacent to the ancient town of Suzhou, with Chang Men mentioned in the novel of Dream of Red Mansions in its east, and *the First Scenic Spot of Wuzhong Tiger Hill* in its west. It was build when the poet Bai Juyi served as the feudal provincial governor in Suzhou, and in history it has many shops, gardens and villas, with a thousand of dwellings by the riverside and gaily-painted pleasure-boat and playing and singing throughout the four seasons. Hilly Pond in former Times is the best place for residents of Suzhou to enjoy outskirts recreation, with rich and colorful material relics and precious historical origin. Till now, it's still featured by Suzhou specialties and old and famous shops, and receives warm welcome from the tourists.

Li Gong Di is the only long beach of Jinji Lake in Suzhou, which is the biggest lake of inner city, with a length of 1400 meters. During the Guangxu years, it was build by the then county magistrate Li Chaoqiong, who organized the people to build the long beach and planted the willows at the beach to consolidate the dike. This long beach was called Li Gong Di by the later generations, and became the excellent spot of Jinji Lake. Now, through three-phased development, it has formed the commercial features by taking catering of various style, characteristic bars and cultural industries as the main part (Table 2).

Table 2 Comparison of featured resources of Ping Jiang Road, Shan Tang Street and Li Gong Di

	Natural resources	History-related resources	Planning and positioning	Graphical representation
Ping Jiang Road	The outer city river has few effects on the view, the inner part is the small scale river system in chessboard type, but the water quality is found bad during the survey.	It has profound historical origin, intact pattern, with many famous people and former residences of celebrities, and rich history-related resources	Rationally utilizes the historical and cultural resources of the block, develops the tertiary industry with cultural connotation and high quality, and makes it to be urban vitality belt with unique cultural landscape	

<p>Shan Tang Street</p>	<p>Land and water running parallel, with Tiger Hill in the west. Natural resources are excellent, but the water quality of core commercial section is bad.</p>	<p>Having a long standing reputation in history, with numerous allusions, historical sites along the way, and rich history-related resources</p>	<p>As the epitome of old Suzhou, window of Wu Culture, street in heaven ; having unique <i>water street of ancient city</i></p>	
<p>Li Gong Di</p>	<p>The only long beach of Jinji Lake, with water fronts at both sizes, landscape is beautiful, natural resources are rich</p>	<p>Has certain historical legend and allusion, but with no historical relics, history-related resources are relatively in sufficient</p>	<p>International-featured commercial water street, integrated with featured catering, sightseeing, recreation and culture ; recreation bars, entertainment, dynamic area ; pro-water Street Mall</p>	

2.4 Artistry

As a carrier of widest public activities, urban characteristic commercial street needs to satisfy the public aesthetic requirements, enabling the people to have physical and mental pleasure and gain resonance and inspiration towards aesthetics. Wide and in-depth public participation is the effective channel to solve the public aesthetics. In addition, the artistry of urban characteristic commercial street has the property of participation. Along with the time and the participation of the users, urban space will accumulate more artistic connotation.

During the protection and renovation, Pingjiang Historical and Cultural Block insists on the four principles of *authenticity, integrity, interpretability, and sustainability*, trying to respect the original historical environment and retain structure frame and restore the interior and exterior to retain the historical rudiment of renovation. At present, the constructions of both sizes of Ping Jiang Road have proper scale, unified architectural style and the antique flavor of architectural material and detail, forming sound historical architecture feature (Figure 3).

Figure 3: Ping Jiang Road Photos

During the protection and renovation period, Shan Tang Street adopts the principle of *rescue comes first and taking protection as the main purpose and restoring the old as the old* to renovate the constructions along the Shan Tang Street. The survey found out that compared with Ping Jiang Road, the constructions of Shan Tang Street have some changes before and after the renovation, in order to satisfy the demand of commercial development and tourism development. Yet, at present, the overall construction still has strong historical features, with unified style and sound features(Figure 4).

Figure 4: Shan Tang Street Photos

Before development and construction, Li Gong Di has not so many historical relics. During the planning and design of first phase, it introduced classical and traditional architectural space symbols by learning from the traditional construction and environment shaping methods, and applied modern means to express, forming the modern Suzhou-style construction featured by whitewashed wall and black tiles and small bridge over flowing stream; the construction style of second phase is the same as that of the first phase, with construction style, color and material more modernized and having traditional features; the third phase adopts modern European style construction feature, to satisfy the requirement of comprehensive environment feature (Figure 5).

Figure 5: Li Gong Di Photos

3. Values and Significance of Urban Characteristic Commercial Street

The four spatial attributes of the urban characteristic commercial street determine the most essential part of city space. These locations are always the most concentrated and advanced place of various urban economic, social and cultural activities. The values and significance of the urban characteristic commercial street are all-around.

3.1 Economic Aspect : Source for Raising and Stimulating City Vitality

The significance of urban characteristic commercial street to urban economy can be reflected in two aspects. Firstly it can strengthen a city's competitiveness. Given the attractiveness and cohesion resulted from the featured advantages that are suitable for commerce and tourism, the characteristic commercial street becomes favorable capital of urban competition. At the same time, the characteristic commercial street is always the carrier of such emerging economies as urban tourism economy and creative economy. Take Tianzifang old block for instance, it attracts a great many of creative talents and creative activities.

Secondly it stimulates regional development potential. By its own development, urban characteristic commercial street can play the role of catalytic agent, activating the potential of surrounding blocks and cities from point to area, becoming the business card of the city and putting forward the development of the whole regional economic development of the city. Since the southern cities of China have rich water resources, enhancing the city vitality and reviving urban economy by renovating water front districts means to utilize the advantage of easy formation of the characteristic commercial street in the water front districts.

Before the development, the three characteristic commercial streets at Suzhou have all carried out commercial planning and design, invited outside investments according to the development orientation, and formulated relevant investment attraction threshold. Along the commercial streets there are basically commercial and cultural facilities (Figure 6). By comparative research, it found that all of the three commercial streets have concentrated and featured commercial activities, although the types of commercial activities and concentration degree are varied (Table 3).

Figure 6: Chart on current land usage of Ping Jiang Road, Shan Tang Street and Li Gong Di

Figure courtesy: <http://www.suzhou.gov.cn/>

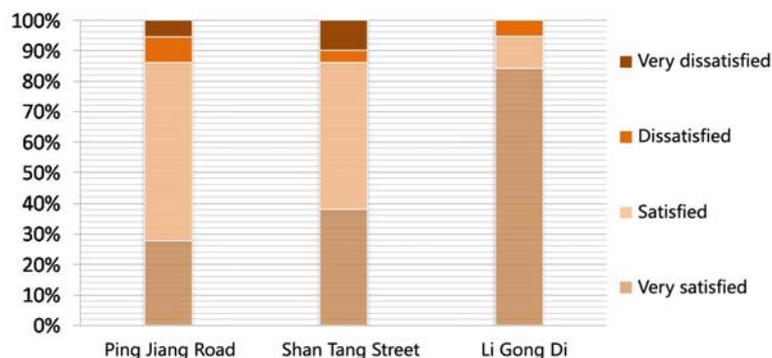

Table 3 Comparison of commercial activities of Ping Jiang Road, Shan Tang Street and Li Gong Di

	Ping Jiang Road	Shan Tang Street	Li Gong Di
Component ratio			

In terms of commercial activities, in Ping Jiang Road and Shan Tang Street, the commercial retail takes 54% and 64% respectively, followed by catering industry and cultural facilities, in Li Gong Di the catering industry takes 63%, then commercial retail with 12%, and cultural facility 12%. In terms of the scale, the commercial space of the three characteristic commercial streets have reached the scale of district-level commercial center, and become important component of urban public commercial service system.

At present, the three commercial streets operate smoothly, with sound revenue and relatively high satisfaction of the operators, all above 85% (Table 4). Furthermore, since Ping Jiang Road is located at the old town of Suzhou, it has close relationship with the residents of surrounding communities. 44% of the residents of surrounding communities of Ping Jiang Road upheld that the development of Ping Jiang Road increased employment opportunities of the residents, 37% upheld that their income has been increased. Thus, the urban characteristic space represented by the characteristic commercial street can promote the economic development of surrounding areas to a certain extent.

Table 4 comparison chart of operators' satisfaction

3.2 Social Aspect: Public Place for Concentrating and Recognizing Collective Memory

As public space, the urban characteristic commercial street is an important place for citizens and tourists to have public activities and exchanges. During the long process of being material carrier of social activities, it fully represents the social relations and ethical order of the times, with sense of belonging and identity to the city. To China, a country with rapid urbanization, the characteristic commercial street has been a patch of pure land to stick to urban collective memory.

The elegant and amiable sceneries, quiet and comfortable atmosphere and the varied recreational commercial activities enabled the three characteristic commercial streets in Suzhou to be not only bustling and busy streets, but also places for recreation and get-together. According to the survey questionnaire to Ping Jiang Road and Shan Tang Street, "love of historical and slow life style" is the main reason for the residents to choose here.

3.3 Cultural Aspect: Vigor Highland for Inheriting and Developing City Spirit

The famous remark *once I take a look at your city, I will know the pursuit of its people* reveals the material spatial environment of the city actually reflects the internal culture and spirit of the city. The aesthetic taste toward the elements of the space, the attitude towards historical relics, and the considerations of people's usage demand reflect the taste, connotation and

values. As a representative place of the urban space, the characteristic commercial street is the concentration place of the city's culture and spirit.

The three commercial streets in Suzhou have their own features in cultural cultivation. The historical spatial layout and environmental advantages of Ping Jiang Road are very outstanding. Thus, in the continuation of historical culture, it mainly needs to protect the historical environment and cultivate real historical atmosphere, and introduces such cultural facilities as the museum of storytelling and ballad singing in Suzhou dialect and the museum of Kunqu opera(Figure 7).

Figure 7: Museums on the Ping Jiang Road

Shan Tang Street is famous in history, with numerous allusions, hence the exploration and utilization of its cultural connotation is the priority of renewal. The exploration of folk culture mainly needs to actively introduce the local featured handicraft (such as embroidery, Suzhou-style fan, wooden carving, stone pot making, etc), set up restaurants with authentic Suzhou cuisine and the venues for listening to story-telling and ballad singing in Suzhou dialect, and organize the folk activities including celebration of Lantern Festival.

The historical culture of Li Gong Di is the fewest among the three commercial streets, in terms of the continuation of history, it mainly explored and publicized historical stories, established the statue of Li Chaoqiong, set up monument and pavilion, and organized various activities related to the allusions of Li Chaoqiong to add colors to historical and cultural atmosphere.

3.4 Ecological Aspect: Ecological Space for Nourishing and Improving Environment

Many urban characteristic commercial streets are integrated with the natural ecological environment with local feature. Different natural ecological environment not only helped to establish various urban characteristic commercial streets, but also integrated the natural ecological elements to the urban life. It's an important component of urban ecological system. In terms of the big metropolitan with high density, close integration with the ecological featured space of urban daily life is of more outstanding significance.

Since the three characteristic commercial streets are all water front sections of the city, water environment is their important feature. Although the three waters are varied in properties and features, they all play positive roles to the ecological environment of the city (Table 5).

Table 5 Comparative analysis of water environment

	Ping Jiang Road	Shan Tang Street	Li Gong Di
Typical waterscape			
Features of water body	Small-scale net-shaped water body	Small-scale linear Water body	Large-scale faceted water body
Protection situation	Old watercourse is retained and the channels are regularly cleaned out, and the sanitary personnel are responsible for routine cleaning	Watercourse is intact, with waterways running through, and old watercourse has been continued	The lake surface of Jinji Lake and small Jinji Lake is intact and open, with exquisite scenery
Water quality	The waters are linked and run through the downtown, and water quality are ordinary	Affected by the machinery pleasure-boat and the surrounding commerce, the water quality is turbid.	Environmental protection is strict, water coverage is large, and water quality of the lake is fine
Picture			
Social evaluation	Fair	Ordinary	Fine

4. How to Shape Urban Characteristic Commercial Street

4.1 Grasp the Source of Characteristics of the Characteristic Commercial Street

By studying the three characteristic commercial streets in Suzhou, it can be seen that the “features” of the urban characteristic commercial street are reflected in three aspects: natural environment, local culture and herald of history.

4.1.1 Combining with the Natural Environment

Many cities have their own unique natural conditions and geological conditions. These are the bases of forming urban characteristic commercial street. On one hand, natural elements can be applied to form the landscape of the space. For example, the Hongyadong by the river-side of Chongqing River spreads tier upon tier according to the terrain condition, and transfers the terrain features to the features of construction and space. The Southern part of China is another example. It developed arcade-house to fit for the rainy and hot weather.

4.1.2 Keeping a Foothold at Local Culture

The display of local culture is an important source of spatial feature. Urban space shall consider the existing historical and cultural relics. These relics are non-duplicable precious wealth of the city. They not only provide historical reference, but also facilitate the cultivation and development of city spirit. Thus, protecting and utilizing the existing historical and

cultural relics is an important means to form the characteristic commercial street. For instance, the “Xintiandi” in Shanghai adopts the old house of Shikumen, and introduces the modern functions of the catering, shopping and entertainment to form cultural and recreational center of fashion and recreation. It needs to be noted that the protection and utilization of historical and cultural relics need to safeguard the originality of historical relics, pay attention to the coordination of accessory building, landscape planting and lightings to fit for the historical landscape, ensure smooth protection and renovation, and control the commercial activities.

4.1.3 Highlighting the Herald of History

The establishment of urban space cannot break away from the history. Of course, it shall reflect the characteristics of the history, and a featured space also needs to respond to the progress of the history. For example, the emerging industries were established to meet with the new requirements of social development, and they have brought new requirements to urban space. The book of *Rise of The Creative Class* indicates that creative class is more keen on the featured urban space with small blocks, small road networks, and small facilities at community level (café, bar, small-scale musical hall, small gallery, etc.). Only by fully understanding the characteristics of new functions, can we accurately reflect the appeal when forming the urban space, thus establishing the characteristics of the space itself.

Take another example, creative thinking is one of the driving forces of constant social progress. Naturally, urban space will have distinct features due to creative thinking and advanced ideas. Nowadays, the ideas on ecology, low-carbon and wisdom are changing today's urban space.

4.2 Establishing Sound Implementation Mechanism

Although urban public space is the main concern of urban design, the urban design results always fail to effectively realize it, and the *features* of characteristic commercial street may be distorted or disappeared. During the protection and renovation process, Ping Jiang Road and Shan Tang Street established separate companies with the financial support of the government, responsible for all the processes from transformation, investment attraction to management and maintenance at later stage. The Harmony Group with state-owned assets is responsible for the development and later-stage management of Li Gong Di. Since the elements of urban characteristic commercial street involves many departments, the establishment of a working mechanism that can coordinate various institutions in a unified manner will better guarantee the implementation of the *features*.

4.3 Receiving the Test of History

Provided that the newly built urban commercial streets grasp the source of “features” and effectively implemented it, they only enable the space to have the possibility of becoming *characteristic commercial street*, or possessing the *basis*. If they want to become featured space in real sense, they need to receive the test of the history, and constantly add rich urban activities. It's just like a museum which needs to constantly enrich the collections over the years. The reason why historical blocks are more easily to become characteristic commercial streets than newly built blocks is that they have abundant traces left from the long-time usage of the space, including renovations, facilities left by people's life exchanges, remnant and archway resulted from certain incidents at various periods, and even the people and events after the space. In this way, they can cultivate the taste of the space.

In addition, the bounty of heaven and earth can also endow the space with some poetic flavor. Wet slab stone path, mottled wall, obsolete doors and windows, or rusty bronze statue

with pigeon feces, glossy rubdown ashlar square, and antiquated red brick wall reflecting the lingering light of the setting sun. The traces of history endow these space with sentiment, enabling the people to feel the poetic flavor of the space.

5. Conclusion

Among the four attributes of *publicity*, *difference*, *reflection* and *artistry* of the urban characteristic commercial street, *reflection* is the soul, revealing not only the geological information of the space, but also the past and present cultural information of the space, and at the same time, representing the future development possibilities of the urban space. Hence, the feature of urban space originates from its natural environment, historical and cultural environment and creative thinking. To the people who are the subject of spatial feeling, apart from comfort and visual aesthetics, it's important to arouse the internal rich emotions. Those traces, details, stories and activities left by the time are the spirit to arouse these feelings, and it's necessary for the space to undergo the severe test of the history.

If urban space is said to be a container carrying urban civilization, what the urban characteristic commercial street carries is the most essential part of urban civilization. It not only represents the essence of urban civilization, but also witnesses the spreading of urban civilization.

Coordinating Strategy of Preserving the Local Identity during the Rapid Urbanization in China: Case Study of Three Towns in the South of Kunshan

Zhi Yang, Southeast University, Jiangsu Institute of Urban Planning and Design, China
Haibo Hu, Jiangsu Institute of Urban Planning and Design, China
Haiyong Wang, Jiangsu Institute of Urban Planning and Design, China

Accompanied by the rapid urbanization in China, the conflict between development and preservation has been reinforced, especially in the area of land use, environment resource and culture heritage. Recently, the preservation of local identity has been appreciated. This paper is aimed at exploring that how to preserve the local identity as well as achieve the economic development during the rapid urbanization. By the method of comparative analysis based on the data source and valuable resource evaluation, the coordinating strategy in historical conservation redevelopment, integrating space and policymaking has been proved to be effective.

1. Problems of local identity preservation in China

Since the reform and opening up in 1978, China has made great advancement in urbanization: the urbanization rate has soared from 17.9% in 1978 to 51.3% in 2011. During the development of economy, the townscape and living style has undergone tremendous change. The inheriting of traditional culture heritage is in deep crisis.

On the base of some current research on the problems of local identity preservation, especially about “whether development and preservation are opposites?”, we can find that there are several problems urgently needed to solve in coordinating the development and preservation. Then by referring to the description and analysis of the challenges of local identity preservation in China in “The theory and planning on the preservation of historic city” and “Urbanization and historic city”, we can sort the problems as follow.

1.1 Rapid urbanization brings the unregulated expansion

Facing to the rapid urbanization, many cities still use the traditional expansion model of single center, which excessively accumulates the whole function of living, working and serving. The accumulation of population causes the pressure of infrastructure and the extensive pattern of land use. Many kinds of “city disease” have arisen. Especially, the preservation of culture heritage and environment become more and more serious.

1.2 Motorization brings the destruction of traditional street model

The trend of urban traffic mechanization has a great impact on traditional bicycle traffic and pedestrian. In order to satisfy the need of high speed transportation, many traditional streets have been enlarged. Elevated roads and grade separations change the urban morphology and street texture. Furthermore, vehicles also maintain rapid growth in volume. The excessive motorizing development causes the degrading of the traditional space feature.

1.3 Homogeneity becomes a common phenomenon

“Characteristic crisis”, which was raised by the research of Zhou Ganzhi, Zhu Guanya, etc, proves to be a usual problem. Some cities borrow indiscriminately from other cities’

experience, which aspire to massive constructing. The townscape follows the same pattern. As a result, some characteristic cities and blocks are submerged in the monotonous new-built environment. Local identity has gradually vanished from the historic areas.

2. Valuing what already exists: case study of three towns in the south of kunshan

According to the research of “The Preservation and Protection of Historical and Cultural Cities in the Course of Urbanization”, the valuable resources of local identity include historical buildings, ecological landscape, culture reputation, and so on.

Kunshan, the top level of comprehensive strength among Chinese counties, is undergoing tremendous changes in economic development and urbanization. According to the master planning of Kunshan, it is divided into three parts, central agglomeration for urban development, northern resorts area around Yangcheng Lake, southern tourism area including watery historic towns. In the south of Kunshan, there are three national historic towns (Zhouzhuang, Jinxi and Qiandeng) in the range of less than 300 square kilometers, which is very rarely in China. There are many historic resources accumulating in this area. Meanwhile, this area is the most excellent district in the aspect of ecological environment, with densely lakes and rivers.

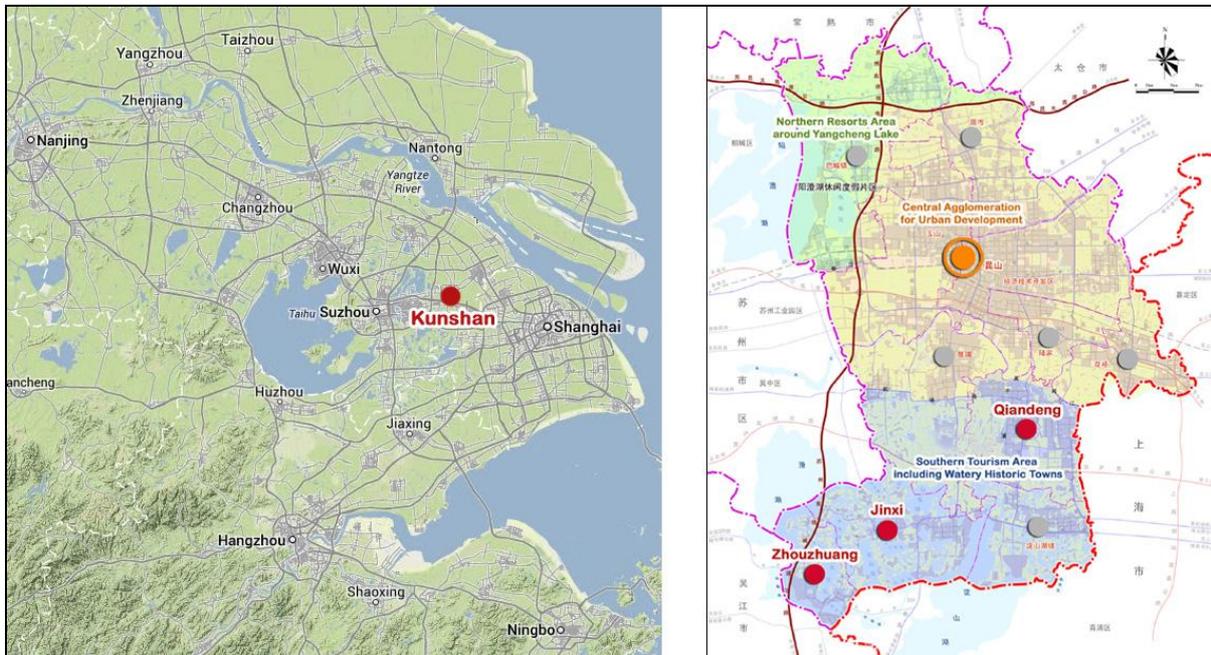

Figure 1: The location of Kunshan and the three towns
Source: The master plan of Kunshan

2.1 The contribution to traditional culture

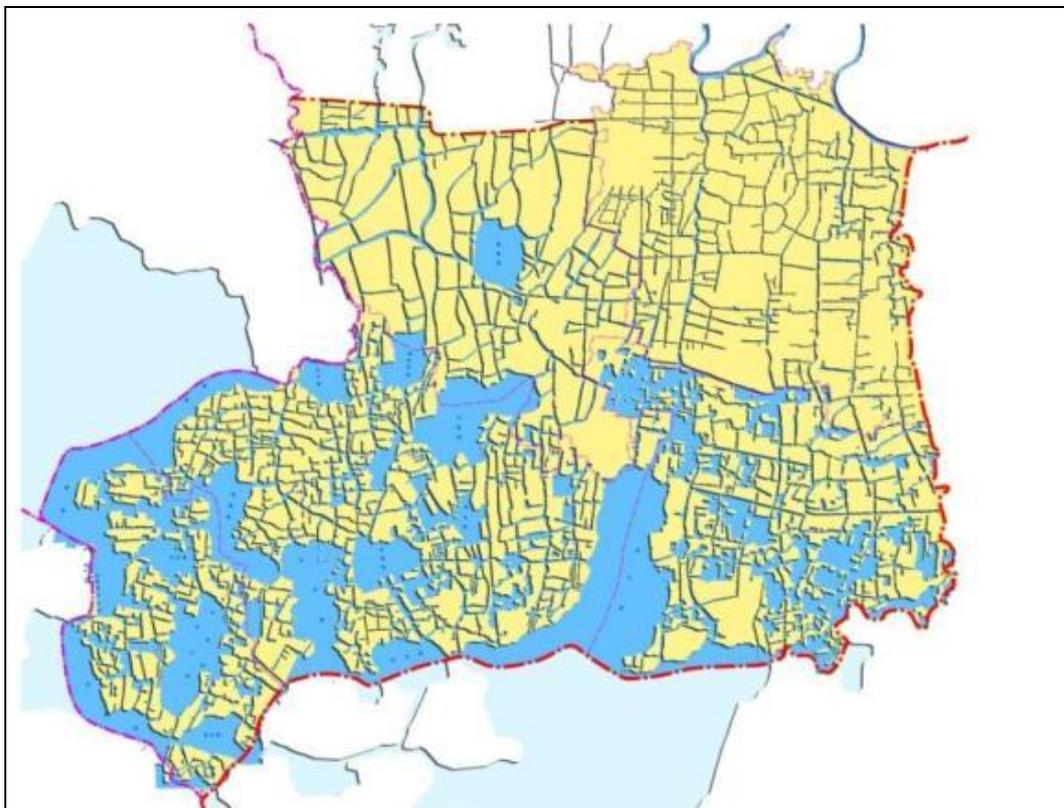

The south area is usually honored by its culture character. The three towns accumulate most of the culture heritage, including 60% of the historical and cultural sites under government protection in Kunshan. In the aspect of nonmaterial I heritage, the three towns occupy 40% of the whole city. Furthermore, Qiandeng is the birthplace of Kunqu opera, which has been listed in the nonmaterial heritage roster by UNESCO. In the aspect of the proportion of culture heritage, three towns account for a large proportion of the whole Kunshan. All in all, the three towns play an important role in the preservation of historic heritage and make a great contribution in the inheriting of culture.

Items		Kunshan	The three towns	Proportion
Historical and cultural sites under government protection	National	1	0	0%
	Provincial	9	7	78%
	Municipal	67	36	54%
Historical buildings		14	9	64%
Cultural relics buried underground region		28	5	18%

*Table1: Three towns' proportion of Kunshan in culture heritage
Source: The author's own study*

2.2 The contribution to ecological townscape environment

The natural landscape resources include many kinds of lakes, rivers and ecological green belt. The three towns belong to the alluvial plain of Taihu lake, where the component of water has accounted to more than 30%. The rivers in this area shape a geographical layout in a crisscross pattern. Along the river layout, the rural land use is arranged. These resources form the townscape feature of “bridge, stream and house”.

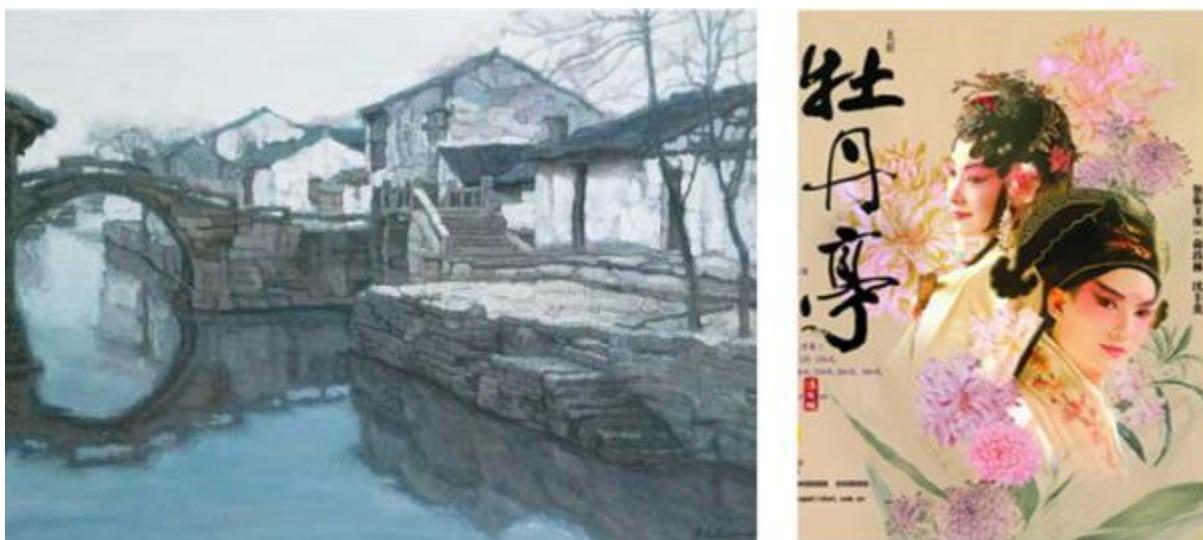

*Figure 2: Watery layout pattern
Source: The author's own study*

2.3 The contribution to reputation and tourism

Because of the cultural fascination of the historic heritage, such as Zhouzhuang and Kunqu opera, the three towns prove to be the worldwide brand of Kunshan. In the recent years, the amount of tourists in three towns has occupied more than 50% of the whole city. As the continual increase of the amount of tourists and the rapid expansion of the influence of tourism brand, the three towns play a significant role in the overall development of the service industries of Kunshan.

	The amount of tourists	Proportion to the whole city
The whole of Kunshan	17,100,000	100%
Zhouzhuang	5,340,000	31.2%
Jinxi	1,730,000	10.1%
Qiandeng	1,520,000	8.9%

*Table2: Three towns' proportion of Kunshan in the amount of tourists, 2011
Source: Kunshan Statistical Yearbook*

*Figure 3: The paint of “Double Bridges in Zhouzhuang” by Yifei Chen (left), Kunqu Opera (right)
Source: The art collection of Kunshan*

2.4 Dilemmas between preservation and development

According to the statistics of 2011, the GDP per person of the three towns covered the range from 8,200 to 15,500 US Dollars. In the aspect of GDP per person, none of the three towns can achieve the average level of Kunshan, let alone the highest level of Kunshan Economic & Technological Development Zone which is mainly responsible for the traditional manufacturing industry.

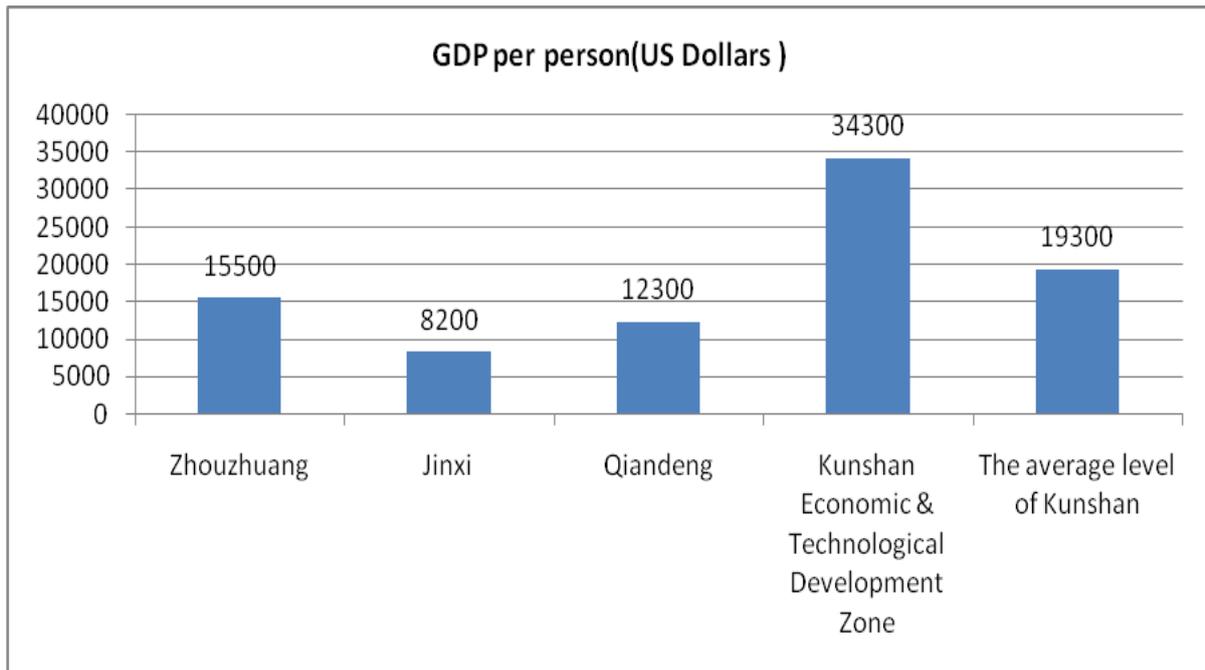

Figure 4: GDP per person of the three towns, 2011
 Source: Kunshan Statistical Yearbook

Although Kunshan is noted for its rapid economic growth, the three towns develop slower than the others because of more strict environmental constraints and historic preservation. The three towns can't follow the development model of Kunshan Economic & Technological Development Zone. The existing development model of the three towns should be restructured. Local identity preservation and economical development should be balanced.

3. Coordinating strategy of preserving the local identity

Despite of the background that many regions have lost the identity during the rapid urbanization in China, the three towns should take the road of characteristic development which depends on the basis of exclusive local culture and ecological resource instead of massive manufacturing industry.

During the current research on the strategy of preserving the local identity, preservation is put more attention than development. Furthermore, local governments' economic and social policies are usually neglected. In response to the problems of local identity preservation during the rapid urbanization, this paper tries to propose coordinating strategy for characteristic areas so as to achieve synchronized planning of development and preservation.

Coordinating strategy is aimed at finding out that how to preserve the local identity as well as achieve the economic development during the rapid urbanization. Moreover, coordinating strategy is involved in the integrated cooperation of different departments instead of disorderly competition. The details are as follows:

3.1 Coordinating strategy in character inheriting

By the method of comparative analysis and evaluation above, what is worthy of preservation has been valued. Culture and watery townscape can be embodied in the local identity of the three towns. The tourism activities should be enriched in order to improve the brand of "watery historic towns". By the integration of resources, the competition and cooperation

among the three towns can be coordinated. The three towns can achieve the developing alliance instead of individual development. Cultural features are protected by the collaboration of three towns. At the same time, every town is encouraged to shape its own identity, not only in the aspect of physical space but also in the aspect of nonmaterial heritage. In the aspect of townscape feature, Zhouzhuang highlights the pattern of “house-street-water-street-house” with significant bridge, Jinxi gives prominence to the model of “house-street-water” with famous porch, Qiandeng emphasizes the texture of “house-water-house-street-house” with the ancient tower.

*Figure 5: Texture and Street pattern of Zhouzhuang (left), Jinxi (middle), Qiandeng (right)
Source: The author's own study*

*Figure 6: The significant bridge of Zhouzhuang, famous porch of Jinxi, ancient tower of Qiandeng
Source: Photo by the author*

In the aspect of nonmaterial heritage, Zhouzhuang highlights the culture of Shen Wansan, a famous merchant in Ming dynasty. Jinxi highlights the culture of Chen Fei, the imperial concubine in Yuan dynasty. Qiandeng highlights the culture of Gu Yanwu, a patriot in Qing dynasty.

Figure 7: The famous merchant (left), the imperial concubine (middle), the patriot (right)
Source: Photo by the author

By the integration of townscape and the cooperation of the three towns, coordinating development of the cultural tourism can be achieved. In addition, by the union with Shanghai and Zhejiang, world-famous agglomeration of historic towns will be gradually cultivated in the future.

3.2 Coordinating strategy in the economical development

On the basis of the local identity, service sector development should be prior to the manufacturing industry and so on. By positive preservation and reasonable use of the resources of historic towns, watery plain and ecological agriculture, the skeleton of service sector development can be constructed. As a catalyst for agriculture and service sector development, tourism also plays an important role in the aspects of culture redevelopment and increasing people's income. By the landscape and activities of agriculture, the relation between the agriculture and tourism can be enhanced. The integration of farmland and tourism route also can advance the added value of agricultural products, as well as improve the income of peasants. The traditional manufacturing industry should be transformed into characteristic and effective development, especially the production of Tourist commodities, art works and cultural handicraft. Synthesizing agriculture, handicraft and tourism, economical development and feature preservation can be coordinated.

Figure 8: Tourism (left), Handicraft (middle), Agriculture (right)
Source: Photo by the author

3.3 Coordinating strategy in the space integration

Coordinating the old towns and new towns on the basis of watery fundament formulates the local morphology in order to balance the ecology, development and society. The new towns have been constructed to satisfy the expansion of urbanization in order to alleviate the pressure of old towns and preserve the texture of historic towns. By reasonable control of the building height and development density, watery townscape can be inherited. In the aspect of

riverside, public character should be a prime concern. The development should give priority to the protection of watery environment.

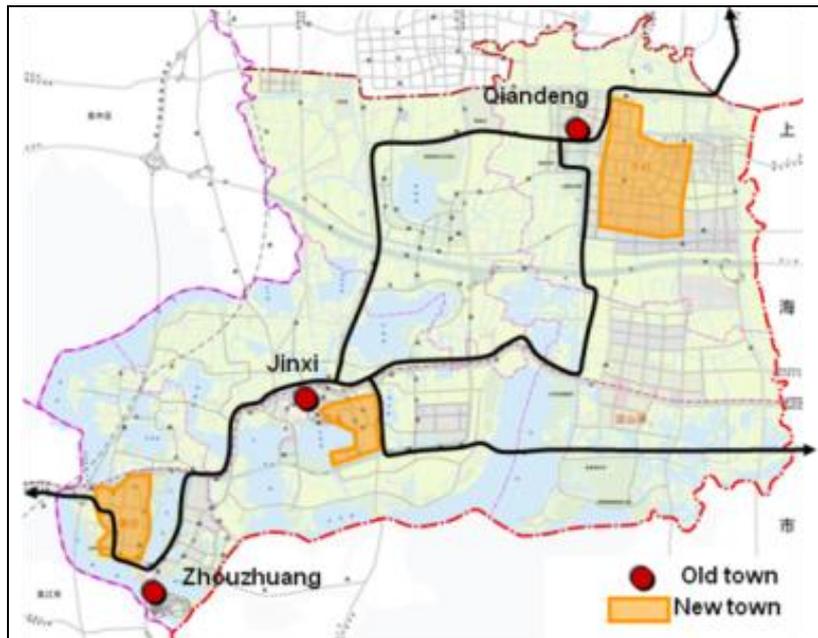

Figure 9: The model of integration with old towns and new towns
Source: The author's own study

There are plenty of characteristic villages around the edge of the three towns. The relation between the residential space and farmland should be balanced in order to help the farming and developing the tourism of villages. Conservation of the integrity of natural landscape inherits the traditional watery layout. According to the advantages of resources, the villages are divided into three groups, cultural, riverside and rustic type. Different types of villages should be adopted different strategy in order to achieve characteristic development.

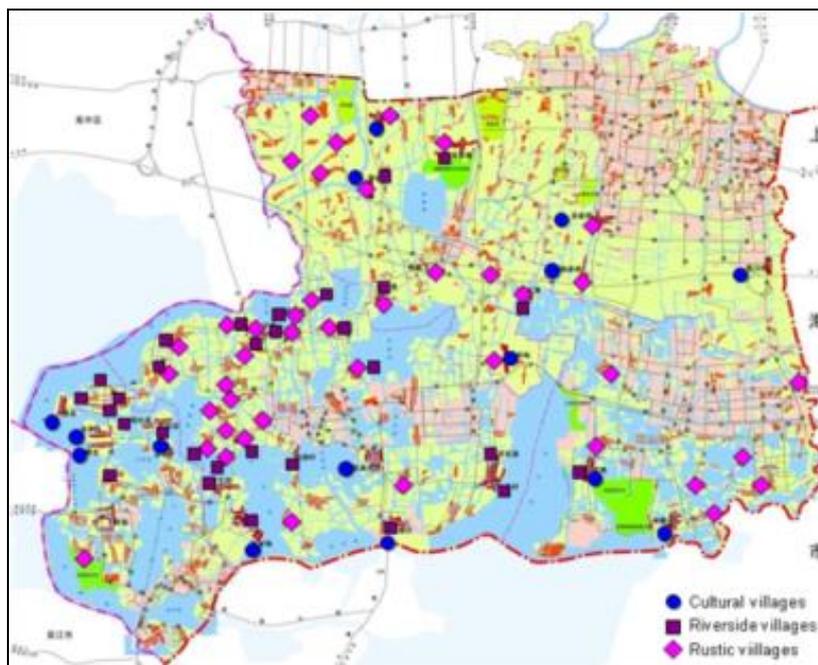

Figure 10: The layout of different types of villages
Source: The author's own study

Tourism system is shaped by the means of integrating many kinds of traditional watery villages with characteristic transport, which not only connect the three towns but also join into the regional tourism routes. Blue corridors along the riverside and green corridors along the road compose the tourism routes. Furthermore, the arrangement of service along the routes is helpful to the development of tourism.

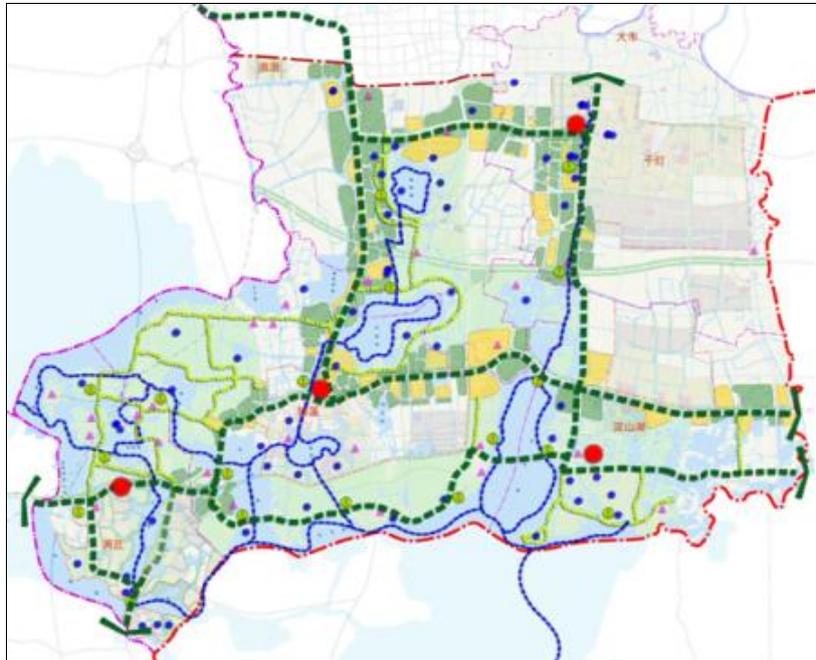

Figure 11: The tourism routes of blue and green corridors
Source: The author's own study

3.4 Coordinating policy

Policymaking in the range of whole city helps to bridge the gap of economic development between the three towns and the others.

Firstly, by increasing transfer payments, the three towns can give priority to the preservation of local identity, both culture and ecology, instead of the manufacturing industry and economical development. Ecological and cultural subsidies help the three towns to preserve the local identity. The improvement of the income helps the peoples' initiative of preserving the culture heritage and ecological environment. Furthermore, the special funds for the three towns have already established to promote the development power.

Secondly, training policy is helpful to the farmers and foreign workers, especially to the development of tourism. For the management leaders, the study of advanced operating model and management should be provided in order to exploit the tourism market. For the service staffs, the knowledge of local culture should be trained in order to spread local culture. In addition, the foreign language training should be provided in order to enhance the ability of tourism service.

Moreover, a coordinating agency is put on the agenda. On the one hand, the agency is responsible for integrating the relationship among the three towns. On the other hand, the agency should cooperate with Shanghai and Zhejiang inter-regionally. By the establishment of regular conferences and communication procedure, the cooperation of local identity preservation and tourism development can be achieved.

4. Conclusion

All in all, the coordinating strategy in the aspects of historical conservation, industrial development, integrating space and policymaking is very useful to the three towns which aim at characteristic development. The coordinating strategy not only helps to preserve the local identity but also achieves the economic development, which can be an excellent balance. Especially, it points out the real possibility that local governments have to implement the coordinating strategy within the current political, economic and social context. Furthermore, the coordinating strategy has a great deal of significance on the future development of the similar regions which are full of cultural and ecological resources in order to preserve the local identity during the rapid urbanization.

Problems and Countermeasures of Dujiangyan Agricultural Area Protection during the Rapid Urbanization in Chengdu

Yuan Lin, School of Architecture, Tsinghua University, Beijing, China
Yuan Lin, College of Architecture and Civil Engineering, North China University of Technology, Beijing, China

1. The Devourment of Dujiangyan Essential Agricultural Area during the Rapid Urbanization in Chengdu

Known as the Land of Abundance and one of the basic economic regions of China since Qin Dynasty, Dujiangyan irrigation area of Chengdu Plain, with the developed artificial basin system gestating the city and Lin Pan, is one of the important essential agricultural areas and a typical example of traditional human settlement practice of ecological civilization.

Chengdu Plain is in tempestuous change contemporarily among the rapid urbanization process. The form of traditional ecological culture is seriously separated in the current era. The process of urbanization expanding on the land formed by thousands of years of hard work is full of conflicts, challenges and even unpredictable risks in the future. Over nearly 30 years, Chengdu Plain has gradually formed a city-centered development model, particularly with Chengdu as the center, enabling the existing traditional human habitat pattern to deteriorate in a gradual manner. In this process, the essential farming area has been swallowed by the fast-growing urban construction land, which shows obvious confrontation between urban development and vast natural areas.

Chengdu's urban area covers an area of 483.35 km² as of 2011, but 95 km² 25 years ago (1986), exhibiting an increase of 388.35 km². However, by 2011, the total built-up area of the six cities of Chengdu, Deyang, Mianyang, Meishan, Leshan and Ya'an was 769.3 km², but 147 km² 25 years ago (1986), up by 622.3 km², with the growth of Chengdu accounting for 62.4%. The data indicate the overall rapid urbanization in Chengdu Plain, and also reveals the obvious single-center growth state of Chengdu, central city in Chengdu Plain, in nearly 25 years' urbanization.

By comparing change of cultivated land in 2011 with that in 1991, the overall arable land in Sichuan Province decreases by 6,489 km², and that in Chengdu is down by 1,378 km², accounting for 21.2% of the whole province, while the total arable land of Chengdu, Deyang, Mianyang, Meishan, Leshan and Ya'an has a reduction of 3,603 km², occupying 55.6% of the whole province. From the statistical data changing curve, after implementing strict policy of cultivated land protection in 2004, the number of cultivated land in Sichuan remained unchanged and a slight increase year by year, however, contains the total range of arable land of six cities in Chengdu Plain being still in the trend of obvious declination. From 2004 to 2011, the cultivated land of six cities reduced by 483.3 km², wherein Chengdu decreased by 320.2 km², accounting for 66.3%.¹

The change of Chengdu Plain built-up area and farm land indicates that the current urbanization has tremendous destruction of agricultural land, and this tendency continues. In the next 20 to 30 years, in accordance with the master plan of the existing counties in the Chengdu Plain of construction land use in indicator development, greater pressure will be exerted on the plain agriculture area. As to Tianfu New Area in the south of Chengdu under construction, the land planned for use has more than 1500 km². By 2020, the building land is going to rise by 550 km², and increase to 650 km² by 2030,² linking up with Chengdu into a single stretch with the growth equivalent to an additional city of Chengdu.

For Dujiangyan irrigation area, 17 counties, that is, Guan, Pi, Chongqing, Shuangliu, Chongning, Peng, Xindu, Xinfan, Jintang, Wenjiang, Huayang, Chengdu, Xinjin, Guanghan, Qingshen, Pengshan and Meishan were irrigated before the foundation of the PRC. The

water conservancy management and development of Dujiangyan irrigation area gradually became modernized and specialized after the establishment of the PRC. The irrigation area now continues to expand in hilly countryside. At present, it has an area of 23,200 km², covering the total arable land nearly 17,632,500 km². The beneficial scope includes Chengdu, Deyang, Mianyang, Leshan, Meishan, Suining and Ziyang, totally 7 cities and 37 counties (towns and districts).³ However, the expanded regions are the areas where natural conditions are relatively weak, while the traditional core irrigation area, especially Chengdu, was put into the reality and risk of being swallowed.

The writer combines the present situation of urbanization in the Chengdu Plain with the master plan of each city of the plain in 2020 together. From the view of configuration, Chengdu displays the shape of increased concentric circle and then gradually increased radial pattern, linking up with Pi, Chongzhou and Wenjiang. Tianfu New Area expands southwards, adjacent to part of Xinjin and Meishan. The essential irrigation area of Dujiangyan shows a clear sense of oppression and the tendency of fragmentation.

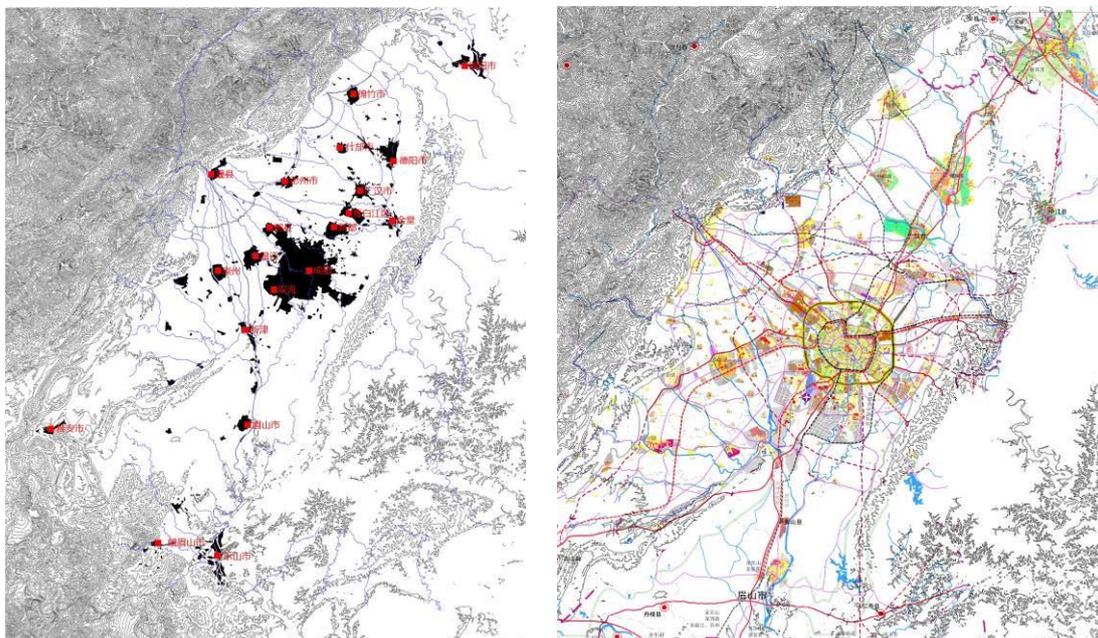

Figure 1: present urbanization pattern (left) and planning in the future (right)

2. Current Agricultural Region Protection Policy and Deep Risks

The open space of the Chengdu Plain has a variety of protection measures during the rapid urbanization in Chengdu. To limit the pernicious urban expansion and promote the protections of agricultural areas, Chengdu has launched and implemented a number of relevant policies, mainly including: (1) answering the call of the country to establish basic farmland protection system; (2) launching creative arable land protection fund in 2008 (has already issued farmland protection fund RMB 1.19 billion to the benefit of 1.14 million households⁴) (3) delineating "198 zones" in the plan, and creating new mode of urban open space in external protection and development; (4) developing *Planning of Lin Pan Protection in Western Sichuan* in the unit of district and county in 2007.

The implementation of the policies has played an active role to protect the open region in the periphery of the city. But we still need a deeper understanding of the hidden deep contradictions and ecological risks behind the implementation of the policies, and judgment on these risks will directly determine the future improvement, promotion of the effective protection of ecological resources. The deep-rooted risks can be seen from several aspects as follows:

2.1 Rural Land Consolidation Based on the Three-Concentration Principle

In recent years, Chengdu has carried out coordination works in urban and rural areas under the guiding idea of “three concentrations”, that is, industry, farmers and land are concentrated in centralized development area, urban area and large-scale operation respectively.⁵ The “Three Concentrations” are the general program of urbanization in Chengdu currently, the fundamental guiding principle in the management of agricultural regions and also the basis of investigation of the utilization of various policies and management nodes. Adhering to the principle of “three concentrations”, Chengdu Government implemented “land consolidation”, “golden land project”, “centralized residence of farmers” and other tentative measures, and vacated much collectively-owned land through demolition, amalgamation, relocation to centralized residence. The land was mostly used for urbanized or industrial development, partly returned for plowland, and partly developed for houses with limited property rights. The land consolidation is bringing about tremendous changes of traditional countryside's Lin Pan pattern, especially large-area Lin Pan destroyed at the boundary of rural and urban areas can be seen everywhere. Moreover, to pursue short-term benefit of agricultural operation, Chengdu also greatly advances large-scale operation of rural land, which is changing the farming mode with household as the unit fundamentally.

Under the “Three Concentrations” principle, the status quo of agricultural land protection system, and implementation and application of farmland protection fund is daunting. The achievement of basic farmland protection target is primarily exhibited by means of village migration and amalgamation, land consolidation, requisition-compensation balance and so on, ostensibly being digital “dynamic balance”, but materially losing the land for thousands of years and increasing new land which is incapable of forming high-efficient agricultural ecologic system in a short period. In addition, the actual effect of farmland protection fund implemented is not obvious⁶, the farmers are not active in farming, and even agricultural land is used for other purposes occasionally, making traditional agricultural system subject to severe test.

2.2 Fragmentation of Lin Pan Protection under Three-Concentration Principle

In 2007, *Planning of Lin Pan Protection in Western Sichuan* was prepared for various districts and counties of Chengdu under the premise of Three-Concentration Principle. The local government took Lin Pan protection planning as the channel of county land consolidation and farmland requisition-compensation balance and adopted separate protection of small residential quarters. For instance, in *Planning of Lin Pan Protection in Pi County* and *Planning of Lin Pan Protection in Wenjiang County*, Lin Pan protection is defined as follows:

“.....The planning of rural residence landscape protective construction in western Sichuan, as the supplement of the “three concentrations” planning, is the house building layout planning in rural areas beyond new rural communities and point layout construction of rural residence yards with preservation value relative to small-scale agglomerated point for scattered settlement, in this way to realize the full coverage of rural areas’ planning.....”⁷

“For the distribution features and value of Lin Pan in Wenjiang District, according to the principle of highly centralized flatland in the new countryside construction and layout planning, Lin Pans with certain scale and high value are protected at certain location.”⁸

It is obvious from the description above that land requisition-compensation balance, land consolidation and new countryside construction are the premise of traditional Lin Pan protection. Under such protection logic, the segments involving Lin Pans of Chengdu shows the tendency of fragmentation, and the understanding of historical heritage and countryside ecological system value is highly insufficient. For example, there are over 8700 Lin Pans in Pi County, while 301 are large-scale ones with more than 10 households living there mostly, accounting for 3.5% (from 1.9% to 17.9% for toher counties) of the total. Such protection is

point-oriented type with water ditches and rivers not included in the system. Furthermore, the protective measures mainly comprise house renovation of single Lin Pan, construction of infrastructure and reconstruction of landscape. According to my visit to various township governments of Pi County in October 2010, the understanding of related departments to Lin Pan protection was diversified, but generally focused on the combination of land consolidation with village migration and amalgamation, protection of large ones, and migration & amalgamation of small ones, or removal of houses with trees remained, or leveling for returning plowland. Few noticed the ecological function of Lin Pans and integrity of traditional intensive cultivation settlement. In the two overall investigation of Lin Pans in Pi County in 2004 and 2006 developed by local government, it was found that the number of Lin Pans in Pi County was rapidly reduced, from over 11,000 in 2004 down to over 8,700 in 2006 in quantity, and 25 Lin Pans/km down to 20 Lin Pans/km viewing from density. As per the tremendous change of the two years, the next round of urbanization shall be carried out according to our current awareness and protection mode. This reduction trend is inevitable and the unique human settlement unit derived from ancient Dujiangyan irrigation area in the Lin Pan of western Sichuan will be under more severe challenges.

2.3 Deep Risks of the Trend of Rural Land Marketization

In the unified design between the city and the countryside, Chengdu's reform also promoted "Rural Marketization"⁹. In 2007 and 2008, Chengdu issued related policies to advance the reform of rural land marketization, drive rural land to become capitalized, promote the reform of rural land and house property right system, boost the flowing of collectively-owned construction land and rural house property rights, stress the launching of rural assets to become capitalized and link the privatization of property right with farmland protection.¹⁰

The current logic of Chengdu to push forward related policies is to reuse the assets through land operation, make them enter the market and produce transactions, which is based on the thought of allowing rural house sites to circulate to create huge wealth. The failure of rural house sites to become wealth is because of the farmers' house sites failing to flow into the market due to the absence of identified property rights.¹¹ The land rights determination developed in the Chengdu Plain currently is the result of further marketization of rural land and the process of land transforming into assets. However, land capitalization and marketization does not mean that high depreciation of ecological value of the land. The trend of marketization is to make the transaction of land and Lin Pans legal and valid, forming capital converting process though the result is hardly to control (commercial, hotels or real estate?).

Land privatization may facilitate out-of-order urbanization of rural areas, bringing deep risks. Vice minister Qiu Baoxing has ever clearly stressed that the protection of public land in China shall not develop in the direction of strengthening private property rights in combination with urbanization development:

"(Currently) the reform targets at land property right's privatization or clarity to avoid the tragedy of public land, allowing thousands of farmers to protect the farmland as their own living house so as to reach the national land saving objective. However, this idea seemingly conforming to logic sense has long been broken up by the practice of western developed countries and developing countries and regions in Africa and South America relentlessly. The rapid urbanization of American land privatization system resulted in farm managers selling their land to the developers with one another, facilitating the spreading of low-density suburbanization. The land privatization in Africa and South America also led to the land owners to sell their land once for all, which caused most farmers without land to flock into big cities to form slums and poor agricultural yield."¹²

Figure 2: real estate development of Lin Pan in the Pi County

3. Advice on the Construction of the Protection Measures of Agricultural Improvement Area of Essential Farming Heritage Area

The development mode of the contemporary regional pattern of Chengdu Plain can be observed with the concept of dual subject of nature and artificiality (“intersubjectivity”) advocated by ecological philosophy. During the urbanization for nearly 30 years, the formation of regional pattern has been led mainly by the system of cities and towns. Under this kind of thinking, the urban construction land has been the main part while nature just the background usually overlooked, and the incessant enlargement of the urban city-built area without scientific guidance has caused the unbalanced development of agricultural and natural land and urban construction land pattern. To change the phenomenon, however, apart from insisting on the consistent concept of big city-growth limitation and coordinated layout of cities and towns, a dependable protection system in plain area needs to be constructed through a series of measures so as to reinforce the subjectivity of nature (including agricultural areas) and expedite the balanced development of the region.

The base of the unfolding of contemporary urbanization of Chengdu Plain is the essential agricultural area in Dujiangyan created by hard-working laboring people during thousands of years. The conflict of land with high quality and urban construction can be observed obviously in Chengdu Plain. As early as 1991, someone mentioned, “Just like the construction of natural reserve and the protection of rare animals and plants, the construction of cultivated land reserve is needed.”¹³ However, in recent years, though basic protection system for farmland has been constructed, the cultivated land protection has been basically unfolded in the logic of requisition-and-compensation balance, which thought highly of the quantity of farmland but attached little importance to the quality.

From the perspective of history, the traditional essential agricultural areas in Dujiangyan refers not only to the farmland with high quality, but also a living system entirely applying to the traditional artificial river basin in Dujiangyan, including basic elements such as artificial water network and woodlands, also places carrying traditional cultural life like counties and towns, and ancestral temples, and so on. From Song Dynasty, Dujiangyan mentioned by ancient people has not been just a headwork project, but has been referred to as the entire artificial basin system in the plain. Historian Tan Jihe thought, “As a world cultural heritage, Dujiangyan should be a complete concept, so the headwork area of Dujiangyan as the world cultural heritage at present can be expanded to the whole irrigated district and can then apply for world cultural heritage entirely as an extension project.”¹⁴ Current situation of the cultural heritage in Dujiangyan mainly refers to the headwork water engineering and is not expanded to the waterway of the plain and the living environment. Tan’s opinion attached importance to the heritage value of the whole irrigated district, combining the development of essential plain areas with the whole heritage protection.

During the urbanization of traditional European agricultural countries, agricultural area protection had been recognized as a key task and had also been tentatively explored by means of the technology method of “national parks”. Take Britain as an example. The formation of humanization of the earth caused by long-hour human activities makes it impossible for Britain to construct wilderness protection-leading systems of national parks in accordance with American modes. In England and Wales, the purpose of national parks construction is to on the whole provide modes for sustainable country management. “Landscape” (including the combination of nature and humanities) is identified as an important object of protection of national parks and protection measures of the highest level are formulated.¹⁵ In order to resist the “threat” to countries of urbanization, in 1926, England specially established Country Protection Society of England. Associated with other societies, CPRE positively asked for the construction of national parks in agricultural areas. Their romantic interpretation of cultural landscape was declared in National Parks Commission (1949), which was responsible for investigating and supervising country development and precluding the infringement of mining, agriculture, tourism and other commercial interest group, for the purpose of maintaining “traditional” agricultural lifestyles through prevention and protection. Later, in 1958, the national commission for country protection turned to be the rural commission.¹⁶

In recent years, Richard T.T. Forman, an ecologist, also put forward his conception of concentrated agriculture protection in the long-term ecological planning for Barcelona. He systematically studied the relationship between regional people and nature, formed the “agricultural parks” conception in the planning of “regional food system” and thought that concentrated protection of agriculture with large areas could not only reduce costs and enhance quality, but also save the value of landscape and ecology.¹⁷ Similar practice had been unfolded in areas with long agricultural history such as Belgium and Germany. This countries delimited “high-value agricultural areas”¹⁸ and its protection scope had exceeded the “open space”, developing in the direction of cultural landscape - focusing on various function value of traditional landscape, giving consideration to many aspects such as production, disaster prevention, aesthetics, recreation, education, and human habitat, including key elements like vegetation, waterway, and villages, in order to protect the sustainable development of traditional countries.

The urbanization of Randstad in Holland embodies another type of development way of agricultural area protection in city region. Before the massive urbanization, for the purpose of protecting traditional country areas, Randstad in Holland delimited the “green heart”, which mainly consisted of lowland agricultural areas formed by reclamation for hundreds of years. At the end of the 20th century and the beginning of the 21st century, the “green heart” had gradually become the “national landscape”, starting to be in combination with the protection action of the United Nations world cultural landscape, and became an independent administration area.

The construction of contemporary system for protection zone in China explores less of the protection in traditional agricultural areas, while Yunnan Hani terraced fields, the world cultural heritage, is an attempt of force and the heritage protection form of exploring the integration of traditional agriculture, landscape, and living environment.

No matter “heritage zone” or “national parks”, they both emphasize the entire protection of traditional large agricultural areas. The contemporary essential agricultural areas in Dujiangyan should use for reference the protection experience described above, expanding the heritage protection of Dujiangyan headwork to that of intensively cultivated agricultural areas in the plain, and agricultural protection areas with large scopes need to be delimited to change the development trend of current fragmentation to private property right. This protection form, on the one hand, has unity of plain irrigation area in aspects such as ecology and culture, and on the other hand, is another way of preventing agricultural areas from infringement during rapid urbanization. Agricultural areas need to be developed, but more

attention should be paid to the heritage and the entire ecological value. The contemporary essential agricultural areas in Dujiangyan have been seriously deteriorated, but quantities of ancient riverway and a number woodlands settlements are still conserved in counties like Wenjiang, Pixian, and Dujangyan. We can plan the counties as a whole, breakthrough the current protection situation of woodlands settlements of each county being protected one by one and the requisition-and-compensation balance of agricultural land, and in combination with the involved scope of traditional irrigation area of 17 counties in Dujiangyan, commonly map out the agricultural areas with higher historic heritage value and better ecological environment, delimit “essential agricultural heritage zone in Dujiangyan” by means of heritage protection theory, recognize as a whole cities and towns, woodlands, ancient riverway, essential farmland, ancestral temples, water culture, and so on, promote the dominant position of agricultural areas in the protection form of “essential agricultural heritage zone in Dujiangyan”, cooperated with urbanization, to expedite the construction of new patterns in the plain areas of Chengdu.
